12) Attach Engine Hoisting Sling Tools 6000-B-A and 6000-C. Position sling to lift engine less transmission. Lift engine slightly. Have second mechanic push forward to clear dash panel. Continue to lift engine until clear of engine compartment while second mechanic guides engine.

CONTINENTAL

ENGINE REMOVAL (Less Transmission);

1) Drain radiator and block, remove hood.

2) Disconnect distributor primary wire at distributor. Pull secondary coil lead from distributor cap.

3) Remove capscrew securing transmission oil filler tube bracket to exhaust manifold. Disconnect two right heater hoses at heater control valve and return pipe. Disconnect right heater control valve vacuum hose at valve.

4) Remove nuts and lockwashers securing right front exhaust pipe to exhaust manifold. Slide inlet pipe free of studs (*NOTE* - Hold exhaust control valve with nut).

5) Remove carburetor air cleaner and duct as an assembly. Disconnect upper and lower radiator hoses. Remove capscrews and lockwashers securing radiator to its support. Remove radiator. Remove fan, spacer, water pump pulley, and drive belts.

6) Loosen power steering drive belt and capscrew securing power steering hose bracket to cylinder block. Remove power steering pump. Wire pump securely to left hood hinge in position to prevent oil leakage.

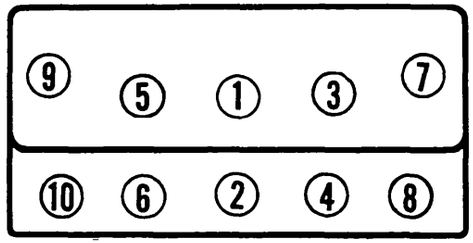
7) Disconnect battery ground cable. Remove converter housing-to-cylinder block capscrews. Remove two accelerator shaft retracting springs. Disconnect carburetor-control shaft rod at carburetor. Remove capscrews securing control shaft assembly to engine, wire control shaft assembly to dash panel.

8) Disconnect temperature sending unit wire at sending unit and oil pressure gauge sending unit at bullet connector. Remove capscrew, lockwasher, and clamp and disconnect tachometer drive cable at distributor (*CAUTION - Remove tachometer drive assembly from cable).* Remove nuts and lockwashers securing left front exhaust pipe to exhaust manifold. Slide pipe free of studs.

9) Disconnect two left heater hoses at heater control valve and return pipe. Disconnect left heater control valve vacuum line at valve and power brake vacuum hose at intake manifold pipe.

10) Raise vehicle. Disconnect generator wires at generator. Disconnect starter cable and engine ground cable at starter. Remove starter. Disconnect antenna and windshield washer vacuum line at connection under generator. Disconnect flex hose at fuel line, plug fuel line. Drain engine and remove oil filter.

11) Remove throttle linkage splash pan and lower left converter housing-to-cylinder block capscrew. Remove converter cover, then remove bolts securing converter to flex plate.



12) Lower vehicle and support transmission with floor jack. Remove capscrews from each engine support bracket. Attach Hoisting Sling Tools 6000-B-A and 6000-C to exhaust manifolds. Position sling to lift engine less transmission. Lift engine slightly. Have another mechanic push engine forward slightly and then guide assembly as it is lifted from engine compartment.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD REMOVAL: Loosen all pushrod adjusting nuts and screws to relieve tension on pushrods. Remove all rocker arm bracket attaching screws and nuts, remove oil overflow pipe from end support (front end on right bank, rear end on left bank), lift rocker arm assembly up over studs and remove as an assembly (see Rocker Arm data under "Valve System" below). Remove all pushrods, remove oil baffle plates from rocker arm pads. Remove the two end cylinder head capscrews and install Pilot Studs, Part No. 6051-A, in these two holes. Install cylinder head holding fixture 6085-A (CAUTION—this fixture recommended to protect machined surfaces of head while it is off the engine AND SHOULD NOT BE REMOVED FROM HEAD UNTIL IT IS RE-INSTALLED ON ENGINE). Remove remaining cylinder head capscrews, lift head up and off the locating dowels and pilot studs. Remove gasket. ***CAUTION—Never pry between cylinder head and block.***

►***CYLINDER HEAD INTERCHANGEABILITY:*** Heads can be changed from one bank to the other if the rocker arm shafts and supports are changed to properly line up oil feed and drain passages. Water jacket plugs must be installed in hole at rear of the cylinder head. Use Tool 6085-C to install new plugs.

CYLINDER HEAD INSTALLATION: Install pilot studs, Tool 6051-A in two end capscrew holes in block. Coat NEW steel head gasket lightly with 8M-19554 sealer and install gasket over pilot studs and dowels. Install cylinder head assembly over studs and dowels **with plugged water jacket hole to rear of engine.** Install 8 cylinder head capscrews, then remove pilot studs and install remaining two capscrews in these holes. Tighten all capscrews evenly as follows with Cyl. Head Wrench and adapter (Snap-On Tool Nos. S-9513-C & S-9526). ***(CAUTION—Three torque applications must be made as indicated below).*** **Initial** COLD torque should be 70 ft. lbs. **Second** COLD torque should be 80 ft. lbs., **Third** HOT torque should be 90 ft. lbs. after 20 minute fast idle warm up. *NOTE*—After above procedure has been completed, the cylinder head capscrews require no additional torquing and should not be disturbed for installation of engine lifting hooks, etc.

LINCOLN CYLINDER HEAD

►***CYLINDER HEAD GASKET INSTALLATION CAUTION:*** Gaskets are interchangeable from one cyl-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

inder bank to the other but MUST BE INSTALLED WITH MARK "FRONT" TOWARD FRONT OF ENGINE. Make certain that water passage holes in gasket and block line up.

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL: Install new packing in crankcase and bearing cap using Tool 6701 to seat packing Before removing tool cut off edges flush with surface Make certain there are no ragged edges protruding Install outer "L" shaped neoprene seal on bearing cap and coat with lubricant Install Pilot Studs Tool 6336-A1, and place unit over pilot studs Push bearing cap through tool and into position in block Remove bearing replacing tool and trim vertical seals, leaving approximately 5/64' of seal above cap Remove pilot studs and install the self locking main bearing cap bolts Tighten to 120-130 ft lbs torque

CRANKSHAFT THRUST BEARING ALIGNMENT: After #1, #2, and #4 bearing caps and inserts have been installed and properly torqued, install #3 bearing cap and insert Install capscrews snug, then pry crankshaft toward rear of engine Reverse this action by prying crankshaft forward (toward front of engine) This will align thrust surfaces of both halves of thrust bearing RETAIN THIS FORWARD PRESSURE on the crankshaft and tighten capscrews to 120-130 ft lbs torque Check crankshaft endplay which should be 004- 012".

ENGINE FRONT COVER

CRANKSHAFT FRONT OIL SEAL (In Timing Chain Cover): Coat new seal with engine oil and install on Tool 6700 Center seal and tool over front cover boss and drive in until seated Make sure spring on inside of seal is properly seated

ENGINE FRONT COVER INSTALLATION: Coat new cover gasket with sealer, install gasket and front cover on engine Align cover and oil seal on crankshaft, BEFORE installing capscrews by positioning Tool 6059 on crankshaft Tighten cover capscrews to correct torque (see Tightening Specifications)

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove cylinder head covers and rocker arm assemblies from cylinder heads (see Cylinder Head Removal) Remove valve pushrods and hydraulic valve lifters Remove timing chain and sprockets (see Timing Chain) Remove fuel pump drive sleeve from camshaft eccentric and remove timing chain oil deflection plate With Tool 9400-B remove snap ring retainer from fuel pump push rod and remove rod Carefully withdraw camshaft to avoid damaging camshaft bearings

VALVE SYSTEM

OVERSIZE VALVE STEM INSTALLATION. Use Tool 6085 Piloted Reamer to ream cylinder head valve guides for oversize valve stems Reamers are furnished in 003', 015', & 030 oversizes Pilots are furnished Std, 003', & 015 Use reamers in sequence with correct pilots when reaming from standard to oversize Regrind valve seats AFTER reaming guides

INITIAL VALVE CLEARANCE: Self-locking adjusting screws used with a tension of 7-15 ft lbs Replace rocker arm when tension reduced to 3 ft lbs Turn adjusting screw clockwise while moving pushrod up and down **until all slack is removed.** *(CAUTION* - Plunger unit of hydraulic lifter should not be forced down into body of lifter during this operation) With all slack removed turn adjusting screw **an additional 2½ turns.** *NOTE* - If lifter is noisy in operation adjustment can be varied by turning adjusting screw ± ¼ turn from original 2½ turn setting Repeat for all valves

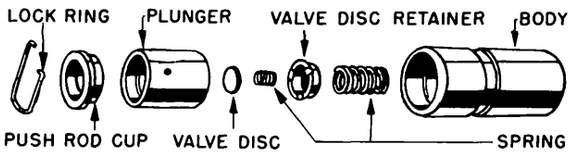
Adjustment Sequence: To insure valve being on the low side of the cam make all adjustments in the following sequence.

No. 1 Piston at TDC (Compression Stroke) - Adjust No 1 Int & Exh No 5 Int & Exh No 7 Int No 4 Exh

No. 6 Piston at TDC (Compression Stroke) - Adjust No 6 Int & Exh No 3 Int & Exh No 7 Exh No 8 Int & Exh No 4 Int

ROCKER ARMS

ROCKER ARM ASSEMBLY: After assembly removed from cylinder head (see Cylinder Head Removal above), disassemble and reassemble the assembly as follows



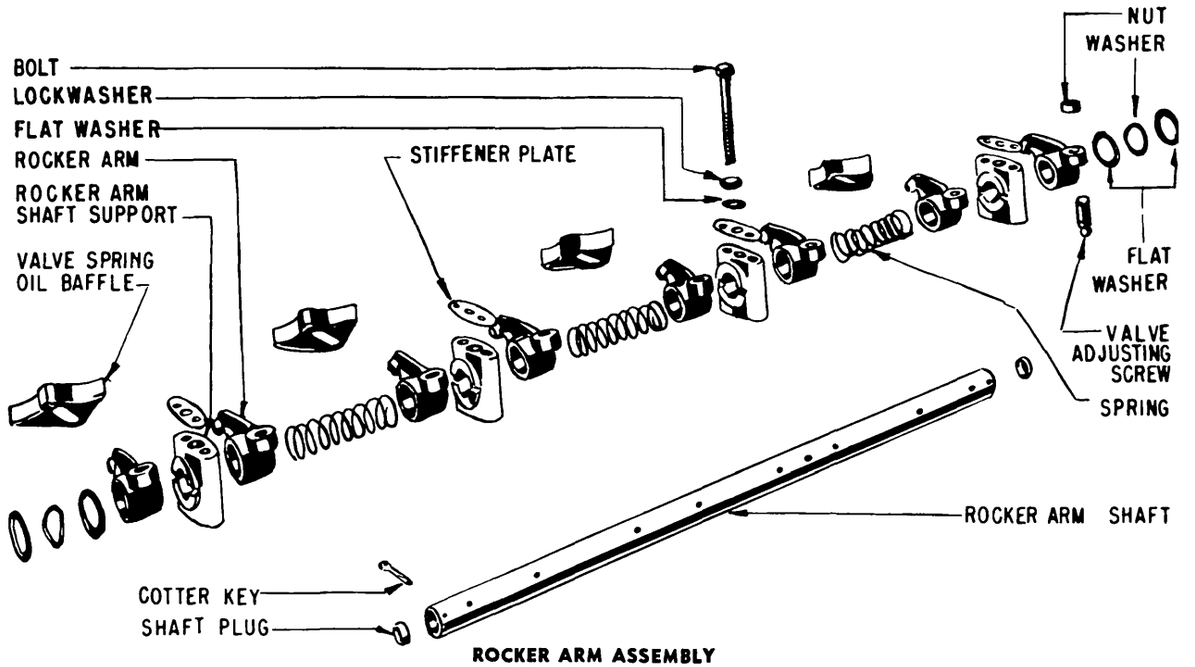
Rocker Arm Disassembly: Remove cotter keys, washers, rocker arms, springs, supports and plugs from shaft ***Keep all parts in order as removed so they may be reinstalled in same position.*** Inspect all parts for wear and replace worn parts If rocker arm radius is scored, replace arm, do not try to regrind radius

Rocker Arm Reassembly: Reverse disassembly procedure Install so valve ends of arms point outward away from support See Illustration

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTERS: Lifters are "barrel type," integral units with a flat, disc type check valve Lifter has three holes in outside diameter groove and four holes in plunger Lifters are furnished in unit packs of eight

Removal: Remove cylinder head covers Take out rocker arm assembly support bolts and remove rocker arm assemblies and valve pushrods Remove intake manifold and gasket then remove pushrod chamber cover Valve lifters can then be removed from lifter bores in block



LINCOLN HYDRAULIC VALVE LIFTER

Disassembly: Immerse all lifters in solvent to remove all varnish and carbon deposits. DO NOT CUT OR SCRAPE CARBON FROM LIFTER. With needle nose pliers, remove lock ring from top of body. Remove push rod seat, plunger, valve disc assembly and spring from body. ***(CAUTION—Disassemble one lifter at a time to avoid inter-mixing lifter parts).***

Reassembly: Place push rod seat upside down on bench. Install plunger on push rod seat and place

CONTINUED ON NEXT PAGE

ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

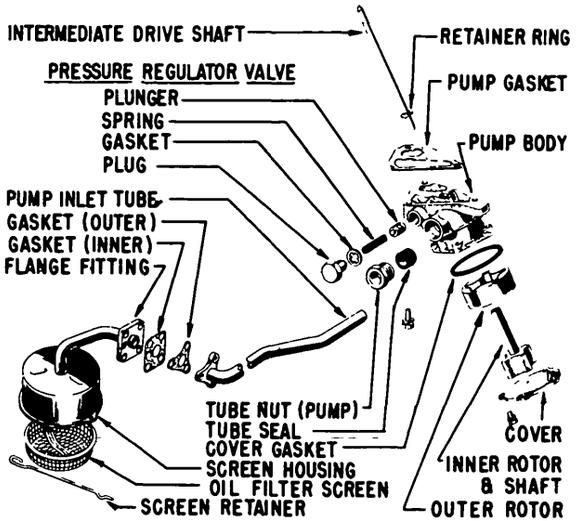
valve disc assembly on plunger and set spring on valve disc retainer. Place body over assemblies and push body down over plunger. Lift assembly and push plunger and push rod seat up into body. Install lock ring using tool 6500-C.

OILING SYSTEM

OIL PUMP

ROTOR TYPE OIL PUMP

Removal: Disconnect external oil line. Remove attaching capscrews (two from bottom, one from above). Remove pump and intermediate shaft.



Disassembly: Remove capscrew securing cover to body assembly. Remove cover and "O" ring gasket. Remove rotor and shaft assembly. Remove relief valve nut, spring and relief valve.

Inspection: Clean all parts in suitable solvent. Check pump housing and rotors for damage or excessive wear. Check compression of relief valve spring which should be 6.1-7.3 lbs. at .80". Check relief valve clearance in body assembly. Measure outer rotor race to body clearance. Clearance should be .006-.009". With rotor and shaft assembly installed in housing, place straightedge over rotor assembly and pump body. Measure clearance between straightedge and pump at rotor. Clearance should be .001-.0035". Check cover for wear, and if scored or grooved, replace it. Drive gear shaft length should be 3.36-3.38" from rotor assembly face to shaft end. *NOTE* - Outer rotor and shaft and rotor assembly are replaced as a unit.

R assembly: Reverse disassembly procedures. Check assembled pump to see that it rotates without bind.

OIL FILTER

OIL FILTER SERVICING: Filter is full-flow type and should be replaced at 4000 mile intervals (or more often if required by operating conditions).

ROTOR TYPE OIL PUMP

Disposable Filter Original Installation - Remove and discard original filter. Install Gasket EAA-6838-A (coat gasket with light grease) and Adapter ECG-66391-A, in adapter recess in cylinder block (mark Top on adapter must be upward), install Oil Filter Mounting Bolt Insert No. ECG-6890-A and tighten insert to 70-80 ft. lbs. torgue. *(CAUTION* - DO NOT allow adapter to rotate). Install Disposable Filter Assembly MHK-6714-A as follows:

Disposable Filter Replacement - Coat gasket face of filter with oil, thread filter on insert by hand until gasket contacts adapter face, then tighten filter an additional one-half turn *(CAUTION* - DO NOT overtighten). Run engine and check for leaks.

FUEL SYSTEM NOTES

LINCOLN & CONTINENTAL

CARBURETOR AIR INTAKE DUCT ASSEMBLY (WITH THERMOSTATIC CONTROL): Thermostatically controlled valve in air intake duct assembly should be fully closed at 65° F. (for air intake from rear "heated" opening), and should start to open at 75° F. At temperature of 95° F., valve should be wide open (for air intake from front "cool" opening). If valve does not operate satisfactorily, remove duct assembly and test operation as follows:

Duct Assembly Removal: Loosen clampscrew and slide flexible hose off end of duct. Remove wing nut retaining air cleaner on carburetor, remove nut and washer retaining duct assembly on bracket. Lift air cleaner and duct assembly off engine. Loosen two clampscrews and slide duct assembly from air cleaner.

Testing: Place duct assembly in pan of water at temperature below 65° F. (thermostat must be covered by water). Valve should be in closed "heat on" position. Heat the water slowly. At temperature of 75° F., valve should start to open *(NOTE* - If valve does not start to open, hold water temperature at 75° F. for eight minutes before discarding thermostat as defective). Increase water temperature to 95° F. Valve should now be wide open in "heat off" position *(NOTE* - If valve not wide open, hold water temperature at 95° F. for eight minutes before discarding thermostat as defective). If valve operation not satisfactory, remove thermostat and spring assembly and check valve shaft for binding. If valve moves freely, replace thermostat and duct assembly. If valve does not operate correctly, adjust thermostat rod as follows:

Adjustment: Increase rod length to move valve toward "heat off" position, decrease rod length to move valve toward "heat on" position.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate attached to left front body pillar between door hinges.

First Number - 3443 (Continental), 5001 (Lincoln).

►*SERIAL NUMBER NOTE (Continental):* Serial number (example *56J3443*) includes following identification data in sequence:

Car	M d l Year	Month	Serial No.
C ①	56	J ②	3443

① - Continental.

② - Model year began in August 1956. Letters used to indicate month of production, (letters began with "A" for Nov. 1955 and alphabetically thereafter).

►*SERIAL NUMBER NOTE (Lincoln):* Serial number (example *57WA5001L*) includes following identification data in sequence:

Year	Assy. Plant	Serial No.	Eng. Type
57	WA ①	5001	L

① - Assembly Plants - **LA** - Los Angeles. **WA** - Wayne.

TUNE-UP

COMPRESSION PRESSURE: 150±10 lbs. at cranking speed.

VACUUM READING: 18-19" at 475-500 RPM in neutral.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

►*VALVE TAPPET CLEARANCE NOTE:* Rocker arms have self-locking adjusting screws for initial tappet clearance adjustment.

MANIFOLD HEAT CONTROL: External valve at right exhaust manifold connection to exhaust pipe. Valve is automatic, requires no adjustment but should operate freely.

►*DUAL EXHAUST NOTE:* When heat control valve closed, all exhaust gases discharge through left hand exhaust pipe and muffler (Lincoln), left hand exhaust pipe and both mufflers (Continental).

►*INTAKE MANIFOLD NOTE:* Production intake manifold has mounting hole (¼" x 18 NPSF) for new constant voltage electric heat indicator bulb sending unit. When replacing a 1957 intake manifold, use a 1956 Lincoln or Continental manifold with 3/8" x 18 NPSF threaded hole and install new constant voltage heat indicator bulb sending unit released for this manifold.

IGNITION

FIRING ORDER: 1–5–4–8–6–3–7–2.

Cylinders - RIGHT BANK 1-2-3-4. LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .032-.036".

Spark Plug - Champion F-14Y. 18 mm. Torque to 15-20 ft. lbs. *NOTE* - Supersedes No. 860 previously used and should be used to replace Nos. 860 & 870 in 1955-57 Lincolns.

►*SPARK PLUG WIRE CAUTION:* New "Hypalon" insulated high temperature wires must be used on engines without heat shields. *NOTE* - Retain heat shields on Nos. 3 & 4 spark plugs. Use for replacement on 1952-1957 Lincolns.

►*SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be tightened within limits of 15-20 ft. lbs.

COIL: Linc ln B6A-12029-B.

Ignition Curr nt -2.5 amps. idling, 4.5 stopped.

R sist r - Lincoln B6A-12250-D. 1.30-1.40 Ohms.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: Lincoln FEL-12127-A, Continental FES-12127-A. New type with mechanical (centrifugal) advance and separate Vacuum Spark Control. *See "Ford, Lincoln, Mercury Distributors" in Electrical Section.*

►*CONTINENTAL DISTRIBUTOR NOTE: This distributor has a tachometer drive.*

►*DISTRIBUTOR PRIMARY WIRE PRODUCTION CHANGE:* New Primary wire with improved insulation, Part No. B7A-12216-B, with shiny black vinyl covering, used in production. Use this wire in place of cloth covered wire previously used.

Condenser - Lincoln B7A-12300-A. **Capacity** .21-.25 mfd.

Contact Point Set - Lincoln B7A-12171-A.

Breaker Gap - .014-.016".

Cam Angle - 26-28.5°.

Breaker Arm Spring Tension - 17-20 ozs.

Rotation - Counter-clockwise viewed from above.

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		300	0		600
1½-2½		400	3-5		800
4-5		500	8-10		1000
5½-6½		800	11-13		1600
9-10		1325	18-20		2650
13-14		2000	26-28		4000

Vacuum Spark Control: On distributor housing. Linked to breaker plate.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
0-1	0-2	5
4-6	8-16	10
7-9	14-18	13
7-9	14-18	20

IGNITION TIMING

Setting - 5° BTDC. with engine idling at 475 RPM. *NOTE* - Maximum initial ignition timing is 8° BTDC.

►*CAUTION:* DO NOT advance timing beyond these specifications.

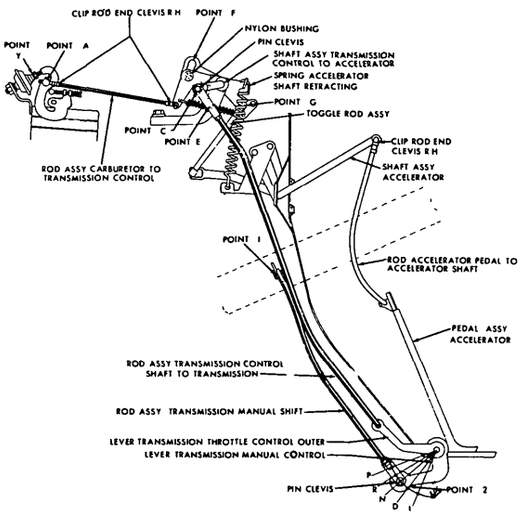
Timing Mark - Crankshaft pulley marked at TDC, 10° BTDC, and 20° BTDC with marks at 2° increments between. Pointer should be half way between the second (4°) and third (6°) marks.

CARBURETOR

Carter WCFB 2404S. 4-barrel with integral Automatic Choke.

►*AIR CLEANER BODY AND ACCELERATOR BELLCRANK INTERFERENCE CORRECTION:* Rear side depression of air cleaner body may interfere with bellcrank on some early cars. To correct, reform air cleaner body to provide 3/16" clearance.

►*CUTTING OUT ON LEFT TURN CORRECTION: See "Carter WCFB Carburetors" in Carburetion Section.*



►*1956-57 HARD STARTING, STALLING OR ENGINE BACKFIRE CORRECTION:* New Choke Heat Tube Part No. ECU-9890-B with larger center section radius and larger runout radius at each end of tube is available for service to correct above conditions. *NOTE* - Service Intake Manifolds ECU-9424-A and C must have original type heat tube replaced by this new type before installation.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2–3–5–8. LEFT barrels 1–4–6–7.*

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

Idle Setting - 1¼ turns open (set both screws alike). **Idle Speed Setting** - 475-500 RPM with selector lever in Neutral, 425-450 RPM with selector lever in Drive.

Idle Speed-Up Control Adjustment (Optl. & Air Conditioned Cars): With engine at normal operating temperature, transmission in "N" (Neutral) position, and fast idle control switch in "ON" position, loosen locknut on control assembly shaft and adjust knurled nut to obtain engine idle speed of 800 RPM. Tighten locknut securely. *NOTE* - Interference between Automatic Throttle Control Lever and Control Assembly may be caused by cut-out on end of lever being off center, or burrs on edge of lever. Mounting bracket may twist

TURBO-DRIVE THROTTLE LINKAGE

out of alignment. To correct, replace bolts and nuts with the following: Bolt, Part No. 20326-S7; Nut, Part No. 33797-S7; Split Lockwasher, Part No. 34781-S7.

Throttle Linkage Adjustment (Turbo-Drive): With engine at normal operating temperature and idle speed set at 425-450 RPM with selector lever in "DR" position, adjust Anti-stall Dashpot (see below), then proceed as follows: Remove clevis pin connecting transmission control rod to control shaft (on engine bracket), insert gauge pin, Tool 77230-MB, through control shaft and bracket. Adjust carburetor-to-control shaft rod so that it freely enters hole in carburetor throttle lever. Remove gauge pin. With carburetor throttle lever in slow idle position, hold transmission control rod up so that transmission lever is against stop, adjust clevis on rod so that clevis pin enters hole in control shaft freely, then l ngth n rod by turning clevis 2½ full turns, connect rod.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Dashpot Adjustment: After making Idle Mixture, Hot Idle, and Fast Idle Adjustments, hold dashpot plunger in to limit of travel. Loosen locknut securing dashpot to dashpot bracket, insert .067" Gauge (Tool T109-234) between dashpot plunger and primary throttle operating lever, rotate dashpot to obtain proper clearance between plunger and lever. *CAUTION* - Improper dashpot adjustment may cause excessive rear axle differential backlash

► *OTHER DATA: See "Carter WCFB Carburetors" in Carburetion Section*

FUEL PUMP PRESSURE: 4-6 lbs. at 500 RPM.

CARB. EQUIPMENT

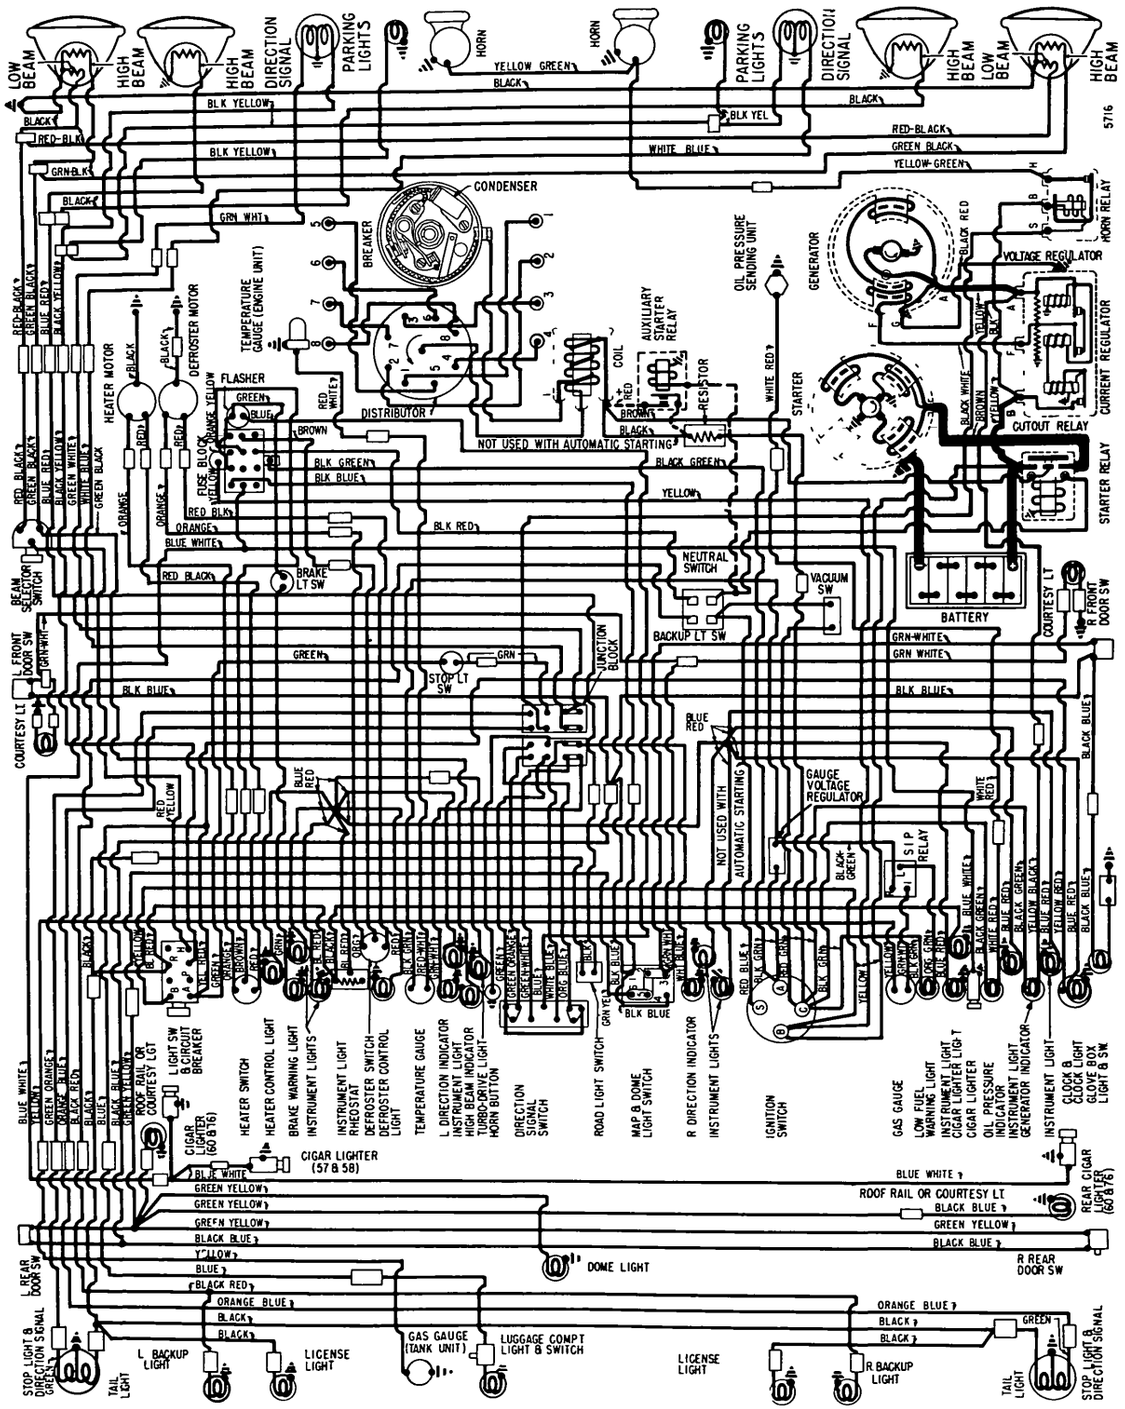
Fu l Pump: Lincoln No. ECU-9350-B (Early), -C (Later), Continental No. ECV-9350-A. Fuel & Vacuum.
Pressure - 4-6 lbs. (Early pump), 4½-6½ (later pump) Lincoln & Continental.
See "Fuel Gauges" in Carburetion Section.

Gasoline Gauge (Lincoln): King-Seeley Electric "CV" (Constant Voltage) type with voltage regulator No. FEL-10804-A.
Dash Unit - Ford No. FEL-9280-B.
Tank Unit - Ford No. FEG-9275-E (Exc. Sta. Wgn.), FEG-9275-D (Sta. Wgn.).
See "Fuel Gauges" in Carburetion Section.

Gasoline Gauge (Continental): Included in Cluster, Lincoln No. 4049792, which includes Ammeter, Fuel, Oil, and Temperature Gauges.
See "Fuel Gauges" in Carburetion Section.

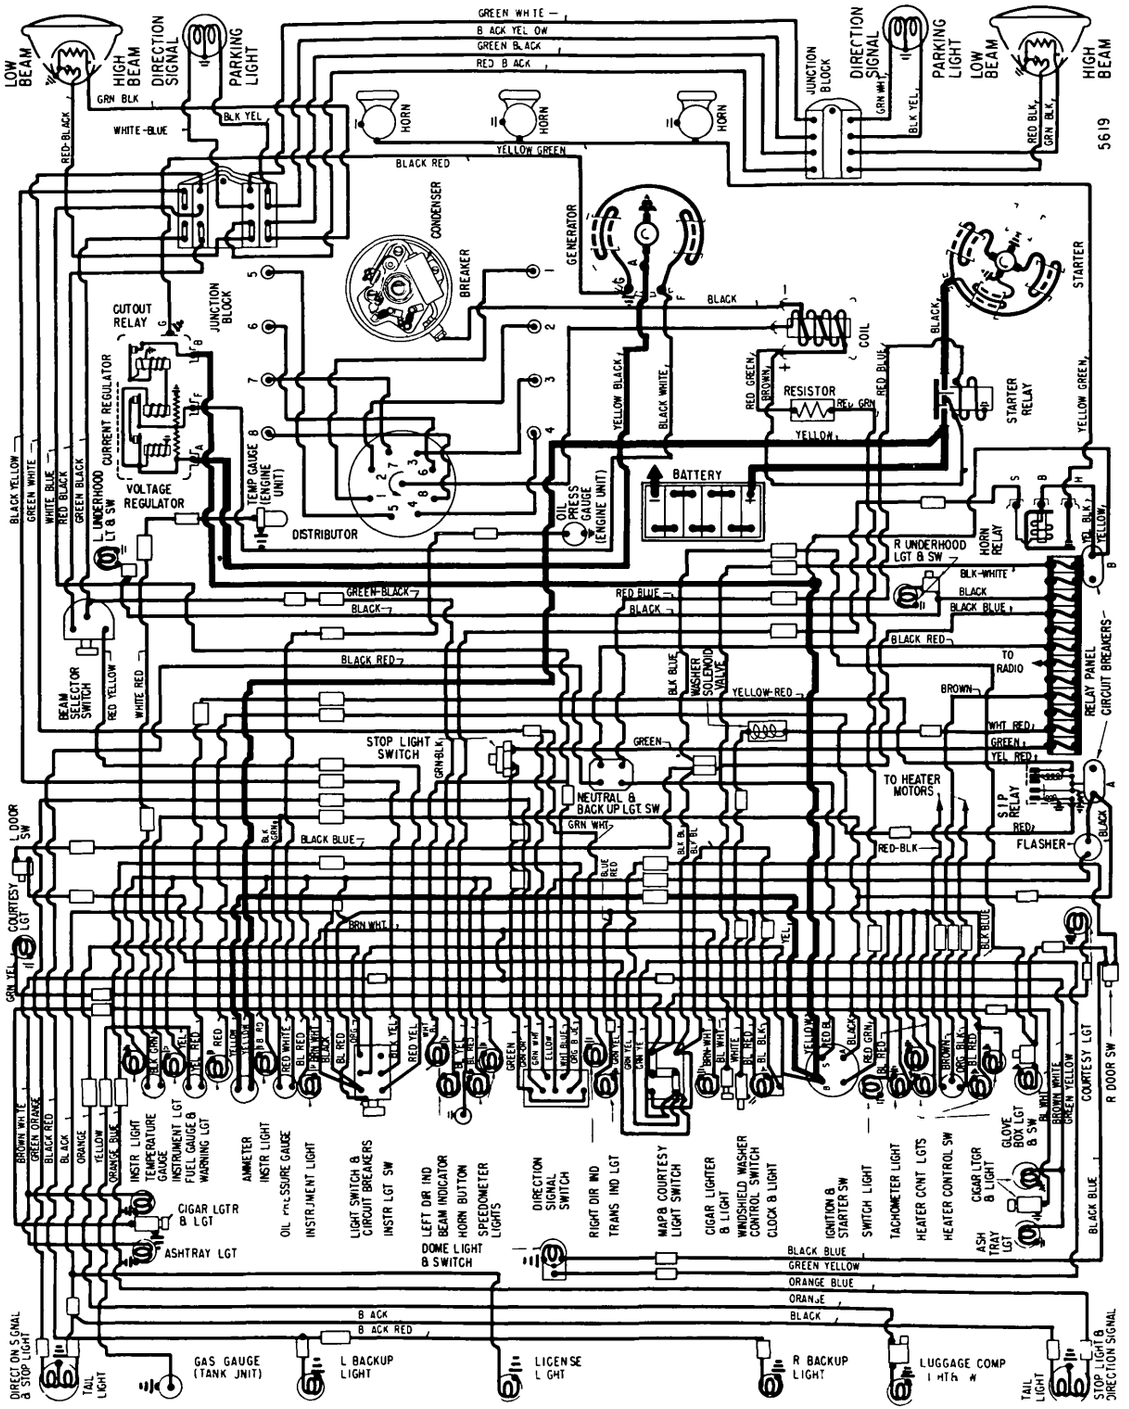
Low Level Fuel Indicator: Light on instrument panel in circuit with Ignition Switch & S.I.P. relay. Replace light bulb when inoperative.

Air Cleaner: DRY FILTER ELEMENT type. Clean every 4,000 miles and replace element every 20,000 miles.
► *CLEANING CAUTION:* Clean element by tapping or shaking to remove particles of dirt. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.*



BATTERY

Lincoln FDU-10655-H, Continental 4050251. 12 Volt. 13 plate, 70 ampere hour capacity (20 hr. rate). Located in right front floor pan (Lincoln), Cowl panel (Engine Side) Continental.
Battery Ground - Negative. Battery to starter.
Engine Ground - Cylinder head to dash.
► *BATTERY NOTE:* Late type battery can be used to replace 1956 Lincoln battery.



STARTER

Lincoln FAR-11002-B. Armature - FAC-11005-B.
► *STARTER GEAR NOISE CORRECTION* Caused by bottoming of starter pinion in converter cover ring gear. To correct, remove starter as described below, leaving three attaching bolts loose. Tighten center (outer flange) bolt to light snug fit, pry starter lower attach-

CONTINUED ON NEXT PAGE

LINCOLN MODELS

CONTINENTAL MODELS

CONTINUED FROM PRECEDING PAGE

ing flange at engine block rear outrigger away from engine block. Hold starter in this position while tightening the three attaching bolts.

Drive - Bendix "Folo-Thru".

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 48-56 ozs.

Cranking Speed - 150-180 RPM with engine warm.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4500	12.0	80

Removal· Remove from below by bending gang ignition wires away from top capscrew, removing transmission cooler line clamp below starter so lines can be held away and removing three starter capscrews. Pull out and down or up until starter drive gear clears housing.

Installation· Tape dust seal lip (use masking tape) to inner circumference of housing to hold seal in place, and reverse removal procedure.

Starting Switch: Relay, Lincoln No. B6A-11450-A, controlled by Ignition & Starter Switch, Lincoln No. 11572-A, and Turbo-Drive Neutral Safety Switch, located on steering column.

Automatic Starting (Optl.) - Vacuum Switch No. FEL 11504-B, Auxiliary Starter Relay FDT-11505-A. Provides automatic starting when ignition switch turned on. *See wiring diagram.*

Turbo-Drive Neutral Safety Switch Adjustment: *See "Turbo-Drive" in Transmission Section.*

GENERATOR

Lincoln No. FGP-10002-A. Armature - FGP-10027-A.

Performance Data

Amperes	Volts	Gen. RPM
40	15	2390

Brush Spring Tension - 26-34 ozs.

Field Current - 1.5-1.6 amps. at 15 volts (Hot).

Rotation - Counterclockwise at commutator end.

Belt Adjustment: Approximately ½" deflection on belts midway between generator and pump pulleys at right side.

REGULATOR

Lincoln FBF-10505-A.

► *SETTING NOTE*· Settings are for regulator at NORMAL OPERATING TEMPERATURE (after running engine for 20 minutes at 1500 RPM if started cold, or until temperature gauge is steady for 5 minutes if engine previously warmed up) with room temperature at 75°F.

Cutout Relay

Cuts In - 12.0-12.8 Volts.

Cuts Out - 2.0-6.0 amps. (reverse current).

Voltage Regulator

Setting - 14.6-15.4 Volts.

Checking & Adjusting - *See "Ford, Lincoln, Mercury 12 Volt Regulators" in Electrical Section.*

Current Regulator

Setting - 38-42 ozs.

Checking & Adjusting - *See "Ford, Lincoln, Mercury 12 Volt Regulators" in Electrical Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

Headlamps: Dual Headlights (4-Light System with Regular Headlights and auxiliary Roadlights). *See "4-Headlight System" in Electrical Section.*

Directional Signals: *See Electrical Section.*

Automatic Headlight Dimmer: *See Electrical Section.*

Lighting Switch Removal: *(NOTE* - Toggle type used on Lincoln, push-pull type used on Continental). Remove anti-rattle bezel from switch, then remove switch from rear of dash panel.

Stop Light Switch Location: On forward end of brake master cylinder (integral with power unit). Master cylinder or power unit located on firewall in engine compartment.

CIRCUIT BREAKERS: Lighting - Two 12 Ampere circuit breakers (one for headlights, one for auxiliary lights) located on headlight switch.

Air Conditioning (Lincoln) - 15 Ampere.

Power Top (Lincoln) - 30 Ampere in Motor Lift circuit, 20 Ampere in Motor Latch circuit, 10 Ampere in Motor Relay circuit.

4 or 6-Way Seat Regulator - 30 Ampere in Battery lead, 20 Ampere in each seat motor ground lead.

Window Regulators - 30 Ampere in Battery lead, 15 Ampere in each motor ground lead.

Electric Door Locks - 30 Ampere (4-Door), 15 Ampere (2-Door) in starter terminal lead, 10 Ampere in Ignition Switch lead.

FUSES: Fuse panel mounted on brake pedal support behind instrument panel with holders marked for size of fuse and circuit.

Directional Signals - SFE 7.5 amps.

Interior lamps (Glove Box, Dome, & Courtesy) - SFE 7.5 Amp.

Heater Blowers - Two SFE 14 Amp.

Radio - SFE 7.5 Amp.

Radio Antenna - SFE 14 Amp.

Cigarette Lighter - 1 Sulphur Disc (Lincoln), SFE 20 Amp. (Continental).

Back-up Lamps - SFE 7.5 Amp.

H rn Relay: Lincoln - Lincoln No. B7A-13853-A, with bracket, **Continental** - Lincoln No. 4050519 without bracket.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use xtreme care when disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

►*ENGINE COOLANT LEAKAGE CORRECTION:* Coolant leakage at generator bracket rear mounting bolt can be eliminated by installation of new self-locking type bolt and lockwasher. New bolt has nylon pellet which gives increased thread tension with improved sealing qualities.

ENGINE SPECIFICATIONS: 90° V8.

B r	Str k	Displacem nt
4.00"	3.66"	368 Cu. Ins.
Rated HP	**C mpr. Rati**	**Dev l p d HP**
51.2	10.0-1	300 at 4800 RPM

C mpr ssi n & Vacuum R ading - *S Tun -Up.*

►*COMPRESSION RATIO NOTE:* Compression ratio increased by revising combustion chamber and increasing length of piston (center of piston pin bore to top of piston) .010".

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Lincoln Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Lincoln Special Data.*

ENGINE REMOVAL: *See "Engine" in Lincoln Special Data.*

OIL PAN REMOVAL: Remove oil inlet pipe hex fittings at oil pump and side of oil pan and remove pipe. Remove oil pan capscrews, then remove oil pan and gasket. *NOTE*–When this operation is performed, turn crankshaft until rear counterweights of crank are up. The oil pan can then be removed from front of engine.

PISTONS

Aluminum alloy, autothermic, slipper type with three rings above pin. Tin-plated.

►*PISTON INTERCHANGEABILITY CAUTION:* 1957 pistons are .010" higher (piston pin bore to top of piston) and STD. SIZE 1956 & 1957 PISTONS ARE NOT INTERCHANGEABLE. However, 1956 Oversize Pistons (.020", .030", .040") can be used in 1957 engines.

►*ORIGINAL BORE & PISTON SIZES:* Std. cylinder bore limits are 4.0000-4.0024" and TWO Standard Pistons are used for selective fitting as follows: 3.9993-3.9996" Diameter (marked "2" on dome), 4.0005-4.0008" Diameter (marked "6" on dome). *NOTE* - Std. piston furnished for service in these two sizes.

Removal – Rod and piston assembly removed from above.

Fitting New Pistons: Using 1/2" wide feeler gauge inserted between piston and cylinder wall at right angle to pin on thrust side, pull should be 6-12 lbs. when using feeler gauge thicknesses as follows: New Piston in New Bore - .0015". New piston in Used Bore - .002". Used Piston in Used Bore - .003".

Replacement Pistons: Standard (Two sizes - see Original Bore & Piston Sizes above), and .020", .030", .040" Oversize.

Installing Pistons: Install all pistons with indentation on head toward front of engine. *See Rod Installation*

PISTON PINS

Floating type with lock rings at each end.

Di ameter – .9120-.9123". **Length** - 3.162-3.176".

Clearance in Piston – .0008" maximum.

Clearance in Rod – .0008" maximum. Select for light thumb press fit at 70° F.

Replacement Pins: Standard (marked Green), and .001" (marked Blue), .002" (marked Yellow) oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0775-.0780"	.013-.030"	.006" max.
Compr.(2)	.0925-.0935"	.013-.030"	.006" max.
Oil (3)	.1860-.1865"	.010-.027"	Ⓒ

Ⓒ - Side sealing type ring.

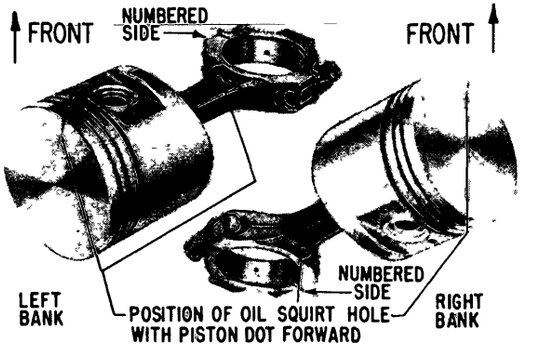
Replacem nt Rings: Standard size and .020", .030", .040" oversize.

►*SPACING NOTE:* Ring gaps should be spaced 120° apart, with oil ring gap to the side opposite spark plug side of cylinder bores.

CONNECTING RODS

L ngth – 7.064-7.066". **W ight** - 28.36 ozs.

Journal Diameter – 2.2482-2.2486" (Color coded BLUE), 2.2486-2.2490" (Color coded RED). Use with bearing of same color.



Lower Bearing – Steel-backed, copper lead alloy lined.

Clearance – .0007-.0036".

Side Clearance – .006-.014". .017" Service max.

Replacement Bearings – Standard (2 sizes marked RED & BLUE for selective fitting) and .010", .020", .030", .040" undersize.

Installing Rods – Assemble rods to piston so indentation embossed on piston head will face front of engine. Numbered side of rods on the right bank should face right side of engine and rods for left bank will face left side of engine. Place caps on connecting rods so numbered sides match and install in same numbered cylinders.

PISTON & ROD ASSY.

CRANKSHAFT

Journal Diameter – 2.6235-2.6239" (Color coded BLUE), 2.6239-2.6243" (Color coded RED).

Out-of-Round Limits – .0005" max. **Tap r Limits** - .001".

Bearings – Steel-backed copper-lead alloy lined.

Clearance - .0008-.0036".

►*NOTE:* Any combination of Red or Blue bearing inserts may be used to obtain desired clearance. If desired clearance cannot be obtained, it will be necessary to regrind journals and install undersize bearing inserts.

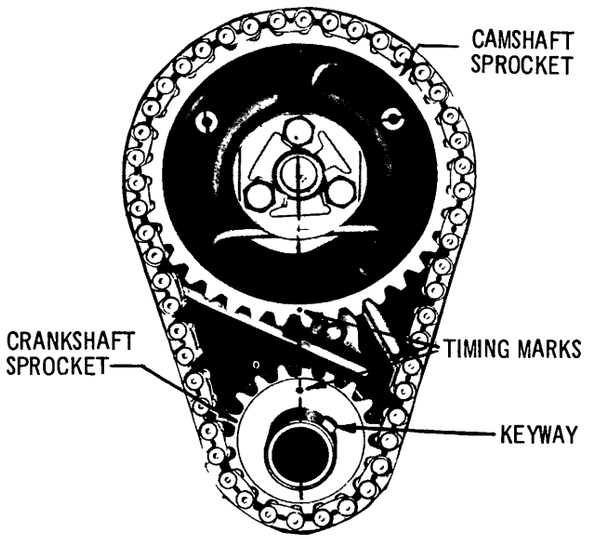
Replacement Bearings: Std. (2 sizes color coded RED & BLUE for selective fitting) and .010", .020", .030", undersize.

►*MAIN BEARING INTERCHANGEABILITY NOTE:* 1957 rear main bearings have 9/16" oil hole (previous bearings had 11/32" oil hole). DO NOT use previous type bearings on 1957 engines (1957 bearings can be used on past models).

End Thrust: Taken by No. 3 main bearing.

Thrust Bearing Alignment – *S "Crankshaft & Main Bearings" in Lincoln Special Data.*

Endplay – .012" maximum.



Crankshaft R ar Oil S al Installati n: *Se "Crankshaft & Main Bearings " In Lincoln Special Data.*

Crankshaft Fr nt Seal Installati n: *See "Engine Front Cov r" in Lincoln Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Journal Diameter – 2.1240-2.1247". **Out-of-Round Limit** - .001".
Bearings – Steel-backed babbit lined bushings.
Clearance – .006" maximum. **Endplay** - .003" (restrained by thrust spring and plunger).
Replacement Bearings: Std. & .015" undersize.
Camshaft Removal: *See "Camshaft & Bearings" in Lincoln Special Data.*
Timing Chain: Width 1.25". Pitch .5". Length 25".
Deflection – 1/2".
Camshaft Setting: Timing marks on camshaft and crankshaft sprockets adjacent and in line with straightedge across shaft centers.
Timing Chain Cover Seal Installation (Crankshaft Front Seal): *See "Engine Front Cover" in Lincoln Spec. Data.*

VALVE TIMING MARKS

VALVES

Valve Tappet Clearance: None in service (hydraulic). Adjustment required only when servicing valves or hydraulic lifters.
Initial Valve Tappet Clearance Adjustment–*See "Valve System" in Lincoln Special Data.*

Valve	Head Diam.	Stem Diameter Ⓘ
Intake	2.000-2.010"	Ⓔ.3415-.3420" or Ⓢ.3420-.3425"
Exhaust	1.630-1.640"	Ⓔ.3400-.3405" or Ⓢ.3405-.3410"

Valve	Seat Angle	Lift④	Stem Clearance
Intake	45°	256" min.	.001-.004" max.
Exhaust	45°	256" min.	.002-.005" max

Ⓘ – Furnished with .003", .015", .030" oversize stems
Ⓔ – Color coded RED. Use with RED valve guide.
Ⓢ – Color coded GREEN. Use with GREEN valve guide.
④ – Cam lobe lift (service limit).
Valve Seat Width – 1/16-5/64" (Intake), 5/64-3/32" (Exhaust).
Valve Stem Seal. Valve stem seals used on both intake and exhaust valve stems. Install seal over valve stem before installing valve spring.
Oversize Valve Stem Installation: *See "Valve System" in Lincoln Special Data.*
Valve Springs: Free Length – 2-1/8".

Spring Specifications	Pressure	Length
Valve Closed	60 lbs.	1.80"
Valve Open	165 lbs.	1.38"

►*SPRING HEIGHT CORRECTION:* Measure valve spring assembled height from point where spring contacts cylinder head to point where it contacts retainer. Assembled height of spring should be 1 25/32-1 13/16". Spacers are available in steps of .030" & .060" to bring assembled height within these limits or as near to this measurement as possible.
►*SPRING SQUARENESS CAUTION:* If springs more than 1/16" out of square, with spring closed coil end on surface plate and measured with steel square, they should be replaced.
Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.004" intake, .005" exhaust), ream guides and install oversize valves. *See "Valve System" in Lincoln Special Data.*
Valve Lifters: Hydraulic, barrel type. Lifters can be removed from above with camshaft in engine.
Diameter–.8740-.8745". **Clearance in Block** .0025" max.
Initial Valve Clearance – *See "Valve System" in Lincoln Special Data.*
Lifter Overhaul – *See "Valve System" in Lincoln Special Data.*
Rocker Arm Assembly: *See "Valve System" in Lincoln Special Data.*
►*ROCKER ARM COVER LEAK CORRECTION (Early Cars):* Grind away approximately 1/16" of inner flange for a length of 1½" at rear of cover.
►*VALVE ROCKER ARM PRODUCTION CHANGE (Self-locking Valve Adjusting Screws). See "Valve System" in Lincoln Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
►*VALVE TIMING NOTE: The following valve opening and closing points are with a camlift as indicated.*
Intake Valves – Open 18° Ⓘ BTDC, Close 72° Ⓔ ALDC.
Exhaust Valves– Open 59° Ⓘ BLDC, Close 31° Ⓔ ATDC.
Ⓘ – Camlift .002". Ⓔ – Camlift .004".
Valve Timing Check – With rocker cover removed, loosen adjusting locknut and screw of valve to be tested. Slide rocker arm to one side in order to have pushrod in the clear. With pushrod in tappet socket install a dial indicator in such a manner as to have actuating arm of indicator in the pushrod socket, in the same plane of pushrod movement (dial indicator used should have at least a total movement of .300" or more). Place a quadrant on the crankshaft pulley. If intake valve opening is being checked, engine is rotated slowly until dial indicator shows .002" camlift. At this point the actual opening reading in degrees is taken(18° BTDC). The engine is further rotated to check the valve closing. Dial indicator should read .004" camlift (72° ALDC)

OILING SYSTEM

►*OIL LEVEL INDICATOR CAUTION:* Two types used as follows: **With Air Conditioning** - Lincoln No. ECU-6750-C, with 23 3/32" from top of tube cover to "Full" mark on dipstick.
With Air Conditioning - Lincoln No. ECU-6750-D with measurement of 23 13/16" between same two points.
Crankcase Capacity: 5 qts. (refill), 6 qts. (with filter change).
Normal Oil Pressure: 45-50 lbs. at 2000 RPM (hot).
Pressure Regulator Valve -In pump body, not adjustable.
Oil Pressure Indicator (Lincoln): Light on instrument panel. Light is on when oil pressure is low.
Oil Pressure Switch - Lincoln No. B6A-9278-B.
Oil Pressure Gauge (Continental): Included in Cluster, Lincoln No. 4049792, which includes Ammeter, Fuel, Oil and Temperature Gauges.
Engine Unit - Lincoln No. FEM-9278-A.
See "Oil Pressure Gauges" in Miscellaneous Section.
Oil Pump: Rotor type, located on left side of engine crankcase driven by distributor drive gear.
Pump Overhaul - *See "Oiling System" in Lincoln Special Data.*
Oil Filter: Full-flow type (early), Disposable type (later).
►*OIL FILTER PRODUCTION CHANGE:* Disposable oil filter used on later cars and can be installed to replace previous full-flow type filter on earlier cars. *See "Oiling System" in Lincoln Special Data.*
Crankcase Ventilation: Combination oil filler and road draft tube and air filter cap, located on front of valve pushrod cover. Clean and oil the oil filler cap filter every 2,000 miles.

COOLING

►*HIGH OPERATING TEMPERATURE CORRECTION:* High operating temperatures resulting from continuous low speeds or extreme load conditions may be improved as follows:
Cars Without Air Cond. - Replace present 4-blade fan with 5-blade fan No. LA-8600-A and install radiator No. LD-8005-D.
Cars With Air Cond. - Replace present 5-blade fan with 6-blade fan No. LA-8600-B.
Water Capacity: 22 qts. Add 3.2 qts. for heater units (Lincoln), 3.4 qts. (Continental).
Pressure Valve: Lincoln No. LA-8100-A (Lincoln), 4048840 (Continental). 12-15 lbs. operating pressure, radiator filler cap.
Thermostat: Lincoln No. EAD-8575-D (157-162°) Std. Lincoln, No. B4Q-8575-B (168-173°) Std. Continental, Optional Lincoln.
Water Pump: Packless, sealed ball bearing type.
See "Lincoln" in Water Pump Section.
Temperature Gauge (Lincoln): King-Seeley Electric "CV" (Constant Voltage) type with voltage regulator No. FEL-10804-A.
Dash Unit - Lincoln No. FEL-10883-B.
Engine Unit - Lincoln No. FEK-10884-A.
Temperature Gauge (Continental): Included in Clusters, Lincoln No. 4049792, which includes Ammeter, Fuel, Oil, and Temperature Gauges.
See "Temperature Gauges" in Miscellaneous Section.

TURBO-DRIVE TRANSMISSION

Torque converter and three-speed automatic transmission with hydraulic control and mechanical parking lock.
See "Turbo-Drive" Transmission in Transmission Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

▷*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Turbo-Drive" Transmission in Transmission Section.*

▷*TESTING & TROUBLE SHOOTING: See "Turbo-Drive" Transmission in Transmission Section.*

Lubrication – Check transmission oil level every 2000 miles and maintain oil level at "Full" mark on dipstick. Drain and refill every 16,000 miles. Use only Automatic Transmission Fluid Type A.

Checking Fluid Level: Bring transmission to operating temperature by running engine with selector lever in Neutral position. Move shift lever through all ranges to assure fluid distribution, then place lever in "P" (Park) position for checking fluid level. Add Automatic Transmission Fluid Type "A" to bring level to the "Full" mark on indicator.

▷*TURBO-DRIVE TRANSMISSION FLUID CAPACITY NOTE:* With the addition of a fluid cooler located ahead of radiator the capacity has been increased to 11.3 qts. When draining and refilling Turbo-Drive Transmission after overhaul, reverse flush cooler and lines with air pressure not to exceed 100 PSI to remove foreign material that will bypass transmission oil screen.

▷*AUTOMATIC TRANSMISSION FLUID COLOR NOTE:* Transmissions with serial number 114-29265 or later will have a red dye added to transmission fluid to assist in locating fluid leaks. New colored fluid may be mixed with old type fluid.

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷*OTHER "TURBO-DRIVE" SERVICE DATA: See "Turbo-Drive Transmission" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

REAR AXLE

Own. Semi-floating, hypoid gear, with Hotchkiss drive.

▷*POWER-LOCK DIFFERENTIAL NOTE:* Optional equipment, and identified by Decal on left front door "Directed Power Differential", plus metal tag with stamped letter "T" under cover bolt, and cover marked a daub of yellow paint. Provides maximum rear wheel drive at all times, by directing drive line or ring gear torque to either or both rear wheels depending on road conditions. Interchangeable with Standard Differential Case. Serviced by replacement.
See "Lincoln (Integral Carrier)" & "Spicer Power-Lock Differential" in Rear Axle Section.

▷*REAR AXLE SHAFT & BEARING REPLACEMENT CAUTION:* Rear axle shaft and bearing Lincoln No. LD-4234-B (1/16" shorter than former type) only, should be used with Power-Lock Differential. This axle shaft and bearing available for usage on all other rear axles.

▷*REAR WHEEL BALANCE (POWER-LOCK DIFFERENTIAL) CAUTION:* Do not attempt to balance rear wheels on the car when car equipped with "Power-Lock" differential.

Ratios – 3.07-1 (Std.), 3.31-1 (Optl. on Lincoln).
Backlash–.003-.008" with .002" maximum variation per gear set.

Axle Shaft Removal: Remove rear wheels and take out screws holding brake drum to axle shaft flange. Remove hydraulic brake lines from brake backing plate. Take out axle retainer nuts (working through opening in axle shaft flange). Use Tool 4235-C2 to remove axle shaft and bearing assembly from axle housing. Take off backing plate and gasket and remove axle being careful not to damage oil seal.

Axle Assembly Removal: Raise rear of car and remove axle shafts and drive shaft. Take off hydraulic line clips from axle housing and free line from differential housing clip. Disconnect shock absorbers and spring U-bolts. Remove axle housing assembly from car.

Wheel Bearing Adjustment: None required.

FRONT SUSPENSION

Independent. "Ball-Joint" suspension with direct acting shock absorbers mounted within front coil springs.
See "Lincoln (Ball Joint)" in Suspension and Wheel Alignment Section.

Alignment Specifications	Lincoln	Continental
Kingpin Inclination	① 7°	① 7°
Caster	② 0°-Neg.1½°	③ Pos. 1°±¼°
Camber	③ 0°-Pos. ¾°	③ Pos. ¾°±¼°
Toe-In	1/8" to 3/16"	3/32" to 5/32"

① - With Pos. ¾° Camber.
② - Within ½° from one side of car to other.
③ - Within ¼° from one side of car to other

Toe-Out on Turns - With wheels at maximum turning angle, outer wheel is at 26° and inner wheel is at 36°.

Direct acting, non-adjustable. Service by replacement.

SHOCK ABSORBERS

Shock Absorber Nos.	Front	Rear
Lincoln (Std.)	LD-18045-J	LD-18080-J
Lincoln (Hvy. Duty) Std.	LD-18045-K	LD-18080-K
Lincoln (Hvy. Duty) Adj.	I-500938	I-500941
Continental	4048114	4048113

▷*HEAVY DUTY ADJUSTABLE SHOCK ABSORBER NOTE:* Use Continental mounting bracket No. 4049673 and spacer No. 4049677 when installing the front adjustable shock absorbers. To adjust shock absorbers proceed as follows:

Adjustment (Front) - Remove shock absorber, fully compress it until internal couplings are mated, then turn upper shaft to align arrow on inner washer with arrow on shock absorber body to obtain desired ride control.

Adjustment (Rear) - Remove only the lower end of rear shock absorber, compress unit until internal couplings are mated, then turn lower shaft until desired ride control is obtained.

STEERING

Power Steering: Saginaw In-Line. *See "Saginaw In-Line" Power Steering in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw In-Line" Power Steering in Steering Section.*

Steering Gear Removal: *See "Saginaw In-Line" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Sect.*

BRAKES

Bendix Hydraulic. Duo-servo with fixed anchor pins. No eccentric adjustment. Parking lever applies rear wheel service brakes.
See "Ford, Lincoln, Mercury Bendix" in Brake Section.

▷*BRAKE FLUID REPLACEMENT NOTE:* Use heavy duty brake fluid HACA-19542 with SAE specification 70 R1 for most efficient brake operation. DO NOT MIX HEAVY DUTY BRAKE FLUID WITH ANY OTHER TYPE.

▷*BRAKE "SQUEAL" CORRECTION:* An anti-squeal spring, Part No. 51A-1140, is available for installation on outside of brake drum.

Drums – Diameter 12"front and rear.
Wheel Cylinder Diameter – 1 3/32". (front), .15/16" (rear).
Lining – Molded type riveted to shoe.
Width – 2.5" (front), 2" (rear). Thickness – 7/32".
Braking Power – 55.5% (front), 44.5% (rear).
Clearance – Tighten adjusting screw about 5 or 6 clicks after wheel stops turning (shoes tight against drum), then back adjusting screw off 12 to 14 clicks.

Brake Pedal Adjustment: Adjust eccentric bolt attaching brake pedal to master cylinder pushrod to give 1/4-7/16" free movement of pedal pad before rod moves master cylinder.

Standard Master Cylinder: Located on engine side of firewall.
Checking Fluid – Maintain fluid level to within ¼" of top of reservoir.
Removal–Disconnect brake line from brake master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch and remove eccentric bolt attaching master cylinder pushrod to brake pedal. Remove capscrews and lock washers attaching master cylinder to fire wall.

Power Brakes: Bendix Vacuum Power Unit (combination vacuum power unit and master cylinder). Unit mounted on engine side of fire wall and replaces regular master cylinder.
See "Bendix Power Unit" in Brake Section.
Checking Fluid–Same as for regular master cylinder.
Removal of Power Unit–Disconnect valve pushrod from brake pedal assembly in drivers compartment. Remove master cylinder outlet fitting bolt from master cylinder. (NOTE–It is not necessary to remove stop light switch, wires or hose assembly from outlet fitting. Do not disturb outlet fitting in master cylinder). Loosen clamp securing manifold vacuum hose to check valve on power unit. Remove hose from valve. Loosen clamp securing vacuum reserve tank hose to fitting on check valve. Remove four capscrews securing power brake assembly to bracket on dash panel and remove power brake assembly.

MISC. MECHANICAL

Windshield Wipers: Cable operated vacuum type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Own. *See "Lincoln Air-Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch. *See "Power Window Regulators" in Miscellaneous Section.*

Power Top Control: Hydraulic-electric type with power operated latch mechanism. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjusters: "4-Way" & "6-Way" electric type. Single motor with solenoid clutches. *See "Power Seat Adjusters" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

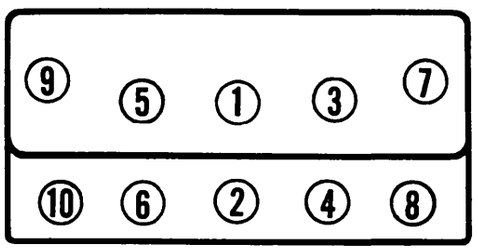
Ⓒ - See Cylinder Head Installation (below) for tightening procedures Three different troque applications must be made

ENGINE



ENGINE REMOVAL (LESS TRANSMISSION): 1) Mask edge of hood, fender and cowl, place fender covers on fenders Remove capscrews that retain hinge assembly to hood, remove hood
2) Remove carburetor air cleaner, disconnect and remove battery
3) Drain cooling system and oil pan (Drain cocks in engine assembly are located on each side and to front of cylinder block)
4) Disconnect both upper and lower radiator hoses, then remove radiator (Radiator is retained by three bolts, nuts and lockwashers at each side) Remove fan assembly
5) Disconnect heater hoses at water control valve and water pump Disconnect and remove heater blower and duct assembly
6) Disconnect starter cable at starter motor (On Merc-O-Matic disconnect transmission fill tube bracket at exhaust manifold) Disconnect primary ignition wire to coil, water temperature gauge sending unit and oil pressure sender unit wires
7) Disconnect flexible fuel line at fuel pump and windshield wiper vacuum hose from vacuum booster pump If car equipped with windshield washer, disconnect and remove windshield washer
8) **On Standard or Overdrive Transmissions,** disconnect clutch pedal retracting spring and release rod from clutch release lever Disengage equalizer bar tension spring and remove equalizer bracket assembly from flywheel housing Let equalizer bar and clutch release rod hang from frame
9) **On Merc-O-Matic Transmissions,** disconnect accelerator linkage (Z-bar) at firewall and throttle valve rod at clevis (linkage remains on engine)
10) Disconnect engine ground strap at firewall
NOTE—If vehicle equipped with power brake or power steering, remove these units at this time
11) From underneath car, remove splash shield in front of linkage and the end and lower converter access covers from transmission bell housing
12) Disconnect accelerator pedal linkage at accelerator shaft
13) Remove starter assembly To remove starter, turn wheels to extreme left turn position and pull starter down between tie rods and tubular engine support crossmember
14) Disconnect generator field and ground wires from generator
15) Disconnect exhaust manifold-to-muffler inlet pipe
16) Remove hex bolts (6) and nuts securing flex plate to converter (Merc-O-Matic only)
17) Remove capscrews (2) securing engine assembly to flywheel housing
18) Position transmission lift under transmission to support transmission while engine is out of vehicle
19) Remove capscrews (2), each side, securing engine to front engine mounts, and loosen self-locking nuts retaining engine mounts to engine front cover support
20) Inside of vehicle, pull front carpet and insulation away from floor pan and remove rubber grommets (2) covering openings to two upper capscrews securing engine assembly to flywheel housing and remove capscrews
21) Attach hoisting sling to engine, positioning sling to properly lift engine without transmission, and take up load of engine with hoist Adjust transmission lift and gently pull engine away from transmission Raise engine, carefully pull it forward and lift out of engine compartment *CAUTION*—When removing engine, be sure oil pump pickup tube and oil filter are clear of engine mount

Installation: Reverse removal procedure above

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION· Install pilot studs coat NEW gasket with Sealer 8M-19554-A and place over studs Install cylinder head assembly over studs with plugged water jacket to rear of block Install cylinder head capscrews make three torque applications as shown in table below Before third torque application bring engine to operating temperature (run engine at fast idle for 20 minutes) Use Tool S-8663 A (ECZ Eng), Tools S-9513-C S-9526 and thin walled socket (ECU Eng)

	ECZ Eng	ECU Eng
1st troque application (cold)	55 lbs	70 lbs
2nd torque application (cold)	65 lbs	80 lbs
3rd torque application (hot)	75 lbs	90 lbs

"ECZ" & "ECU" ENGINE CYLINDER HEAD

CRANKSHAFT & MAIN BEARINGS

"ECZ" ENGINE

REAR MAIN BEARING OIL SEALS: *NOTE*—Crankshaft seal is installed in groove in block and in Seal Retainer (directly behind rear main bearing) Retainer is sealed in block by special sealing strips inserted in grooves in sides of retainer after it is installed in the block

Seal Installation: With crankshaft out, install new packing in groove in block and in groove in retainer using Tool 6701-A to seat packing Cut packing off flush with surface before removing tool *(CAUTION* —do not leave frayed edges which may prevent proper seating of retainer in block) After crankshaft installed, coat retainer-to-block mating surface lightly with oil resisting sealing compound install retainer **without** side seals, tighten retainer screws securely (see Seal Retainer Production Change above) Dip side seal strips in engine oil and install immediately (seals are special graphite coated rubber asbestos composition and will swell immediately on contact with engine oil) Side seals may be tapped in place with a mallet but should project approximately 050- 070' below oil pan gasket surface after installation DO NOT cut off this excess length

Testing Seal Installation—Squirt engine oil along seal retainer-to-block parting line, direct compressed air nozzle at inner upper corners of retainer If air bubbles noted, remove and clean retainer thoroughly, install new side seals

"ECU" ENGINE

REAR MAIN BEARING OIL SEAL: Install new packing in crankcase and bearing cap using Tool 6701 to seat packing Before removing tool cut off edges flush with surface Make certain there are no ragged edges protruding Install outer 'L" shaped neoprene seal on bearing cap and coat with lubricant Install Pilot Studs Tool 6336-A1, and place unit over pilot studs Push bearing cap through tool and into position in block Remove bearing replacing tool and trim vertical seals, leaving approximately 5/64' of seal above cap Remove pilot studs and install the self locking main bearing cap bolts Tighten to 120-130 ft lbs torque

ALL ENGINES

CRANKSHAFT THRUST BEARING ALIGNMENT: After #1, #2, and #4 bearing caps and inserts have been installed and properly torqued, install #3 bearing cap and insert Install capscrews snug, then pry crankshaft toward rear of engine Reverse this action by prying crankshaft forward (toward front of engine) This will align thrust surfaces of both halves of thrust bearing RETAIN THIS FORWARD PRESSURE on the crankshaft, and tighten capscrews to 95-105 ft lbs Check crankshaft endplay which should be 002- 010"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

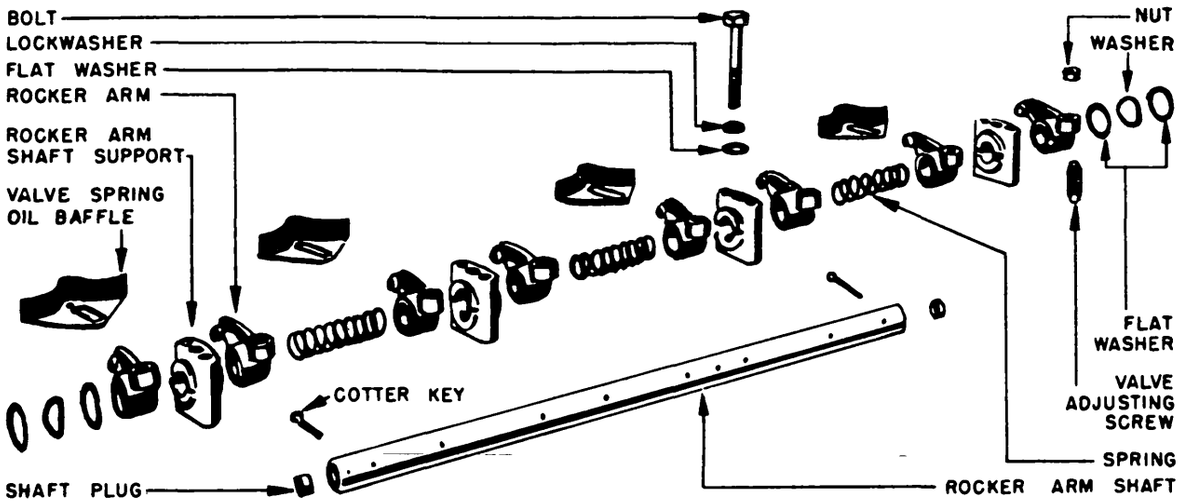
ENGINE FRONT COVER

CRANKSHAFT FRONT OIL SEAL INSTALLATION: Coat seal with engine oil, place seal on Tool 6700-B. Center tool and seal over inner end of bore in front cover, drive seal in until it is seated.

►*FRONT OIL SLINGER CAUTION:* Make certain that front oil slinger, Part No. B6A-6310-B (ECZ), No. B6Q-6310-B (ECU), is installed on forward end of crankshaft (in front of crankshaft sprocket) before installing Engine Front Cover.

ENGINE FRONT COVER INSTALLATION: Use new gasket and position Tool 6059 on crankshaft to align cover with block before installing cover capscrews. Tighten screws to correct torque (see Tightening Specifications).

CAMSHAFT & BEARINGS



CAMSHAFT REMOVAL: Drain cooling system, remove radiator. Remove coil, disconnect all vacuum lines remove accelerator shaft retracting springs, carburetor control shaft at carburetor. Remove control shaft assembly and accelerator shaft bracket capscrew and secure them to dash panel. Remove intake manifold rocker arm and pushrod covers. Loosen rocker arm adjusting screws to slide arms to one side while removing pushrods. Remove all belts, fan assembly and spacer, water pump pulley, power steering pump and reservoir (with hoses intact) and secure them to one side. Disconnect heater outlet hose at water pump. Remove power steering pulley and crankshaft damper (Tool 6316), water pump and timing indicator, fuel pump, oil pan, generator and brackets, cylinder front cover. Remove spacer, fuel pump eccentric and counterweight (later cars have spacer in place of counterweight). Remove camshaft and crankshaft sprockets with timing chain as an assembly. Remove distributor, hood lock dowel support, front fender apron and radiator support tie bar. Secure tappets UP out of way of camshaft, remove camshaft thrust plate, key, spacer and camshaft.

CAMSHAFT BEARING REMOVAL & INSTALLATION:
Removal—Remove camshaft and drill a ½" hole through plug at rear bearing bore and remove plug. Remove bearings from block with Camshaft Bearing Remover & Installer 6261-C and adapter pilots 6261-F.

Installation—Install bearings with same tool used for removal making sure that oil holes in bearings are in line with holes in cylinder block web. Notch on edge of bearing should face front of engine at bottom of bore. *(CAUTION—#1* camshaft bearing must be at least .005" and not more than .020" below front face of bearing bore in cylinder block. Install bearings with oil hole in line with oil hole in cylinder block web and notch on edge of bearing facing front of engine at bottom of bore

VALVE SYSTEM

OVERSIZE VALVE STEM INSTALLATION: Use Tool 6085 Piloted Reamer to ream cylinder head valve guides for oversize valve stems. Reamers are furnished in .003", .015", .030" oversizes. Pilots are Std., .003", .015". Use reamers in sequence with correct pilot when reaming from standard to oversize. Regrind valve seats after reaming guides.

MERCURY ROCKER ARM ASSEMBLY

"ECZ" ENGINE.

INITIAL VALVE CLEARANCE: To insure valve being on low side of the cam, make all adjustments in the following sequence and with No. 1, 3, & 4 pistons in the indicated position:

No. 1 Piston at TDC (Compression Stroke)—Adjust No. 1 Intake & Exhaust, No. 2 Intake, No. 4 Exhaust, No. 5 Exhaust, and No. 7 Intake.

No. 4 Piston at TDC (Compression Stroke)—*(NOTE —Rotate engine 180° from the point where No. 1 piston is at TDC).* Adjust No. 6 Exhaust, No. 4 Intake, No. 8 Exhaust, No. 5 Intake.

No. 3 Piston at TDC (Compression Stroke)—*(NOTE —Rotate engine 270° from the point where No. 4 piston is at TDC).* Adjust No. 2 Exhaust, No. 3 Intake & Exhaust, No. 6 Intake, No. 7 Exhaust, No. 8 Intake.

►*CAUTION*—Final tappet adjustment is made after engine assembly is completed and with engine at normal operating temperature. The final setting is .019".

"ECU" ENGINE

INITIAL VALVE CLEARANCE: Self-locking adjusting screws used with a tension of 7-15 ft. lbs. Replace rocker arm when tension reduced to 3 ft. lbs. Turn adjusting screw clockwise, while moving pushrod up and down, **until all slack is removed.** *(CAUTION* - Plunger unit of hydraulic lifter should not be forced down into body of lifter during this operation). With all slack removed, turn adjusting screw **an additional 2½ turns.** *NOTE* - If lifter is noisy in operation, adjustment can be varied by turning adjusting screw ± ¼ turn from original 2½ turn setting. Repeat for all valves.

Adjustm nt S qu nc : To insure valve being on the low side of the cam, make all adjustments in the following sequence:

N . 1 Pist n at TDC (C mpr ssi n Str k) - Adjust No. 1 Int. & Exh., No. 5 Int. & Exh., No. 7 Int., No. 4 Exh.

No. 6 Piston at TDC (Compr ssi n Str k) - Adjust No. 6 Int. & Exh., No. 3 Int. & Exh., No. 7 Exh., No. 8 Int. & Exh., No. 4 Int.

VALVE SERVICING: Valves are "Rotatable" type operating directly in valve guide holes in cylinder head and are removed and installed as follows:

Valve Removal—Use Tool 6513-EE to compress valve springs, remove valve spring locks, retainer sleeve, retainer, spring, and "umbrella" type oil seal. Discard oil seal.

Valve Assembly Installation—Install valve in port from which it was removed. Install valve stem oil seal with cupped side toward valve guide boss. Install valve spring, spring retainer, retainer sleeve, and valve locks.

ROCKER ARMS

ROCKER ARM SERVICING: Disassembly—Remove assembly from head by taking out rocker arm shaft bracket retaining screws. Remove cotter pins at each end of rocker arm shaft and remove flat washers and spring washers. Slide rocker arms, springs, and washers off shaft *(Be sure to identify each part for assembly in same position).* Pull oil tube out of end rocker arm support to remove shaft from support.

Rocker Arm Shaft Assembly—Oil moving parts with engine oil. Install a plug at each end of shaft. **Do not peen plugs to make them tight.** Assemble rocker arm shaft parts in order shown in illustration. Install oil outlet tube in end of rocker arm support and make certain end of tube enters hole in shaft. Tighten rocker arm shaft support-to-cylinder head bolts to the correct torque. Install rocker arm covers and tighten hold down bolts finger tight after making preliminary valve adjustment. Make final adjustment after engine warmed up to normal operating temperature. Install new gaskets (cement to cover only), install cover, and tighten hold down bolts to 2-2½ ft. lbs. torque.

CONTINUED FROM PRECEDING PAGE

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTERS: Lifters are "barrel type," integral units with a flat, disc type check valve. Lifter has three holes in outside diameter groove and four holes in plunger. Lifters are furnished in unit packs of eight.

Removal: Remove cylinder head covers. Take out rocker arm assembly support bolts and remove rocker arm assemblies, and valve pushrods. Remove intake manifold and gasket then remove pushrod chamber cover. Valve lifters can then be removed from lifter bores in block.

"ECU" ENGINE HYDRAULIC VALVE LIFTER

Disassembly: Immerse all lifters in solvent to remove all varnish and carbon deposits. DO NOT CUT OR SCRAPE CARBON FROM LIFTER. With needle nose pliers, remove lock ring from top of body. Remove push rod seat, plunger, valve disc assembly and spring from body. ***(CAUTION—Disassemble one lifter at a time to avoid inter-mixing lifter parts).***

Reassembly: Place push rod seat upside down on bench. Install plunger on push rod seat and place valve disc assembly on plunger and set spring on valve disc retainer. Place body over assemblies and push body down over plunger. Lift assembly and push plunger and push rod seat up into body. Install lock ring using tool 6500-C.

OILING SYSTEM

OIL PUMP

ROTOR TYPE OIL PUMP

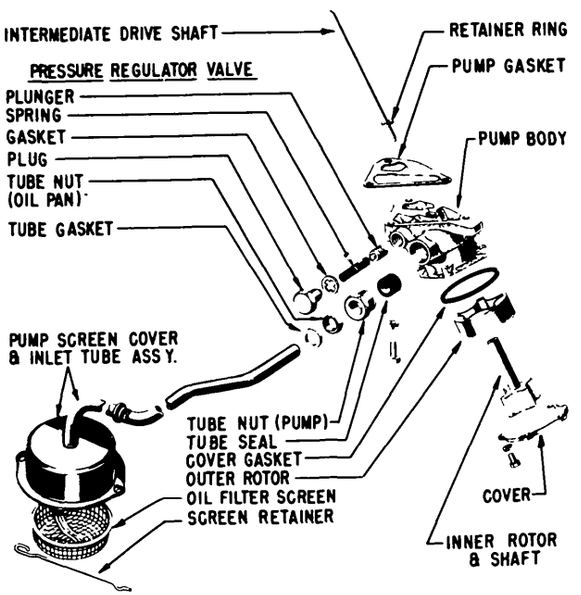
Removal: Disconnect external oil line. Remove attaching capscrews (two from bottom, one from above). Remove pump and intermediate shaft.

Disassembly: Remove capscrew securing cover to body assembly. Remove cover and "O" ring gasket. Remove rotor and shaft assembly. Remove relief valve nut, spring and relief valve.

Inspection: Clean all parts in suitable solvent. Check pump housing and rotors for damage and excessive wear. Check compression of relief valve spring which should be 9.2-10.4 lbs. at .80". Check relief valve clearance in body assembly. Measure outer rotor race to body clearance. Clearance should be .006-.009". With rotor and shaft assembly installed in housing, place straightedge over rotor assembly and pump body. Measure clearance between straightedge and pump at rotor. Clearance should be .001-.0035". Check cover for wear, and if scored or grooved, replace it. Drive gear shaft length should be 3.36-3.38" from rotor assembly face to shaft end. *NOTE* - Outer rotor and shaft and rotor assembly are replaced as a unit.

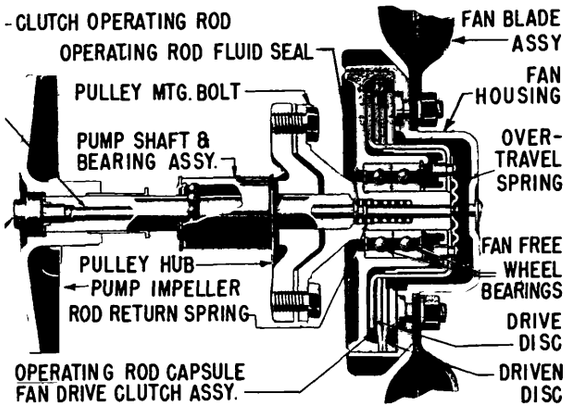
Reassembly: Reverse disassembly procedures. Check assembled pump to see that it rotates without bind.

OIL FILTER



Disposable Filter Original Installation - Remove and discard original filter. Install Gasket EAA-6838-A (coat gasket with light grease) and Adapter ECG-66391-A, in adapter recess in cylinder block (mark Top on adapter must be upward), install Oil Filter Mounting Bolt Insert No. ECG-6890-A and tighten insert to 70-80 ft. lbs. torgue. *(CAUTION* - DO NOT allow adapter to rotate). Install Disposable Filter Assembly MHK-6714-A as follows:

Disposable Filter Replacement - Coat gasket face of filter with oil, thread filter on insert by hand until gasket contacts adapter face, then tighten filter an additional one-half turn *(CAUTION* - DO NOT overtighten). Run engine and check for leaks.



COOLING

POWER BOOSTER FAN

DESCRIPTION & OPERATION: This "Power Surge" Fan is a completely automatic unit built-in the fan hub and water pump shaft. The fan blade and hub assembly is mounted on two ball bearings on the pulley hub which allow the fan to "free-wheel" when the clutch is disengaged. The clutch assembly consists of a drive disc (on the end of the pulley hub) and a driven disc (in the fan hub). Clutch is engaged by an operating rod extending through the pump shaft which is actuated by a capsule in the center of the pump impeller. As the water temperature increases, the capsule extends to engage the fan drive clutch causing the fan to be positively driven by the engine. Whenever the engine is at normal

ROTOR TYPE OIL PUMP

MERCURY AUTOMATIC FAN

temperature or below (with the operating capsule not extended), the rod return spring moves the rod toward the impeller and disengages the clutch so that the fan free-wheels.

FUEL SYSTEM NOTES

CARBURETOR AIR INTAKE DUCT ASSEMBLY (WITH THERMOSTAT CONTROL): Thermostatically controlled valve in air intake duct assembly should be fully closed at temperatures below 75°F (for air intake from rear "heated" opening) and should start to open at 85°F. Valve should be wide open at 105°F (for air intake from outside through left radiator side air deflector) If valve does not operate satisfactorily, remove duct assembly and test operation as follows:

Duct Assembly Removal: Loosen clampscrew and slide flexible hose off end of duct. Remove wing nut retaining air cleaner on carburetor remove nut and washer retaining duct assembly on bracket. Lift air cleaner and duct assembly off engine. Loosen two clampscrews and slide duct assembly from air cleaner.

Testing: Place duct assembly in pan of water at temperature below 65°F. (thermostat must be covered by water). Valve should be in closed "heat on" position. Heat the water slowly. At temperature of 75°F. valve should start to open *(NOTE* - If valve does not start to open, hold water temperature at 75°F. for eight minutes before discarding thermostat as defective). Increase water temperature to 105°F. Valve should now be wide open in "heat off" position *(NOTE* - If valve not wide open, hold water temperature at 105°F. for eight minutes before discarding thermostat as defective). If valve operation not satisfactory, remove thermostat and spring assembly and check valve shaft for binding. If valve moves freely replace thermostat and duct assembly. If valve does not operate correctly, adjust thermostat rod as follows:

Adjustment: Increase rod length to move valve toward "heat off" position, decrease rod length to move valve toward "heat on" position.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on patent plate attached to left front body pillar extension.
First Number - 10001 up.

► *SERIAL NUMBER NOTE: The serial number (example *57LA10001M*) includes following identification data in sequence.*

Year	Assembly Plant	Serial No.	Vehicle Name
57	See below	10001	ⓜM

ⓜ - "M" indicates Mercury.
Assembly Plants - Indicated in serial number by following code **LA** - Los Angeles. **ME** - Metuchen. **SL** - St. Louis. **WA** - Wayne.

► *ENGINE IDENTIFICATION·* Two different engines used "ECZ" Safety-Surge 312 cu. ins., and "ECU" Jato-Thrust 368 cu. ins. Specifications below are marked "ECZ" or "ECU" for each particular engine.

TUNE-UP

► *INTERMITTENT ENGINE MISS:* May be caused by distributor primary lead shorting out through nylon insulation. Correct by taping lead with rubberized tape.

COMPRESSION PRESSURE: (ECZ) 170 lbs , **(ECU)** 160 lbs at cranking speed of 150-180 RPM *NOTE* - Supersedes previous specification of 165 and 160 lbs

VACUUM READING: (ECZ) 19-20", **(ECU)** 18-19" with engine idling at 475 RPM in neutral.

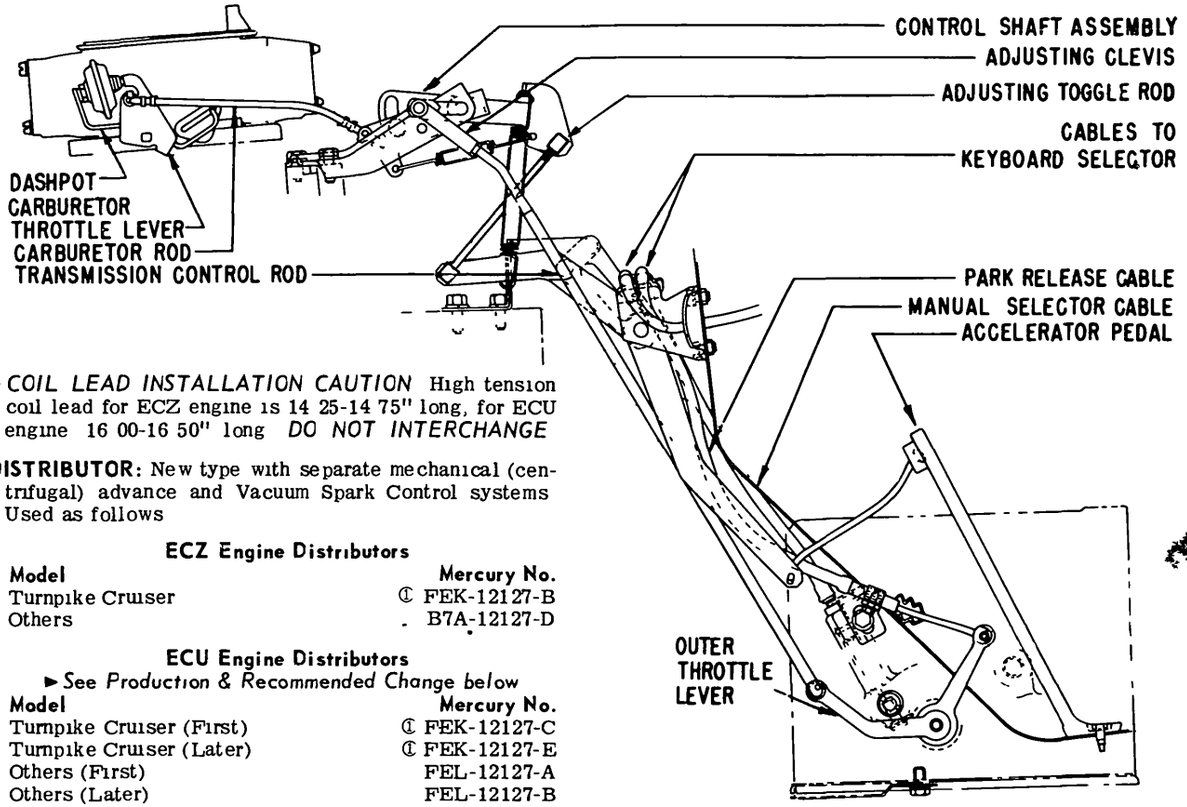
VALVE TAPPET CLEARANCE: (ECZ) .020" (Intake & Exhaust COLD), .019" (Intake & Exhaust HOT). If adjusted while engine Cold, recheck with engine Hot (after 30 minutes operation to normalize temperature). **(ECU)** - None in service (Hydraulic Lifters).

MANIFOLD HEAT CONTROL: Butterfly type valve mounted between right hand manifold and exhaust pipe (Single & Dual exhaust systems). When installing, make certain counterweight is toward right front.

► *DUAL EXHAUST NOTE:* When valve closed, all exhaust gases are discharged through left hand exhaust pipe.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders - RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.



SPARK PLUG GAP: .032-.036"
Spark Plug - Champion 860 (early) F-14Y (later) Use F 14Y for replacement

► *SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be tightened to 15-20 ft. lbs

COIL: Mercury B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4.5 amps. stopped.
Resistor - Mercury B6A-12250-D. 1.30-1.40 ohms at 75°F.

► *COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

► *COIL RESISTOR GROUNDING CORRECTION.* Resistor may ground on intake manifold To correct, bend resistor on its mounting bracket in direction of coil to give proper clearance

MERCOMATIC TRANSMISSION THROTTLE LINKAGE

► *COIL LEAD INSTALLATION CAUTION* High tension coil lead for ECZ engine is 14 25-14 75" long, for ECU engine 16 00-16 50" long *DO NOT INTERCHANGE*

DISTRIBUTOR: New type with separate mechanical (centrifugal) advance and Vacuum Spark Control systems Used as follows

ECZ Engine Distributors

Model	Mercury No.
Turnpike Cruiser	ⓒ FEK-12127-B
Others	B7A-12127-D

ECU Engine Distributors

IGNITION TIMING

Engine	Std. Setting
ECZ (Std. & O.D.)	3° BTDC (6° BTDC Max.)
ECZ (Mercomatic)	6° BTDC
ECU	5° BTDC (8° BTDC Max.)

Timing Mark - Crankshaft pulley marked "TDC", "10° BTDC", and "20° BTDC" with 2° graduations between these marks. Align correct mark with pointer on timing chain cover.

CARBURETOR

▷ *CARBURETOR APPLICATION: ECZ Engines equipped with Carter AFB or Holley 4-Barrel Carburetors, ECU Engine equipped with Carter WCFB 4-Barrel Carburetor.*

▷ *CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

Carburetor Air Intake Duct Assembly (Thermostatic Control): Carburetor air intake duct to air cleaner has thermostatically controlled valve which provides warm air for cold engine (air taken in through muff or shroud around exhaust manifold) or cool air for warm engine (air taken in from the left radiator side air deflector) Valve should be closed at temperatures below 75°F (for air intake from rear "heated" opening) and should start to open at 85°F Valve should be fully open at 105°F (for air intake from outside through left radiator side air deflector) *See "Fuel System Notes" in Mercury Special Data*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Accel rator Pedal Adjustment: Adjust toggle rod linking accelerator pedal bellcrank on firewall to bellcrank on cylinder head for shortest overall length Attach one end of rod to accelerator shaft and other end to transmission control shaft Distance between bottom surface of accelerator pedal and bare floor pan should be 4" Lengthen rod to raise pedal shorten to lower *CAUTION* - Adjust pedal height by **toggle rod only.** Shortest rod length possible must be used

Throttle Linkage Adjustment (Mercomatic Cars): With engine at normal operating temperature and idle speed set at 425-450 RPM with selector button in "D", adjust Anti-stall Dashpot (see below), then proceed as follows Remove clevis pin connecting transmission control rod to control shaft (on engine bracket), insert gauge pin, Tool 77230-MB, through control shaft and bracket. Adjust carburetor-to-control shaft rod so that it freely enters hole in carburetor throttle lever. Then **lengthen 2 full turns** and install rod Remove gauge pin With carburetor throttle lever in slow idle position hold transmission control rod up so that transmission lever is against its stop adjust clevis on rod so that clevis pin enters hole in control shaft freely then **lengthen** rod by turning clevis **3 full turns**, connect rod

Dashpot Adjustment (Holley & Carter WCFB Carbs.): Hold dashpot plunger in to limit of travel, loosen dashpot mounting locknut, rotate dashpot in or out on bracket until .067" feeler (Tool T109-234) can just be inserted between dashpot plunger and carburetor throttle lever (throttle closed and throttle stopscrew against stop). Tighten locknut and recheck clearance.

Dashpot Adjustment (Carter AFB Carburetor): This model has dashpot built-in carburetor. Hold primary throttle valves in wide-open position, measure distance from top surface of bowl cover to bottom of dashpot arm lever (at dashpot plunger). This distance should be 7/16". Adjust by bending inner tang on dashpot arm.

HOLLEY 4-BARREL

Mercury No. B7A-9510-U Auto. Trans. (replaces ECZ-9510-V), ECZ-9510-AD Std. & O.D. (replaces ECZ-9510-Y). *NOTE* - Carburetor ECZ-9510-AD is B7A-9510-U with dashpot and attaching parts removed New type 4-barrel carburetor with automatic choke

► *POOR OR HESITANT ACCELERATION CORRECTION* *See "Holley 2 & 4-Barrel Carburetors" in Carburetion Section*

► *MALFUNCTIONING CAUSED BY IMPROPER GASKET INSTALLATION CORRECTION* Throttle body-to-main body gasket may block vacuum passage from carburetor to distributor vacuum diaphragm To correct install gasket **on throttle body** and make sure **all** holes are aligned correctly

Idl Setting - Both screws (primary side only) ½-1½ turns open Adjust each screw in sequence, turn screw in until engine begins to run rough, then turn screw out until engine begins to roll, finally turn screw in just enough for smoothest idling (favor rich side of adjustment range). Readjust both screws after rechecking idle speed, turn screws 1/8 turn in either direction for smoothest idle (screws must be within ½ turn of each other)

Idle Speed - 475-500 RPM in Neutral. On Mercomatic cars, recheck idle speed in "D" and readjust as necessary to 425-450 RPM.

Throttle Linkage Adjustment: *See CARBURETOR above.*

► *OTHER DATA See "Holley 2 & 4-Barrel Carburetors" in Carburetion Section*

CARTER AFB 4-BARREL

Carter AFB No. 2441S,SA. New type 4-Barrel carburetor with automatic choke

► *RICH OPERATION AT HIGH ALTITUDE CORRECTION*· Install new metering rods or jets *See "Carter AFB 4-Barrel Carburetors" in Carburetion Section*

► *ACCELERATOR PUMP SPECIFICATION CHANGE* Changed from 27 64" to 15/32" from top of pump plunger to top of air horn

► *CHOKE SETTING SPECIFICATION CHANGE* Changed from 2 notches to 1 notch rich from center index

Idle Mixture & Idle Speed Setting - *Same as for Holley 4-Barrel above*

Throttle Linkage Adjustment: *See CARBURETOR above*

► *OTHER DATA*· *See "Carter AFB 4-Barrel Carburetors" in Carburetion Section*

CARTER WCFB 4-BARREL

Carter WCFB No. 2404S,SA. 4-barrel carburetor with automatic choke

► *STUMBLE OR CUTTING OUT ON TURNS CORRECTION* May be caused by poor seal between carburetor body and air horn *See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section*

Idle Mixture & Idle Speed Setting - *Same as for Holley 4-Barrel above*

Throttle Linkage Adjustment: *See CARBURETOR above*

► *OTHER DATA See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section*

FUEL PUMP PRESSURE: 3.5-5.5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Mercury No ECZ-9350-B (ECZ Eng), No ECU-9350-D (ECU Eng) Fuel & Vacuum

Pressure - 3½-5½ lbs (ECZ Eng), 4½-6½ lbs (ECU Eng)

See "Fuel Pumps" in Carburetion Section

Gasoline Gauge: King-Seeley Electric "CV" (Constant Voltage) type with voltage regulator No FEL-10804 A

Dash Unit - (Std) Mercury No FEK-9280-A (Turnpike Cruiser) FEK-9280 D

Tank Unit -(Std) Mercury No FEG-9275-E (Sta Wgn) FEG-9275-D (Turnpike Cruiser) FEG-9275-E

See "Fuel Gauges" in Carburetion Section

Air Cleaner: DRY FILTER ELEMENT type Clean every 4,000 miles replace element every 30,000 miles

► *CLEANING CAUTION*· Clean filter element by tapping or shaking to remove dirt particles *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate*

► *AIR CLEANER AIR LEAK CORRECTION (ECZ Eng).* Install Air Cleaner Element Seat Part No ECZ-9610-A beneath air cleaner element and body

► *HEAVY DUTY AIR CLEANER NOTE*· Heavy Duty Air Cleaner Part No EDB-9601 B available for replacement of standard Cleaners No EDB-9601-A1 & EDB 9601-A2 for use in dusty areas

BATTERY

ECZ Eng. - Mercury Kit No. MGK-10655-A. 12 volt, 11 plate, 55 ampere hour capacity

ECU Eng. - Mercury Kit No. MHK-10655-A. 12 volt, 13 plate 70 ampere hour capacity

Battery Ground - Negative to engine block

Engine Ground - Cylinder head to dash

STARTER

Mercury No. B6A-11002-A. Armatur - FAC-11005-B. Drive - Mercury No 1CM-11350-C Bendix "Folo-Thru"

Rotation - Counter-clockwise at commutator end.

Brush Spring Tension - 48-56 ozs.

Cranking Speed - 150-180 RPM., 155-190 amps.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4500	12.0	80 max.

Starting Switch· (Synchro-mesh Trans.) - Relay No B6A-11450-A controlled by Ignition & Starter Switch No B5A-11572-A

(Auto. Trans.) - Relay Part No B6A-11450-A controlled by Neutral & Starter Switch Vacuum Starter Cutout Switch FEK-11516-A and Neutral Starter & Back-up Light Switch FEK-15812-B

Starter Removal· Disconnect battery ground cable, raise front end of car, turn wheels to full right, disconnect starter cable. Remove ignition cable mounting bracket bolt, bracket and wires. Remove starter drive end plate screws, pull starter out and upward until drive assembly clears housing, hold in vertical position, with drive end down, then rotate and lower housing between tie rod and idle arm.

Installation: Tape dust seal lip (use masking tape) to inner circumference of housing to hold it in place, and reverse removal procedure. *NOTE* - Tighten outer cap-screw first, then top and bottom capscrews to maintain alignment of starting motor with flywheel housing.

Mercomatic Neutral Safety Switch Adjustm nt: *See "Ford-omatic & Mercomatic" in Transmission Section*

GENERATOR

GENERATOR: As follows:

Generator No.	Armature N .
B6A-10002-H (Std.)	FGT-10027-A
FGP-10002-B (Special)	FGP 10027 A

Performance Data

Generator	Amperes	Volts	GEN RPM
B6A 10002-H	30	15	2450
FGP 10002-B	40	15	2390

Brush Spring Tension - 26-34 ozs

Field Current - 1 5-1 6 amps at 15 volts (Hot)

Rotation - Counterclockwise at commutator end

Belt Adjustment: Approximately ½" deflection on belts midway between generator and water pump pulleys with normal thumb pressure

REGULATOR

REGULATOR: Used with generator as follows

Regulator No.	G nerat r No.
B6A-10505-A	B6A-10002 H
FBF-10505-A	FGP-10002 B

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*SETTING NOTE:* Settings are for regulator at NORMAL OPERATING TEMPERATURE (after running engine for 20 minutes at 1500 RPM if started cold or until temperature gauge is steady for 5 minutes if engine previously warmed up) with room temperature at 75°F

Cutout Relay

Cuts In - 12 0 12 8 volts
Cuts Out - 2 0-6 0 amps (reverse current)

Voltage Regulator

Setting - 14 6-15 4 volts
Checking & Adjusting - *See "Ford, Lincoln, Mercury 12 Volt Regulators" in Electrical Section*

Current Regulator

Setting - 28-32 amps (B6A-10505-A) 38-42 amps (FBF-10505-A)
Checking & Adjusting - *See "Ford, Lincoln, Mercury 12 Volt Regulators" in Electrical Section*

MISC. ELECTRICAL

Headlamps: Sealed Beam 2-Headlights Std (Exc Turnpike Cruiser), 4-Headlights Std (Turnpike Cruiser) *See "4-Headlights" in Electrical Section*

Directional Signals: *See Electrical Section*

Lighting Switch Removal: Disconnect battery ground cable Depress spring and pin retainer located on top of switch pull knob and shaft assembly from switch Use wide blade screwdriver to remove switch retainer nut from face of instrument panel and remove switch

Stop Light Switch Location: On forward end of brake master cylinder (integral with power brake unit) Master cylinder or power brake unit located on firewall in engine compartment

CIRCUIT BREAKERS: 12 ampere used with dual headlights 20 ampere used with Air Conditioner Protects headlights

FUSES: Located in fuse panel behind instrument panel
Interior Lights - SFE 7 5 ampere
Turn Signals - SFE 7 5 ampere
Heaters Blowers - SFE 14 ampere
Radio - SFE 7 5 ampere
Clock - Electric wind 1 AG-1
Overdrive - AGC 15 ampere
Windshield Wipers - SFE 7 5 ampere
Back-Up Lights - 7 5 ampere
Spotlight - SFE 7 5 ampere
Underhood Lamps - SFE 7 5 ampere
Power Lubrication - SFE 7 5 ampere
Horn Relay: Mercury No B7A-13853-A

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning system for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 90° V8, Overhead Valves. "Safety Surge" (ECZ) & "Jato-Thrust" (ECU) engines.

Model	Bore	Stroke	Displacement
ECZ	3.80"	3.44"	312 cu. ins.
ECU	4.0"	3.66"	368 cu. ins.

Model	Rated HP	Compr. Ratio	Developed HP
ECZ	46.2	9.7-1	255 at 4600 RPM
ECU	51.2	10-1	290 at 4600 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

►*POWER BOOSTER FAN NOTE* Power Booster Fan is standard on some ECZ engines *See "POWER BOOSTER FAN" under "Cooling" in Mercury Special Data*

►*ENGINE OR GEAR NOISE NOTE:* Objectional engine and gear noise can be caused by metallic contact between rear engine mount retainer bracket contacting frame To correct, loosen two mounting bolts align retainer bracket hold drift between retainer and crossmember while tightening mounting bolts to 22-28 ft lbs

►*MANIFOLD HEAT VALVE STICKING CORRECTION:* Chamfer lower edge of valve plate to eliminate contact with aligning dimple of muffler inlet pipe

►*IGNITION TIMING CAUTION:* Setting Ignition Timing in advance of specifications will burn spark plug electrodes shorten valve life and cause excessive detonation with burned pistons *See IGNITION TIMING above*

►*CRANKCASE VENTILATION TUBE OIL LEAK CORRECTION (ECZ Eng):* When screen in tube is longer than 1 820" cover will not contact gasket causing oil leak To correct cut either end of screen to reduce length to 1 820"

►*ENGINE OPERATION IN LOW OCTANE AREAS (FOREIGN TRAVEL):* Low octane fuel Kit No I-501769 (ECZ) No ECU-99025 A (ECU) available for service to lower compression ratio

►*AIR CLEANER NOISE CORRECTION* To eliminate noise due to air cleaner duct contacting exhaust manifold remove duct cut out "U" section at lower end to give 1/8" clearance and reinstall air duct and cleaner.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Mercury Special Data*

►*"ECU" CYLINDER HEAD BOLT & TORQUE SPECIFICATION CHANGE:* New high tension steel cylinder head bolts Part Nos B4Q-6065 A & B4Q 6066-A permit higher torque specification and reduce possibility of water and combustion chamber leaks *See "Torque Specifications" in Mercury Special Data*

TIGHTENING TORQUES: *See "Tightening Specifications" in Mercury Special Data*

ENGINE REMOVAL: *See "Engine" in Mercury Special Data*

OIL PAN REMOVAL: On early cars with front Engine Steady Rest Support, turn crankshaft so No. 1 piston is at 12° ATDC, raise car, drain oil, remove radiator splash shield, stabilizer bar mounting bolt. *NOTE* - With Automatic transmission, remove cooler line clip oil pan screw, loosen cooler outlet pipe at left hand side of radiator and right hand side of transmission. Remove steady rest bracket to frame crossmember bolt, engine front support nuts and retainers, rear engine support crossmember, raise engine 4½" ONLY, drop oil pan down, position stabilizer between oil pan and cylinder block and remove oil pan.

PISTONS

Aluminum alloy Autothermic, solid skirt type with three rings above pin *NOTE* - Pin is offset in piston

►*ORIGINAL BORE & PISTON SIZES* Original bore range is (ECZ) 3 8000 3 8024", (ECU) 4 0000-4 0024" and TWO standard size pistons are used as noted below Piston "Grade" is marked on dome

Std. Piston Sizes

Engine	Grade "2"	Grade "6"
ECZ	3 7993 3 7996"	3 8005-3 8008"
ECU	3 9991-3 9994"	4 0003-4 0006"

Removal - Pistons and rods removed from above

Fitting New Pistons: Use ½" wide feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side Feeler thickness as follows.

New Piston in New Bore - 002" feeler 5-10 lbs pull
New Piston in Used Bore - 0025" feeler 5-10 lbs pull
Used Piston in New or Used Bore - 003" feeler 5-10 lbs pull

NOTE - Specifications cover both ECZ & ECU engines and supersede previous specifications

Replacement Pistons: (ECZ) standard 0225", 0325", 0425" oversize
(ECU) Standard 020" 030", 040" oversize

►*NOTE* - Standard furnished in two sizes *See "Original Bore & Piston Sizes" above*

Installing Pistons: Indentation or notch on top of piston must face front of engine *See Rod Installation*

PISTON PINS

Floating type with lock ring at each end

Diameter - (All) 9120 9123" **Length** - (ECZ) 3 016-3 030", (ECU) 3 162 3 176"
Clearance in Piston - 0001- 0003" Service max 0008"
Clearance in Rod - 0001- 0003" (ECZ) 0002- 0004" (ECU) Service max 0008"
Replacement Pins - (All) Std (Green), 001" (Blue) 002" (Yellow) Oversize

PISTON RINGS

ECZ Engine

Ring	End Gap	Side Clearance
Compr. (1)	012-.022"	Ⓒ 0035"
Compr. (2)	.012-.022"	Ⓒ.003"
Oil Contr.	.015-.062"②	-

ECU Engine

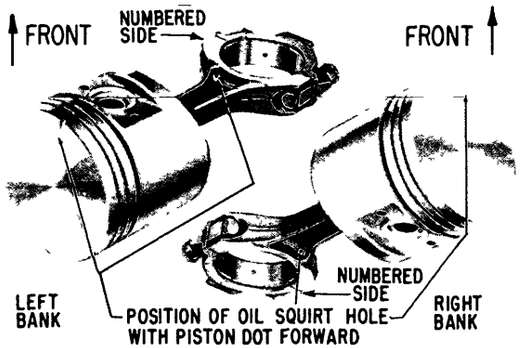
Ring	End Gap	Side Clearance
Compr. (1 & 2)	.013-.030"	Ⓒ 003"
Oil Contr.	.015-.062"②	-

Ⓒ - Service maximum ② - On rails.

Replacement Rings: Standard and 020", 030" 040" oversize

CONNECTING RODS

Journal Diameter - Two (Standard) sizes as follows



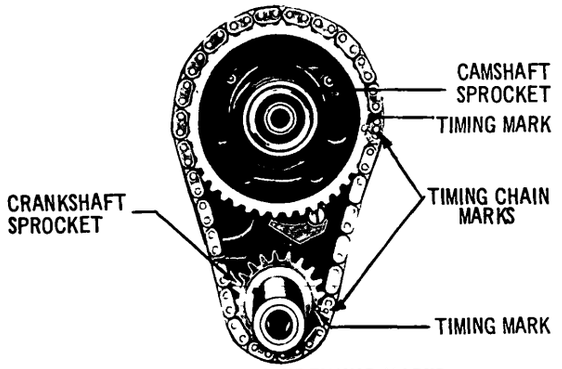
Engine Ⓒ	Code Blue	Cod Red
ECZ	2 1880-2 1884"	2 1884-2 1888"
ECU	2 2482-2 2486"	2 2486 2 2490"

Ⓒ - Use bearing with same Code Color

CONTINUED ON NEXT PAGE

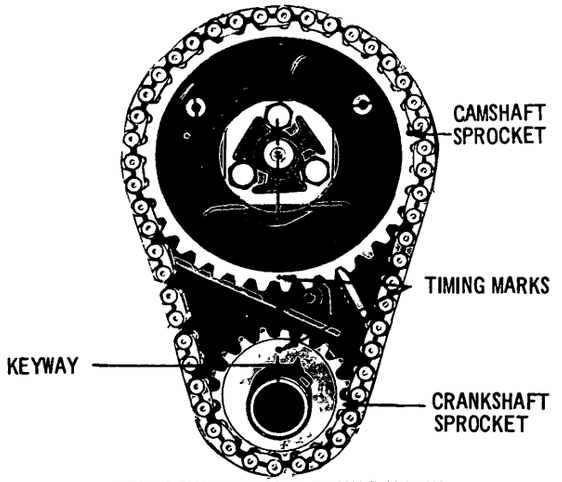
CONTINUED FROM PRECEDING PAGE

Bearings - Copper Lead Alloy with Steel back. Upper and lower halves interchangeable.
Clearance - .0007-.0036".
Side Clearance - .019" (ECZ), .017" (ECU).
Replacement Bearings: Two Standard Sizes (Coded Blue or Red), and .010", .020", .030" (ECZ & ECU) plus .040" (ECU) undersize.
Installing Rods: Assemble rods to piston so indentation embossed on piston head will face front of engine with numbered side of rod to right side of engine (right bank), or to left side of engine (left bank). When installing assemblies in engine, numbers on rods and caps must be together and toward outside of block.



PISTON & ROD ASSEMBLIES

CRANKSHAFT



Journal Diameters: 2.6235-2.6239" (Color Coded Blue), 2.6239-2.6243" (Color Coded Red).
Bearings - Copper Lead Alloy, with steel back.
Clearance - .0008-.0026". Service max. .0036".
Replacement Bearings: Two Standard Sizes (Coded Blue or Red), and .010", .020" .030" (ECZ & ECU) plus .040" (ECU) undersize. *NOTE* - Bearings are different on the two engines.
End Thrust: Taken by No. 3 main bearing.
Thrust Bearing Alignment - *See "Crankshaft & Main Bearings" in Mercury Special Data.*
End Play - .010" (ECZ), .012" (ECU).
Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Mercury Special Data.*
Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Mercury Special Data.*

CAMSHAFT

Journal Diameter - (ECZ) 1.9255-1.9265". (ECU) 2.1240-2.1247".
Clearance - .006" maximum (ECZ). .003" (ECU).
End Thrust (ECZ): Taken by thrust plate between camshaft sprocket and shoulder of block.
End Thrust (ECU): Restrained by spring and piston located in front end of camshaft.
Replacement Camshaft Bearings: Reamed bearings furnished in Standard and .015" oversize. *NOTE* - ECZ and ECU bearings are different.
Camshaft Bearing Removal & Installation: *See "Camshaft & Bearings" in Mercury Special Data.*
Camshaft Setting (ECZ): Timing is correct when timing marks on sprockets correspond with marks on chain when on drive side of chain.
Camshaft Setting (ECU): Timing is correct when timing marks on sprockets are adjacent and in line across shaft centers.

"ECZ" ENGINE VALVE TIMING MARKS

"ECU" ENGINE VALVE TIMING MARKS

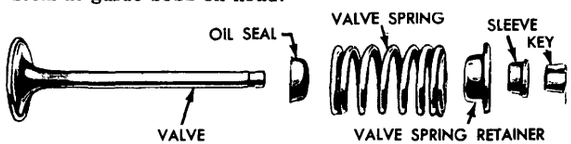
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Mercury Special Data.*
Timing Chain Cover Seal Installation (Crankshaft Front Oil Seal): *See "Engine Front Cover" in Mercury Special Data.*

VALVES

Tappet Clearance: (ECZ) - .020" Intake & Exhaust (Cold), .019" Intake & Exhaust (Hot). Recheck Cold setting after engine warmed up.
(ECU) - None in service, hydraulic lifters.
Initial Valve Clearance Adjustment - *See "Valve System" in Mercury Special Data.*

ECZ Engine

Valve	Head Diameter	① Stem Diameter
Intake	1.920-1.930"	.3416-.3423"
Exhaust	1.505-1.515"	.3403-.3410"



Valve	Seat Angle	② Lift	Stem Clearance
Intake	45°	.272"	③ .001-.002"
Exhaust	45°	.267"	④ .0023-.0037"

ECU Engine

Valve	Head Diameter	① Stem Diameter
Intake	2.000-2.010"	.3416-.3423"
Exhaust	1.630-1.640"	.3403-.3410"

Valve	Seat Angle	② Lift	Stem Clearance
Intake	45°	.261"	③ .001-.002"
Exhaust	45°	.256"	④ .0023-.0037"

① - Furnished with .003", .015", .030" OS stems.
② - Cam Lift (Service Minimum).
③ - Service maximum: .004" (ECZ), .0045" (ECU).
④ - Service maximum: .006" (ECZ), .0065" (ECU).
Valve Seat Width - 1/16-5/64" (Int.), 5/64-3/32"(Exh.).
Oversize Valve Stem Installation - *See "Valve System" in Mercury Special Data.*
Valve Servicing - *See "Valve System" in Mercury Special Data.*
Valve Stem Seals - "Umbrella" type seals used on all valves. Install seals with cupped side down on valve stem at guide boss on head.

VALVE ASSEMBLY

Valve Springs: Free Length - 2.09" (ECZ), 2.12" (ECU).

Valve Spring Specifications

ECZ Engine

	Pressure	Length
Closed	64 lbs.	1.780"
Open	145 lbs.	1.390"

ECU Engine

	Pressure	Length
Closed	60 lbs.	1.800"
Open	165 lbs.	1.380"

►*HIGH PERFORMANCE INNER VALVE SPRING (ECU):* Inner valve spring Part No. ECU-66515-A available for high speed operation, and requires use of Valve Spring Retainer No. ECZ-6514-A. Outside of valve guide is machined for usage of inner valve spring. *NOTE* - Free length 1.875". **Specifications** - 28-32 lbs. pressure at 1.62", 78-82 lbs. pressure at 1.17".
Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (.004" Intake, .005" Exhaust), ream guides and install oversize valves. *See "Valve System" in Mercury Special Data.*
Valve Lifters: (ECZ) Mushroom type. Removed from below with camshaft removed.
Diameter - .4989-.4995".
Valve Lifters: (ECU) Hydraulic, barrel type. Lifters can be removed from above with camshaft in engine.
Diameter - .8740-.8745". **Clearance in Block** - .0025" maximum.
Lifter Overhaul (ECU) - *See "Valve System" in Mercury Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rocker Arm Assembly: See *"Valve System" in Mercury Special Data.*

▷ *ROCKER ARM COVER INTERFERENCE CORRECTION (ECZ Eng.): See "Valve System" in Mercury Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

▷ *VALVE TIMING NOTE:* Following valve opening and closing points are with cam lift as indicated.

Valve Timing (ECZ)

Intake Valve - Open 18° ① BTDC. Close 58° ① ALDC.
Exhaust Valve - Open 66° ② BLDC. Close 10° ③ ATDC.

Valve Timing (ECU)

Intake Valve - Open 18° ④ BTDC. Close 72° ⑤ ALDC.
Exhaust Valve - Open 59° ④ BLDC. Close 31° ⑤ ATDC.
Camlift - ① .015", ② .013", ③ .016", ④ .002", ⑤ .004".
Valve Timing Check - With No. 1 piston in firing position (No. 1 intake valve closed), back off adjusting screw and push rocker arm to one side. Mount dial indicator directly above No. 1 intake valve pushrod with indicating button in pushrod socket, set dial indicator at zero. Place a quadrant on crankshaft pulley. Rotate engine to point where dial indicator registers camlift as listed in Valve Timing table above. Quadrant reading should agree with valve timing figure in table.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add 1 quart when filter changed.
Normal Oil Pressure: 45-50 lbs. at 2000 RPM (Hot).
Oil Pressure Indicator: Light on instrument panel. Light is on when oil pressure is low.
Oil Pressure Switch - Mercury No. FDA-9278-A.
See "Oil Pressure Gauges" in Miscellaneous Section.
Oil Pump: Rotor type. Located at left side of engine crankcase and driven by distributor drive gear.
Pump Overhaul - *See "Oiling System" in Mercury Special Data.*
Oil Filter: Full-flow type early cars, disposable type late.

▷ *OIL FILTER PRODUCTION CHANGE:* Disposable oil filter used on later cars and can be installed to replace previous type full-flow filter on earlier cars. For disposable filter installation *see "Oiling System" in Mercury Special Data.*

Crankcase Ventilation: Filter in oil filler cap (Inlet), filter screen in road draft tube (Outlet). Clean and oil every 2,000 miles or more often in dusty areas.

COOLING

Water Capacity: 19 quarts. Add 1 quart with heater.
Pressure Valve: Mercury No. LA-8100-A (12-15 lbs.). Radiator filler cap.
Thermostat: (ECZ) Mercury No. B4A-8575-A (157-162°F) Std.; B4A-8575-B (177-182°F) High Temperature.
(ECU) Mercury No. B7Q-8575-A (157-162°F) Std.; B4Q-8575-B (168-173°F) High Temperature.

▷ *THERMOSTAT INSTALLATION NOTE:* Install thermostat with the word "TOP" up and toward front of engine to prevent a retarding of flow of coolant.

▷ *RADIATOR NOTE:* Two types of radiator used, Standard and Extra Cooling. All air conditioned cars use Extra Cooling. *NOTE* - Minimum clearance between fan and radiator core is 13/16" or 17/32" between fan and top tank.

▷ *POWER BOOSTER FAN NOTE:* Power Booster Fan is standard on some ECZ engines. *See "POWER BOOSTER FAN" under "Cooling" in Mercury Special Data.*

Water Pump: Packless, sealed ball bearing type.
See "Mercury" in Water Pump Section.
Temperature Gauge: King-Seeley Electric "CV" (Constant Voltage) type with voltage regulator No. FEL-10304-A.
Dash Unit - Ford No. FEK-10883-E.
Engine Unit - Mercury No. FEG-10884-B.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck Model 10.5A6 (Std.), Long Model 11CF (Heavy Duty). Single plate, dry disc type.

Cover Assembly	Mercury No.
Borg & Beck No. 361378	B7C-7563-A
Long No. 265126	B6A-7563-A

See "Borg & Beck" and "Long" in Clutch Section.

Clutch Disc	Mercury No.
Borg & Beck No. 382374	B7C-7550-B
Long No. 287226	81T-7550-A

▷ *CLUTCH PEDAL AREA NOISE CORRECTION:* Install pedal assist spring with hook (on long stem of spring opening) attached to rivet of clutch pedal lever with opening upward. This position will eliminate spring to cowl panel interference.

Pedal Adjustment: If pedal free travel is not 1 to 1¼", loosen clutch pedal release rod locknut (lower end) and turn adjusting nut for correct free travel, tighten locknut.
Removal: Remove transmission (see Transmission Removal below), and disengage clutch pedal retracting spring and release rod from clutch release lever. Disengage equalizer bar tension spring and remove two capscrews retaining equalizer bracket assembly to flywheel housing. Remove flywheel housing. Mark position of flywheel and pressure plate so parts may be installed in original position. Compress clutch pressure plate assembly with Tool 7563. Remove capscrews, pressure plate and disc.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second and high), sliding gear (low and reverse).
See "Mercury Synchro-mesh" in Transmission Section.
Transmission Control: *See "Transmission Controls" in Transmission Section.*
Removal: If equipped with overdrive, remove kickdown switch retainer nut and push switch through floor. Raise car and drain transmission. On overdrive cars remove governor, solenoid, and control cable. Disconnect speedometer cable and remove speedometer drive gear. Remove transmission shift rods at transmission. Remove bolts retaining rear universal joint to companion flange and remove drive shaft. Support rear of engine and remove the detachable cross-member of the frame. Remove two top capscrews retaining transmission to flywheel housing and install a couple of studs to act as guide pins. Remove lower capscrews and slide transmission to rear as far as possible and lower front end. Remove from below car.

▷ *SINGLE EXHAUST SYSTEM NOTE:* When removing transmission, it will be necessary to remove nuts that secure muffler inlet and exhaust pipes to exhaust manifold, and to remove manifold outlet pipe from mounting bracket at rear of manifold and move exhaust system away from working area.

OVERDRIVE

Warner Model AS1-R10F. Solenoid operated type, with governor control and throttle operated kickdown. Lockout Switch not used on this model.
See "Warner R10 Overdrive" in Transmission Section.
Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

MERC-O-MATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock.
See "Fordomatic & Mercomatic" in Transmission Section.

▷ *NO FORCED DOWNSHIFT CORRECTION (Early Cars):* Install new adjustable type accelerator rod No. MG-9784-B which entered production Nov. 1956. For adjustment, *See "Fordomatic & Mercomatic" in Transmission Section.*

▷ *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Mercomatic" in Transmission Section.*

▷ *TESTING & TROUBLE SHOOTING: See "Fordomatic & Mercomatic" in Transmission Section.*

Lubrication - Check fluid level every 2,000 miles, drain and refill every 16,000 miles. Use only Automatic Transmission Fluid Type "A".
Checking Fluid Level - Bring transmission to operating temperature by running engine with selector lever in Neutral position. Move selector lever through all ranges to assure fluid distribution, then place in (P) "Park" position for checking fluid level. Maintain level at "Full" mark on dipstck.
Throttle Linkage Adjustment: *See CARBURETOR above.*
Manual Selecter & Park Release Cable Adjustment: *See "Mercury Mercomatic Transmission Keyboard Control" in Transmission Section.*

▷ *OTHER MERCOMATIC DATA: See "Fordomatic & Mercomatic Transmission" in Transmission Section.*

UNIVERSALS

Spicer. One used at each end of drive shaft.

REAR AXLE

Own. New separate carrier type with straddle-mounted pinion, hypoid gear and Hotchkiss drive.
See "1957 Ford & Mercury" in Rear Axle Section.

▷ *REAR AXLE LUBRICANT LEAK CORRECTION:* Install axle carrier lower studs using non-hardening (light gray aviation type) sealer on threads as necessary. *NOTE* - Check and clean axle housing vent.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Axl Rati s

Model	Standard	Optional
S-M (Exc Sta Wgn)	3 70-1(37 10)	3 89-1(35 - 9)
S-M(Sta Wgn)	3 89-1(35 - 9)	3 70-1(37-10)
O D (Exc Sta Wgn)	3 89-1(35 - 9)	
O D (Sta Wgn)	3 89-1(35 - 9)	3 70-1(37-10)
Mercomatic	2 91-1(32-11)	
Mercomatic(Sta Wgn)	3 22-1(29 - 9)	2 91-1(32-11)

NOTE - 2 91-1(32-11) supersedes 3 22-1(29-9) with ECU Engine

Backlash - 004- 009"

Axle Shaft Removal: Remove wheel and brake drum Remove axle shaft retainer locking type nuts (work through opening in axle shaft flange) Use Puller and pull shaft (do not disturb brake backing plate or damage wheel bearing oil seal) Replace one nut to secure brake backing plate

Carrier Assembly Removal. *NOTE* - Pinion carrier assembly can be removed separately without disturbing differential carrier by disconnecting rear universal joint at companion flange, and removing five bolts that attach pinion carrier assembly to differential carrier housing With rear universal joint disconnected, axle shafts removed (see above) remove differential carrier housing to rear axle housing bolts and lift out carrier assembly

Wheel Bearing Adjustment: None required

SHOCK ABSORBERS

Direct acting, non-adjustable Service by replacement.

Front Shock Absorber

Model	Standard	Heavy Duty
All(Exc Sta Wgn)	MG 18077-R	MG 18077-Y
Sta Wgn	MG 18077-S	MG 18077-AA

Rear Shock Absorber

Model	Standard	Heavy Duty
All(Exc Sta Wgn)	MG 18097-K	MG 18097-R
Sta Wgn	MG 18097-M	MG 18097-N

FRONT SUSPENSION

Independent. "Ball-Joint" suspension with direct acting shock absorbers mounted within front coil springs *See "Ford & Mercury (Ball-Joint)" in Suspension & Wheel Alignment Section*

Steering Axis Inclination: 7° at 0 Camber Not adjustable

► *CASTER & CAMBER ADJUSTMENT NOTE* New mounting of upper control arm inner shaft (bolted to outer surface of frame bracket) changes suspension alignment procedure as follows

Caster - Adding 1 '16" shim at front bolt changes caster Pos ½°, adding 1 16" shim at rear bolt changes caster Neg ½°

Camber - Adding 1 16" shim at both front and rear bolts will change camber Pos ¼°, removing 1/16" shim at both bolts will change camber Neg ¼°

Caster - 0° to Neg 1½° Maximum variation between wheels ½°

Camber - 0° to Pos ¾° Maximum variation between wheels ¼°

Toe-In - 1/16 to 3/16"

Toe-Out on Turns - With outer wheel turned 26½°, inner wheel should be 38°(maximum turning angle)

STEERING

► *STEERING GEAR BIND CORRECTION (Early Cars)* Install Steering Gear to Frame Spacers, Part No MG-3566-A, as necessary to eliminate any bind in worm shaft and steering column

Manual: Saginaw Recirculating Ball Nut type *See "Saginaw Worm & Nut" in Steering Section*

Power Steering: Bendix (Ford & Mercury) Linkage type Used in conjunction with standard type steering gear *See "Bendix Linkage Type (Ford & Mercury)" in Steering Section*

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Saginaw Worm & Nut" in Steering Section*

Steering Gear Removal· *See "Saginaw Worm & Nut" in Steering Section*

BRAKES

► *BRAKE DESIGN NOTE.* Front brake anchor pin (fixed anchor type) is mounted on wheel spindle independently of backing plate (wheel cylinder mounted on anchor pin)

► *REAR WHEEL BRAKE TUBE FITTING CAUTION.* Use new brake tube fitting Part No MG-2074-B (Exc Sta Wgn), MG-2074-A (Sta Wgn) to provide clearance between rear wheel brake hose and shock absorber

Bendix Hydraulic, Single Anchor (Without eccentric and with fixed anchor pins) **Early type** requires hand adjustment, **Later type** has automatic adjustment *See "Ford, Lincoln, Mercury Bendix" or "Mercury Bendix (With Automatic Adjuster)" in Brake Section*

Drum Diameter - 11" front and rear

Wheel Cylinder Diameter - 1 1/8" Front 15 16" Rear

Lining - Molded type, riveted to shoe

Width - 3 0" (ECU) 2 5" (ECZ) front and rear

Braking Power - 55 5% front 44 5% rear

Clearance - **(Hand Adjusted)** Expand shoes until wheel is locked Back off adjusting screw 12-14 clicks until wheel turns free

(Automatic Adjusted) For initial adjustment use Tool No 2081 to expand shoes until wheel is locked Hold adjusting lever away from adjusting screw (use narrow screwdriver through hole in backing plate) and back off adjusting screw until wheel turns free, then one more stroke of tool (Approximately 13 strokes total) Wheel should turn free

Brake Pedal Free Play Adjustm nt: 1/4-7/16" If play not correct after adjustment, loosen locknut on the eccentric bolt attaching brake pedal to master cylinder pushrod and rotate eccentric bolt for desired clearance

Standard Master Cylinder: Located on engine side of firewall

Checking Fluid - Maintain fluid level to within ¼" of top of reservoir

Removal - Disconnect brake line from master cylinder and depress brake pedal a few times to force out fluid. Disconnect wires leading to stop light switch, and remove eccentric bolt attaching master cylinder push rod to brake pedal Remove capscrews and lock washers attaching master cylinder to firewall

Power Brakes: Bendix Power Unit (new type with hydraulic reaction valve rod) Combination vacuum power unit and master cylinder Unit mounted on engine side of firewall and replaces regular master cylinder *See "Bendix Power Unit" in Brake Section*

Checking Fluid Level - Same as for regular master cylinder

Removal of Power Unit - Release pushrod from lever assembly master cylinder outlet fitting bolt from master cylinder *NOTE* - DO NOT remove stop light switch or hose assembly from outlet fitting Leave outlet fitting in master cylinder Remove manifold vacuum hose from unit and reserve tank hose from valve fitting Remove mounting screws and unit from bracket on dash panel

MISC. MECHANICAL

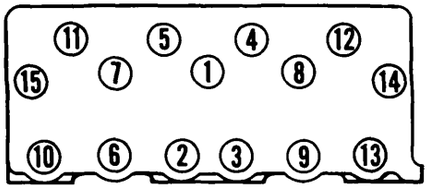
Windshield Wipers: Vacuum Cable & Tensioner type *See "Windshield Wipers" in Miscellaneous Section*

Power Window Regulators: Electric Reversible motor in each window Controlled by door switch and master control switch *NOTE* -Rear Window on Turnpike Cruiser and Tall Gate Window on some Station Wagons also power operated *See "Power Window Regulators" in Miscellaneous Section*

Power Top Control· Electric-Hydraulic with reversible pump motor *See "Power Top Controls" in Misc Section*

Power Seat Adjusters· "4-Way" Electric Screw and Jack type with single electric motor driving screw jack *See "Power Seat Adjusters" in Miscellaneous Section*

Seat-O-Matic Control - Automatic position adjustment controlled by switch on instrument panel *See "Seat-O-Matic Power Seat Adjusters" in Miscellaneous Section*



Air Conditioning: Combination Air Conditioning-Heater System, *See "Mercury Air Conditioning" in Misc Sect*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	60-65
Main Bearing Cap (Rear)	50-55
Main Bearing Cap (Others)	80-85
Con Rod Caps	46-50

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Cylinder block has two sleeve locating dowels to assist in lining up cylinder head and gasket during installation. Coat gasket with non-hardening gasket paste, install gasket with marks "AM" and "TOP" upward. Install cylinder head, pushrods, and rocker arm assembly *(CAUTION* - Special drilled capscrew must be installed in rear rocker arm support bracket to provide lubrication for rocker arms). Tighten head bolts in sequence shown in diagram to correct torque. See Tightening Specifications.

HUDSON HORNET & NASH AMB. V8 CYLINDER HEAD

PISTON PINS

PISTON PIN: Pin is press fit in connecting rod and no clamp bolt or locking rings are used to retain the pin. Piston pin must be removed and installed as detailed below to prevent distortion or damage to piston.

Removal - Remove pins with special Piston Pin Remover J-6360 and an arbor press. Place piston in remover support so pin will enter support when pressed out with piloted driver.

Installation - Place piston pin pilot in support, insert piston and connecting rod. This aligns piston and connecting rod piston pin bores. Press piston pin into connecting rod and piston assembly until lower pilot bottoms in support which will properly center rod on pin.

► *CAUTION:* Pin must be tight press fit in connecting rod.

CRANKSHAFT & MAIN BEARINGS

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Install hemp packing in block and in bearing cap using Tool J-3048-A to seat packing in groove Trim excess packing off flush with face of cap. Rubber seals are installed in side grooves of bearing cap.

VIBRATION DAMPENER

REMOVAL: *(NOTE* - Vibration damper can be removed without removing radiator core) Remove fan blade assembly and pull vibration damper with a suitable puller A puller may be fabricated in the shop by threading a 1" x 5" (N C Thread) jack screw into a steel plate ½" thick, with a 13/32" wide slot in each end of plate. Use two screws 3½" long with 2" of 3/8 x 16 U N C 2B-T thread in the slots. Stake a ½" ball bearing in end of jack screw to prevent damage to crankshaft.

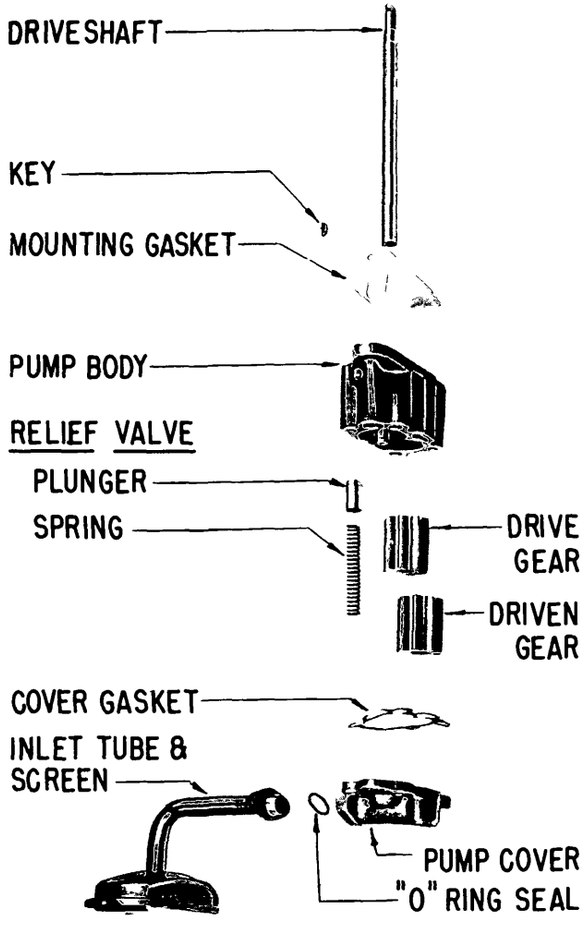
INSTALLATION: To install hub assembly, install large lockwasher with notches on inner edge, cork seal ring rubber seal ring and hub retainer in recess in hub Install hex head lockscrew with helical lockwasher under it, in screw hole in end of crankshaft and tighten screw securely. Rubber block retaining bolt nuts on front face of damper hub are drawn up until shoulders bottom on hub (30-35 ft lbs. torque) *CAUTION* - When installing vibration damper on hub, timing marks must be aligned with hub key-way and on same side.

ENGINE FRONT COVER

ENGINE FRONT COVER: Removal - Remove water pump, fuel pump assembly and vibration damper Remove cover-to-cylinder block screws and remove cover.

Installation - Locate dowels in cylinder block and leave cover screws loose until vibration damper is partially installed. This prevents damage to oil seal and aligns cover properly. Then tighten cover screws and install fuel and water pumps.

CRANKSHAFT FRONT OIL SEAL: Oil seal is installed in timing chain cover at vibration damper hub. To replace seal, remove cover (see above), old seal, and install new seal.

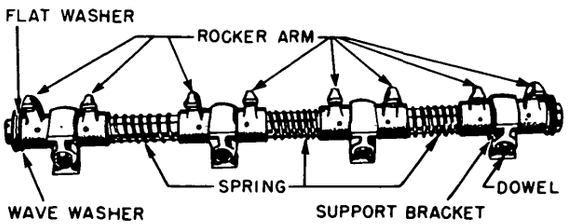


CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove spark plug wires, cylinder head covers, and rocker arm assemblies. Remove intake manifold and carburetor. Remove all pushrods and hydraulic valve lifters *(CAUTION* - Keep these parts in order so they can be installed in same relative positions). Remove fuel pump. Remove vibration dampener and timing chain cover. Remove water pump and cylinder head water distribution manifold. Crank engine until timing marks on chain sprockets line up on vertical line through shaft centers. Remove fuel pump eccentric, remove both sprockets and timing chain as an assembly. Remove camshaft retainer thrust plate and thrust spacer. Carefully withdraw camshaft through front of engine.

VALVE SYSTEM

ROCKER ARM ASSEMBLY: Complete assembly mounted on cylinder head by four long cylinder head retaining capscrews *(CAUTION* - Rear bolt is special hollow type for rocker arm lubrication). Assembly can be removed by taking out the retaining screws.

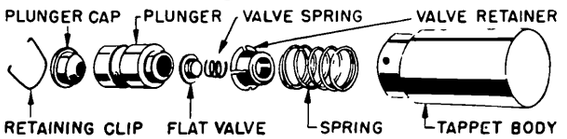


CONTINUED ON NEXT PAGE

OIL PUMP

CONTINUED ON NEXT PAGE

Disassembly & Inspection: Remove snap ring on end of shaft and slide all parts off shaft. Keep all parts in order so they can be reassembled in same relative positions. Clean and inspect all parts for wear. Inspect rocker arm radius at valve stem end for wear and replace worn rocker arms. Make certain that plugs are tight in ends of shaft.



ROCKER ARM ASSEMBLY

R assembly & Installation: Install all parts in same relative positions *(CAUTION* - Rocker arms are "Right" and "Left" and will not contact valve stem properly if interchanged). When installing assembly, make certain that special hollow bolt installed in rear support bracket (necessary for correct rocker arm lubrication).

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTERS: Removal–Remove valve rocker covers and rocker arm shaft mounting bracket bolts and lift off rocker arm assembly. Remove upper valve tappet cover and breather tube and then remove lower tappet cover. Remove pushrods and hydraulic valve lifters keeping pushrods and lifters in sequence so they can be replaced in same relative position.

Disassembly: Press down on valve pushrod socket and use a pair of needle nose pliers to remove the lock ring. Remove pushrod socket, plunger, and plunger spring. Remove check valve assembly from plunger being careful not to lose the small flat valve and coil spring. *(CAUTION–Disassemble one lifter at a time to avoid mixing plungers and bodies. These parts are selectively fitted and must not be interchanged).* Use clean solvent and thoroughly wash all parts. Remove all varnish and gum deposits.

HYDRAULIC VALVE LIFTER ASSY.

Inspection: Inspect the plunger and wall of body for scratches (if plunger or body is scratched, replace complete unit). Try the plunger for fit in body. If check valve removed from plunger, inspect flat disc valve, spring and seat.

R ass mbly: Reverse disassembly procedure. See illustration for correct sequence.

Testing: Fill body with kerosene and install plunger return spring, plunger assembly, and pushrod socket (do not install snap ring). Place lifter between jaws of Checking Tool J-5978 and check leak-down by depressing tool. A decided resistance should be felt. If lifter leaks down rapidly or collapses immediately, it must be rechecked and/or replaced with a complete new lifter assembly. Normal lifter will take 10-45 seconds to leak down with kerosene (.125" travel with 50 lb. load).

Installation: Lifters should be pre-lubricated and assembled in engine without a charge. They will normally charge themselves in 3 to 8 minutes of engine operation.

OILING SYSTEM

OIL PUMP

Removal - Remove oil pan and screws retaining oil pump to rear main bearing cap, remove oil pump.

NOTE - Oil pump is driven by distributor drive shaft so removal of oil pump does not affect ignition timing.

Disassembly - Remove inlet tube and screen assembly from pump cover. Remove cover retaining screws, cover, pump gears, relief valve spring and plunger.

Inspection - Check gear to cover clearance by placing straight edge across pump body with gears in operational cavity. Clearance should not exceed .004". A clearance of .008" maximum should exist between gears and walls of gear cavity opposite point of gear mesh.

Reassembly & Installation - Reverse disassembly procedure. Before installing pump on engine, check for free operation.

MODEL IDENTIFICATION

Mdl	Model Designation
Hudson Hornet	35780
Nash Ambassador	5780

SERIAL NUMBER: Stamped on plate attached to center of dash under hood

Starting Serial No. - V-16501 (Amb. V8), Y-10501 (Hornet V8).

ENGINE NUMBER: Stamped in block at lower right front corner of engine

Starting Engine No. - N-1001 (Amb. & Hornet V8).

TUNE-UP

COMPRESSION PRESSURE: 140 lbs min at cranking speed of 315 RPM, throttle wide open

VACUUM READING: 18-21" at idling speed

VALVE TAPPET CLEARANCE: None in service (hydraulic)

MANIFOLD HEAT CONTROL: Automatic thermostatic type Located between left bank exhaust manifold and exhaust cross-over pipe (exhaust gases diverted through heat passages in manifold when valve closed)

IGNITION

FIRING ORDER: 1–8–4–3–6–5–7–2

Cylinders - RIGHT BANK 2–4–6–8 LEFT BANK 1–3–5–7

SPARK PLUG GAP: 035"

Spark Plug - Auto-Lite AL-7 or Champion H-10 14 mm Torque to 30 ft lbs

COIL: Delco-Remy 1115087.

Resistor - Delco-Remy 1927809. 1.4-1.65 Ohms.

►*COIL RESISTOR NOTE* Connected in series between battery and coil Resistor is by-passed during cranking by solenoid or magnetic starter switch, making direct lead from battery to coil

DISTRIBUTOR: Delco-Remy 1110887. 12 Volt "Window Type" with external adjustment. *See "Delco-Remy Window Distributor in Electrical Section*

Condenser - Delco-Remy 1932004. **Capacity** .18-.23 mfd.

Contact Point Set - Delco-Remy 1931988.

Breaker Gap - 016"

Cam Angle - 28-32° (set to 30°)

►*BREAKER GAP AND CAM ANGLE NOTE* Setting cam angle at 30° will provide 016" breaker gap

Breaker Arm Spring Tension - 19-23 ozs

Rotation - Counter-clockwise viewed from above

Automatic Advance

Degrees	Distr	RPM	Degrees	Eng	RPM
Start		350	0-4		700
7 5 9 5		775	15-19		1550
12-14		1300	24-28		2600
17-19		1900	34-38		3800

Vacuum Spark Control: Delco-Remy 1116117

Vacuum Advance

Distr Degrees	Eng Degrees	Vacuum (" of Hg)
Start	0	5-7
10	20	14 25-15 75

IGNITION TIMING

Setting - 5° BTDC *NOTE* - 10° BTDC optional with Automatic Transmission or where local fuel octane permits

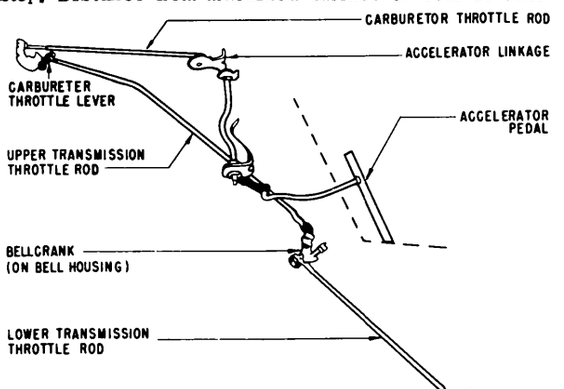
Timing Mark - Timing indicator on front cover and 5° mark on vibration damper

CARBURETOR

CARTER WCFB 2593S, SA

►*VAPOR LOCK OR LOW PRESSURE CORRECTION (Early Cars)* Carburetor-to-fuel tank return tube elbow, Part No 3152259, on some cars prior to Car Serial Number V-18114 (Nash), Y-11786 (Hudson) did not conform to specifications Affected part must have No 65 drill (.034-.036") diameter hole drilled from male end to provide a correct metered opening If hole not drilled through, vapor lock may result If drilled to 3/16", low fuel pressure may result To correct, install new fitting, Part No 3152259, with correct .034-.036" restriction

►*ROUGH ENGINE IDLE* May be caused by air leak in left primary throttle bore *See 'Carter WCFB Carburetors" in Carburetion Section*



►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyl 2–3–5–8, LEFT barrels Cyl 1–4–6–7*

Idle Setting - ¼-1¼ turns open Turn screws out for richer mixture

Idle Speed - 550 RPM (Std & O D), 425 RPM (Auto Trans in Neutral), 475 RPM (Auto Trans & A C "ON")

THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC CARS): Make adjustments in the following order

1) - Disconnect throttle valve rod from throttle valve lever on transmission case, disconnect vent pipe at lower left of case. Hold throttle lever to rear against stop. Distance from machined surface on rear of case

1957 HUDSON & NASH AMBASSADOR THROTTLE LINKAGE

to center of pin on throttle lever should be 5 9/16". Bend lever to correct position.

2) - Measure length of lower throttle valve rod from center of lower hole to outer surface of upper end. Length should be 16 1/8" (plus 0", minus 1/32"). Adjust by bending rod.

3) - Set carburetor throttle at slow idle (closed throttle). Adjust upper throttle rod at carburetor throttle rod bracket so that rod enters hole in bracket freely, then lengthen rod by turning adjusting end one full turn to left, tighten locknut and connect rod.

►*OTHER DATA: See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section*

FUEL PUMP PRESSURE: 4-5½ lbs Max

CARB. EQUIPMENT

Fuel Pump: Fuel and vacuum Carter No M2433SA, Nash No 3152318

Pressure - 4-5½ lbs maximum

See "Fuel Pumps" in Carburetion Section

Gasoline Gauge: Stewart Warner (Hudson) or Auto-Lite (Nash) Electric type

Dash Unit - Hudson No 3119655 (Stewart Warner No 441168) Nash No 3200136 (Auto Lite No 14420A)

Tank Unit - Hudson & Nash No 3146814 (Auto-Lite No 14165A)

See "Fuel Gauges" in Carburetion Section

BATTERY

Auto-Lite 11-HS-60 12 Volt 11 plate 60 ampere hour capacity (20 hour rate)

Battery Ground - Negative

Engine Ground - Transmission case to rear engine crossmember

STARTER

Delco-Remy 1107648 Armature 1926626

Drive - Overrunning clutch (solenoid pinion shift)

Rotation - Counterclockwise at commutator end

Brush Spring Tension - 35 ozs

Performance Data

Torque	RPM	Volts	Amperes
0 ft lbs	6900	10 3	75
10 5 ft lbs	Lock	5 8	435

Starter Switch: Delco Remy No 1119760 solenoid switch, located on starter, actuated by combination ignition and starter switch (Std and Overdrive cars) by Delco Remy No 1996085 Switch operated by raising shift lever upward in "P" or "N" positions (Hydra Matic)

GENERATOR

Delco-Remy 1102018 (Std), 1102070 (Air Cond Cars).

Armature - Delco Remy 1923535 (1102018 Gen) 1932900 (1102070 Gen)

Performance Data

Generator	Amperes	Volts	RPM
1102018	30	14 0	2210
1102070	35	14 0	2510

Rotation - Counterclockwise at commutator end

Brush Spring Tension - 28 ozs

Field Current - 1 48 1 62 amperes (1102018) 1 69 1 79 amperes (1102070) 12 volts at 80°F

Belt Adjustment: ½" deflection with 25 lbs pressure applied midway between fan and generator pulleys

REGULATOR

Delco-Remy 1119003 (1102018 Gen), 1119168 (1102070 Gen) *NOTE - Specifications are "Normal" settings*

Cut-Out Relay

Cuts-In 11 8 13 5 volts

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

C ntact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting - 13.8-14 8 volts (Hot).
Air Gap - .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section.*

Current Regulator

Setting (1119003) - 27-33 amperes (Hot)
Setting (1119168) - 32-37 amperes (Hot)
Air Gap - 075" with armature pressed down to point where contacts just touch.
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

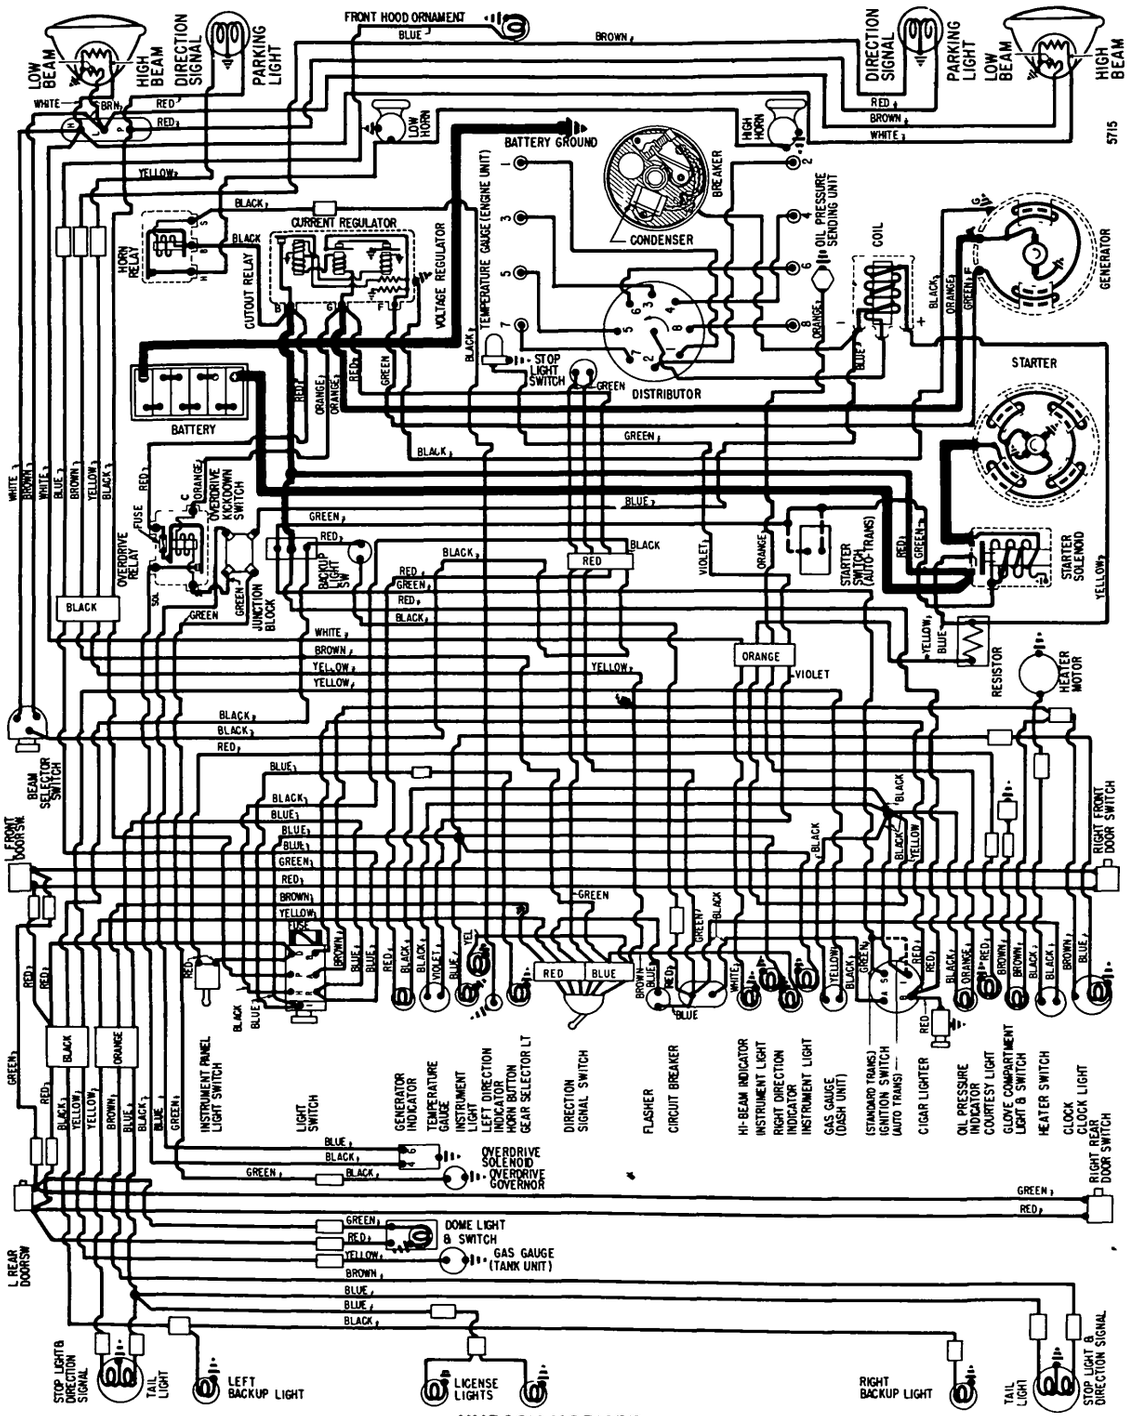
Headlamps: Hudson - Sealed Beam.
Nash - 4-Headlight System Std. *See "4-Headlights" in Electrical Section.*
Directional Signals: *See Electrical Section.*
Light Switch Removal: Disconnect battery. With switch in "OFF" position, press release on top of light switch assembly, and pull knob and shaft clear of switch. Remove slotted nut, pull switch out to rear of instrument panel.
Stop Light Switch: Located in tee fitting in line to left front brake.
FUSES: Dome, Map, Glove Box Lights - 7 5 amperes. On back of light switch.
Overdrive - 15 amperes. On overdrive relay under hood.
CIRCUIT BREAKERS: Headlights (Hudson) 12 amperes, (Nash) 18 amperes. In Light Switch.
Park, Tail, License, & Instrument Lights - 12 amperes. In Light Switch.
Stop & Directional Lights - 30 ampere. Auxiliary Circuit Breaker on dash behind instrument panel.
Horn Relay: Nash No. 3145684.

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Section.*

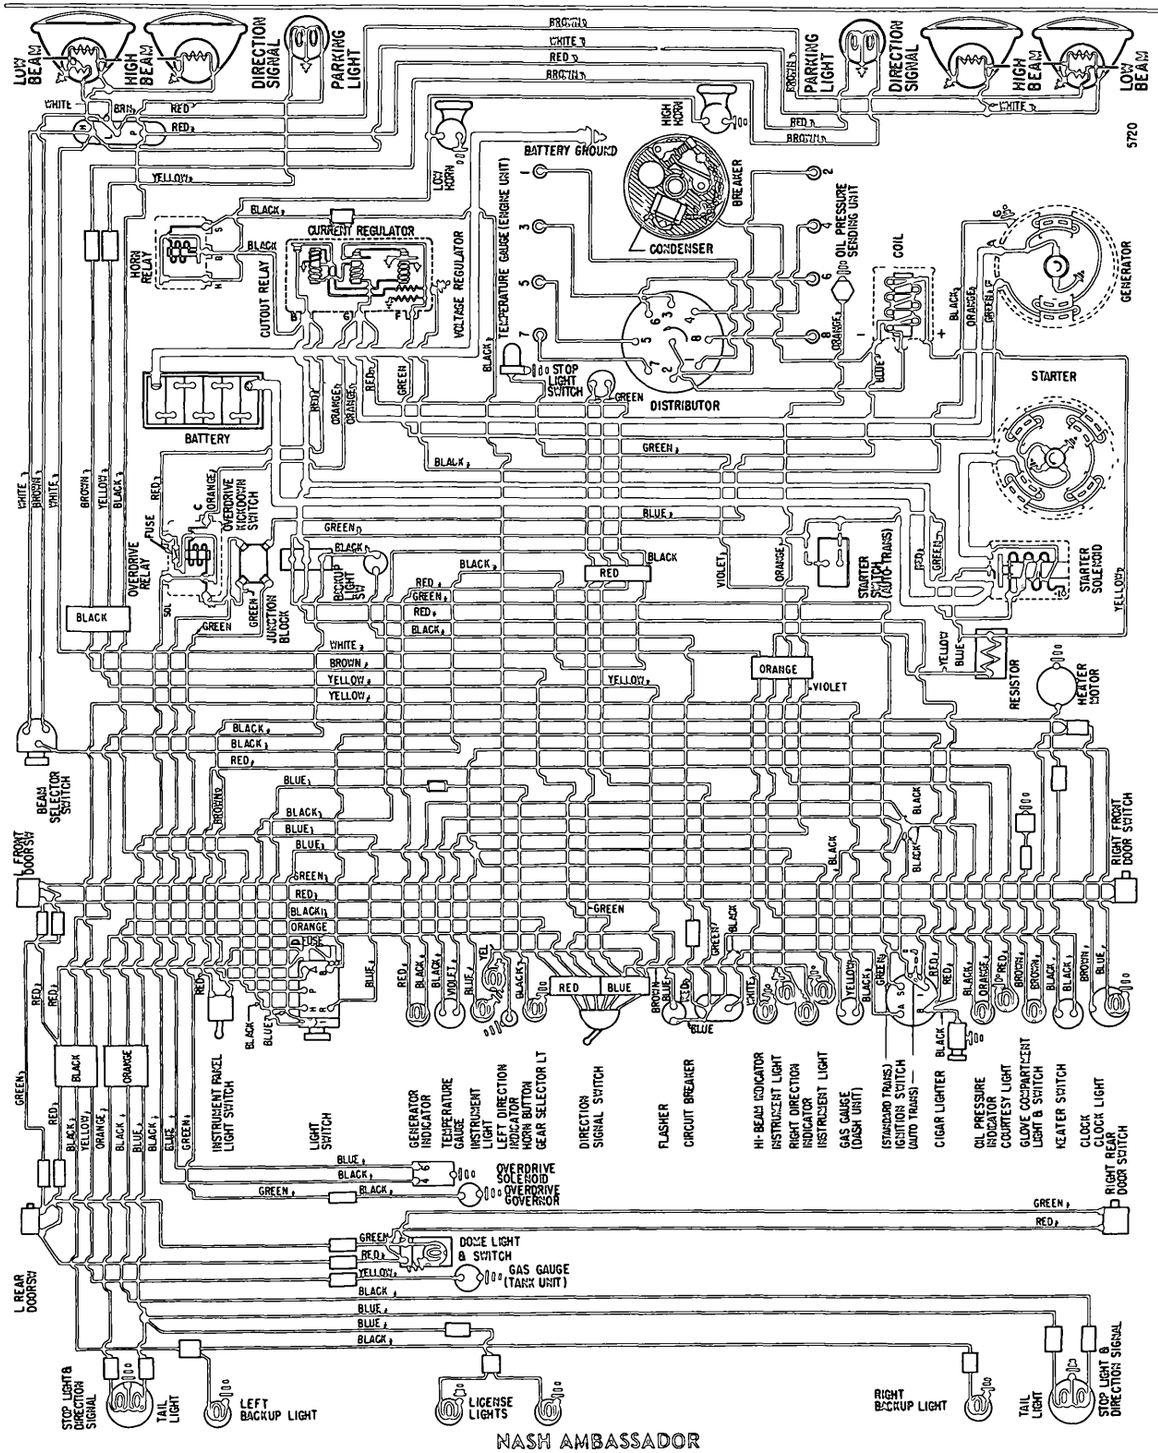
► *1957 EXHAUST RUMBLE CORRECTION:* On cars prior to Serial No. Y-11460 (Hudson), V-17650 (Nash), reversed front tail pipe supports may cause an exhaust rumble. Correct by installing both supports with fabric side toward **front** of car.

ENGINE SPECIFICATIONS: Own V8. Valve in head.



Bore	Stroke	Displacement
4"	3¼"	327 Cu. Ins.
Compression Ratio	**Rated HP**	**Developed HP**
9 00-1	51 2	255 at 4700 RPM

Compression & Vacuum Reading - *See TUNE-UP.*



CYLINDER HEAD INSTALLATION: *S "Cylinder Head & Manifolds" in Nash Special Data.*

TIGHTENING TORQUES: *See "Tightening Specificati ns" in Nash Sp cial Data.*

HUDSON HORNET

NASH AMBASSADOR

CONTINUED FROM PRECEDING PAGE

PISTONS

Aluminum alloy, slipper type, tapered skirt, cam ground with steel reinforcement. Piston pin offset toward thrust side of piston.

Weight - 23 45 ozs.

Removal - Piston and rods removed from above.

Clearance . 0009- 0025" (Skirt Top), 0009- 0015" (Skirt Bottom)

Replacement of Pistons: Std., .002", .005", .010", .020", .030", .040" Oversize.

Installing Pistons: Install with "F" cast in piston strut and notch in piston head toward front of engine.

PISTON PINS

Press fit in connecting rod. No locking device.

Diameter - 9307". Length - 3 1870"

Pin Fit in Piston – Palm press fit at room temperature.

Pin Removal & Installation – *See "Piston Pins" in Nash Special Data.*

Replacement Pins: Std., .003", .005" Oversize.

PISTON RINGS

Three rings (two compression & one oil) used. Upper ring is chrome plated. Oil control ring is three piece type (two oil control wiper rails with a segmented steel spacer between them).

Ring	Width	End Gap	Side Clearance
Compr. #1	.0778"	010- 020"	002 - 006"
Compr #2	0778"	010- 020"	002 006"
Oil #3	0245"	015- 055"	0001- 0079"

Replacement Rings: Sets of Std., 020" & 030" oversize.

Installing Rings: Stepped inner edges of both compression rings must be up.

CONNECTING RODS

Crankpin Journal Diameter – 2.2483-2.2490".

Length - 6 3750" center-to-center Weight - 27 6 ozs

Lower Bearing – Precision, steel-backed, babbitt.

Clearance – .0007-.0028". Side Clearance –.004-.012"

Replacement Bearings: Std., .001", .002", .010", .012" Undersize

Installing Rods: Assemble connecting rod with notch in piston and connecting rod identification mark to front of engine. Cylinder numbers on connecting rod should be toward outside of bank in which they are installed.

CRANKSHAFT

Journal Diameter – 2.4983" - 2.4990". Five bearings.

Bearings – Precision, steel-backed, babbitt.

Clearance – .0006"-.0032".

Replacement Bearings: Std., .001", .002", .010", .012" Undersize.

End Thrust: Taken by No. 1 flanged bearing.

Endplay – .003-.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Nash Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Nash Special Data.*

VIBRATION DAMPER REMOVAL & INSTALLATION: *See "Vibration Damper" in Nash Special Data*

CAMSHAFT

▷ *1957 CAMSHAFT REPLACEMENT CAUTION:* Camshafts designed for use with mechanical lifters not

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

interchangeable with those designed for hydraulic lifters. Mechanical lifter shafts identified by white paint on area ahead of oil pump and distributor drive gear. Hydraulic lifter shafts have no identifying marks.

Bearings - Five, steel-backed, babbitt lined bushings pressed in block and line reamed.

Clearance - .001-.003".

End Thrust: Taken by thrust plate behind camshaft sprocket.

End Play - .003-.006".

Timing Chain: Morse non-adjustable type. **Width** .875", **Pitch** .375", **Length** 23¼" or 62 links.

Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers. To check assembly, rotate crankshaft until timing mark on camshaft sprocket is on horizontal line at either 3 or 9 o'clock position. There should be 10 links or 20 pins between timing marks.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Nash Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Nash Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Nash Special Data.*

VALVES

Tappet Clearance – None in service (Hydraulic).

Valve	Head Diameter	Stem Diameter
Intake	1.787"	.3412-.3417"
Exhaust	1.406"	.3407-.3412"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30° ①	.375"	.0013-.0028"
Exhaust	45° ②	.375"	.0018-.0033"

Valve Seat Width – .078-.093" (Intake), .093-.104" (Exhaust).

Valve Stem Seals – Rubber deflector installed on valve stem and over top of guide on all valves.

Valve Springs: Install springs with closed coil end against cylinder head. **Free Length** - 2.20".

Valve Spring Specifications

Valves	Spring Pressure	Spring Length
Closed	85 - 91 lbs.	1 13/16"
Open	150 -160 lbs.	1 7/16"

Valve Guides: Drive old guides out, drive new guides in to height of ¾" ± 1/64" above cylinder head (measure from top of guide to flat machined surface of lower spring retainer on head). Ream all guides to I.D. of .3430-.3440" after installation.

Valve Lifters: Hydraulic type.

Hydraulic Valve Lifter Removal, Overhaul & Testing – *See "Valve System" in Nash Special Data.*

Rocker Arm Assembly: *See "Valve System" in Nash Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves–Open 12°30' BTDC. Close 51°30' ALDC.

Exhaust Valves– Open 53°30' BLDC. Close 10°30' ATDC.

Valve Timing Check: Remove valve compartment cover and spark plugs. Crank engine until #6 piston in right bank is on TDC of compression stroke (#1 piston will be on TDC of exhaust stroke in overlap position). Rotate crankshaft 90° counter-clockwise. Install dial indicator on #1 intake rocker arm pushrod end. Crank engine in a clockwise direction until dial indicator dicates pushrod movement, (hydraulic lifter should be fully charged for this check). At time indicator moves, ignition timing pointer on front cover should align with a point approximately 25/32" before TDC position on vibration damper. *NOTE* – If more than ½" variance in either direction, remove timing chain cover and inspect installation. Replace if deflection exceeds 1/2".

OILING SYSTEM

Crankcase Capacity: 5 qts. refill, 1 qt. addt'l with filter change.

Normal Oil Pressure: 10 lbs. minimum at 600 RPM.

Pressure Regulator - In oil pump. Opens at 55-60 lbs. Not adjustable.

Oil Pressure Indicator: Light on instrument panel goes on when ignition switch is turned on, goes out as oil pressure reaches pressure of gauge. Sending unit Nash No. 3142826 (6½ lbs.) or No. 3200422 (4 lbs.), located on left rear side of engine block.

Oil Pump: Gear type. Mounted on rear main bearing cap and driven by distributor drive shaft. *NOTE* - Removal of oil pump does not disturb ignition timing.

Oil Pump Removal, Overhaul & Installation - *See "Oiling System" in Nash Special Data.*

Oil Filter: Partial Flow type. Replace element every 4000 miles or sooner as needed.

Replacement Filter Element - Nash No. 8990346, or No. 8990050.

Crankcase Ventilation: Filter element in oil filler cap (air inlet) and outlet pipe in valve tappet cover.

COOLING

Water Capacity: 19 quarts, add 1 quart for heater.

Pressure Valve: Radiator filler cap. 7 lbs. (Std.) 13 lbs. (Air Cond.).

Thermostat: Choke type. Nash No. 3132708 (150°), No. 3131817 (167°-173°). *NOTE* - No. 3131985 (177°-182°) for use with permanent anti-freeze only.

Water Pump: Centrifugal, double row ball bearing type. Requires no lubrication. Serviced as an assembly. *See "Nash & Hudson V8" in Water Pump Section.*

Temperature Gauge: Stewart Warner (Hudson) or Auto-Lite (Nash). Electric type.

Dash Unit - Hudson No. 3119681, Nash No. 3119504 (Auto-Lite No. 14158A).

Engine Unit - Hudson & Nash, No. 3144585 (Auto-Lite No. 13550A).

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 10.5A6. Assy. No. 361442 (Std.), No. 361449 (Heavy Duty). Single plate.

See "Borg & Beck" in Clutch Section.

Clutch Disc No. - Borg & Beck No. 382574. Nash No. 3150449.

Pedal Adjustment: Pedal free travel ½-¾". Adjust by loosening locknut and turning adjusting nut on control link at clutch fork. *CAUTION - The pedal to beam rod should never be disturbed in service.* With pedal against floor board, outer end of beam lever should project 5/16" forward of the rear edge of beam bracket to provide proper leverage.

Removal: Remove transmission (see below), disconnect clutch pedal linkage, remove clutch housing and pan. Punch mark flywheel clutch cover and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange.

SYNCHRO-MESH TRANSMISSION

Warner. Three speed, helical gear type.

See "Warner Transmissions" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect hydraulic brake tube bracket on underside of body, torque tube at rear of transmission, hand brake cable and housing, speedometer cable, and shifter rods. Disconnect overdrive control cable and electrical control wires from solenoid and governor where so equipped. Move rear axle to rear to separate universal joint. Remove two upper transmission-to-bell housing bolts and install special guide pins (Tool J-1434) in their place. Remove lower bolts, slide transmission out.

OVERDRIVE

Warner R10. *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

HYDRA-MATIC DRIVE

"Flashaway" Hydra-Matic. New four speed, hydraulically controlled transmission with two fluid couplings. *See "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

Lubrication – Check fluid every 1,000 miles. Drain and refill every 25,000 miles (remove oil pan and clean oil screen). Use Automatic Transmission Fluid type "A" ("AQ-ATF").

Checking Fluid Level – Bring transmission to normal operating temperature. Idle engine to 425 RPM, with selector lever in "P" (Park) position, with car on level floor. Remove fluid level indicator, wipe clean, reinsert it, then remove it again and note reading.

Throttle Linkage Adjustment: *See CARBURETOR above.*

► *OTHER HYDRA-MATIC SERVICE DATA: See "Dual-Coupling Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Detroit or Mechanics. One universal used at front end of propeller shaft.

REAR AXLE

Spicer. Semifloating, hypoid gear with torque tube drive. *See "Spicer Hypoid" in Rear Axle Section.*

CONTINUED ON NEXT PAGE

Axle Ratios - Std. & Overdrive 4 1-1 (10-41), **Hydra-Matic** 3 2-1 (13-41)
Backlash – .002-.006".

Axle Shaft Removal: Remove wheel, pull drum (use Hub Puller J-1644). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims (check thickness of shims, and replace same amount when reassembling). Withdraw shaft using Puller J-2498; do not drag on inner seal.

Rear Axle Assembly Removal: Raise and support rear end of car. Disconnect rear brake cables at center equalizer. Disconnect torque tube at rear of transmission. Disconnect brake hose and shock absorbers at axle end (let hang from body). Roll axle free.

Wheel Bearing Adjustment: Shims behind brake backing plate. *NOTE* – Adjust axle shaft end play on **Right Hand Side Only.**

Rear Suspension: *See "Nash" in Suspensions & Wheel Alignment Section.*

SHOCK ABSORBERS

Manufacturer. Direct acting type. Service by replacement.
Front - Nash No. 3200285. **Rear** - Nash No. 3119751.

FRONT SUSPENSION

Independent. With coil springs located between upper ends of steering knuckle pin and seat in outer wheelhouse panel.
See "Nash" in Suspensions & Wheel Alignment Section.
King Pin Inclination – 3°36' (Hudson), 6½° (Nash).
Caster – (Std.) ½° Pos. desired. Limits 0-½° Pos. **(Power Steering)** 1° desired. Limits ½° - 1° Pos.
Camber – 0° desired. Limits ¼° Neg. to ¼° Pos.
Toe-In – 1/16" to 3/16". *CAUTION* – When adjusting toe-in on Power Steering Cars, operate engine so that pump will supply oil pressure to center spool in power cylinder valve.
Toe-Out on Turns - (Std.) Outer wheel 20¼°, inner wheel 25° **(Power Steering)** Outer wheel 21¾°, inner wheel 25°

STEERING

Manual: Gemmer Model 305. Worm & Roller with "push-pull" adjustment.
See "Gemmer Steering Gears" in Steering Section.
Power Steering: Monroe Power Guide. Linkage type.
See "Monroe Power Guide" in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*
Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix Hydraulic, Single Anchor. Hand lever applies rear wheel service brakes.
See "Bendix Hydraulic, Single Anchor" in Brake Sect.
Drums – Diameter 10". (Front and Rear).
Wheel Cylinder Diameter – 1 1/8"(Front), 7/8" (Rear).
Replacement Lining & Shoes: Linings and shoes with linings furnished standard size only.

Lining Width & Length

	Front Wheel	Rear Wheel
Primary Shoes	2" x 8 7/8"	1¾" x 8 7/16"
Secondary Shoes	2½" x 10 31/32"	1¾" x 10 25/32"

Clearance – .015" heel and toe of secondary shoe with primary shoe out against drum, or adjusting screw backed off 14 notches from point where wheel can just be turned by hand.
Standard Master Cylinder: Mounted on support under floor pan.
Checking Fluid – Roll back floor mat, remove access cover. Maintain fluid level ½ - 1" below top of filler opening.
Removal – Remove from below without disturbing other units.
Power Brakes: Bendix Power Unit, Hydraulic Reaction Type. Replaces standard master cylinder.
See "Bendix Power Unit" in Brake Section.
Checking Fluid -Same as for standard master cylinder.
Removal - Same as for standard master cylinder.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit.
See "Nash-Hudson Air Conditioning" in Misc. Sect.

Window Regulators: Electric with reversible motor. *See "Nash Window Regulators" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs
Cylinder Head	60-70
Intake Manifold (Bolts & Nuts)	25-35
Exhaust Manifold (Bolts & Nuts)	19-25
Oil Pan	9-11
Main Bearing Caps (except Rear)	100
Main Bearing Caps (Rear)	140
Flywheel	85-95
Crankshaft Pulley	100
Con Rod Caps	45-50
Camshaft Sprocket & Pump Eccentric	15-20
Rocker Arm Support Brackets	14-17
Engine Front Cover (3 8" & 7/16" Bolts)	30-35
Oil Pump Mounting	10-15
Oil Filter to Cylinder Block	30-35
Oil Filter to Housing Base	40-45
Flywheel Lower Housing	50-55
Transmission Mounting	60-70

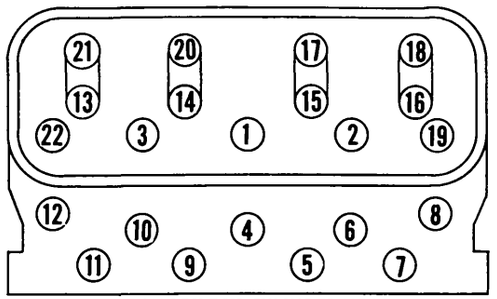
OIL PAN

OIL PAN REMOVAL: Remove starter and exhaust cross-over pipe Disconnect idler arm from frame and drop steering relay rod Remove oil pan cap-screws and withdraw pan.

Installation. Cement new cork gaskets to pan, assemble front and rear synthetic seals to pan Place coat of graphite grease on exposed surface of seals to insure that seal maintain their proper position in pan and do not nang up on front cover and main bearing sealing surfaces during oil pan installation

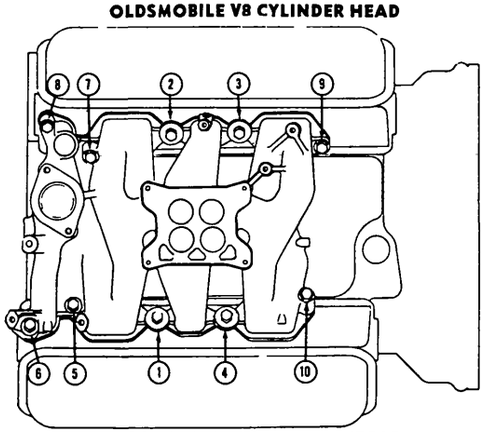
CYLINDER HEAD & MANIFOLD

CYLINDER HEAD REMOVAL: Drain radiator and cylinder block Remove intake manifold and generator, disconnect exhaust pipes Remove valve cover and rocker arm shaft assembly Rock rods to break oil seal between rod and lifter seat to avoid pulling lifter from bore, remove pushrods, then remove remaining cylinder head bolts Remove cylinder head with exhaust manifold attached



CYLINDER HEAD INSTALLATION: Rocker shaft bracket bolts (Nos 13, 14, 15, 16 in illustration) should be tightened in sequence and as part of cylinder head installation as follows With head in place and all bolts finger-tight, tighten all cylinder head attaching bolts (excluding 13, 14, 15, 16) to 50-60 ft lbs and tighten rocker shaft bracket attaching bolts (Nos 13, 14, 15, 16) to 14-17 ft lbs in sequence shown in head diagram Then retighten all cylinder head attaching bolts (excluding 13, 14, 15, 16) to 60-70 ft lbs in sequence shown

Intake Manifold Installation - After head installed, install manifold with new graphite coated metal gaskets and apply Permatex No 3 or equivalent sealer around gasket water holes Dip threads of intake manifold in C P No 9 sealer, tighten bolts to 25-35 ft lbs torque in sequence shown in diagram



CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL: Asbestos covered wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove)

Oil Seal Installation - With crankshaft out of engine and bearing cap off use new seal coated with graphite grease, crowd seal by hand into rear groove in

OLDSMOBILE V8 CYLINDER HEAD

OLDSMOBILE INTAKE MANIFOLD

cap and block Drive seal tightly into place by tapping Tool 23-14 with a hammer With tool resting on seal cut ends flush with parting line between upper and lower bearing Ends of seal must be cut clean so no frayed ends will be clamped between block and cap Seal must entirely fill groove

ENGINE FRONT COVER

ENGINE FRONT COVER (Removal) · Disconnect lower radiator hose and heater hose from front cover and disconnect generator link at generator Remove oil pan and remove the two bolts attaching front engine mount to frame Support engine with Special Tool BT-29 (engine must clear front cross member) Remove radiator assembly, fan blades and pulley and crankshaft pulley Remove fuel and vacuum pump assembly Remove front cover attaching bolts and front cover Reverse removal sequence to install cover, using a new gasket coated on one side with gasket cement Lubricate sealing surface of front oil seal and fuel pump operating arm Dip attaching cover bolts in POB No 3 sealer

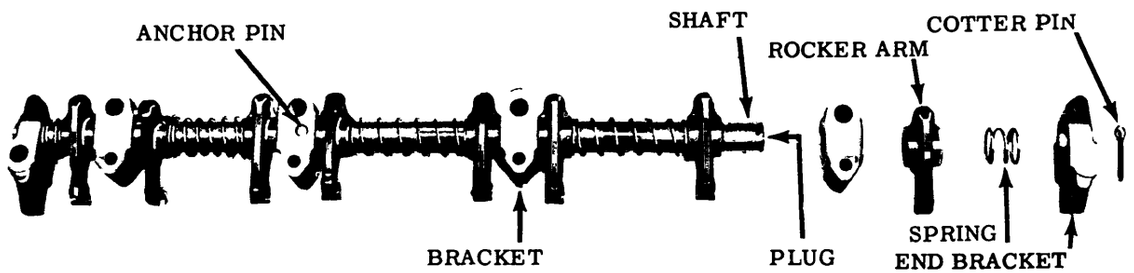
Engine Front Cover Oil Seal (Crankshaft Front Oil Seal) Replacement. *(NOTE—Front cover oil seal can be replaced without removing front cover by using Tool J-4176)* Remove crankshaft pulley and replace large capscrew in crankshaft end Place fingers of Tool J-4176 over end of crankshaft and turn tool fingers so that hooks will pass through clearance between crankshaft end and inner diameter of front oil seal, (some light taps on tool center screw will force fingers behind rubber ring of oil seal) Use an end wrench on fixed nuts below puller plate and rotate each finger outward 90° to engage the finger hooks with ring of oil seal, then tighten nuts on upper plate for puller to hold fingers in position Rotate puller center screw against crankshaft screw and remove seal

Installation—Use Tool J-4177 to replace seal in cover by first placing seal in cover and then assembling adapter ring and driver so slot in driver will clear crankshaft key Drive seal into place until adapter bottoms on cover face

VALVE SYSTEM

ROCKER ARMS

ROCKER ARM SHAFT ASSEMBLIES: Identical hollow steel shafts used (end plugged). Six brackets used on each shaft as follows One type used for RH Front or LH Rear, one type for LH Front or RH Rear, one type for pin hole, and one type for all other positions. Drive pin is flush with top of bracket Rocker arms are all one type.



Disassembly: Remove cotter pins from ends of shafts and remove brackets, springs, and arms. *NOTE* - If necessary to remove bracket that is pinned to shaft, drill hole in shaft end plug and pry plug out. Use drift in hollow shaft to drive out pin. Drive replacement plug in end of shaft until it seats against shoulder in shaft or approximately 9/16" in from end of shaft.

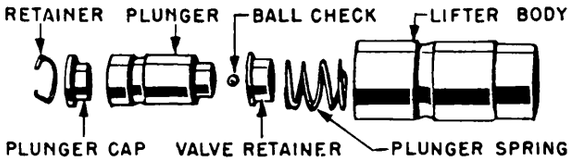
Reassembly: Reverse disassembly and follow diagram for position of each type of bracket in respect to cylinder head bolt holes and sequence of assembly.

HYDRAULIC LIFTERS

VALVE LIFTERS. Hydraulic, Barrel Type Consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet body (See

CONTINUED ON NEXT PAGE

OLDSMOBILE ROCKER ARM ASSEMBLY



CONTINUED FROM PRECEDING PAGE

illustration). Oil is introduced to this unit from main oil gallery through hole in side of lifter plunger and body

Removal: Remove intake manifold, cylinder block cover, valve covers, rocker arm shaft assemblies, push rods and valve lifters

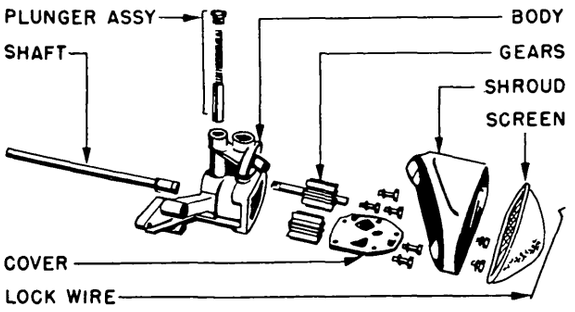
►*CAUTION*—Valve lifters must be installed in same bores from which they were removed

Disassembly: Remove plunger retainer with Lock Spring Tool BT-31. Remove push rod seat, plunger, ball check valve, ball retainer and spring. If plunger is stuck tight, allow lifter to soak in "D-Carb" solvent for approximately five minutes. Tool 23-16 may be used if plunger does not fall out.

OLDSMOBILE HYDRAULIC VALVE LIFTER

Cleaning & Inspection: Wash all parts in a suitable cargon solvent and remove all trace of carbon and varnish Inspect plunger and lifter body for scoring or other damage that would prevent free movement Inspect lower end of lifter body for nicks or indentations If any exist, replace complete lifter assembly Dry lifter parts with air, then install plunger in lifter body without other parts and check for free movement Plunger should drop of own weight into body bore

Reassembly: *(NOTE—Body and plunger are selectively fit and must not be interchanged, or replaced individually).* Place plunger over push rod seat and then turn plunger over holding push rod seat in place, and install ball on its seat in plunger Place ball check valve retainer over ball and then place valve retainer spring over retainer Carefully assemble valve lifter body over complete assembly Turn assembly over and while holding push rod seat down, install retaining lock spring, using Tool BT-31



Identification Note—It is important when replacing lifters that the correct oversize lifter be used An identification number is etched on all lifter bodies except standard Lifters are furnished in Std., size and the following oversizes .001", .002", .003", .005". The cylinder block is marked 1, 2, 3, or 5 for lifter size on rail under engine top cover

OILING SYSTEM

OIL PUMP

OIL PUMP: Removal & Disassembly—Remove oil pan, then remove pump Remove oil screen lock wire and screen, and oil screen shroud Remove extension shaft and coupling by removing lower snap ring from coupling Remove oil pump cover, oil pump gears and pressure regulator nut, spring and valve

Reassembly & Installation: Reverse removal & disassembly procedures outlined above

OLDSMOBILE OIL PUMP

COOLING

►*LOSS OF COOLANT & HEATING CORRECTIONS:* When check of thermostat, water pump and hoses, Ranco valve, does not reveal cause for poor heater operation, loss of coolant or for engine overheating, look for restrictions (core flashing) in engine front cover at the following locations:

1) When heater operation is unsatisfactory, remove heater hose from cover connection and look for restriction at cover connection, and if found remove with long bladed screwdriver.

2) Loss of coolant and overheating can be caused by similar restriction in cover where water from pump passes into right cylinder block. This type restriction will cause water to back up in radiator upper tank when engine is decelerated quickly. Remove restriction as described in item #1.

NOTE - When restriction is too heavy to break out, replace engine front cover.

PROPELLER SHAFT NOTES

►*DRIVE LINE VIBRATION CORRECTION (Saginaw Universal Joint):* To correct this vibration, check for condition and position of bearing retaining straps, which hold bearing during shipment and which fit into groove in companion flange when universal joint is assembled. Broken or damaged straps should be removed completely. File strap flush with end of companion flange groove should it extend beyond groove. *NOTE* - New specification for drive shaft "U" bolt torque is 14-18 ft. lbs.

PROPELLER SHAFT: Shaft assembly consists of two sections, a center bearing support, and three universal joints. The rear propeller shaft or center support can be removed independently of the front shaft. Whenever it is necessary to remove the front shaft, the complete shaft assembly must be removed.

►*CAUTION:* When removing center bearing support, scribe a line from center of support to frame member attaching bolts on frame member to facilitate lateral alignment on reassembly. Keep shims grouped so they can be reinstalled in same location.

PROPELLER SHAFT ALIGNMENT: Shaft aligned vertically and laterally as follows:

Vertical Alignment: Position Aligning Gauge 6514 against right side flange of transmission oil pan (Hydra-Matic), or right side of engine oil pan (Synchro-mesh) so the contact surfaces of gauge seat squarely against pan with level adjusting screw toward front of car. Adjust leveling bubble until bubble is centered in gauge level. Position gauge against front propeller shaft so contact surfaces of gauge seat squarely against bottom side of propeller shaft with level adjusting screw toward front of car. If bubble is not within 1/16" from center of level, it will be necessary to align the front propeller shaft as follows: Scribe a line from center of support to frame member attaching bolts on frame member to facilitate lateral alignment on reassembly. Add or subtract shims between frame member and support as required (see "Shim Part Numbers" below) until bubble in gauge level is centered (or within 1/16" from center of level).

Shim Part Numbers		
Size	Convertibles	Other Models
.060"	570380	570378
.120"	570053	570052
.180"	570381	570379

►*NOTE: A .060" shim will change level bubble approximately one graduation of level.*

Lateral Alignment: Attach three plumb lines using string 18" to 24" long to underside of car in such a position that the strings touch side of propeller shaft. Position one string at front of front propeller shaft, between front weld and balance weights. Put second string at rear of front shaft ahead of center bearing, between the end weld and balance weights, and the third plumb line at rear of rear shaft in a similar position. Sight along the three plumb lines. If center line does not line up with front and rear strings, loosen support-to-frame member bolts and slide center bearing assembly laterally in the elongated holes until alignment is obtained. Tighten bolts to 45-55 ft. lbs.

CENTER BEARING OVERHAUL: Disassembly - Pry crimped area of slip yoke nut retainer away from nut, unscrew nut, pull propeller shafts apart and remove nut retainer and rear slinger. Remove center bearing support assembly with Puller TR-278-R and Adapter TR-278-R-2. Remove bearing retainer-to-mounting plate bolts and separate parts

Reassembly - Assemble center bearing support assembly. Apply a bead of No. 4 cup grease around dished area of front slinger and Permatex #2 between bearing retainer and mounting plate. *(NOTE* - High side of mounting plate must be on right side and bearing retainer must face rearward on car) Place bearing assembly over front shaft, install and tighten slip yoke nut to force assembly into place. Remove slip yoke nut. Apply 1 oz. special lubricant (Part No. 571035) to splines of propeller shaft Place rear slinger against center bearing on front shaft and nut retainer on front shaft with tang in slot and cupped side rearward. Align slip yoke index clip with wide serration in front shaft and install yoke. Tighten slip yoke, crimp nut retainer against nut. Align propeller shaft assembly (see above)

MODEL IDENTIFICATION

SERIAL NUMBERS: On left body pillar post.
Starting Serial Number - 1001.

► *SERIAL NUMBER NOTE: Complete serial number (example 577M 1001) includes following identification data in sequence:*

Year	Series ①	Assy. Plant ②	Serial No.
57	7	M	1001

① - Series Designation: 7 - (88 Series).8 - (Super 88 Series) 9 - (98 Series).
② - See Assembly Plant Designation following.

Assembly Plant Designation

M - Lansing	**L** - Linden
A - Atlanta	**C** - South Gate
B - Framingham	**W** - Wilmington
K - Kansas City	**T** - Arlington

ENGINE NUMBER: Stamped on machined pad located on top of left hand cylinder bank of block between the center and rear exhaust manifold ports.
Starting Engine Number - A001001. *NOTE* - Export engines are identified by an "E" after the serial number.

TUNE-UP

COMPRESSION PRESSURE: 100 lbs. minimum at cranking speed. Reading on low cylinders should not be less than 80% of high cylinder.

VALVE TAPPET CLEARANCE: None in service (hydraulic lifters).

MANIFOLD HEAT CONTROL: Thermostatic coil type located on left side between exhaust manifold and exhaust pipe. Install with inner end of coil pointing toward spring pin.

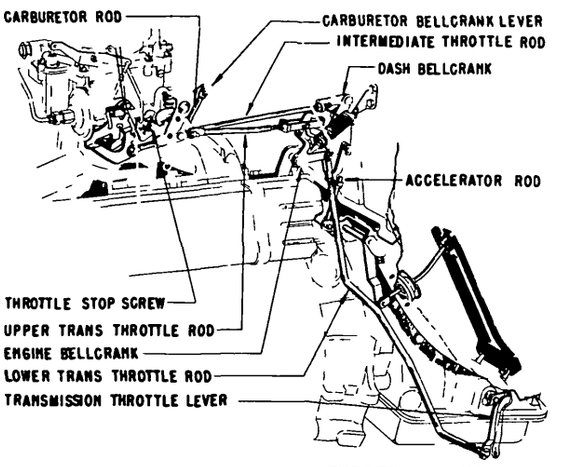
IGNITION

FIRING ORDER: 1–8–7–3–6–5–4–2.
Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .030".
Spark Plugs - AC No. 44. 14mm. Torque to 23-28 ft. lbs

COIL: Delco-Remy 1115087.
Ignition Current - 2.0 amps. idling, 4.5 stopped.
Resistor - Delco-Remy 1928016. 1 40-1 62 ohms.

► *COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch-to-coil. This resistor is by-passed during cranking by a lead from starter solenoid-to-coil.*



DISTRIBUTOR: Delco-Remy 1110883. "Window" type with external adjustments. *See "Delco-Remy (Window Type) Distributor" in Electrical Section*

► *CONTACT POINT REPLACEMENT CAUTION:* Mounting plate is slotted (old points can be removed by loosening screws and turning plate out) When installing new point set, center hole in mounting plate over dowel in distributor plate when tightening screws.

Condenser - Delco-Remy 1932004. **Capacity** .18-.23 mfd
Contact Point Set - Delco-Remy 1931988.
Breaker Gap - .016"
Cam Angle - 28-32° (set at 30°).

► *BREAKER GAP & CAM ANGLE NOTE.* Setting cam angle at 30° will provide 016" breaker gap.

Br ak r Arm Spring Tensi n - 19-23 ozs.
Rotation - Counter-clockwise viewed from above.

HYDRA-MATIC TRANSMISSION THROTTLE LINKAGE

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		400	0-4		800
6.5-8.5		975	13-17		1950
8-10		1200	16-20		2400
11-13		2200	22-26		4400

Vacuum Spark Control: Delco-Remy 1116096
Plunger Travel - 7/32-15/64".

Vacuum Advance

Distr Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	4 5-6 5
10	20	15 25-16 0

IGNITION TIMING

Setting - 5° BTDC, with engine idling at 850 RPM and vacuum line to distributor disconnected and carburetor opening taped closed

► *DETONATION NOTE: If engine detonates (due to low octane fuel or carbon build-up) set timing to 2½° BTDC For high altitude operation, timing can be adjusted to 7½° BTDC, if detonation does not occur.*

Timing Mark (Early Cars) - Slot in rim of crankshaft balancer and pointer on front cover. Leading edge of slot is 5° BTDC. Trailing edge is TDC Midway between these points is 2½° BTDC

Timing Mark (Later Cars) - Three slots in rim of crankshaft balancer and pointer on front cover Center slot is 5° BTDC Facing rear of car, left hand slot is TDC. Right hand slot is 10° BTDC

CARBURETOR

► *CARBURETOR APPLICATION: Rochester 4GC 4-Barrel Std. on all Series, Rochester 2GC Triple Two-barrel Compound Installation Optl on J-2 Engines*

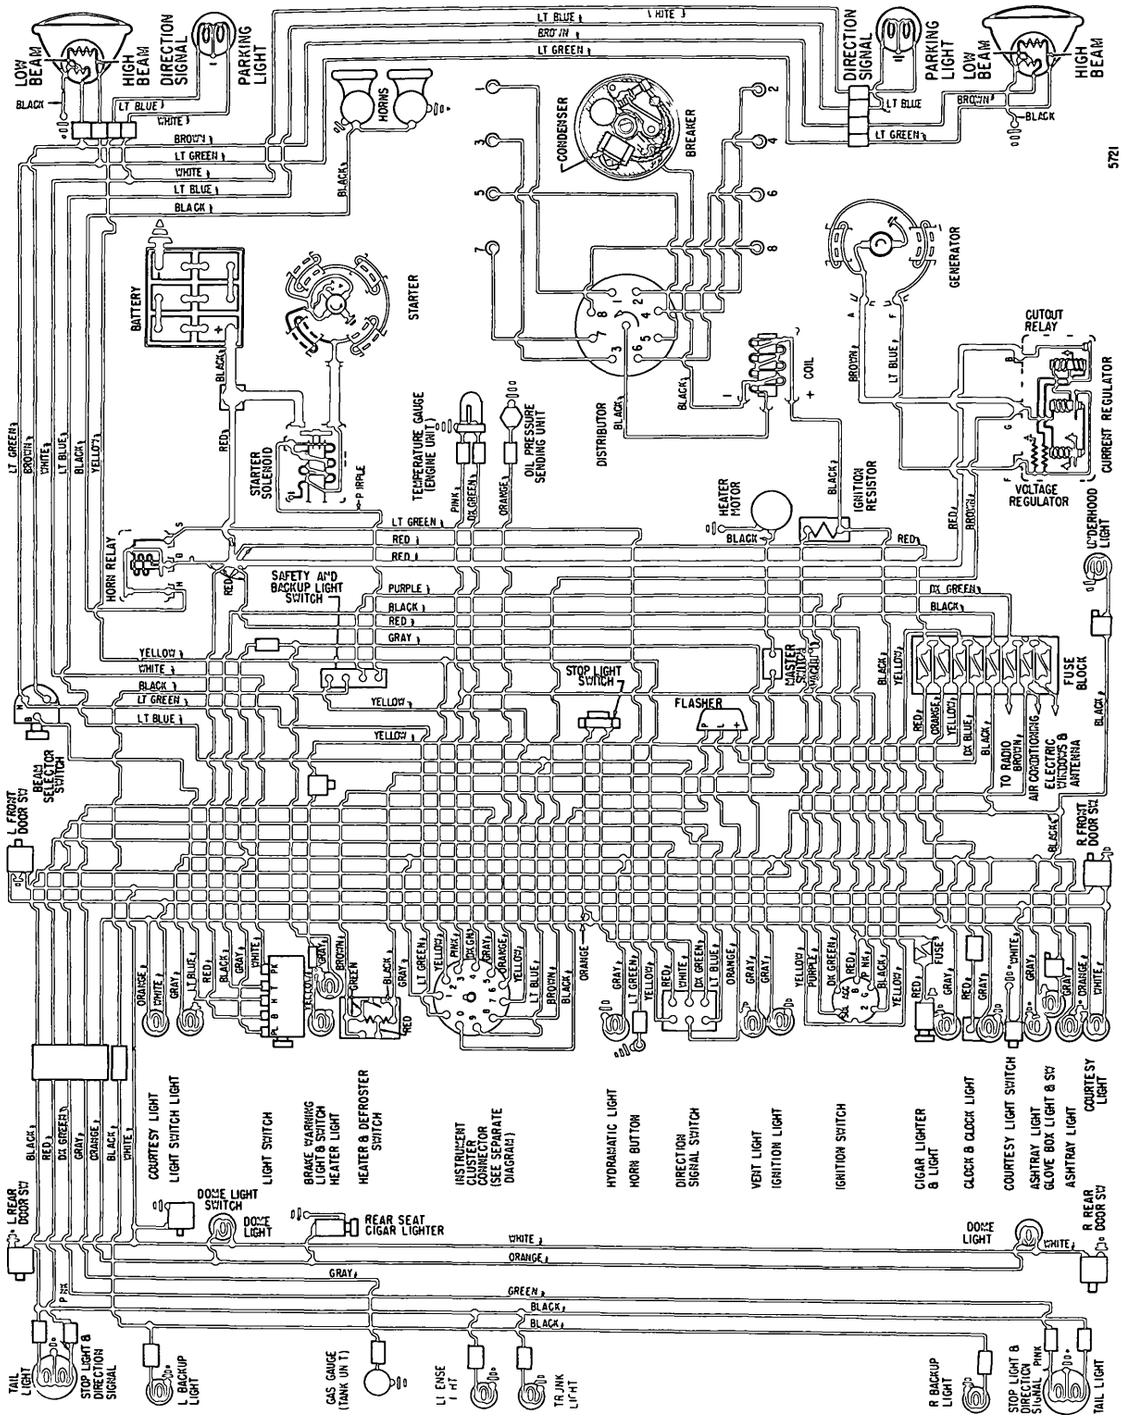
► *IDLE SPEED ADJUSTMENT NOTE: "Slow" idle speed adjustments can be made after Hydra-Matic Throttle Linkage Adjustment completed without affecting relationship between carburetor and transmission.*

Throttle Return Check Adjustment: With transmission in "N" (Neutral) and engine at normal operating temperature, set carburetor on fast idle and adjust to 1500 RPM. Flash the throttle and allow to return to slow idle, then turn off the ignition switch. Set carburetor on fast idle and check clearance between throttle return check plunger and throttle lever. Adjust to .020" using two wrenches so that diaphragm is not permitted to turn.

THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC DRIVE CARS): Install Throttle Return Check Holding Tool J-6342 to hold plunger away from throttle lever. Proceed as follows:

1) Remove throttle rod from transmission throttle lever and move throttle lever to rear against its stop, and with Throttle Lever Gauge J-6344 placed flat against rear face of transmission case, rod on gauge should just enter hole in throttle lever. Adjust throttle lever by bending with Tool J-6373-01 (*NOTE* - This tool may be revised by cutting 5/8" from top of tool). Attach throttle rod to lever

2) Back out slow idle adjusting screw until carburetor throttle valves are completely closed. Remove clips from carburetor throttle lever and carburetor bellcrank lever (do not remove carburetor rod). Place Gauge No. 33-67 against rod with hole in gauge over pin on carburetor throttle lever With gauge held up against bellcrank pivot pin, the open end of the tool should fit over pin on bellcrank lever freely without rotation of the bellcrank. If pin does not enter hole freely, remove rod and place in a vise and increase or decrease the bend.



3) Loosen jam nut on transmission throttle rod at bellcrank and remove clevis pin. Remove clevis pin from end of upper transmission throttle rod at bellcrank. With both bellcrank and transmission lower throttle rod held against their rearward stops, adjust lower throttle rod clevis so that pin will enter freely into holes in clevis and the bellcrank Install cotter pin and tighten jam nut.

► *"J-2 ENGINE" CAUTION:* On first cars (with Throttle Valve Bellcrank Assy. 571315 & Lower Control Rod 571318), it may be necessary to **lengthen** rod when making above adjustment as much as 3½ turns to obtain correct throttle valve oil pressure for correct shift pattern. On cars after Engine No. A-198511, new parts used (Throttle Valve Bellcrank Assy. 572496 & Lower Control Rod 569544) and above setting procedure should be used. *NOTE* - If either throttle valve bellcrank or lower control rod require replacement on cars before Engine No. A-198511, install both new parts and use standard setting procedure.

4) With engine bellcrank against its stop and upper transmission throttle rod pulled lightly toward rear of engine to take up slack, adjust clevis on upper transmission throttle rod so that pin enters freely into holes in clevis and bellcrank Install cotter pin and tighten jam nut. Set carburetor slow idle at 460 RPM with transmission selector lever in "D" (Drive) position, this will pull engine bellcrank forward from stop and provide proper throttle valve adjustment) *CAUTION - On air conditioned cars, slow idle speed must be set with compressor running*

5) Loosen jam nut and back out throttle stop screw several turns. Hold choke wide open and pull forward on dash bellcrank until throttle valves are wide open, then go beyond to point of maximum transmission throttle lever travel *(CAUTION - This point is a matter of*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

feel and care should be taken to not bend or stretch linkage beyond this point) With throttle held in this position, adjust throttle stop screw to just touch tang on downshift lever Allow throttle valves to return to a closed position, then turn throttle stop screw in 1½ to 2 turns and tighten jam nut

6) If clearance between dash bellcrank and dash is not 3/8" ± 1/32" adjust as follows Loosen jam nut on intermediate throttle rod, remove pin and clevis from dash bellcrank, adjust throttle rod so there is 3/8" clearance between dash bellcrank and front of dash Install rod end and clip with open side of rod toward outside of car, and tighten jam nut

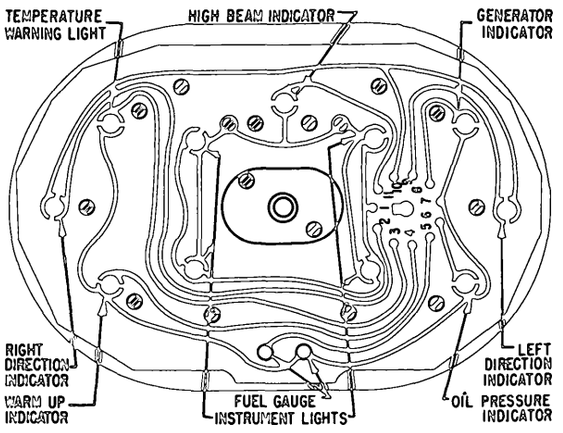
7) Adjust accelerator pedal height as follows Position a 3 7/8" wooden block between bottom of accelerator pedal and top of floor mat retainer Remove clip and accelerator rod assembly from dash bellcrank Loosen jam nut and adjust accelerator rod so that hole just slides over pin on bellcrank with accelerator pedal touching gauge block Install rod end on bellcrank with open side toward left side of car Tighten jam nut and remove gauge block

ROCHESTER 4GC

Rochester 4GC 4-Barrel type similar to design used on previous models except for addition of Choke Modifier. Used as follows

	First Cars	Later Cars
Synchro-mesh Cars	7009471	7010926
Hydra-Matic Cars	7009470	7010925

Replacement Carburetor Pkg. - Rochester 7015704



▷ *CARBURETOR PRODUCTION CHANGES & RECOMMENDED SETTING CHANGES See 'Rochester 4GC 4-Barrel" in Carburetion Section*

▷ *MANIFOLD FUEL DISTRIBUTION. Carburetor RIGHT barrels feed Cyls 1-4-6-7, LEFT barrels 2-3-5-8*

▷ *IDLE ADJUSTMENT-CAUTION* It is recommended that idle adjustments be made with Air Cleaner in place (Use of Tool BT-1000-S will make this possible)

Idle Setting: With engine warm and operating at correct idle speed, adjust each idle adjusting screw for smooth

CONTINUED ON NEXT PAGE

INSTRUMENT CLUSTER PRINTED CIRCUITS

CONTINUED FROM PRECEDING PAGE

idle and highest RPM and vacuum, then turn each screw out (rich) ¼ turn. *NOTE* - If engine rolls from richness when throttle snapped closed, turn each screw in (lean) 1/8 turn

Idle Speed - 460 RPM (All Cars) with selector lever in "DR" on Hydra-Matic cars On Air-conditioned cars set control in "Maximum Cooling" position *NOTE* - This setting supersedes previous recommendation of 450 RPM (Synchro-mesh) & 425 RPM (Hydra-Matic)

► *AIR CONDITIONED CAR NOTE: On cars with air conditioning, the compressor must be operating when idle speed adjusted*

► *OTHER DATA: See "Rochester 4GC 4-Barrel Carburetors" in Carburetion Section*

Throttle Return Check Adjustment (Hydra-Matic Drive Cars): *See CARBURETOR above*

Hydra-Matic Throttle Linkag Adjustment: *See CARBURETOR above.*

ROCHESTER 2GC
(Triple Two-barrel Compound)

Rochester 2GC. "Triple Two-Barrel Compound" installation as follows:

	Rochester No.
Front	7010960
Center	7010959
Rear	7010958

For complete adjustment data on these carburetors (including linkage adjustment to insure correct synchronization), see "Oldsmobile Triple Two-Barrel Compound" Carburetors in Carburetion Section

FUEL PUMP PRESSURE: 4-5½ lbs at 450-1000 RPM (1st type with glass filter bowl), 5-6 lbs. at 1800 RPM (later type with pulsator dome)

CARB. EQUIPMENT

Fuel Pump: AC No 4317 (Early cars), No 4397 (Later cars) Fuel and vacuum

Pressure - 4-5¼ lbs at 450-1000 RPM (No 4317), 5-6 lbs at 1800 RPM (No 4397)

See "Fuel Pumps" in Carburetion Section

Gasoline Gauge: AC Electric type

Dash Unit - AC No 1518721

Tank Unit - AC No 1518730

See "Fuel Gauges" in Carburetion Section

Air Cleaner: (Cars with 4-Barrel Carb.) Oil-wetted type (Std.) Oil-bath type (Optl),

(Cars with Triple Compound Carb.) - AC No 1553292 DRY TYPE with paper filter element Clean at 4000 mile intervals (or at engine oil change intervals). Replace element at 10,000 mile intervals or more often under severe conditions Use AC Type A-59C Replacement Element

► *DRY TYPE FILTER CLEANING CAUTION:* Remove filter element from air cleaner and clean by shaking and tapping end plates on a flat surface *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate*

BATTERY

Delco-Remy 3KMR70. *12 Volt,* 11 plate 70 ampere hour capacity (20 hr rate)

Battery Ground - Negative

Engine Ground - From engine to forward side of firewall.

STARTER

Delco-Remy No. 1107665. Armature No 1932185

Drive - Overrunning clutch (solenoid pinion shift)

Rotation - Counterclockwise at commutator end

Brush Spring Tension - 35 ozs minimum

Performance Data

Torque	RPM	Volts	①Amperes
0 ft lbs	3600-5100	10 6	65-100
	Lock	3 5	300-360

① - Includes Solenoid Switch

Starter Switch: Solenoid switch, Delco-Remy No. 1119798 mounted on starter and controlled by combination Starter & Ignition switch Delco-Remy No 1116534 and Neutral Safety and Back-up Switch (see below)

Hydra-Matic Neutral Safety Switch: Oldsmobile No 570386. Neutral Safety and Back-up Light Switch

Adjustment - *See "Dual-Coupling Hydra-Matic" in Transmission Section*

GENERATOR

Delco-Remy No. 1102085 (Std.), No. 1102067 (Air Cond.). Armature - No 1923535 (1102085 Gen), No 1932900 (1102067 Gen)

Performance Data (Cold)

	Amperes	Volts	RPM
Standard	30	14 0	2210
Air Cond	35	14 0	2400

Rotation - Counterclockwise at commutator end

Brush Spring Tension - 28 ozs

Field Current - 1 48-1 62 amperes at 12 volts (1102085) 1 62-1 82 amperes at 12 volts (1102067)

Belt Adjustment: Place Tool 33-70 on belt Loosen generator adjusting link bolt and then tighten belt until line on gauge is even with pointers of gauge Tighten adjusting link bolt

REGULATOR

Delco-Remy No. 1119001 (1102085 Gen.), No. 1119002 (1102067 Gen.). *NOTE - Specifications are "Normal" Settings*

► *REGULATOR IDENTIFICATION:* Std (1119001) regulator marked by daub of red paint, Optl. (1119002) regulator by daub of yellow paint on mounting lug

Cut-Out Relay

Cuts In - 11 8-13 5 volts

Contact Gap - 020"

Air Gap - 020" (with contacts just closed)

Voltage Regulator

Setting - 13 8-14 8 volts

Air Gap - 075" with armature pressed down to point where contacts just touch.

Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section*

Current Regulator

Setting - 27-33 amperes (1119001), 32-37 amperes (1119002)

Air Gap - 075" with armature pressed down to point where contacts just touch.

Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section*

MISC. ELECTRICAL

► *INSTRUMENT PANEL PRINTED CIRCUIT NOTE:* Entire instrument cluster served by a printed circuit All units in cluster are connected by a multiple contact plug which is keyed to prevent improper assembly Service of printed circuit is by **replacement nly.**

► *FUSE BLOWING CORRECTION:* If caused by loose fuse clips, replace Fuse Panel Check fuse clips to make certain rivets are staked and clips have sufficient tension to grip fuse ends securely

Headlamps: Sealed Beam *See Electrical Section*

Direction Signal: *See Electrical Section*

Autronic Eye: *See Electrical Section*

Light Switch Removal: Disconnect battery cable and disconnect wires from lighting switch Pull switch knob out to last notch then depress spring loaded latch button on switch body while pulling rod and knob assembly out of switch Remove switch mounting nut and remove switch and escutcheon from panel

Stop Light Switch Location (Std. Brak s): Mechanical type on toe board near brake pedal

Stop Light Switch Location (Power Brak s): Directly above brake pedal on firewall Adjust so lights come on within free travel of brake pedal

FUSES: All fuses (exc Instrument Panel and Cigar Lighter fuses) are located on a combination fuse and junction block under instrument panel A color code is used on fuse panel corresponding to color code of circuits protected by each fuse The following fuses will be found on this panel

(1) Clock (Std. on 98 Series only). 1 ampere

(2) Courtesy, Dome & Stop Lights; Rear Cigar Lighter. 25 amperes

(3) Temp., Generator, Oil Pressur Lights; Fuel Gauge, Back-up Lights, Hand Brake Signal Light. 9 amperes

(4) Turn Signal. 9 amperes

(5) Glove Box, Underhood, Keyh le, Tail, Trunk, Stop Lights. 9 amperes

(6) Radio. 7 5 amperes

(7) Heater & Air Conditioner. 20 amperes (25 amperes with Air Conditioning)

(8) Electric Windows & Antenna. 20 amperes

Instrument Panel Lights - 3 amperes located on headlight switch

Cigar Lighter - 20 amperes, located behind lighter

CIRCUIT BREAKER: 25 amperes, located in switch

Horn Relay: Delco-Remy No 1116781

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section*

ENGINE SPECIFICATIONS: Own 90°V8 with overhead valves TWO engines used **T-400** (Std Engine with 4-Barrel Carb), J-2 (Optl Engine with Triple Two-Barrel Compound Carbs)

Eng.	Bore	Stroke	Rat d HP	Displac ment
All	4"	3 11/16"	51	371 cu. ins

Engine	Compr. Ratio	Dev l p d HP
T-400	9 5-1	277 at 4400 RPM
J-2	10 0-1	300 at 4600 RPM

Compressi n & Vacuum R ading - *See TUNE-UP*

► *ENGINE COMPRESSION RATIO NOTE* Std Engine (9 5-1 Ratio) has 050" thick cylinder head gasket

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Special (10.0-1 Ratio) engine has .025" thick gasket. Same cylinder head used on all engines. *NOTE* - Head gasket for Export (Low Octane Gas) Engine is .085" thick.

►*ENGINE OVERHEATING & LOSS OF COOLANT IN NORMAL DRIVING, OR POOR CAR HEATER PERFORMANCE: See "Cooling" in Oldsmobile Special Data*

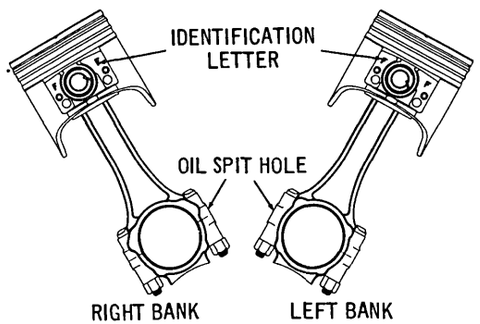
CYLINDER HEAD INSTALLATION: *See "Cylinder Heads & Manifolds" in Oldsmobile Special Data.*

INTAKE MANIFOLD INSTALLATION: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Oldsmobile Special Data.*

OIL PAN REMOVAL: *See "Oil Pan" in Oldsmobile Special Data.*

PISTONS



Aluminum alloy, three ring, autothermic, steel strut, slipper skirt, cam ground, tin plated.

Length - 4.05". **Weight** - 25.22 ozs. (less rings & pin).

Removal - Pistons & rods removed from above only.

►*CAUTION:* Mark piston, rods, and bearing caps with cylinder number before removal to insure correct reinstallation.

Clearance - .00075-.00125" Selective fit at thrust surface.

OLDSMOBILE PISTON & ROD ASSY.

Fitting New Pistons: With piston inverted and pin removed, insert piston into bore. Pull required to withdraw a .0015" x ½" feeler placed at 90° to normal position of pin and piston at center of normal travel, should be 1-6 lbs.

►*CAUTION: Allow rebored cylinders to cool to normal room temperature before fitting pistons.*

Replacement Pistons: Std., .010", .020" & .030" Oversize. Furnished with fitted pins.

Installing Pistons: Install pistons 1,3,5,7 in left bank, and 2,4,6,8 in right bank with letter "F" cast on each side of piston pin hole, and notch in piston head, toward front of engine.

PISTON PINS

Floating type with lock rings at each end.

►*CAUTION:* Discard old lock rings and install new service type lock rings when installing pins.

Diameter - .9803-.9807". **Length** - 3.126".

Pin Fit in Piston - .0000-.0002" loose. Pin should not fall through piston of own weight when using the low limit (.0000" fit). Pin can be tapped into place using brass drift.

Pin Fit in Rod Bushing - .0003-.0005" loose.

Replacement Pins: Std., .001" & .003" Oversize (in sets).

PISTON RINGS

Two compression and one oil ring used.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0775-.078"	.013-.023"	.001 - .003"
Compr. #2	.0925-.0935"	.013-.023"	.001 - .003"
Oil	.188" (Max.)	①	.0023-.0039"

① Sealed Power .013-.033", Perfect Circle .015-.055".

Replacement Rings: Std. & .010" Oversize, not in sets.

Installing Rings: Install upper chrome and lower black compression rings with side marked "T" or "Top" up.

CONNECTING RODS

Length - 6.625" center-to-center. **Weight** - 29.53 ozs.

Crankpin Journal Diameter - 2.2488-2.2498".

Out of Round Limit - .0045".

Lower Bearing - Aluminum with babbitt overlay, steel backed, both halves interchangeable.

Clearance - .0009-.0030" (vertical), .0019-.0040" (horizontal).

Sideplay - .002-.011" (total for both rods).

Replacement Bearings: Std., .002", .010" & .020" Undersize.

Installing Rods: Bearing index notches on rods and caps, and pads for numbering caps and rods should be to outside of engine. Spit hole for lubrication should be to inside of engine.

►*CAUTION: Use Guide Tool BT-22 over rod bolts to prevent damaging crankpin journals when removing and installing piston and rod assemblies.*

CRANKSHAFT

Journal Diameter - 2.748-2.749". Five bearings.

Bearings - Steel backed aluminum. Rear bearing flanged, upper and lower inserts **not** interchangeable.

Clearance - *Front & Rear bearing clearances are selective fit - See Notes below. CAUTION - Front bearing clearance has been reduced and specification below supersedes previous recommendations.*

Crankshaft Bearing Clearance

Front Bearing (see Note)	.0003-.0015"
Intermediates (2, 3, 4)	.0005-.0031"
Rear Bearing (see Note)	.0020-.0035"

►*FRONT MAIN BEARING NOTE:* Bearings are selective fit during manufacture. Standard size **Upper** bearing insert furnished with standard wall thickness only, **Lower** bearing insert furnished in FOUR wall thicknesses and marked by letter stamped on back of tang as follows: "B" .0006" thicker wall, "D" .0012" thicker wall, "E" .002" thicker wall, "F" .003" thicker wall. These bearings are in addition to regular Undersize Bearings listed below. *When correcting excessive front main bearing clearance, it will only be necessary to replace lower half of bearing insert with one of the selective fit thicker wall inserts listed above.*

►*REAR BEARING NOTE:* Bearings are selective fit during manufacture. Standard size furnished with Thin, Medium and Heavy wall (marked "T", "M", & "H" on tang). These are in addition to regular replacement Undersize Bearings listed below. *Use same thickness bearing (as indicated by letter on tang) unless undersize bearings being installed to correct wear.*

Replacement Bearings: Std. (Front & Rear furnished in special thicknesses - see Notes above), and .002", .010", .020" Undersize.

End Thrust: Taken by rear (#5) flanged bearing.

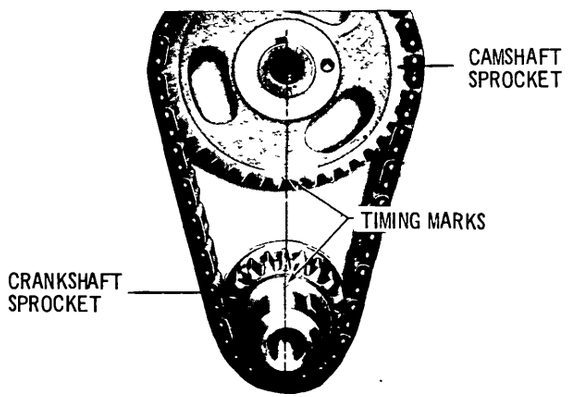
Endplay - .004-.008".

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Oldsmobile Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Oldsmobile Special Data.*

CAMSHAFT

Bearings - Steel backed babbitt or copper, lead, bronze.



Journal Diameter - 1.9977-1.9985".

Clearance - .001-.0033".

End Thrust: Forward thrust taken by plunger and spring at front end of camshaft.

Timing Chain: Link Belt or Morse. *NOTE - Both chains are completely interchangeable (may be used with either type crankshaft and camshaft sprockets).* **Width** - 27/32". **Pitch** - .50". **Length** - 24" or 48 links.

Camshaft Setting: Mesh chain with sprocket marks adjacent and in line with a straight edge across shaft centers (or use Tool BT-11).

OLDSMOBILE VALVE TIMING MARKS

►*FUEL PUMP ECCENTRIC NOTE:* Fuel pump eccentric bolted to front of camshaft ahead of sprocket. Assemble with cupped side out.

►*CAMSHAFT REPLACEMENT CAUTION:* For initial lubrication of NEW camshaft, it should be liberally coated with mixture of G.M. Concentrate No. 567725 and engine oil before installation (2 Pints of concentrate in 4 qts. of oil) and balance of concentrate should be added to crankcase oil for run-in purposes.

CONTINUED FROM PRECEDING PAGE

Engine Front Cover Removal & Installation; *See "Engine Front Cover" in Oldsmobile Special Data*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Oldsmobile Special Data*

VALVES

Tappet Clearance· None in service, hydraulic

Valve	Head Diam.	Stem Diam.	Length
Intake	1 745-1 755"	3417- 3425"	4 989-5 009"
Exhaust	1 557-1 567"	3930- 3938"	4 989-5 009"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	419"	0017- 0035"
Exhaust	45°	435"	0022- 0040"

Valve Seat Width - 037- 075" all valves

Valve Stem Seals - A "Top Hat" type oil seal (deflector) is installed on valve stem below valve spring retainer

Valve Springs: Intake and exhaust valve springs are alike Dampers used on lower end of all springs

►*VALVE SPRING PRODUCTION CHANGE* Beginning Engine No A-176654, larger diameter valve spring (wire diameter size 1/64" larger) with different pressures used Valve spring counterbore in cylinder head was increased 043" in diameter to accommodate this larger spring *NOTE* - First & Later Valve Springs (in Sets) and Cylinder Heads are interchangeable (tolerance limits may cause snug fit if second type spring used with first type head)

Valve Spring Specifications

	First Type		Later Type	
Valve	Pressure	Length	Pressure	Length
Closed	100 lbs	1 880"	90 lbs	1 880"
Open	190 lbs	1 480"	220 lbs	1 480"

Fr e Length - 2 40"

►*CAUTION* Lower end of damper and spring must seat in recess in head Install closely wound spring coils toward cylinder head

Valve Guides: Remove guides with Remover Tool J 3062 Drive new guides into top of cylinder head as follows Lay Gauge Washer J-5158 on valve spring seat, then install guide into cylinder head (with grooved end of guide up) by driving on Tool J-5158 2 until tool seats against gauge washer Guides should extend 25/32" above face of valve spring seat Inside diameter of guide is 3442- 3452" (Intake), 3960- 3970" (Exhaust) *NOTE* - Service guides are Parco-Lubrited and finished to size **DO NOT** ream Guides furnished Std and 010" oversize Oversize guides identified by a groove on O D of guide

Hydraulic Valve Lifters: Barrel type larger in length and diameter than previous models

►*HYDRAULIC LIFTER INSTALLATION CAUTION:* FIVE different sizes used in production as follows (marked as indicated)· Standard (unmarked) 001" O S (marked "1"), 002" O S (marked "2"), 003" O S (marked "3"), 005' O S (marked "5") **Lifters** marked by etched number on lifter body **Cylinder Block** marked by number on rail under engine top cover *Reinstall lifter in same hole or replace with proper size*

Diameter - 9210- 9215" (Std) **Length** - 2 125"

Cl arance in Block - 0005- 0020" (Selective)

Replacement Lifters· Std , 001", 002", 003" & 005" Oversize

Hydraulic Lifter Removal, Overhaul & Testing - *See "Valve System" in Oldsmobile Special Data*

Rocker Arm Assembly: *See "Valve System" in Oldsmobile Special Data*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above

Intake Valves - Open 13°30' BTDC Close 54°30' ALDC

Exhaust Valves - Open 51°30' BLDC Close 20°30' ATDC

Valve Timing Check: Remove left hand cylinder head rocker arm assembly and rotate engine so that #1 piston is on top dead center (firing stroke) Trailing edge of notch in crankshaft pulley will be aligned with pointer on timing chain cover Install Tool J-5374 in place of rear rocker shaft bracket with step plunger over #7 cylinder exhaust pushrod The 7 16" diameter pilot at bottom of tool will fit into cylinder head bolt hole Screw main body of gauge down so step plunger contacts pushrod and small diameter of step plunger is flush with top of main body Tighten clamp bolt Rotate engine one complete revolution so that #1 piston is again at TDC (intake stroke) Distributor rotor should now be pointing toward rear of engine If timing chain is installed properly top of tool plunger will rise so the top of main body of tool is flush with the third step If camshaft is retarded one tooth the third step will rise above top of main body and if advanced on tooth second step will be below main body

OILING SYSTEM

Crankcase Capacity: 5 quarts refill Add 1 quart with filter change

Normal Oil Pressure· 35 45 lbs at 50 MPH

Pressure Regulator - In pump body Not adjustable Valve starts to open at 45 lbs Maximum pump pressure is 45-55 lbs

Oil Pressure Indicator - Oil pressure warning light on instrument panel and oil pressure switch in engine block or oil filter Lights when pressure below 3 lbs

Engine Unit - AC No 1508319

Oil Pump· Gear type In crankcase at rear end

Oil Pump Removal, Overhaul & Installation - *See "Oil Pump" in Oldsmobile Special Data*

Oil Filter: Full flow type Replace every 5000 miles or sooner if needed Located on lower right side of crankcase at rear

Replacement Filter Element - AC No PF 122

Crankcase Ventilation: Air intake in oil filler cap has oil-wetted cleaner AC No 1552233 (Std), No 1551509 (Heavy Duty) Outlet is connected to ventilating baffle at rear of block above right bank Outlet pipe is push fit at ventilator and extends down below right rear corner of engine

►*NOTE* Air cleaner also used in lower section of ventilator outlet tube on cars with heavy duty inlet breather in filler cap and oil bath air cleaner

COOLING

Water Capacity: 19½ qts (without heater), 21 qts (with heater)

Pressure Valve: Radiator filler cap AC No RC-6, 13 lbs (Std), AC No RC-15, 15 lbs (Air Cond Cars)

Thermostat: Choke type Dole or Harrison

Type	Dole	Harrison
160°①	563219	3126289
180°②	563311	3626290

①Use with alcohol base anti freeze

②Use with permanent type anti-freeze

Water Pump: Packless, sealed ball bearing type

See "Oldsmobile" in Water Pump Section

Pump Removal - Remove fan and fan pulley Remove six mounting bolts (4 to engine cover, 2 to engine block) Remove Pump

Temperature Indicator: Two light system (Red & Green) with temperature switch in engine block GREEN light is lighted when engine running cold and goes off when engine temperature reaches 111-115°F RED light remains off during normal engine operation but comes on when engine temperature reaches 230-234°F *NOTE*- Red light will come on when ignition key turned to "Start" position but should go out when key returned to running position (this tests bulb and circuit each time engine started)

Engine Unit - Delco-Remy No 1998181 (Std), No 1998189 (Air Cond Cars)

See "Oldsmobile Temperature Indicator" in Electrical Section

CLUTCH

Long 11CF Assy. No. L5167, Oldsm bile No. 570035. Semi-centrifugal single plate type

See "Long Clutches" in Clutch Section

Clutch Disc - Long No 282687 Oldsmobile No 565059

Pedal Adjustment: Pedal free travel 1-1¼" Adjust by turning adjusting nut on clutch connector link at throw out yoke

Removal: Remove transmission (see below) Remove left engine filler plate engine breather pipe and right and left rear lower flywheel housing bolts Remove return spring and disconnect adjusting rod at yoke Install Engine Rear Support Tool BT-28 entering pilot supports into lower housing bolt holes Remove engine rear mount bolts at clutch housing and remove frame crossmember by removing three bolts at each end Remove clutch housing by removing eight bolts holding housing to flywheel housing Remove clutch assembly from flywheel

SYNCHRO-MESH TRANSMISSION

Own. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type

See "Oldsmobile Synchro-mesh" in Transmission Section

Transmission Controls: *See "Transmission Controls" in Transmission Section*

Rem val· Drain transmission and disconnect manual control rods and speedometer cable at transmission Mark location of center bearing support on frame to facilitate lateral alignment Disconnect front and rear companion flanges and center bearing support to frame

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

attaching bolts (*NOTE* - Keep shims grouped so they can be reinstalled in same location) Slide propeller shaft assembly out of frame Remove bolts holding transmission to clutch housing, and remove transmission by moving rearward until main drive gear clears clutch assembly

HYDRA-MATIC DRIVE

"J taway" Dual-C upling Hydra-Matic. Four speed automatic transmission and fluid coupling

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual-Coupling Hydra-Matic" in Transmission Section*

► *TESTING & TROUBLE SHOOTING: See "Dual-Coupling Hydra-Matic" in Transmission Section*

Lubrication - Check fluid level every 1000 miles Drain and refill every 25,000 miles Use GM Hydra-Matic Drive Fluid Type "A" (marked AQ-ATF)

Ch cking Fluid L v l - Check with transmission at normal operating temperature, engine idling, and selector lever in "P" (Park) position Add Hydra-Matic Fluid Type "A" to bring level to "FULL" mark on dipstick *CAUTION* - Do not fill above "FULL" mark

Thr ttl Linkag Adjustm nt: *See CARBURETOR above*

► *OTHER HYDRA-MATIC SERVICE DATA: See "Dual-Coupling Hydra-Matic" in Transmission Section*

UNIVERSALS

Saginaw r Spicer. Cross type three used, one each at front and rear and one at center

► *UNIVERSAL JOINT INSTALLATION CAUTION TO PREVENT DRIVE LINE VIBRATION. See "Propeller Shaft Notes" in Oldsmobile Special Data*

► *CAUTION:* Rear universal companion flange nut controls rear axle pinion bearing preload (must be ad justed whenever nut loosened) *See "Oldsmobile Hypoid" in Rear Axle Section*

Prop ller Shaft Center Bearing Overhaul: *See "Propeller Shaft Notes" in Oldsmobile Special Data*

Prop ll r Shaft Alignm nt: *See "Propeller Shaft Notes" in Oldsmobile Special Data*

REAR AXLE

Own. Hypoid gear semi-floating type with Hotchkiss drive

See "Oldsmobile Hypoid" in Rear Axle Section

Car Model	Axl Ratios Ratio	①Code
88 & S88 S M Std	3 64-1 (40-11)	6
88 H M Std	3 23-1 (42-13)	9
88 H M With Air Cond	3 42-1 (41-12)	8
88 H M Optl	3 08-1 (40-13)	0
S88 H M Std	3 42-1 (41 12)	8
S88 H M Optl	3 08-1 (40-13)	0
98 H M Std (exc Conv)	3 42-1 (41-12)	8
98 H M Std (Conv)	3 64-1 (40-11)	6
98 H M Optl	3 64-1 (40-11)	6
98 H M Optl	3 23-1 (42-13)	9

S M - Synchro-mesh H M - Hydra-Matic

① - Rear axle ratio code number stamped on lower locating boss on forward side of carrier

Backlash - 007- 008" (Limits 003- 012")

Axl Shaft Removal: Remove wheel and take off brake drum by removing two Tinnerman nuts from wheel studs (if nuts removed by turning off threads they can be reused, if nuts damaged, new nuts must be used) Remove backing plate mounting nuts and static collector Loosen bearing retainer (do not move backing plate or brake line may be damaged) Pull shaft and bearing with Puller J-942 (do not allow shaft to drag on oil seal), replace one nut to hold backing plate in position

Differential Carrier Assembly Removal: Remove axle shafts (see above) Clean differential carrier and axle housing around carrier to prevent dirt entering housing Disconnect propeller shaft at rear universal joint after having wired trunnion blocks together to avoid loss of rollers Mark universal joint so it can be replaced in the same position Drain oil by removing nuts from carrier mounting studs and moving carrier away from housing

Wheel Bearing Adjustment: None required

SHOCK ABSORBERS

Delco. Direct acting front and rear Service by replacement

Shock Absorbers (Oldsmobile No.)

Model	Front	Rear
88 & S88 (Exc Sta Wgn)	5329177	5531044
98 All	5536671	5531046
All Station Wagons	5532424	5531045

FRONT SUSPENSION

Independent. New "Spherical" joint type, with ball joints connecting upper and lower control arms to steering knuckle

See "Oldsmobile" in Suspensions & Wheel Alignment Section

Steering Axis Inclination - 6° at 0° camber

Caster - 0° to Pos ¾° Maximum variation between either side of car should not exceed ½°

Camber - Neg ¾° to Pos ¾° Maximum variation between either side of car should not exceed ½°

Toe-In - 1/16" to 1 8"

Toe-Out on Turns - With outer wheel at 20°, inner wheel should be 23°±½°

STEERING

Manual: Saginaw Ball Bearing Worm & Nut. Recirculating ball worm & nut

See "Saginaw Ball Bearing Worm & Nut" in Steering Section

Power Steering: Saginaw (In Line). *See "Saginaw In Line Power Steering" in Steering Section*

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section*

BRAKES

Bendix Hydraulic (Single Anch r). Conventional two shoe with short molded lining front (Primary) and long molded lining rear (Secondary) Parking brake applies rear wheel service brakes

See "Bendix Hydraulic Single Anchor (Without Eccentric)" in Brake Section

Drum Diamet r - 11"

Wh el Cylind r Diam t r - 1 1/32" (Front), 31/32" (Rear)

Replacement Linings & Shoes - Shoes and linings furnished in half sets of Std and 030" Oversize

Lining Width & Length

	Front Wheel	Rear Wh l
Primary Shoes	2½" x 9 3/8"	2" x 9 3/8"
Secondary Shoes	2½" x 12 1/32"	2" x 12 1/32"

Lining Thickness - 7/32"

Clearance - Adjusting screw backed off 16 notches from point where wheels can just be turned by hand

Braking Power - 56% Front, 44% Rear

Standard Master Cylinder: On left chassis frame front extension under hood

Checking Fluid - Maintain fluid level to within ½" of top of master cylinder gasket surface

Removal - Remove from above Not necessary to disturb other parts

Power Brakes: Bendix or Moraine. Combination vacuum power unit and hydraulic master cylinder Unit is mounted on underside of toe board and replaces regular master cylinder *See "Bendix Power Unit" or "Moraine Power Unit" in Brake Section*

► *1957 BENDIX POWER UNIT PRODUCTION CHANGE:* Two types Bendix Power Unit used Early production cars have vacuum reaction type Later cars have hydraulic reaction type

Checking Fluid -Same as for standard master cylinder

Removal of Power Unit - Disconnect positive battery cable at junction block on right fender filler plate disconnect purple solenoid lead wire from wiring harness, then pull cable through sleeve on power brake Disconnect hydraulic line at master cylinder and secure hose so end is above level of junction assembly Disconnect vacuum hoses at power cylinder , and remove dipstick Disconnect leads from stop light switch and fold back floor mat Remove three brake pedal bracket attaching bolts and remove pedal and bracket Remove mast jacket grommet retainer and slide grommet up mast jacket Remove mast jacket cover plate attaching screws, cover plate and power cylinder assembly Remove two cover plate-to-power cylinder bolts and remove cover plate Remove power unit through toe pan opening

MISC. MECHANICAL

Windshield Wipers: Cable operated, vacuum type *See "Windshield Wipers" in Miscellaneous Section*

Air Conditioning: *See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section*

Power Window Regulators: Electric type with individual motors in each window and master control switch on left front cowl *See "Power Window Regulators" in Miscellaneous Section*

Power Top Control: Hydro-Lectric *See "Power Top Controls" in Miscellaneous Section*

Power S at Adjuster 4-Way: Electric type with single reversible type motor *See "GM 4-Way Seat Controls" in Miscellaneous Section*

Power Seat Adjuster 6-Way: Electric type with single reversible type motor *See "GM 6-Way Seat Controls" in Miscellaneous Section*

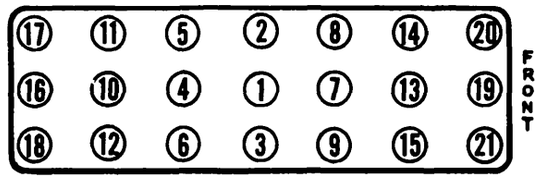
ENGINE MOUNTINGS

V8 ENGINES

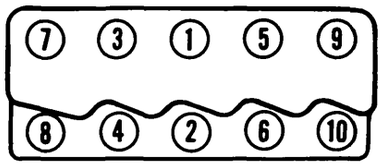
ENGINE FRONT MOUNT (V8 ENGINES): Front engine mounts are spool type with rubber insulator to absorb normal engine torque impulses. The mounting stud is off center. When installing late type mounting the larger section of insulator should be positioned next to engine. On late type mount assembly the rib on insulator must be in line with engine bracket having one mounting hole.

► *ENGINE VIBRATION CORRECTION:* Use only late type engine mount consisting of Insulator Part No. 1828237 and Bracket Assembly Part No. 1828233 (right), No. 1828234 (left) and install as described above to eliminate excessive engine impulse vibration.



CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.



Tight ning Torque—See Tightening (Torque Wrench) Specifications above.

6 CYL. ENGINES

CYLINDER HEAD INSTALLATION: When installing cylinder head, use new gasket. Coat threads of capscrews with sealer except the three screws that lead into intake manifold ports. If sealer used on these capscrews, there is a possibility that it will be drawn into carburetor or valves. Use torque indicating wrench to tighten cylinder head bolt nuts and capscrews. Tighten in sequence shown in diagram.

6 CYL. CYLINDER HEAD

V8 CYLINDER HEAD

INTAKE & EXHAUST MANIFOLD INSTALLATION: Install the new gasket between intake and exhaust manifold (make sure that heat valve is free and operates freely), and insert the four bolts through exhaust manifold and into intake manifold. Draw bolts down snug but DO NOT TIGHTEN. Install thermostatic coil spring and counter-weight. Install manifold-to-engine block gaskets and install assembled manifolds. While holding manifold and gaskets evenly against engine block, install long center bolts and draw down snugly. (If bolts show signs of water leakage, coat threads with suitable sealer). Install remaining washer and nuts. *(CAUTION*—Be sure to install the four conical, brass washers and nuts on the extreme ends of exhaust manifold). Tighten manifold nuts and bolts, starting from center and working out towards ends, to 15-20 ft. lbs. torque. Tighten the four bolts holding exhaust manifold to intake manifold.

V8 ENGINES

CYLINDER HEAD REMOVAL & INSTALLATION: Removal - Drain cooling system, remove intake manifold and rocker arm cover. Back off all tappet adjusting screws, slide rocker arm to one side and lift out pushrod. *NOTE* - Keep pushrods separate in order to reinstall in original locations. Remove cylinder head bolts and lift head off dowel guide pins in cylinder block. **Installation** - Use new gasket and reverse removal procedure. Tighten cylinder head bolts to specifications, following sequence shown in diagram.

CRANKSHAFT & MAIN BEARINGS

6 CYL. ENGINES

REAR MAIN BEARING SEAL: Neoprene type seal. When replacing seal, both upper and lower halves should be replaced. Remove oil pan, clutch housing pan, and rear main bearing cap. Remove seal from cap, and then remove upper seal by pushing one corner of seal until opposite end protrudes about ⅜" from block. Pull out with long-nosed pliers. Install new seal in lower half by carefully inserting lower half of seal into bearing cap. Before installing upper seal, coat seal contacting lip with grease. Insert one end of seal into block and push it into place with a rolling motion. Install cap seals in main bearing cap, making certain that cap seals fit in channel.

V8 ENGINES

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos. With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap. Tap seal down in position with Tool C-3511 until tool is seated in bore. Hold tool down and cut off protruding ends flush with cap. Install bearing insert and both cap seals. The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine.

ENGINE FRONT COVER

6 CYL. ENGINES

FRONT OIL SEAL: To replace, drive old seal out with suitable drift. When installing seal, make sure seal is driven into place evenly to insure a tight fit. Use a new gasket and position cover in place.

FRONT COVER INSTALLATION: Use new gasket and position cover in place. Install screws but do not tighten. Install pulley and hub on crankshaft far enough so that seal can be evenly positioned on crankshaft. Tighten two screws on right side lightly. Then tighten remainder of screws in like manner. Repeat tightening procedure and torque screws to 15 ft. lbs.

V8 ENGINES

ENGINE FRONT COVER (Single Rocker Shaft Engines): Proceed as follows:

Removal: Drain and remove radiator. Disengage fan belt and remove generator. Install Tool C-3033 over pulley and force pulley off end of crankshaft. Support engine with suitable chain hoist fastened to intake manifold. Remove motor support "U" bolts and nuts. Remove fan blades and hub, then remove bolts that hold water pump housing to cylinder block and heads. Lift water pump housing, water pump, front motor support and insulator up and away from front of engine. Discard gaskets. Loosen bolts that hold oil pan to cylinder block. Drop pan slightly to clear chain case cover. Disconnect inlet and outlet fuel lines at fuel pump. Remove bolts that hold pump to chain case cover. Slide pump out and away from engine. Discard gasket. Remove bolts and washers from cover. Disengage cover from locating dowels, remove from engine. Discard gasket.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Installation: Be sure mating surfaces of cover and cylinder block are clean and free of burrs. Install new gasket and position cover locating dowels. Coat screws with suitable sealer and tighten to 15 ft. lbs. *NOTE*—Coat four center screws with sealer suitable for water. Coat other screws (upper and lower) with sealer suitable for oil.

FRONT OIL SEAL: Remove crankshaft pulley and water pump housing. Loosen oil pan bolts sufficiently until pan clears chain case cover. Install Tool C-3506 and remove seal. Discard seal and retainer. Position new seal and retainer assembly in housing and press into place using Tool C-3506. Seal must be tight against seat surface. *CAUTION* - Always have thin shoulder away from front of cover with stamped case cover, thick shoulder away from front of cover with cast iron cover.

CAMSHAFT & BEARINGS

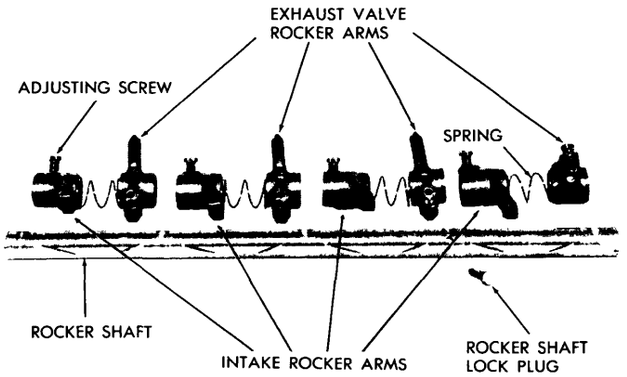
6 CYL. ENGINES

CAMSHAFT REMOVAL: Drain coolant, remove radiator, cylinder head, wheel and splash shield. Remove front engine support, timing chain cover, camshaft sprocket and timing chain. Hold lifters off camshaft lobes by blocking valves open and supporting lifters with spring type clothes pins. Remove thrust plate bolts and camshaft.

V8 ENGINES

CAMSHAFT REMOVAL: Drain and remove radiator, crankshaft pulley, fan, water pump, water pump housing assembly. Lower oil pan sufficiently to clear chain case cover. Remove fuel pump, chain case cover, camshaft hub screw and fuel pump eccentric. Remove camshaft gear and timing chain. Remove intake manifold, distributor, distributor drive gear, rocker cover, and pushrods. Remove lifters and carefully remove camshaft.

VALVE SYSTEM



6 CYL. ENGINES

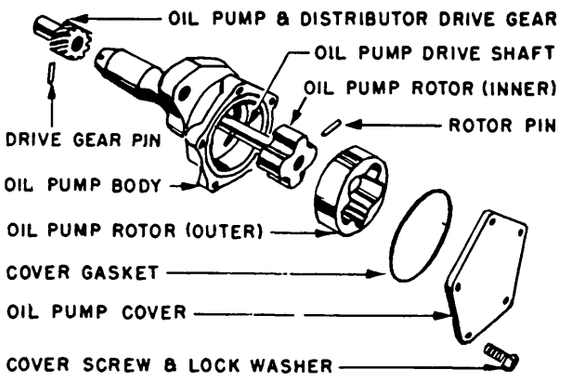
EXHAUST VALVE SEAT INSERT REPLACEMENT: Furnished .010" oversize. Use Tool C-732 to remove inserts. After inserts have been removed from engine, smooth any roughness of seat with a blunt drift Valve seat inserts should be from 002- 004" larger than counterbore to insure correct fit. If inserts are found to be loose, enlarge counterbore with Tool MH-M-1 and install oversize insert. Place inserts in dry ice for approximately 10 minutes Clean counterbore thoroughly and install a chilled insert with valve side up, and drive it into place with Installing Tool C-767

ROCKER ARMS

V8 ENGINES

ROCKER ARM ASSEMBLY: Slide rocker arm shaft into bore of strut, engage intake rocker arm. Install spring and engage exhaust rocker arm. Repeat this operation until all intake and exhaust rocker arms are installed. Make sure that rocker shaft bolt grooves align with head bolt holes in rocker shaft struts. *NOTE* - The plug hole in strut must align with hole in rocker shaft. Install new rocker shaft plug.

V8 ROCKER ARM ASSEMBLY

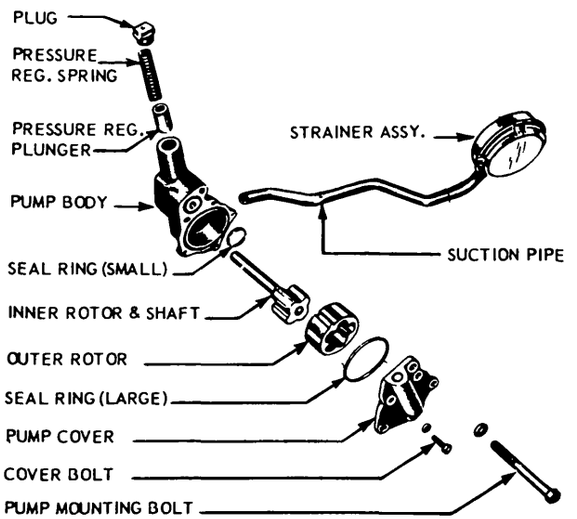


OILING SYSTEM

OIL PUMP

6 CYL. ENGINES

ROTOR TYPE OIL PUMP: Removal—Before removing oil pump, rotate crankshaft and make sure "DC" mark on crankshaft pulley lines up with pointer on timing chain case cover Do not rotate engine with oil pump removed Remove the attaching screws and remove pump from engine *NOTE*—On some models it will be necessary to remove the two upper cover capscrews to obtain sufficient clearance to remove oil pump



Disassembly & Inspection: Remove the oil pump cover and gasket Hold hand over cover opening and with pump upside down, turn drive shaft until outer rotor slips out Drive out the straight pin holding pump drive gear to shaft Press the shaft out of drive gear and slide shaft and inner rotor assembly out of pump body Wash all parts and dry with air Inspect all parts and replace as necessary, then measure clearance between opposite lobe of inner rotor and outer rotor Clearance should be .010" or less If clearance is greater replace both rotors Measure thickness and diameter of outer rotor If thickness is 748" or more and diameter is 2 245" or more, rotor is satisfactory Thickness of inner rotor should be 748 or more If either rotor is less than these dimensions, replace BOTH rotors

6 CYL. OIL PUMP

Insert both rotors into pump body and place a straight edge across pump body between bolt holes Clearance between straight-edge and rotor should be 004" maximum If greater, replace pump body Press outer rotor to one side against pump body and measure clearance between rotor and body on opposite side Maximum clearance should be 008' If greater, replace pump body Cover should be smooth and flat If it is scratched or grooved replace cover Check flatness by placing a straight-edge across inner surface of cover If it is possible to insert a 001" feeler between cover and straight-edge, replace cover

Reassembly: Slide the drive shaft and rotor assembly into pump body Press drive gear on shaft until end play of shaft is from 003" to 010" Press rotor down in body with hand and measure clearance with feeler gauge Install pin and peen over both ends If pin holes do not line up, drill a new pin hole through gear and shaft, using a 5/32" drill Slide outer rotor into place in pump body Install new cover gasket and install cover and tighten screws evenly.

V8 OIL PUMP

V8 ENGINES

ROTOR TYPE OIL PUMP: Removal—Drain engine oil, remove oil pan. Remove oil pump mounting bolts and lower pump straight down.

Disassembly & Inspection: Remove cotter pin holding oil strainer to oil pump suction pipe, then remove pipe Remove cover bolts and cover. Discard oil seal ring Remove pump rotor shaft and lift out pump outer rotor Remove oil pressure relief valve plug and lift out spring and plunger. Wash all parts in a suitable solvent and inspect for damage or excessive wear. Check all pump parts as follows·

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Outer Rotor—Measure diameter and thickness of rotor with micro-calipers. If diameter less than 2.244" or thickness less than .998", replace both inner and outer rotors.

Inner Rotor—Measure thickness of inner rotor with micro-calipers. If thickness measures less than .998", replace both inner and outer rotors.

Rotor Depth—Slide rotors in pump body. Place a straightedge across pump body. Use a feeler gauge and measure clearance between top of rotors and straightedge. If clearance in excess of .004", replace pump body.

Outer Rotor to Inner Rotor Clearance - To check rotors for excessive wear, measure clearance between lobes of inner and outer rotors. If clearance in excess of .010", replace both inner and outer rotors.

Outer Rotor to Body Clearance - Insert outer rotor in body and hold to one side. If clearance between rotor and opposite side of body is more than .012" replace pump body.

Pump Cover Clearance - Place straightedge across inner face of pump cover. If clearance between straightedge and cover at rotor positions is more than .0015", replace cover.

Reassembly: Use new oil seal ring between cover and body. Tighten cover bolts to 10-15 ft. lbs. Prime pump and then install new oil seal ring in pump mounting face.

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

IGNITION NOTES

V8 ENGINES

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows: Rotate crankshaft until No. 1 cylinder is at TDC (or firing position). When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener. Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear. Coat shaft of drive gear with engine oil. Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase).

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing. Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block.

Installation: Slide new bushing over burnishing end of Tool C-3053. Insert tool and bushing into bore of block. Drive bushing and tool down into position, using a soft hammer. As the burnisher is pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size. ***DO NOT REAM THE BUSHING.***

COOLING SYSTEM

6 CYL. ENGINES

WATER DISTRIBUTION TUBE: Replace whenever engine completely overhauled. If tube becomes rusted or corroded, overheating of engine may occur due to failure of water to circulate properly through cylinder block. To replace tube, remove radiator core and water pump. Pull tube out of block with stiff hooked rod. Install tube with slots up and be sure tube is inserted far enough into block so that water pump will seat properly against block.

PROPELLER SHAFT NOTES

REAR UNIVERSAL JOINT OPERATING ANGLE: Rear universal joint operating angle must be within range of 1-3° (2° preferred). Check and adjust this angle as follows:

► *CHECKING CAUTION:* Car weight must be on wheels (use drive-on type hoist or platform) and there must be no extra weight in trunk.

Checking Rear Universal Joint Angle : Measure angle of pinion shaft companion flange by placing spirit level vertically on back face of flange. Measure angle of propeller shaft by placing spirit level parallel to shaft on top or underside of shaft. Add these two readings. This is the universal joint angle and should be 2° (limits 1-3°).

Adjusting Rear Universal Joint Angle : If angle exceeds 3°, install wedge shim between the rear spring and spring seat on axle housing. Make sure that shim surface is not burred, install shim with flat side toward spring and thick end toward front of car. Recheck universal joint angle.

BRAKE NOTES

HAND BRAKE ADJUSTMENT (Internal Type): Place transmission shifting lever in neutral and be sure the hand brake is released. Disconnect front end of propeller shaft and remove adjusting screw cover plate. Loosen brake cable guide clamping screw and back off cable adjusting nut. Turn brake shoe adjusting nut to decrease shoe-to-drum clearance until a slight drag is felt on drum. Back off adjusting nut one full notch (using spanner wrench C-3014) to give approx. .010" clearance. (NOTE—be sure the two raised shoulders on the adjusting nut are seated in the grooves on adjusting sleeve). The cable length adjusting nut should be positioned against cable housing so there is at least .005" (but not more than .010") clearance between operating lever and brake shoe cable. To lock the adjustment, tighten cable housing clamp securely and then tighten cable adjusting nut against housing. Test hand brake lever for travel. When properly adjusted, 4 to 6 clicks of ratchet should be obtained to hold car. Install adjusting screw cover plate and connect propeller shaft.

HAND BRAKE ADJUSTMENT (External Type): Adjust anchor screw to obtain .015" clearance between drum and lining at anchor bracket, and lock anchor screw. Turn guide bolt adjusting nut to obtain .015" clearance between band and bottom of drum, then lock guide bolt securely. Turn adjusting bolt nut to obtain .015" clearance between drum and upper half of band. *NOTE* - Do not draw wire which retains anchor bolt up tight or uneven wear on linings will take place. Take up slack in hand brake cable by turning yoke with actuating cam flat against end bracket on the band. Hand brake should lock when lever is pulled back 4-6 notches.

MODEL IDENTIFICATION

Series	Model Identification
Plaza	P-30-1
Savoy	P-30-2
Belvedere	P-30-3

SERIAL NUMBER: On plate attached to left front hinge pillar post.

First Serial No. - 14.280,001 (Detroit), 20,860,001 (Evansville). 25,215,001 (Los Angeles).

ENGINE NUMBER: Stamped on boss located on left front section of cylinder block

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number) indicates the following:*

"A" - All cylinders .020" oversize.

"B" - All Main & Connecting Rod Journals .010" undersize.

"AB" - Both above conditions exist.

TUNE-UP

►*HARD COLD ENGINE STARTING (1956-57 Cars):* On cars with oil-filled coil (Auto-Lite CAG-4001), change the coil position as follows: Remove coil from bracket, cut off angular flange at top of bracket leaving vertical section intact, position coil against vertical face of bracket with terminals upward and mark coil strap mounting hole location, drill holes with ¼" drill (elongate holes horizontally to facilitate coil mounting). Mount coil on bracket vertically with terminals up. Make up new longer high tension lead to connect coil to distributor.

COMPRESSION PRESSURE: 125-155 lbs. at cranking speed (150 RPM). Maximum allowable variation between cylinders 10 lbs.

VACUUM READING: Steady 18-21" at idling speed.

VALVE TAPPET CLEARANCE: .010" (Intake & Exhaust) with engine hot and idling.

►*CONTINUOUS HIGH SPEED TAPPET CLEARANCE:* An additional .002" clearance for exhaust tappets is desirable.

MANIFOLD HEAT CONTROL: Thermostatic coil type See that valve operates freely. When installing coil, spring should be installed so that about one full turn (355° wrap) is required to hook outer end around stop stud.

IGNITION

FIRING ORDER: 1–5–3–6–2–4.

SPARK PLUG GAP: .035".

Plugs - Auto-Lite Resistor AR-51. 14 mm. Tighten to 30-32 ft. lbs.

COIL: Auto-Lite CAG-4001A.

►*COIL MOUNTING CHANGE (To Correct Hard Cold Starting). See Hard Cold Starting under TUNE-UP (above).*

Ignition Current - 1.8 amps. idling, 2.4 stopped.

Resistor - None used.

DISTRIBUTOR: Auto-Lite IAT-4101B (First Cars), IBR-4001 (Later Cars), IBR-4002 (Canada).

Condenser - Auto-Lite IAT-3076RA (IAT-4101B), IAT-2015RA (IBR-4001, 2) **Capacity -** 25-28 mfd. (All)

Contact Point Set - Auto-Lite IGW-3028BS (All)

Breaker Gap - .020". Limits .018-.022".

Cam Angle - 39° plus or minus 3°.

Breaker Arm Spring Tension - 17-20 ozs.

Rotation - Clockwise viewed from above.

Automatic Advance - IAT-4101B

Degrees	Distr.	RPM	Degrees	Eng.	RPM

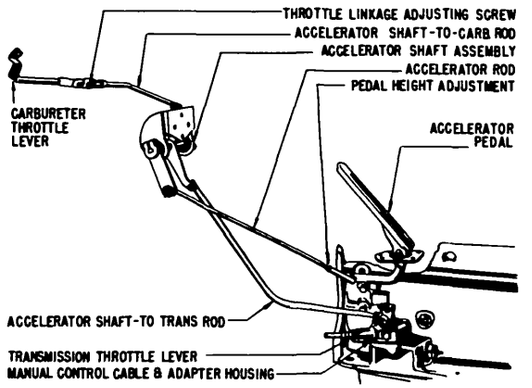
►*DISTRIBUTOR INSTALLATION NOTE Make certain that No. 1 piston is at TDC on compression stroke and that distributor rotor is at No. 1 firing position.*

IGNITION TIMING

Setting - 2° BTDC *NOTE -* This supersedes previous setting of TDC to provide better performance and economy

Timing Mark - "DC" mark on fan pulley or vibration dampener aligned with pointer on chain case cover.



CARBURETOR

►*CARBURETOR APPLICATION Carter single barrel carburetors used on all models.*

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE Special cleaning procedure required. See AIR CLEANER below.*

THROTTLE LINKAGE ADJUSTMENT (PowerFlite): Loosen vertical clamp rod and adjust the carburetor throttle lever rod to provide a 5 7/16" distance between the anchor points of the throttle return spring. Then with engine idling (off fast idle), take up slack at the vertical rod and tighten the clamp nut.

Throttle Pressure Adjustment (PowerFlite): *See "PowerFlite Transmission" in Transmission Section*

POWERFLITE THROTTLE LINKAGE

CARTER BBS (SINGLE)

Transmission	Carter Carb. No.
Synchro-mesh	BBS 2567S
Overdrive	BBS 2568S
PowerFlite	BBS 2569S
Replacement	① BBS 2604S
City Traffic	② BBS 2403S
Taxi	BBS 2410S

① - Replacement for 2567S. Use with kickdown switch (192-33U) to replace 2568S. Use with dashpot (202-80U) to replace 2569S. ② - With throttle restrictor.

Idle Setting - ½-1¾ turns open (2567S, 2568S, 2569S & 2403S), 1-2 turns open (2410S). Turn screw out for richer mixture.

Idle Speed - 450-500 RPM (Synchro-mesh & Overdrive). 475-500 RPM (PowerFlite - in Neutral).

Float Level - 7/32" (Exc. 2403S, 2410S), 9/32" (2403S, 2410S) from top of each float to top surface of body casting with float pin retainer removed and float pin at bottom of guide slots.

Accelerating Pump - Install connector rod in center hole of throttle lever (medium stroke).

Fast Idle: .016-.020" clearance between lower edge of throttle valve and carburetor bore with fast idle cam in fast idle position. Adjust by bending connector rod at lower angle (Tool T109-213).

Automatic Choke: Centered at index (all models).

Slow Closing Throttle Dashpot (PowerFlite): Loosen locknut and adjust dashpot unit so that dashpot plunger shaft can be moved inward approximately 3/32" with throttle valve fully closed.

Overdrive Kickdown Switch: With throttle valve in wide open position, adjust hex nuts on switch to have 1/64-3/64" clearance between kickdown lever and switch stem guide.

Throttle Linkage Adjustment (PowerFlite): *See CARBURETOR above.*

►*OTHER DATA. See "Carter BBS Carburetors in Carburetion Section*

R gulator	Test A - Operating Amperes -	Test B
VRX	36 Max.	30 (28-32)
VAT	46 Max	40 (38-42)

T st A - After 15 minutes operation charging at 10 amperes

T st B - After additional 15 minutes operation on current regulator (load applied to hold voltage at 13 7-13 9 volts (VAT), 13 6-13 8 volts (VRX).

Air Gap - 048-.052" with contacts just opening

Ch cking & Adjusting - *See Auto-Lite 12 Volt Regulators" in El ctrical S ction*

MISC. ELECTRICAL

H adlamps: Sealed Beam *See Electrical Section*

Dir cti nal Signal: *Se Electrical Section*

Lighting & Pan l Switch Removal: Remove headlight switch knob recessed hex screw, remove knob Remove hex nut and threaded sleeve holding switch or switches in instrument panel Slide panel light switch control off lugs of tab plate

St p Light Switch (L cati n): On forward end of master cylinder

CIRCUIT BREAKERS: Used as follows

20 Amp r - Located on headlight switch, protects headlight, beam indicator, parking and ignition lights

15 Ampere - Protects all other lighting circuits

5 Ampere (Single Speed), 6 Ampere (Variable Speed) - Located on windshield wiper switch Protects windshield wiper circuit

FUSES: Clock - 2 ampere In clock lead

Overdrive - 14 amps. On Overdrive Relay.

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl , "L" head

Bore	Stroke	Displacement
3 1/4"	4 5/8"	230 cu ins.
Compr. Ratio	**Rated HP**	**Developed HP**
8 0-1①	25 4	132 at 3600 RPM

① - Std with No 1731545 Head (Casting No 1676337) 8 2-1 on Taxicab with No 1821845 Head (Casting No 1821682)

Compression & Vacuum Reading - *See TUNE-UP*

OIL PAN REMOVAL: Drain engine oil, disconnect pitman arm from cross shaft and idler arm from idler arm bracket Remove dust shield and remove starter Disconnect front motor mounts and raise front of engine approximately 2" Install small wooden block under motor mounts and remove oil pan

►*OIL PAN INTERFERENCE NOTE.* If the oil pan contacts right hand frame cross member, install a 1/8" shim under right motor mount

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Plymouth Special Data*

TIGHTENING TORQUES - *See "Tightening Specifications" in Plymouth Special Data*

PISTONS

Aluminum alloy, U-slot, cam ground type.

►*CYLINDER BORE OVERSIZE CAUTION. Engines with letter "A" following engine number indicates that cylinder bore .020" Oversize.*

Weight—16 ozs. (stripped).

Removal—Pistons and rods removed from above.

Fitting New Pistons: 0007' measured ¾' from the bottom on thrust face. With piston pin and rings removed, cylinder wall and piston dry and clean, insert piston, upside down, into cylinder bore, with feeler stock, .002" x 1/2", inserted between cylinder wall and piston, on high spot of piston contour. Pull to withdraw feeler should be 6-10 lbs.

Replacement Pistons Std., .005", .020", .030", .040," .060" Oversize.

Installing Pistons "U" slot away from valves.

PISTON PINS

Full floating type.

Diameter—55/64". **L ngth**— 2-3/4".

Pin Fit in Pist n— 0000-.0005". DOUBLE THUMB push fit at room temperature (70° F.).

Pin Fit in R d Bushing—.0001-.0002". Tight thumb push fit at room temperature (70° F.).

R plac m nt Pins Std., .003", .008" Oversize.

NOTE—Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (#1)	3/32"	.010-.020"	.0025-.004"
Compr. (#2)	3/32"	.010-.020"	.002-.0035"
Oil (#3)	5/32"	.010-.020"	.001-.0025"
Oil (#4)	5/32"	.010-.020"	001- 0025'

Replacement Rings Std., .010", .020", .030", .040", .050", .060" Oversize.

Installing Rings #1 Compression, with step on inner edge up. #2 Compression with step on inner edge up (step down, if step on outer edge).

CONNECTING RODS

Length (Center.to.Center)—7 13/16

Weight—27 9 ozs

►*THICKER WALL-BEARING & JOURNAL DIAMETER CAUTION (One or more Journals Machined Undersize). "See "CRANKSHAFT" below.*

Crankpin Journal Diameter—2.0625".

Maximum out-of-round and taper limits—.001".

Lower Bearings—Removable, precision type, thin babbitt on steel No shims.

►***LOWER BEARING NOTE (Taxi Cab)*** - Starting with Engine No P-30 7563 NEW BI-METAL GRID bearings were installed in production Use new type bearing when servicing Taxi Cabs

►*JOURNAL DIAMETER CAUTION (ONE OR MORE Journals Machined UNDERSIZE)—See "CRANKSHAFT" below.*

Clearance—.0005-.0015".

Endplay—.006-.011"

Bearing Adjustment None. Replace bearings.

Replacement Bearings - Std., .001", .002", .003", .010", .012", .020" Undersize.

Installing Rods Oil metering hole toward valve side of engine.

CRANKSHAFT

Journal Diameter —.2.4995-2.5005". Four bearing.

Bearing Type—Removable, precision type, thin babbitt on steel. No shims.

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION.* Engines with undersize journals identified as follows

.010" UNDERSIZE (All Main & Connecting Rod Journals)—Letter "B" stamped with engine serial number indicates that ALL Main & Connecting Rod Journals are .010" Undersize.

001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)—When replacing bearings, look for stamped number on middle throw arm of crankshaft. An "M" or "R" followed by a number indicates that a main or connecting rod bearing has a thicker-wall bearing. For example "M2" and "R1" means that .001" thicker-wall bearing inserts are used on the No. 2 main bearing and the No. 1 connecting rod bearing.

Cl arance —.0005-.0015".

Replac ment Bearings: Std., .001", .002", .003", .010", .012", .020", .030", .040" Undersize.

CONTINUED FROM PRECEDING PAGE

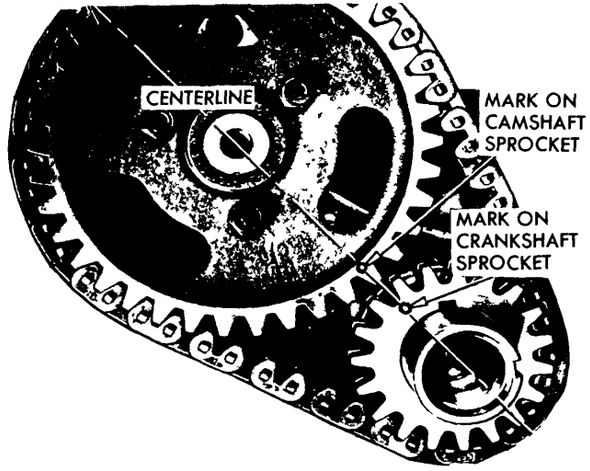
Crankshaft Rear Oil Seals: *See "Crankshaft & Main Bearings" in Plymouth Special Data*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Plymouth Special Data*

End Thrust: Taken by flanged faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT

Journal Diameters—(1) 2", (2) 1-31/32", (3) 1-15/16", (4) 1-1/4".



Bearings—Removable, steel-backed babbitt lined bushings (exc. #4—machined in crankcase).

Clearance—.001-.003" NOTE—If clearance exceeds .005" (measure with dial indicator placed against cam lobe and pry toward indicator), install new camshaft for test and if clearance is greater than .0035", replace bearings.

Removal & Installation: *See "Camshaft & Bearings" in Plymouth Special Data.*

End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain: Width—1". **Pitch**—.500". **Length**—24" or 48 links.

PLYMOUTH 6 CYL. VALVE TIMING MARKS

Camshaft Setting: Sprockets marked. Mesh chain in sprockets with "0" marks on sprockets adjacent and in line with straightedge across shaft centers.

Engine Front Cover Installation: *See "Engine Front Cover" in Plymouth Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Plymouth Special Data.*

VALVES

Tappet Clearance: .010" Intake, .010" Exhaust. Engine hot and idling. NOTE—.002" additional clearance on exhaust tappets if car driven at continuous high speed.

Valves	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.340-.341"	4.84"
Exhaust	1 13/32"	.340-.341"	4.89"

Valves	Seat Angle	Lift	Stem-Clearance
Intake	45°	.365"	.001-.003"
Exhaust	45°	.365"	.003-.005"

Valve Seat Width—1/16-3/32". Runout .0015" maximum.

►*VALVE SEAT INSERT CAUTION: See "Valve System" in Plymouth Special Data.*

Valve Guides: Remove from above. Press new guides in with upper end 7/8" below top of block, ream guides to inside diameter of .342-.343" (Intake), .344-.345" (Exhaust). *CAUTION—Guides must be installed with counterbore end UP on exhaust valves and counterbore end DOWN on intake valves.*

Valve Springs: Can be installed with closely coiled end at either top or bottom. *NOTE—Springs are available in several colors. Colors do not refer to spring tension but merely identify the manufacturer.*

Free Length—2".

Valve Spring Specifications

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1-3/4"
Valve Open	110-120 lbs.	1-3/8"

Valve Lifters: Mushroom type (remove from below).

Stem Diameter—5/8". Ream holes from above (pilot in guide). Oversizes .001", .008", .030".

Lifter Clearance in Block—.002" maximum.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE:* The following valve opening and closing points are with tappet clearance of .014". Reset to operating specifications after checking valve timing.

Intake Valve - Open 12° BTDC Close 44° ALDC

Exhaust Valve - Open 50° BLDC. Close 6° ATDC

OILING SYSTEM

►*OIL PUMP OUTLET PIPE INTERFERENCE CORRECTION:* To correct noise caused by outlet pipe interfering with oil pan, bend outlet pipe to provide clearance.

Crankcase Capacity: 5 quarts (refill). Add one quart with filter change.

Normal Oil Pressure - 40-50 lbs. at 25-30 MPH

Oil Pressure Relief Valve-Located on left side of cylinder block below starter.

Oil Pressure Relief Valve Spring: Color black. Free Length 1 7/8", Pressure 14:25-15.75 lbs. when compressed to length of 1¼".

Oil Pressure Indicator Switch: Located on left side of cylinder block at rear. When oil pressure exceeds 8-12 lbs. switch opens, indicator lamp goes out.

Oil Pump: Rotor type. On right side of crankcase.

Overhaul - *See "Oiling System" in Plymouth Special Data.*

Oil Filter: By-pass type with shunt type oil circuits. When pressure relief valve close, it blocks oil return from filter. As valve opens oil is permitted to flow through filter and excess oil returns to crankcase.

Filter Element - Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element changed.

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe.

COOLING

Water Capacity: 13 quarts. Add one quart for heater.

Pressure Valve - Radiator filler cap. Opens at 14 lbs.

Thermostat: Pellet type located in cylinder head water outlet. Opens at 157-162°F.

Water Pump: Ball bearing type. No lubrication required.

Water Distribution Tube: *See "Cooling System" in Plymouth Special Data.*

Temperature Gauge: Auto-Lite Electric.

Dash Unit - Auto-Lite 14333A.

Engine Unit - Auto-Lite 14405A.

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck 9A7 No. 361384 (Std & Overdrive), **Auburn No. 100131-1** optional without overdrive.

Disc No. - Borg & Beck 382649.

See "Borg & Beck" or "Auburn" Clutches in Clutch Section.

Pedal Adjustment: Turn clutch release fork rod adjusting nut until 3/16" free movement of clutch fork outer end is obtained. This adjustment will provide necessary 1" free play at pedal.

Over-Center Spring Adjustment: Tighten eyebolt sleeve on clutch pedal overcenter spring bolt finger tight with pedal in depressed position, then tighten four complete turns.

Removal: Disconnect propeller shaft, speedometer cable, parking brake cable, and gearshift control rods. Remove transmission (See Synchro-mesh Transmission). Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel; loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).

See "Plymouth Synchro-mesh" in Transmission Section.

►*LOW & REVERSE GEAR BINDING CORRECTION: See "Synchro-mesh Transmission" in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

►*CAR TOWING CAUTION:* If car is to be towed long distances, disconnect propeller shaft at rear axle carrier.

Removal: Disconnect propeller shaft, speedometer, cable, hand brake cable, and control rods. If transmission is to be disassembled, apply hand brake to hold mainshaft while loosening flange nut. This method will also prevent possible brinelling of bearings, or other damage caused by pounding on wrench. Remove transmission by pulling it straight back until pinion shaft clears clutch disc before lowering transmission. This precaution will avoid bending clutch disc.

OVERDRIVE

Warner Type R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down.

See "Warner R10" Overdrive in Transmission Section.

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

CONTINUED ON NEXT PAGE

CONTINUED ON NEXT PAGE

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated two speed planetary transmission.

See "PowerFlite" Transmission in Transmission Section

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section*

►*TESTING & TROUBLE SHOOTING. See "PowerFlite" Transmission in Transmission Section*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles Use only Automatic Transmission Fluid Type "A"

Checking Fluid Level - See TORQUEFLITE below

Throttle Linkage Adjustment: See CARBURETOR above

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section*

TORQUEFLITE TRANSMISSION

Torque Converter and hydraulically operated three speed planetary transmission.

See "TorqueFlite" Transmission in Transmission Section

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "TorqueFlite" Transmission in Transmission Section*

►*TESTING & TROUBLE SHOOTING: See "TorqueFlite" Transmission in Transmission Section*

LUBRICATION: Check fluid level every 1000 miles, drain and refill every 20,000 miles. Use only Automatic Transmission Fluid Type "A".

Checking Fluid Level - CAUTION - *Following procedure and fluid level I superseded previous recommendations.* Check transmission COLD if possible. Idle engine with brakes applied, press all pushbuttons in turn, then check fluid level on dipstick with engine idling in "N". Maintain level as follows:

Cold Transmission (After standing and before being driven for several miles) - Level should be between "L" mark and ½" below "L" mark. Add oil if below ½" below "L" mark, remove oil if above "L" mark. Do not add oil if level within above range.

Hot Transmission (After being driven several miles) - Level should be between "F" mark and ½" below "F" mark (on cars with first type dipstick with distance of 1 5/8" between "F" and "L" marks, level should be ½" below "F" mark). Add oil if level below "L" mark to bring level up to ½" above "L" mark, remove oil if level above "F" mark. Do not add oil if level within above range.

Throttle Linkage Adjustment: See CARBURETOR above.

►*OTHER "TORQUEFLITE" SERVICE DATA: See "TorqueFlite" Transmission in Transmission Section*

UNIVERSALS

Driveshaft Universal - Ball & Trunnion type front, Gross type rear.

Rear Universal Joint Operating Angle - See "Propellor Shaft Notes" in Plymouth Special Data.

REAR AXLE

Own. Semi-floating with separate carrier and Hotchkiss drive *See "Plymouth Hypoid" in Rear Axle Section*

►*REAR AXLE LUBRICATION LEVEL NOTE:* Recommended capacity (3¼ pints) will bring fluid level to 1" below filler opening DO NOT add to bring level to opening

►*BANJO HOUSING INSTALLATION NOTE: Check rear universal joint angle See "Propellor Shaft Notes" in Plymouth Special Data*

Rear Axle Ratios	Standard	①Optional
Conventional	3.73-1(41-11)	4.1-1(41-10)
Overdrive	4.1-1(41-10)	
Auto Trans.	3.73-1(41-11)	3.9-1(43-11)

①Mountains and Hilly country.

Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly

Axle Shaft Removal: Remove wheel, drum, and hub assembly (use screw type hub puller-Tool C-845), block brake pedal disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 Puller)

Wheel Bearing Adjustment: Shims between backing plate and axle housing With wheel and hub removed Check endplay with dial indicator To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick (equally at both wheels) **End Play** - .013-.018"

SHOCK ABSORBERS

"Oriflow". Direct-acting, hydraulic type Serviced by replacement

FRONT SUSPENSION

Independent. New "Torsion-Aire" Suspension with ball joint mounted steering knuckles and torsion bar front springs

See "Torsion-Aire" in Front Suspension and Wheel Alignment Section

►*UPPER BALL JOINT LUBRICANT LOSS CORRECTION: See "Torsion-Aire" in Front Suspension and Wheel Alignment Section*

Steering Axis Inclination - 6½° with correct camber.

Camber - Left Wheel 3/8° preferred, limits Pos. ½°-0°. Right Wheel 0° preferred, limits 0°±¼°.

Caster - 0 to Neg. 1½° (Manual Strg.), Pos. 1½° to 0° (Pwr. Strg.) *NOTE* - Set both sides the same.

Toe-In - 1/8" preferred, limits 3/32-5/32".

Toe-Out on Turns - Inner wheel 20°, outer wheel 17½-19°.

STEERING

Manual: Gemmer. Worm and three-tooth roller

See "Gemmer Worm & Roller" in Steering Section

Power Steering: "Coaxial". Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column

See "Coaxial" Power Steering in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section*

Steering Gear Removal *See "Gemmer Worm & Roller" in Steering Section*

BRAKES

►*BRAKE LINING PRODUCTION CHANGE & PARTS REPLACEMENT CAUTION:* Improved brake lining (identified by one white and one blue spot on side) used in production beginning approx April 15, 1957. This lining recommended for severe braking conditions and can be installed on **all four wheels.** Furnished in Service Pkg. No. 1843349 (8 Linings), and No. 1674067 (Shoe & Bonded Lining).

►*FRONT WHEEL DUST SHIELD SEALING CAUTION:* Dust shields are sealed with heavy body sealer to prevent entrance of dust and water. Whenever wheel cylinder seal disturbed, reseal wheel cylinder openings when servicing brakes.

Service. Plymouth "Total-Contact" (Floating Shoe) type.

See "Chrysler, De Soto, Dodge, Plymouth Center-Plane & Total-Contact" Brakes in Brake Section

Drum Diameter - 11" front and rear.

Wheel Cylinder Diameter - 1 1/8".

Lining - Molded asbestos (bonded to shoe).

Length - 11½". **Width** - 2". **Thickness** - .20".

Braking Power - 60% front, 40% rear.

Clearance - Front Wheels - Turn each adjusting cam in direction of forward wheel rotation until shoe is solid against drum and wheel locked. Turn cams in opposite direction until wheel turns free.

Rear Wheels - Same as for front wheels except that forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe cams are rotated in direction of reverse wheel rotation.

Master Cylinder: On engine side of dash panel

Checking Fluid - Filler plug on top of master cylinder (on dash panel in engine compartment).

Removal - Disconnect pedal return spring, push rod and brake tube at master cylinder Disconnect stop light wires from switch and remove nuts and bolts that secure master cylinder to dash panel. Pull master cylinder straight out from dash panel

Power Brakes: "Bellows Assist" type. Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder).

See "Chrysler, Plymouth Bellows Type Power Unit" in Brake Section

Removal of Power Unit - *See Plymouth V8 data.*

Parking Brake: On shaft at rear of transmission 6" external contracting type used with Synchro-mesh Trans., 7" internal expanding type used with Automatic Trans.

Adjustment - *See "Brake Notes" in Plymouth Special Data*

Lining	Width	Thickness	Length
6" Ext.	2"	5/32"	15.38"
7" Int.	2"	5/32"	13.44"

►*PARKING BRAKE CAM LEVER INTERFERENCE CORRECTION:* Install 1/8" steel shim between rear engine mount and crossmember when interference prevents brake from releasing.

MISC. MECHANICAL

See Plymouth V8 data for all miscellaneous Mechanical specifications.

MODEL IDENTIFICATION

Series	Model Identification
Plaza	P-31-1
Savoy	P-31-2
Belvedere	P-31-3
Fury	P-31

SERIAL NUMBER: On plate attached to left front hinge pillar post.

First Serial No. - 16,083,001 (Detroit), 22,330,001 (Evansville), 26,595,001 (Los Angeles).

ENGINE NUMBER: Stamped on boss at center of cylinder block directly beneath and behind water pump and below battery ground wire attaching point at block.

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number). Indicates as follows*

"A" - All cylinders .020" oversize.

"B" - All Main & Connecting Rod Journals .010" undersize.

"AB" - Both above conditions exist.

♦ (3/8" High) - .008" oversize tappets used.

TUNE-UP

COMPRESSION PRESSURE: 125-165 lbs (exc "Fury"), 145-180 lbs ("Fury") Maximum variation between cylinders 15 lbs

VALVE TAPPET CLEARANCE: All Engines - .008" Intake, .018" Exhaust, HOT.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located at right exhaust manifold (between manifold and exhaust pipe).

IGNITION

FIRING ORDER: 1–8–4–3–6–5–7–2.

Cylinders - RIGHT BANK 2–4–6–8. LEFT BANK 1–3–5–7.

SPARK PLUG GAP: 035" (All)

Spark Plugs - Auto-Lite Resistor AR-52 (277" & 301" Engines), AR-32 (Fury). 14 mm. Tighten to 30-32 ft. lbs. *torque.*

COIL: Auto-Lite CAH-4001B. All Engines.

Ignition Current - 2.5 amperes idling, 3.1 stopped.

Resistor - Auto-Lite PU-4003. .665-.735 ohms. Resistor is permanently connected in primary circuit between coil and breaker terminal on distributor (no by-pass for starting). Test coil and resistor separately.

DISTRIBUTOR: Auto-Lite.

Engine	Auto-Lite Distr. No.
277" (Early)	IBJ-4301B
277" (Late)	IBP-4003C
301" (Exc. Power Pak)	IBP-4003
301" (Power Pak)	IBP-4003A
318" (Fury)	IBS-4003

►*NOTE:* IBS-4003 is "Double Breaker" type.

Condenser & Contact Point Sets

Distributor	Condenser No.	Contact Point Set
IBJ-4301B	IBB-2015R	IGW-3028MS
IBP-4003, 3A, 3C	IAT-2015RA	IBP-3028AS

Condenser Capacity - .25-.28 mfd.

Breaker Gap - .017" (.015-.018").

Cam Angle - (IBJ & IBP Single Breaker) 27-32° (IBS Double Breaker) 36-39° for both sets of contacts operating together

►*CAM ANGLE SETTING CAUTION (IBP DISTR.).* Cam angle should be checked with vacuum line **disconnected.** Cam angle may decrease as much as 10° with maximum vacuum advance but must not decrease more than 12°

Breaker Arm Spring Tension - 17-20 ozs.

Rotation - Clockwise viewed from above.

Automatic Advance - IBJ-4301B

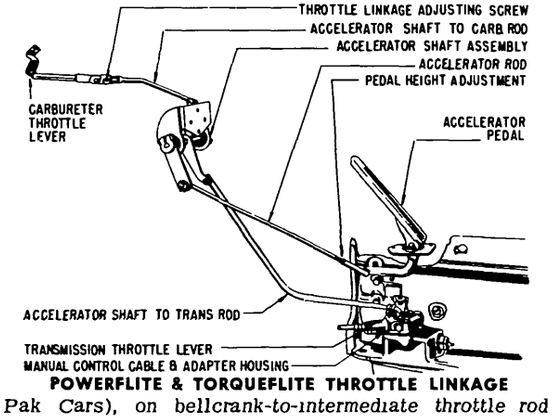
IGNITION TIMING

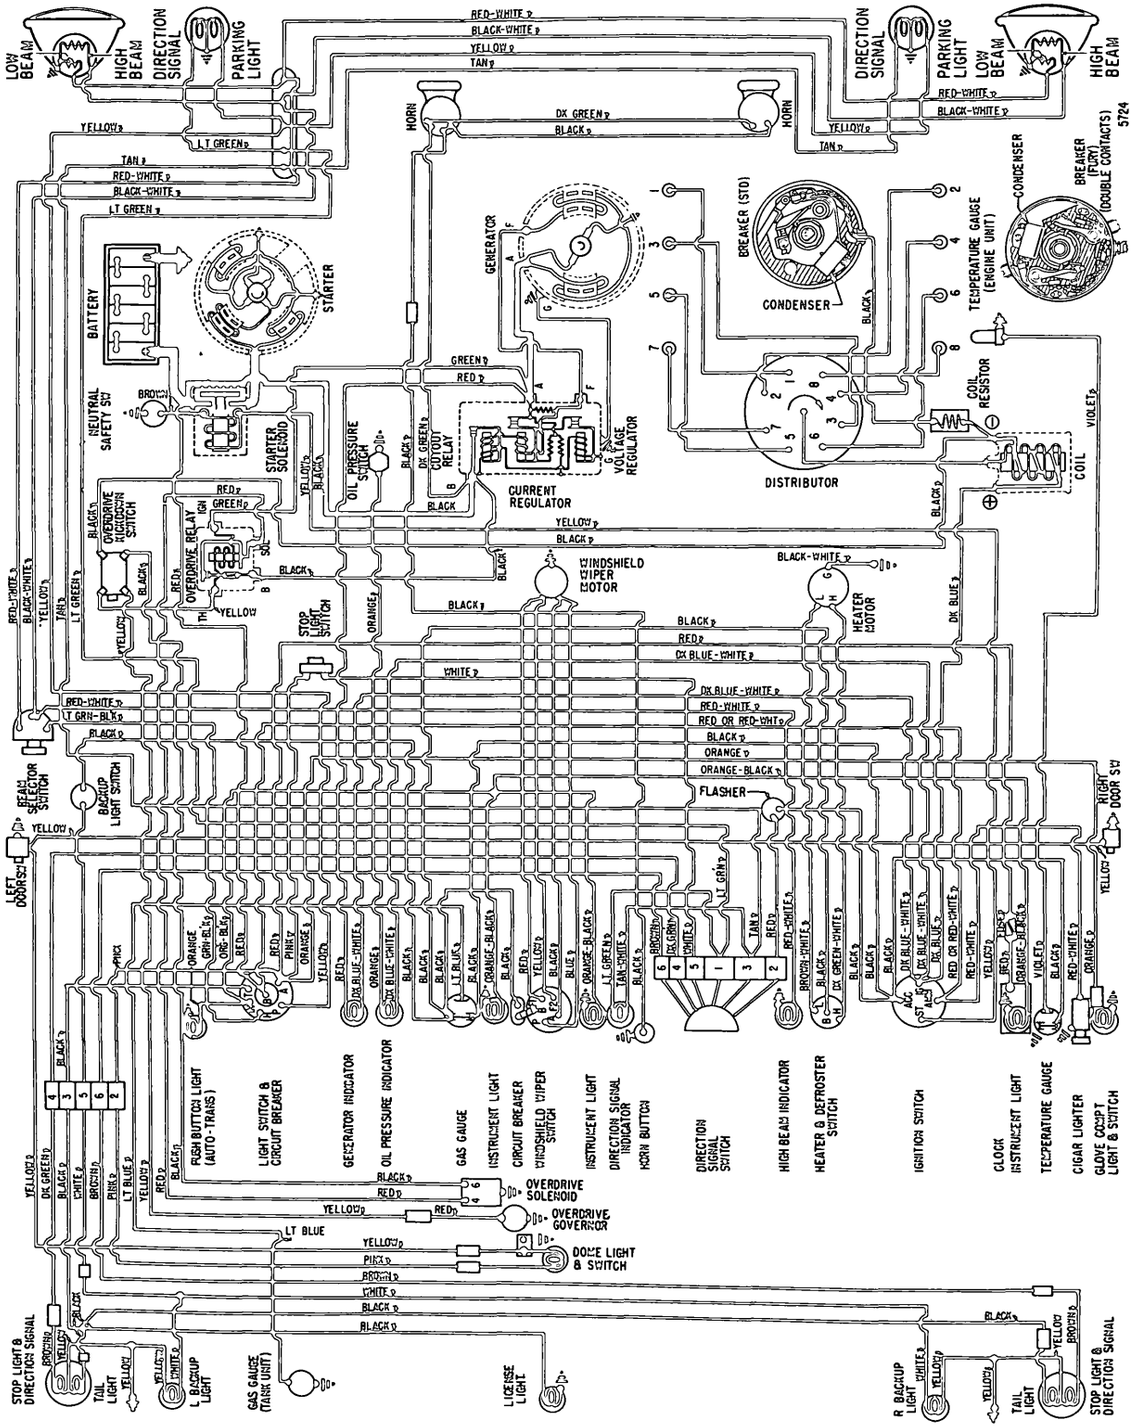
Engine	Distr. No.	Std. Setting
277" (Early)	IBJ-4301B	At TDC
277" (Later)	IBP-4003C	4° BTDC
301" (Exc.Pwr.Pak)	IBP-4003	10° BTDC
301" (Pwr.Pak)	IBP-4003A	4° BTDC
318" (Fury)	IBS-4003	8° BTDC



Timing Mark - Vibration dampener marked "DC" with 2° graduations before and after this point for a total of 10° (10° point marked "10"). Align correct mark with pointer on chain case cover.

CARBURETOR

►*CARBURETOR APPLICATION NOTE: Carter and Stromberg Carburetors standard on 277" & 301" engines. A single Carter 4-Barr l Carburetor is optional on the 301" engine. Two Carter 4-Barr l Carburetors are standard on the 318" (Fury) engine.*



►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedures required. See AIR CLEANER below*

THROTTLE LINKAGE ADJUSTMENT (PowerFlite & TorqueFlite): With engine at normal operating temperature, idle speed adjusted to 475-500 RPM and transmission in "N" (Neutral), loosen the throttle linkage adjusting nut on bellcrank-to-carburetor rod (Exc. Power Pak Cars), on *bellcrank-to-intermediate throttle rod* (Power Pak Cars). Hold light preload rearward on rod so throttle valve lever on transmission is against its stop, then tighten throttle adjusting nut. Adjust accelerator pedal rod so that wide open throttle is obtained when pedal depressed just down to the floor mat with-

POWERFLITE & TORQUEFLITE THROTTLE LINKAGE

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

out compressing it. Make this adjustment by disconnecting pedal rod at pedal arm and turning ball and socket end on rod.

Throttle Pressure Adjustment (PowerFlite): *See "PowerFlite Transmission" in Transmission Section.*

CARTER BBD (Dual)
277" & 301" Engines

Transmission	Carter Carb. No.
Synchro-mesh	Ⓒ BBD 2512S,SA,SB,SC
Overdrive	Ⓒ BBD 2513S,SA,SB,SC
PowerFlite & TorqueFlite	Ⓒ BBD 2514S,SA,SB,SC

Ⓒ - Cross-Over type choke.

▷ *CARBURETOR LIMITED PRODUCTION NOTE (Plaza Models with 277" Engine): Carter BBD No. 2407S & 2409S used on some cars. For data on these models, see 1956 Plymouth V8 data.*

▷ *PRODUCTION CHANGES AND RECOMMENDED PARTS CHANGES FOR IMPROVED PERFORMANCE: See "Carter BBD Carburetors" in Carburetion Section.*

Idle Setting - ¼-1¼ turns open. Turn both screws out equally for richer mixture.

Idle Speed - 450-500 RPM (Synchro-mesh & Overdrive). 475-500 RPM (PowerFlite & TorqueFlite).

Float Level - 9/32" (Gauge T109-239) between top of each float ridge (at center of float) and top surface of body casting. Adjust by bending lip on float arm.

Accelerating Pump - Install throttle connector in center hole (medium stroke) of throttle lever and inner hole of pump arm.

Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever, align index mark with adjusting screw. Adjust by bending lip on inner choke shaft lever.

Fast Idle Throttle Clearance: .020" (Gauge T109-29) between lower edge of throttle valve and bore with adjusting screw on high step of cam. This supersedes previous setting of .015".

Automatic Choke (Cross-over Type): *(NOTE - One-piece and Two-piece assemblies used. Adjustment is the same for both types).* Set at index as follows: Remove choke assembly from manifold and loosen mounting post locknut and turn mounting post with a screwdriver until index mark on disc is aligned with center mark on scale. Hold in this position and tighten locknut. *(NOTE - If connector rod does not clear sides of hole in housing cover without binding, replace the unit. Do not bend connector rod.*

Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64-3/64" between kickdown lever and switch stem guide.

Throttle Linkage Adjustment (PowerFlite & TorqueFlite): *See CARBURETOR above.*

▷ *OTHER DATA: See "Carter BBD Carburetors" in Carburetion Section.*

STROMBERG WW (Dual)
277" & 301" Engine

Transmission	Stromberg Code No.
Synchro-mesh	WW 15-23
Overdrive	WW 15-24
PowerFlite & TorqueFlite	WW 15-25

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*
Idle Setting - 1-2 turns open. Adjust both screws alike. Turn screws out for richer mixture.
Idle Speed - 450-500 RPM (Synchro-mesh & Overdrive), 475-500 RPM (PowerFlite & TorqueFlite).
Float Level - Top of float at center should be 7/32" below top edge of float bowl with needle valve seated. Check with Tool T-25569 placed on top of bowl and float lip held firmly against fuel inlet needle. Adjust by bending float lip.
Accelerating Pump - Normal setting, pump rod connected in center hole of throttle lever. Inner hole for less fuel, outer hole for more fuel.
Fast Idle: Turn throttle stopscrew out so that throttle valves completely closed. Hold throttle valves closed, back out fast idle screw until fast idle cam can be positioned with **first** step in line with fast idle screw, turn screw in until it just contacts cam, then turn screw in additional 5½ turns. With the fast idle cam held in this position, close choke valve until fast idle screw is against shoulder on cam, measure choke valve opening by inserting No. 12 drill between upper edge of valve and air horn wall. If opening not correct, bend fast idle rod as required.
Automatic Choke Setting: *NOTE* - Choke is "Cross-over" type mounted in manifold and linked to choke valve. Should not require adjustment (must be removed from manifold well for checking). Index mark on disc should be centered on scale on thermostat cover plate.
Throttle Linkage Adjustment (PowerFlite & TorqueFlite): *See CARBURETOR above.*
►*OTHER DATA: See "Stromberg WW (DeSoto, Dodge, Plymouth) Carburetors" in Carburetion Section*

CARTER WCFB (4-Barrel)
301" Engine (Power Pak)

Carter WCFB 2530S, SA (All Transmissions). 4-Barrel downdraft type of same design as used on previous models.
►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*
Idle Setting - 1-2 turns open. Turn screws out equally for richer mixture.
Idle Speed - 450-500 RPM (Synchro-mesh & Overdrive), 475-500 RPM (PowerFlite & TorqueFlite).
Throttle Linkage Adjustment (PowerFlite & TorqueFlite): *See CARBURETOR above.*
►*OTHER DATA: See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section*

CARTER WCFB (4-Bbl.) DUAL
318" Engine Fury Models

Carter WCFB, 2631S (Front). 2632S (Rear).
►*PRODUCTION CHANGES AND RECOMMENDED PARTS CHANGES FOR IMPROVED PERFORMANCE: See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section*

►*MANIFOLD FUEL DISTRIBUTION: RIGHT barrels feed right bank cylinders, LEFT barrels feed left bank*
►*CARBURETOR IDLE ADJUSTMENT CHANGE NOTE: The following idle speed & mixture adjustment procedure supersedes previous instructions.*
►*CARBURETOR SYNCHRONIZATION NOTE:* Before adjusting idle mixture and idle speed, the carburetor inter-connecting rod must be adjusted as follows: Hold rear carburetor throttle in wide open position (choke off) and adjust rod at slotted end so front carburetor throttle valve will be in wide open position. Make sure rod can rotate slightly on pivots and not bind.
Idle Speed & Mixture Adjustment: Screw the "idle by-pass" screw (7/16" slotted hex head screw located on left rear side of each carburetor body flange) against its seat *(NOTE - This "by-pass screw" is no longer used for idle speed adjustment and must remain in the closed position).* Adjust engine idle speed to 650 RPM (transmission in neutral) by screwing in the **idle speed screw** (throttle stop screw at throttle shaft lever) on the front carburetor only. Adjust all four (two on each carburetor) idle mixture screws 1 turn open from a lightly seated position. Obtain the smoothest possible idle speed by further adjusting idle mixture screws on **front** carburetor *(NOTE - It may also be necessary to re-adjust idle mixture screws on rear carburetor if adjustment of front carburetor does not provide proper engine idle speed).*
Throttle Linkage Adjustment (Automatic Transmission Cars): *See CARBURETOR above.*
►*OTHER DATA: See "Carter WCFB 4-Barrel Carburetor" in Carburetion Section.*
FUEL PUMP PRESSURE: 6-7 lbs. at 2000 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter M2501S (Exc. Air Cond.), M2504S (Air Cond.)
Pressure - 5-7 lbs. at 500 RPM.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: Auto-Lite Electric type.
Dash Unit - Auto-Lite 14332A (All).
Tank Unit - Auto-Lite 14382A (P31), 14380A (Sub.).
See "Fuel Gauges" in Carburetion Section.
Air Cleaner: DRY FILTER ELEMENT type. Clean every 5000 miles, replace element every 15,000 miles.
►*CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.*

BATTERY

Auto-Lite 11-HS-50 or Willard HO-11-50. 12 Volt, 9 plate, 50 ampere hour capacity (20 hr. rate).
Grounded Terminal - Negative.

STARTER

Auto-Lite MDM-6001 (Synchro-mesh), MDM-6002 (Auto. Trans.), MDL-6003 (Canada).
Armature - Auto-Lite MDL-2088 (All).
Drive - Bendix "Folo-Thru", No. A3596.
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 31-47 ozs.

Performance Data - MDL

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10.0	60
6.0 ft. lbs.	Lock	4.0	225

Performance Data - MDM

Torque	RPM	Volts	Amperes
0 ft. lbs.	4400	10.0	50
5.0 ft. lbs.	Lock	4.0	210

Starting Switch: Auto-Lite SAE-4001 (Std.), SAE-4002 (Auto. Trans.). Magnetic switch controlled by ignition switch. Neutral safety switch mounted on transmission on Automatic Transmission cars.
See "Starter Controls" in Electrical Section.
Neutral Safety Switch Adjustment: *See "PowerFlite & TorqueFlite" in Transmission Section.*

GENERATOR

Auto-Lite. Used as follows:

Generator No.	Armature No.	Application
GJC-7001D	GJC-2030F	Std. (Early)
GJC-7012A	GJC-2030F	Std. (Later)
GJC-7001C		Std. Ⓒ
GGA-6001AC	GFY-2101F	Special ②
GHM-6004C	GHM-2059F	Air Cond.
GHM-6004A	GHM-2059F	Taxicab

Ⓒ - Limited Prod. ② - Except Power Steering.

Performance Data - GJC

Amperes	Volts	RPM
0.0	12.8	1225-1325
30.0	15.0	2050-2250

Performance Data - GGA

Amperes	Volts	RPM
4.0	14.6	950 Max.
40.0	14.6	1600 Max.
40.0	15.0	1600 Max.

Performance Data - GHM

Amperes	Volts	RPM
5.0	14.0	875 Max.
25.0	15.0	1350 Max.
30.0	15.0	1500 Max.

Field Current - 1.2-1.3 amps. (GJC), 1.1-1.3 amps. (GGA & GHM) all at 10.0 volts at 70°F
Motoring Current - 3.4-3.9 amps. (GJC), 2.3-2.6 amps. (GGA), 3.0-3.5 amps. (GHM) all at 10.0 volts.
Brush Spring Tension - 18-36 ozs. (GJC), 34-41 ozs. (GGA), 35-53 ozs. (GHM).
Rotation - Counter-clockwise at commutator end.
Belt Adjustment: **(Std.)** - ¼' deflection with 10 lb. pull midway of longest span.
(Air Cond.) - Loosen generator mounting bolts and use Tool C-3379 & Tool C-3005 to apply 15 lbs. tension on belt. Tighten generator mounting bolts while holding this tension.

REGULATOR

Auto-Lite VAT-6201A (GGA Gen.), VRX-6201A (GJC & GHM Gen.). Current Regulator
►*SETTING CAUTION. "Temperature Compensated" type. Set to following specifications at 70°F.*

Regulator	Test A - Operating Amperes -	Test B
VRX	36 Max.	30 (28-32)
VAT	46 Max.	40 (38-42)

Test A - After 15 minutes operation charging at 10 amperes.
Test B - After additional 15 minutes operation on current regulator (load applied to hold voltage at 13.7-13.9 volts (VAT). 13.6-13.8 volts (VRX).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Air Gap - .048-.052" with contacts just opening.
Ch cking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

Cutout Relay

Cuts In - 12.6-13.6 volts (VRX), 13.0-13.7 volts (VAT).
Cuts Out - 8.2-9.3 volts.
Contact Gap - .015".
Air Gap - .031-.034" with contacts open.

Voltag Regulator

Setting - 14.5 volts at 80°F while charging at 10 amps. or with .25 ohm resistor in series between regulator and battery.
Air Gap - .048-.052" with contacts just opening.
Ch cking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Se aled Beam. *See Electrical Section.*
Dir ctional Signals: *See Electrical Section.*
Lighting & Panel Switch Removal: Remove headlight switch knob recessed hex screw, remove knob. Remove hexnut and threaded sleeve holding switch or switches in instrument panel. Slide panel light switch control off lugs of tab plate.
St p Light Switch L cation: On forward end of master cylinder.
CIRCUIT BREAKERS: Used as follows:
20 Amper - Located on headlight switch, protects headlight, beam indicator, parking and ignition lights.
15 Amper - Protects all other lighting circuits.
5 Amp r (Singl Sp d), 6 Ampere (Variable Speed). Located on windshield wiper switch. Protects windshield wiper circuits.
FUSES: Cl ck - SFE 2 in clock lead.
Ov rdriv - 14 am ps. Located on overdrive relay.

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Servic Cautions" in Miscellaneous Section.*
► *ENGINE NOTE: Three engines used. All have polysph rical combustion chambers with lateral valves and single rocker arm shaft. Bores and stroke differ in engines as indicated in Specifications below.*

ENGINE SPECIFICATIONS: 90° V8 (All Models).

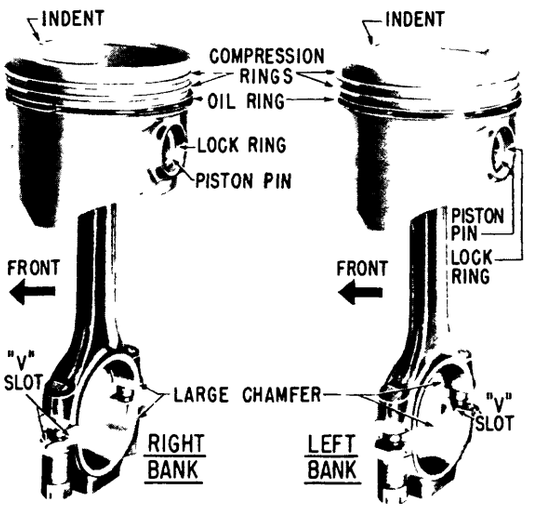
Engine	Bore	Stroke	Displacement
P-31-1 (Std.) ①	3.75"	3.13"	277 cu. ins.
P-31-2,3 (Std.)	3.91"	3.13"	301 cu. ins.
Fury	3.91"	3.31"	318 cu. ins.

① - 301" Engine is standard on Suburban models and optional on other models.

Engine	C mpr. Ratio	Rated HP	Developed HP
277"	8.0-1	45.0	197 at 4400 RPM
301"	8.5-1	48.9	② 215 at 4400 RPM
318"	9.25-1	48.9	290 at 5400 RPM

② - 235 at 4400 RPM with Power Pak.

C mpr ssi n & Vacuum Reading - *See TUNE-UP.*
ENGINE REMOVAL: *See "Engine" in Plymouth Special Data.*
ENGINE MOUNTS: *See "Engine Mountings" in Plymouth Special Data.*
► *ENGINE IMPULSE NOISE CORRECTION:* See "Engine Mountings" in Plymouth Special Data for installation of latest type engine front mount insulator.



OIL PAN REMOVAL: Remove distributor cap and rotor. Drain engine oil. Disconnect pitman arm from cross-shaft and idler arm from idler arm bracket. Remove starter motor. Remove exhaust cross-over pipe, and dust shield. Disconnect front engine mounts and raise front of engine approximately 2". Install small blocks under mounts to support engine and remove oil pan bolts and pan.

► *OIL PAN INTERFERENCE NOTE: If the oil pan touches right hand frame member, install a 1/8" shim under right motor mount.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Plymouth Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Plymouth Special Data.*

PISTONS

Aluminum alloy, elliptically turned, horizontal slot, tin-plated, thermally controlled by steel band.
Clearance - .005-.0015" at top of skirt. Pull to withdraw .0015 X ½" feeler should be 5-10 lbs. at 70°F.
► *CYLINDER BORE OVERSIZE CAUTION:* Engines with letter "A" following engine number will have .020" oversize cylinder bore.
Removal: Pistons and rods removed from above.
Replacement Pistons: Std., .005", .020", .030", .040", and .060" oversize.

V8 ENGINE PISTON & ROD ASSYS.

Installing Pistons: Assemble pistons to connecting rod on right hand cylinder bank (2-4-6-8) with indent on top of piston on side opposite to large chamfer at insert end of connecting rod. On left bank (1-3-5-7) assemble with detent on same side as large chamfer at insert end of connecting rod. *See Rod Installation.*

PISTON PINS

Floating type with lock ring at each end.
Diameter - .9841-.9843".
Clearance in Piston - .0000-.0005". Tight double thumb press fit at 70°F.
Clearance in Rod - .0001-.0004". Tight thumb press fit at 70°F.
Replacement Pins: Std. .003" and .008" oversize.

PISTON RINGS

Ring	Widtn	End Gap	Side Clearanc
Compr. (1)	.0775-.0780"	.010-.020"	.0015-.003"
Compr. (2)	.0775-.0780"	.010-.020"	.001-.0025"
Oil (3)	.1860-.1865"	.010-.020"	.001-.003"

Replacement Rings: Std. .010", .020", .030", .040", .050", .060" oversize.
Installing Rings: Install compression rings with step on inner edge up.

CONNECTING RODS

Length - 6.12" (Center to Center).
Crankpin Journal Diameter - 2.12".
► *JOURNAL DIAMETER CAUTION (ONE OR MORE Journals Machined UNDERSIZE): See CRANKSHAFT below.*
Lower Bearing - Replaceable, precision type.
Clearance - .0007-.0022" (P-31-1), .0005-.0015" (Others).
Side Play -,006-.014" (two rods).
Installing Rods: Install in cylinder with indent on piston to front of engine. The large chamfer on connecting rod must be toward crankshaft journal fillet.
Bearing Adjustment: None, replace bearings.
Replacement Bearings: Std., .001", .002", .003", .010", and .012" undersize.
► *BEARING INSERT CAUTION:* When installing lower bearing insert, make sure that "V" groove in insert is in line with "V" groove in cap for proper lubrication.

CRANKSHAFT

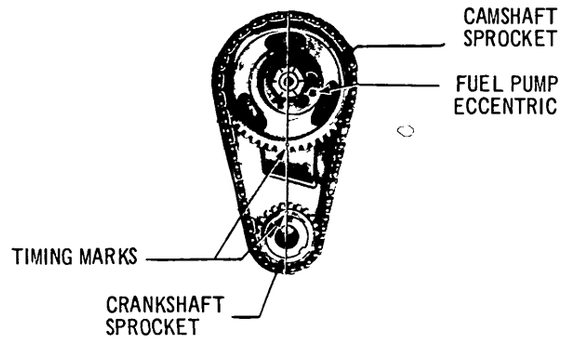
Journal Diameter - 2.50".
► *CRANKSHAFT JOURNAL DIAMETER CAUTION:* Engines with undersize journals identified as follows:
.010" UNDERSIZE (Main & Connecting Rod Journals) - Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" undersize.
.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals) - When replacing bearings, look for stamped number on middle throw arm of crankshaft. An "M" or "R" followed by a number indicates that a main or connecting rod bearing has a thicker wall bearing. For example, "M2" and "R1" means that .001" thicker wall bearing inserts are used on the No. 2 main bearing and the No. 1 connecting rod bearing.
Clearance - .0005-.0015".
Replacement Bearings: Std., .001", .002", .003", .012", undersize.
Crankshaft Rear Oil Seals: *See "Crankshaft & Main Bearings" in Plymouth Special Data.*
Crankshaft Front Oil S al: *See "Engine Front Cover" in Plymouth Special Data.*
End Thrust: Taken by center (No. 3) main bearing.
End Play - .002-.007".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CAMSHAFT

Journal Diameters - (1) 2", (2) 1 63/64", (3) 1 31/64", (4) 1 61/64", (5) 1 9/16".



Bearings - Removable, steel backed babbitt.

Clearance - .001-.003".

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Timing Chain: **Width** - 1.02". **Pitch** - .38. **Length** - 68 links.

Camshaft Setting: Valve timing is correct when timing marks on camshaft and crankshaft sprockets are adjacent and in line across shaft centers.

V8 ENGINE VALVE TIMING MARKS

Removal & Installation: *See "Camshaft & Bearings" in Plymouth Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in Plymouth Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Plymouth Special Data.*

VALVES

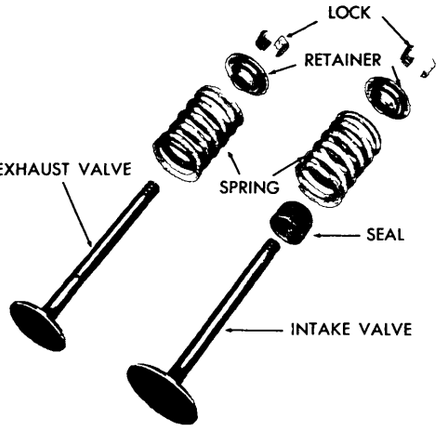
Tappet Clearance: .008" Intake, .018" Exhaust, Hot and idling.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.84"	.372-.373"	4.60"
Exhaust	1.56"	.371-.372"	4.58"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	①	.001-.003"
Exhaust	45°	②	.002-.004"

① - .387" (277" & 301" Engines), .405" (Fury).
② - .387" (277" & 301" Engines), .405" (Fury).

Valve Seat Width - .060-.085" (Intake), .040-.060" (Exhaust).



►*VALVE OVERSIZE NOTE:* "I" or "E" stamped on head at rocker arm cover gasket boss, indicates that all intake or all exhaust valves are oversize in that head, depending upon letter stamped on boss.

Valve Springs: Same spring used on intake and exhaust.

Free Length - 1 15/16" (277"), 2" (Others).

Valve Spring Specifications (277" & 301" Engines)

Valve	Spring Pressure	Length
Closed	72 lbs.	1.69"
Open	166 lbs.	1.31"

V8 ENGINE VALVE ASSY.

Fury Engine

Valve	Spring Pressure	Length
Closed	90 lbs.	1.66"
Open	185 lbs.	1.28"

►*VALVE SPRING HEIGHT CAUTION:* If installed height of spring is greater than 1 11/16", install a 1/16" spacer (Part No. 1400482) in head counterbore to bring spring height back to normal 1 5/8-1 11/16".

Valve Guides: Cast integral with cylinder head. Service as follows When valve stem clearance excessive, use Reamer Tool Set to ream guides to NEXT OVERSIZE Valve as follows Tool C-3433 (.005" O.S.), Tool C-3430 (.015" O.S.), Tool C-3427 (.030" O.S.). Valves furnished Std., and .005", .0015". .030" oversize.

Valve Lifters: **(All)** - Barrel type mechanical lifters. Remove from above.

►*LIFTER PRODUCTION CHANGE:* Lifters used in later engines have a shorter overall length (2" early, 1 25/32" later), but are of same weight and are interchangeable.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE* Valve timing specifications are with valve train solid.

277" Engine

Intake Valves - Open 14° BTDC. Close 50° ALDC.
Exhaust Valves - Open 52" BLDC. Close 12° ATDC.

301" Engine

Intake Valves - Open 8° BTDC. Close 52° ALDC.
Exhaust Valves - Open 52° BLDC. Close 8° ATDC.

Fury Engine

Intake Valves - Open 17° BTDC. Close 59° ALDC.
Exhaust Valves - Open 55° BLDC. Close 21° ATDC.

OILING SYSTEM

Crankcase Capacity: 5 qts refill Add 1 qt with filter change.

Normal Oil Pressure - 50-65 lbs at 1500 RPM

Oil Pressure Relief Valve - In oil pump body, Adjustable by replacing spring

►*OIL PRESSURE RELIEF VALVE SPRING NOTE:* Springs identified as follows

Color	Free Height	Spring Pressure & Checking Height
Gray (Lt.)	3 1/32"	16 1-17 1 lbs at 2 1/16"
Red (Std)	2 27/32"	19 5-20 5 lbs. at 2 1/16"
Brown (Hvy.)	2 31/32"	22 9-23 9 lbs at 2 1/16"

Oil Pressure Indicator: Lamp on Instrument panel. Light comes on when ignition switch turned on, goes out when oil pressure reaches 8-12 lbs. Operated by oil pressure switch located at the rear of cylinder block at the top

Oil Pump: Rotor type Located at rear of engine on rear main bearing cap.

Priming Oil Pump (After Overhaul) - Prime oil pump before installation of pump and strainer to rear main bearing cap

Overhaul - *See "Oiling System" in Plymouth Special Data*

Oil Filter: Shunt type. A portion of oil from oil pump is directed through filter and remainder flows into engine lubrication system

►*ENGINE OILING SYSTEM PRODUCTION CHANGE:* Early production cars had oil by-pass valve in lead from oil pump to main oil galley, later cars have sleeve with 9/64" orifice replacing bypass valve

Filter Element - Install new filter element and cover gasket at 5000 mile intervals (or earlier if required). Change oil at same time filter element is changed.

Crankcase Ventilation: Filter element in oil filler cap and air cleaner in crankcase ventilation outlet pipe (if so equipped).

COOLING

Water Capacity: 20 qts. Add 1 qt. for heater.

►*AIR CONDITIONER OPERATING CAUTION:* Engine cooling system must be protected to a temperature of 20°F (above zero) for summer operation.

Pressure Valve: Radiator filler cap. Opens at 14 lbs.

Thermostat: Pellet type. Located under water outlet elbow. Opens at 157-162°F.

Water Pump: Sealed ball bearing type. No lubrication required.

Overhaul - *See "Plymouth" in Water Pump Section.*

Fan Belt Adjustment (Air Conditioned Cars): 1/8" deflection with 10 lbs. pressure midway between idler and water pump pulleys. *NOTE - For generator belt adjustment, see Generator above.*

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit - Auto-Lite 14333A.

Engine Unit - Auto-Lite 14405A.

See "Temperature Gauges" in Misc. Section.

CLUTCH

Borg & Beck. 10A7 No. 361376 (Std. V8), 10.5A8 No. 361418 (Fury).

Disc No. - Borg & Beck 382358 (10A7), 382621 (10.5A8).

See "Borg & Beck" Clutches in Clutch Section.

Pedal Adjustment: Turn clutch release fork rod adjusting nut until 3/16" free movement of clutch fork outer end is obtained This adjustment will provide necessary 1" freeplay at pedal

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Ov r-Cent r Spring Adjustment: Tighten eyebolt sleeve on clutch pedal overcenter spring bolt finger tight with pedal in depressed position, then tighten four complete turns.

R m val: Disconnect propeller shaft, speedometer cable, parking brake cable, and gearshift control rods. Remove transmission (See Synchro-mesh Transmission). Mark clutch cover and flywheel. Remove bolts that hold clutch cover to flywheel; loosening each bolt a few turns (in succession) until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See "Plymouth Synchro-mesh" in Transmission Section.

Trans mission C ntr ls: *See "Transmission Controls" in Transmission Section.*

►*CAR TOWING CAUTION:* If car is to be towed long distances, disconnect propeller shaft at rear axle carrier.

R m val: Disconnect propeller shaft, speedometer cable, hand brake cable, and control rods. If transmission is to be disassembled, apply hand brake to hold mainshaft while loosening flange nut. This method will also prevent possible brinelling of bearings, or other damage caused by pounding on wrench. Remove transmission by pulling it straight back until pinion shaft clears clutch disc before lowering transmission. This precaution will avoid bending clutch disc.

OVERDRIVE

Warn r Typ R10. Planetary gear type with solenoid operation and accelerator pedal controlled kick-down.
Se "Warner R10" Overdrive in Transmission Section.

Overdriv C ntrols: *See "Overdrive Controls" in Transmission Section.*

R m val: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated two speed planetary transmission.
S "P w rFlit " Transmission in Transmission Sect n.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: S "PowerFlite" Transmission in Transmission S ction.*

►*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubricati n: Check fluid level every 1000 miles, drain and refill every 20,000 miles. Use only Automatic Transmission Fluid Type "A".

Ch cking Fluid L v l - *Se TORQUEFLITE below.*

Thr ttl Linkag Adjustm nt: *See CARBURETOR abov .*

►*OTHER POWERFLITE SERVICE DATA: S "Pow r-Flit " in Transmission S ction.*

TORQUEFLITE TRANSMISSION

Torque Converter and hydraulically operated three speed planetary transmission.
See "TorqueFlite" Transmission in Transmission Section.

►*NO REVERSE CORRECTION: See "TorqueFlite" Transmission in Transmission Section.*

►*HARSH SHIFTING OR SLIPPAGE IN 1-2 UPSHIFT CORRECTION: See "TorqueFlite" Transmission in Transmission Section.*

►*DOWNSHIFT "RUNAWAY" CORRECTION: See "TorqueFlite" Transmission in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "TorqueFlite" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "TorqueFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid Type "A"

Checking Fluid Level - *CAUTION - Following procedure and fluid level supersede previous recommendations.* Check transmission COLD if possible. Idle engine with brakes applied, press all pushbuttons in turn, then check fluid level on dipstick with engine idling in "N". Maintain level as follows:

Cold Transmission (After standing and before being driven for several miles) - Level should be between "L" mark and ½" below "L" mark. Add oil if below ½" below "L" mark, remove oil if above "L" mark. Do not add oil if level within above range.

Hot Transmission (After being driven several miles) - Level should be between "F" mark and ½" below "F" mark (on cars with first type dipstick with distance of 1 5/8" between "F" and "L" marks, level should be ½" below "F" mark). Add oil if level below "L" mark to bring level up to ½" above "L" mark, remove oil if level above "F" mark. Do not add oil if level within above range.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER "TORQUEFLITE" SERVICE DATA: See "TorqueFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universal. Ball & Trunnion type front, Cross type rear.

Rear Universal Joint Operating Angle - *See "Propellor Shaft Notes" in Plymouth Special Data.*

REAR AXLE

Own. Semi-floating with separate carrier and Hotchkiss drive.
Se "Plymouth Hypoid" in Rear Axle Section.

►*REAR AXLE LUBRICATION LEVEL NOTE:* Recommended lubrication capacity (3½ pints) will bring fluid level to 1" below filler opening. DO NOT add to bring level to opening.

►*BANJO HOUSING INSTALLATION NOTE: Check rear universal joint angle. See "Propellor Shaft Notes" in Plymouth Special Data.*

Rear Axle Ratios

Transmission	Exc. Fury	Fury
Synchro-mesh	3.54-1(39-11)	① 3.73-1(41-11)
Overdrive	3.91-1(43-11)	
PowerFlite	3.36-1(37-11)	
TorqueFlite	3.18-1(35-11)	② 3.36-1(37-11)

① - Optional Ratios - 3.36-1(37-11); 3.54-1(39-11); 3.91-1(43-11); 4.1-1(41-10); 4.3-1(43-10).
② - Optional Ratios - 2.92-1(38-13); 2.93-1(41-14); 3.18-1(35-11); 3.54-1(39-11); 3.73-1(41-11); 3.91-1(43-11); 4.1-1(41-10); 4.3-1(43-10); 4.56-1(41-9); 4.89-1(44-9).

Backlash - .006-.010".

Carrier Removal: Disconnect rear universal, remove axle shafts (see below), take out carrier capscrews, lift off carrier assembly.

Axle Shaft Removal: Remove wheel, drum, and hub assembly (use screw type hub puller—Tool C-845), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-745) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 Puller).

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick equally at both wheels). **End Play -** .013-.018".

SHOCK ABSORBERS

"Oriflow". Direct-acting, hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Independent. New "Torsion-Aire" suspension, with ball joint mounted steering knuckles and torsion bar front spring.
See "Torsion-Aire" in Front Suspension & Wheel Alignment Section.

►*UPPER BALL JOINT LUBRICATION LOSS CORRECTION: See "Plymouth" in Suspension & Wheel Alignment Section.*

Steering Axis Inclination - 6½° with correct camber.
Camber - Left wheel 3/8° preferred, limits Pos. ½°-0°. Right wheel 0° preferred, limits 0° ± ¼°.
Cast r - 0° to Neg. 1½° (Manual Strg.), Pos. 1½° to 0° (Pwr. Strg.). *NOTE -* Set both sides the same.
T -In - 1/8" preferred, limits Pos. 3/32-5/32".
T -Out n Turns - Inner wheel 20°, outer wheel 17½-19°.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STEERING

Manual: Gemmer. Worm and three-tooth roller.
See "Gemmer Worm & Roller" in Steering Section.

Power Steering: "Coaxial". Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column.
See "Coaxial" Power Steering in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service. Plymouth "Total-Contact" (Floating shoe) type.
See "Chrysler, DeSoto, Dodge, Plymouth Center-Plane & Total-Contact" Brakes in Brake Section.
Drum Diameter - 11" front and rear.
Wheel Cylinder Diameter - 1 1/8".
Lining - Molded asbestos (bonded to shoe).
Length - 11½". **Width** - 2". **Thickness** - .20".

►*BRAKE LINING PRODUCTION CHANGE AND PARTS REPLACEMENT NOTE:* Improved brake lining (identified by one white spot and one blue spot on side of lining) used in production on front wheel brakes approximately April 15th, 1957. They are recommended for use for severe braking conditions and can be installed on both front and rear wheels. Part No. 1738920 consists of 8 linings. Part No. 1674067 consists of one shoe with bonded lining.

Braking Power - 60% front, 40% rear.

Clearance - Front Wheels - Turn each adjusting cam in direction of forward wheel rotation until shoe is solid against drum and wheel locked. Turn cams in opposite direction until wheel turns free.

Rear Wheels - Same as for front wheels except that forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe adjusting cams are rotated in direction of reverse wheel rotation.

►*DUST SHIELDS (Front Wheels) SEALING CAUTION:* Wheel shields are sealed with heavy body sealer to prevent dust and water entering braking area. Reseal wheel cylinder openings as necessary, when servicing brakes.

Master Cylinder: On engine side of dash panel opposite base of brake pedal.

Checking Fluid - Filler plug on top of master cylinder (on dash panel in engine compartment). Maintain level to within ½" of top of reservoir.

Removal - Disconnect pedal return spring, pushrod and brake tube at master cylinder. Disconnect stop light wires from switch and remove nuts and bolts that secure master cylinder to dash panel. Pull master cylinder straight out from dash panel.

Power Brakes: Bellows Assist type. Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder).

See "Chrysler, Plymouth Bellows Type Power Unit" in Brake Section.

Removal of Power Unit - Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket, to prevent trigger arm from extending beyond bracket. Remove attaching nuts, slide reinforcement plate off studs and remove unit from dash.

Parking Brake: On shaft at rear of transmission. 6" external contracting type used with Synchro-mesh Trans., 7" internal expanding type used with Automatic Trans.
Adjustment - *See "Brakes" in Plymouth Special Data.*

Lining	Width	Thickness	Length
6" Ext.	2"	5/32"	15.38"
7" Int.	2"	5/32"	13.44"

►*PARKING BRAKE CAM LEVER INTERFERENCE CORRECTION:* Install 1/8" steel shim between rear engine mount and crossmember when interference prevents brake from releasing.

MISC. MECHANICAL

Windshield Wipers: Auto-Lite Electric. EPW-4001 (Single Speed), EPV-4001A (Variable Speed).
See "Auto-Lite Electric Windshield Wipers" in Misc. Section.

Air Conditioning: Heater-Air Conditioning. *See "Air Conditioning" in Miscellaneous Section.*

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch.
See "Electric Window Regulators" in Misc. Section.

Power Seat Adjusters: Electric, 2-Way type.
See "Power Seat Adjusters" in Misc. Section.

Convertible Top Control: Electric-hydraulic type. *See "Power Top Controls" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	95
Exhaust Manifold	25
Flywheel	95
Harmonic Balancer	160
Intake Manifold	40
Con Rod Caps	45
Main Bearing Caps(Exc rear)	95
Main Bearing Cap(Rear)	120
Oil Pan	18
Pushrod Cover	5
Rocker Arm Cover	5
Water Pump Mounting	18

ENGINE

ENGINE REMOVAL: *NOTE–The engine may be removed with the transmission attached, however if it is desired to remove transmission before removing engine, see "Transmission Removal" on Car Page.*

1) Drain engine oil, water, and transmission lubricant With hood raised, remove hinge to cowl attaching screws and hinge to hood attaching screws, and remove hood

2) Remove battery Remove carburetor air cleaner and disconnect throttle linkage On cars with power steering, remove power steering pump belt and pump with mounting bracket, leaving hoses connected Place pump in position where it will not become damaged Remove upper and lower radiator hoses and disconnect heater line from intake manifold and bottom of radiator On Hydra-Matic cars remove oil cooler inlet and outlet lines from radiator

3) Disconnect flex fuel line at fuel pump, oil pressure gauge line at connector near dash, and windshield wiper vacuum hose at rear of engine Disconnect power brake vacuum hose at check valve to carburetor pipe Remove thermo gauge unit from fitting in intake manifold Disconnect coil primary lead at coil Disconnect generator to regulator wires from generator (release from clips retaining to valve cover and pull clear of engine)

4) Disconnect wire loom running to right headlight across radiator at junction block on right side of radiator support to fender brace and release loom from clips retaining it to radiator Remove fan, fan shroud, and radiator

5) Remove engine right side apron and crankcase ventilator outlet pipe Disconnect exhaust pipe from exhaust cross over pipe Disconnect solenoid wire loom from junction block on fender skirt Remove gearshift linkage at transmission Disconnect linkage from clutch control countershaft bracket from flywheel housing (synchro-mesh cars) Remove propellor shaft

6) Hook a chain fall to intake manifold by means of a strong chain threaded through the openings in manifold just behind carburetor Raise engine just enough to take weight off engine insulators Remove screws holding front and rear insulators to frame crossmembers

7) On Hydra-Matic Cars, support bottom of transmission with a jack and jack adapter J-2808 and remove frame crossmember to which engine rear insulators were fastened *CAUTION*–Use care to prevent transmission swinging down when crossmember is removed

8) Carefully hoist engine and transmission out of car checking frequently to see that sufficient clearance exists to prevent bending any parts

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD: Removal–Remove intake manifold and push rod cover Remove rocker arm covers (On left bank, remove spark plug wires and wire support). Remove battery and engine ground straps, Hydra-Matic level indicator tube bracket and indicator. Loosen all rocker arm adjusting nuts and move rocker arms off pushrods Remove pushrods and place in order so they can be reinstalled in the same position (*NOTE*–The rearmost pushrod on left bank (cars with defroster) cannot be removed withdraw rod part way and tie to head Remove exhaust crossover pipe to manifold attaching screws and remove screws from cylinder head water outlet fitting Remove cylinder head (dowel pins will hold head in place) and remove head with exhaust manifold attached (*NOTE*–When left head being removed, raise head off dowels, move it forward and "jockey" the the head in order to clear defroster, power steering, and power brake equipment)

Installation: *(NOTE–Right and left cylinder heads are interchangeable except for water passage plug in end of water passage which must be installed in correct position if new head installed).* To install, reverse removal procedure and note the following Head screws are three different lengths and when properly installed, all screws will project an equal distance from head. Do not use sealer of any kind on threads.

CONNECTING ROD & BEARINGS

CONNECTING ROD BUSHING REPLACEMENT: Press out old bushing using Bushing Remover & Installer J-5753-3 and Block J-5753, (*NOTE*–For removal of bushing, the smallest diameter or third shoulder on tool is inserted in bushing). Press new bushing into place using same tools as for removal, but using opposite end of Bushing Remover & Installer This tool must be used since the thin wall bushing will distort when pressed into rod unless supported by shank of tool. Drill a 5/32' hole in bushing through oil hole in top of rod, using care to prevent end of tool damaging opposite side of bushing Swage or expand bushing into connecting rod using Burnisher Tool J-5753-1 and Block J-5753, pressing Burnisher Tool through bushing with connecting rod assembly supported on Block Hone bushing to fit piston pin

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL REPLACEMENT:

1) Drain oil and remove oil pan, oil pump, and oil pump drive shaft Remove oil baffle and cylinder block to oil baffle tube (lower oil level indicator tube). Remove transmission (See Synchro-mesh Transmission Removal on Car Page or Hydra-Matic Drive in Transmission Section)

2) Remove rear center main bearing cap and upper half of rear center main bearing shell to allow crankshaft to be lowered and to prevent damage to thrust surfaces of bearing. Remove rear main bearing cap and loosen remaining bearing caps sufficiently to allow crankshaft to be lowered approximately 3/8" at rear.

3) With crankshaft lowered to provide clearance, remove upper half of rear main bearing oil seal and bearing shell.

4) Install seal in cap with one end flush with cap and compress seal using hammer and Seal Compressor J-6528 *Do not pack seal into locking recess in cap.* Remove seal from cap and install in groove in block by slipping over crankshaft into cavity of block Insert end which was flush with cap first Install rear center main bearing cap with bearing shell and tighten to 95 ft lbs to pull crankshaft up into place against seal Carefully trim both ends of seal flush with block

5) Install a new seal in cap, as above, *except that Seal must be packed into locking recess in cap.* Trim seal flush with cap. Install cap with shell and tighten to 120 ft lbs Remove rear main bearing cap again and inspect split line to be certain that none of seal material has been compressed between cap and block. Make sure mating surfaces are clean.

6) Next, apply a bead of sealer (Permatex No. 3) approx. 1/16" in diameter to mating surface of cap extending from packing seal groove outward to the groove for oil pan cork rear gasket Install rear main bearing cap and tighten to 120 ft lbs. torque

7) Remove rear center main bearing cap and reinstall upper half of bearing shell. Install cap and tighten to 95 ft. lbs. Tighten remaining bearing caps to 95 ft. lbs. Replace transmission, oil pump, oil pump drive shaft, oil baffle, oil pan and flywheel lower cover and shield.

►*CAUTION:* Seal must be installed exactly as detailed above to prevent oil leaks at rear bearing Make certain that seals not cut too short and that mating surfaces of bearing cap and block are free of any packing material, dirt or oiliness (except for Permatex bead on cap) and that they are not scratched or burred

VIBRATION DAMPENER

VIBRATION DAMPENER: Removal–Loosen generator at adjusting strap and remove fan belt from vibration dampener. On card equipped with power steering, also remove power steering pump belt. Position fan so wide angles will be at top and bottom allowing access to dampener Remove dampener attaching screw (15/16" socket) and retaining washer, and slide dampener off shaft

Installation: Reverse the removal procedure.

ENGINE FRONT COVER

ENGINE FRONT COVER: Removal–1) Drain radiator. On cars with power steering, remove pump with mounting bracket from pad on top of engine front cover and lay it back on fender skirt where it will be out of the way. *(CAUTION–Disconn ct batt ry ground strap).*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

2) Disconnect wires from generator and remove generator and mounting bracket and adjusting strap. Remove fan belt, power steering pump belt, and fan and pulley. Disconnect upper and lower radiator hoses, remove fan shroud, and remove radiator. Remove water inlet elbows from cylinder heads (leave hose attached). Remove fuel pump and remove vibration dampener.
3) Take weight off engine front insulator using suitable engine lifting equipment. *(CAUTION–Do not use jack under oil pan).* Remove screws and lockwashers attaching front insulator to engine front cover. Remove four front oil pan-to-engine front cover screws. Remove engine front cover-to-block attaching screws and nuts. Pull cover forward to clear studs and remove.

Installation: See Crankshaft Oil Seal (below), install new front oil pan gasket (cement gasket to oil pan), Position new front cover gasket over studs on front of block, position front cover on engine, install all capscrews and nuts with lockwashers and tighten securely. Install four oil pan-to-front cover capscrews and lockwashers then tighten these screws to 18 ft lbs. Install front engine support-to-front cover screws loosely, then lower engine and tighten screws to correct torque of 60 ft. lbs. Reassemble engine by reversing removal procedure (above).

CRANKSHAFT FRONT OIL SEAL REPLACEMENT: After front cover removed (above), slide old seal off end of crankshaft. Coat face of new seal with graphite lubricant and install on crankshaft before installing front cover.

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL & INSTALLATION: Drain radiator. Remove intake manifold, crankcase ventilator outlet pipe, pushrod cover and rocker arm covers. Disconnect and move spark plug wires out of way. Loosen rocker arm ball nuts so rocker arms can be disengaged from pushrods and turned sideways. Remove pushrods and hydraulic lifters. Mark or store pushrods and lifters so they can be installed in original positions *(NOTE* - Exhaust valve pushrod of No.7 cylinder cannot be removed because of interference with defroster core. It should be blocked up so that it will not interfere with removal of camshaft. Use spring-loaded clothes pin). Remove radiator and timing chain cover. Remove timing chain cover seal and fuel pump eccentric. Slide timing chain and sprockets off ends of crankshaft and camshaft. Remove camshaft thrust plate attaching screws and remove thrust plate. Slide camshaft out of engine carefully, making sure not to damage bearings in block. Front of engine should be raised as necessary to permit shaft to slide between grille and hood catch support plate. To install camshaft, reverse removal procedure.

TIMING CHAIN

▷*TIMING CHAIN REMOVAL CAUTION: Do not rotate crankshaft with timing chain out of engine.* Damage to valves, pistons, or both will result due to piston striking valve. To rotate camshaft with timing chain off, crankshaft must be positioned so pistons are 45° before or after TDC, to avoid damage to valves.

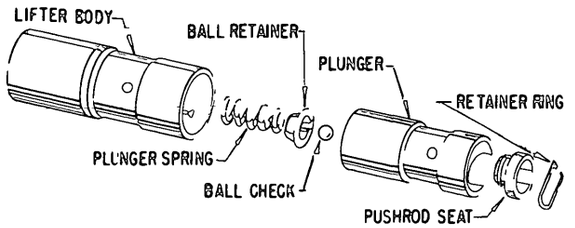
TIMING CHAIN: Removal–Remove engine front cover (See Engine Front Cover above). Remove fuel pump eccentric. Align timing marks on sprockets. Slide timing chain and sprockets off camshaft and crankshaft.

Installation: Install new timing chain and sprockets making sure that marks on sprockets are aligned exactly on a straight line passing through shaft centers. Install fuel pump eccentric indexing pin on eccentricwith hole in sprocket. Install retainer screw and retainer washer and tighten securely. Install engine front cover.

VALVE SYSTEM

CHECKING VALVE STEM LENGTH: Position rocker arm on stud and hold in place using Rocker Arm Stud Installer J-6301. Slip valve into place and hold it against valve seat. While holding rocker arm and valve in position securely, insert Valve Train Gauge J-6324 through pushrod hole and seat snugly in pushrod seat of rocker arm. With all parts seated, step end of gauge should be at least flush with gasket face of head, but should not project past step on gauge. If gauge projects too far (indicating valve stem too long), grind off tip of valve stem as necessary. *CAUTION*–When grinding end of valve stem be careful not to overheat it which will soften the hardened stem.

ROCKER ARMS



ROCKER ARM STUD REPLACEMENT: *NOTE–Use oversize stud (.003") only when original stud is found to be loose in cylinder head. Use Std. size stud for replacement when original stud threads are damaged .*

Removal: 1) Remove cylinder head from engine. With rocker arm removed, file two slots 3/32" to 1/8" deep on opposite sides of rocker arm stud. Top of slots should be 1/4-3/8" below thread travel. Place washer J-6392-3 at bottom of rocker arm stud. Position Rocker Arm Stud Remover J-6392-1 on rocker arm stud and tighten screws securely with 5/32" allen wrench. Place spacer J-6392-2 over stud remover. Thread 7/8" standard nut on stud remover and turn nut until rocker arm stud is out of cylinder head. If oversize stud being installed, ream out stud hole with Reamer J-5715.
2) Remove plugs from ends of cylinder head oil gallery and thoroughly clean out metal deposits and foreign matter from cylinder head (head must be right side up so metal or foreign material will not lodge around studs).

Installation: 1) Position rocker arm on new rocker arm stud and place Rocker Arm Stud Installer J-6301 on stud in place of rocker arm ball. Carefully press stud into head using a 2-Ton press, until it is installed about half-way (7/16").
2) Position Valve Train Gauge J-6324 in pushrod hole so that it seats properly in the rocker arm. With valve seated, slowly press rocker arm stud into cylinder head until gauge projects about midway between end of gauge and step with respect to gasket surface of cylinder head.
3) Remove Rocker Arm Stud Installer, rocker arm and ball. Blow air through hole in new stud to insure that passage is not restricted, and blow air through oil gallery. Replace plugs in ends of oil gallery. Check oil passages from oil gallery to all studs. Install rocker arm and ball and install nut loosely. Replace cylinder head.

HYDRAULIC LIFTERS

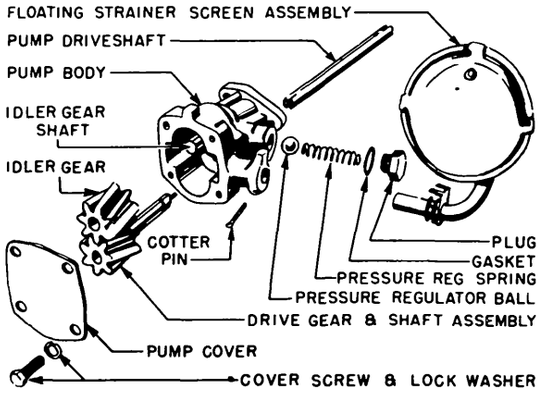
HYDRAULIC VALVE LIFTER OVERHAUL: Rem val– Remove intake manifold, pushrod cover and rocker arm cover. Loosen rocker arm ball nut and move rocker arm off pushrod. Remove pushrods (rear lifter on left bank cannot be removed if car is equipped with defroster, but must be raised and moved out of way for removal of lifter). Remove lifter from bore in cylinder block.

V8 HYDRAULIC VALVE LIFTER

Disassembly: Remove pushrod seat retaining ring by holding down seat with pushrod while dislodging spring from lifter body with pointed tool (*NOTE*–it may be necessary to unseat lifter ball, using plunger unloader J-5097, before plunger can be pushed down). Invert lifter and allow plunger to slide out of body. If plunger sticks, place lifter in large end of Hydraulic Valve Lifter Plunger Remover J-4160-A, with pushrod end of lifter downward. Hold tool firmly in hand with thumb over lifter body and strike sharply against a block of wood until plunger falls out (it may be necessary to soak a lifter with a stuck plunger in cleaning solvent to loosen plunger in body). *CAUTION–If more than one lifter is being disassembled at a time make very sure that parts for each individual lifter be kept together so that parts are not intermixed.*

Inspection: Wash individual lifters separately, keeping parts for each lifter together. If necessary, soak lifter in suitable carbon solvent to dissolve varnish and carbon. Using a lint free cloth, clean each part with a hard wiping action. Use a bristle brush if required. Do not use a wire brush or sandpaper. Inspect lifter body for scoring, and check cam surface at end of lifter for wear. Check plunger, and using a magnifying glass, inspect check ball seat for defects, and outer surface of plunger for scratches or scores. Inspect pushrod seat for roughness and make sure hole in seat is open. Inspect lifter ball for nicks or scoring. If any part of lifter is found defective, replace entire unit.

Assembly: Rinse all parts in clean kerosene before assembly and assemble without drying. Rinse plunger spring and ball retainer and position retainer in spring.



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Install ball in retainer Rinse plunger and place on retainer so seat on plunger mates with ball Invert plunger with parts assembled thus far and after rinsing body install body over spring and plunger Place lifter body on clean paper, rinse and install pushrod seat and retainer ring

Checking Leakdown Rat · Fill tester cup in Valve Lifter Leakdown Tester J-5790, to approximately 1 inch from top with special testing fluid Swing weight arm up out of way, raise ram, and position lifter into boss in center of tester cup Place 7 32" steel ball in pushrod seat of lifter and lower ram onto ball Adjust ram (with weight arm clear of ram) so that pointer is positioned on set line (marked "S") Tighten jam nut to maintain setting Operate lifter through full travel of plunger by pumping weight arm to fill lifter with test fluid and force out air, (Lifter must be completely submerged at all times) Continue pumping for several strokes after definite resistance is felt (*NOTE*–If noticeably weak resistance is felt during any one of last few strokes (of hard pumping), replace ball in lifter and repeat test to this point Raise weight arm to allow plunger spring to expand fully, lower arm onto ram and commence turning crank slowly (1 revolution every 2 seconds) Time indicator travel from lower line (first line above set line) to line marked .125" or 1/8", while still rotating cup with crank. Lifter is satisfactory if rate is between 12 and 40 seconds Check a questionable lifter 3-4 times before discarding

Installati n· *(CAUTION–If new lifter is to be installed, remove sealer coating from new lifter, making sure that hole in pushrod seat is not plugged with sealer coating. Check leakdown rate).* Place new lifter in lifter boss and replace pushrod exactly as removed (same end against rocker arm). Tighten rocker arm ball retaining nuts to 15 ft. lbs. Replace rocker arm cover, pushrod cover and intake manifold.

V8 OIL PUMP

OILING SYSTEM

OIL PUMP

OIL PUMP OVERHAUL: Removal–Remove oil pan and remove oil pump attaching screws while holding pump in place Carefully lower oil pump away from block with one hand while removing oil pump drive shaft with the other hand

Disassembly: Remove cotter pin which retains floating screen to pump inlet and remove screen Remove pressure regulator and spring retainer, spring and pressure regulator ball Remove screws retaining cover to oil pump body and remove cover. Remove driven gear and drive gear with shaft

Cleaning & Inspection: Clean all parts thoroughly (clean screen with Bendix Cleaner) Inspect pressure regulator spring for distortion, cracks, and wear on sides Inspect pressure regulator ball for nicks or other damage Inspect oil pump drive shaft (distributor to pump shaft) for wear or cracks Inspect all other pump parts for wear Replace parts as necessary.

Assembly· Install drive and driven gears Install cover and turn drive shaft by hand to insure that it turns freely and has a slight amount of endplay Install pressure regulator ball, spring and retainer using a new gasket on retainer *(CAUTION–Do not attempt to chang oil pressure by varying length of pressure regulator spring).* Install screen assembly on oil pump and install new cotter pin retainer

Installation: To install pump, position drive shaft into position in distributor and oil pump drive gear, then position oil pump in place on block, indexing drive shaft with pump drive gear shaft Install two attaching screws with lockwashers and tighten securely *(NOTE–* Removal and installation of pump does not disturb distributor timing) Install oil pan

FUEL SYSTEM NOTES

FUEL FILTER: On cars with AC glass bowl type filter at carburetor remove and clean glass bowl Replace filter element if it is becoming plugged *See car model page for filter element production change NOTE* - Additional filters located in fuel tank and in fuel pump (screen located in fuel passage directly below inlet valve)

EXCESSIVE FUEL PUMP PRESSURE (Causing Carburetor Flooding)· If fuel pump pressure in excess of 5 lbs., check pump for incorrect diaphragm installation (insufficient slack) before replacing pump

1) Mount pump in vise with fuel side up, loosen fuel pump cover screws two turns to free diaphragm.

2) Flex diaphragm by moving rocker arm up and down several times (use short piece of pipe fitted over rocker arm to provide leverage)

3) Hold rocker arm in extreme upper position while tightening all cover screws securely This will provide slack in diaphragm

4) Reinstall pump and check pressure. If pressure still in excess of 5 lbs . replace pump

► *"TRIPLE CARBURETOR" & "EXTRA HORSEPOWER" ENGINE NOTE:* Specifications for special equipment used on these engines (Carburetors, Distributors, Camshaft, etc.) are included in data below.

MODEL IDENTIFICATION

Model	Model Designation
Chieftain	57-27
Super Chief	57-27
Star Chief ①	57-27
Star Chief	57-28

① - 2-Seat Station Wagons only (2 Dr. & 4 Dr.).

SERIAL & ENGINE NUMBER: Numbers are the same. Located on left front hinge pillar post and on machined pad on front of R.H. Cyl. bank. *NOTE* - Production Engine No. located on front of block near R.H. edge of timing chain cover, for factory usage.

► *ENGINE COMPRESSION RATIO NOTE:* Compression ratio indicated by mark stamped on Serial No. pad as follows: "L" in circle - 8.5-1. No mark 10-1.

► *SERIAL NUMBER NOTE:* Engine and serial number (Example P757H 1001) includes following identification data in sequence:

Assembly Plant	Model ①	Model Year	Trans. Type ②	Serial No.
See below	7	57	H	1001

① - **7** - (27 Series). **8** - (28 Series).
② - **H** - (Hydra-Matic). **S** - (Synchro-mesh).

Assembly Plant Designations

P - Pontiac	**K** - Kansas City
C - South Gate	**L** - Linden
W - Wilmington	**A** - Atlanta
F - Framingham	**T** - Arlington

TUNE-UP

COMPRESSION PRESSURE: (8.5-1 Hd.) 140-150 lbs., (10.0-1 Hd.) 155-165 lbs. at cranking speed of 155-165 RPM. Lowest cylinder must not be less than 80% of highest cylinder.

VALVE TAPPET CLEARANCE: All Engines with Hydraulic Lifters - None in service.
Extra HP. Engine with Mechanical Lifters - .018" COLD, All Valves.

MANIFOLD HEAT CONTROL: Thermostatic coil type in right hand exhaust manifold outlet. Valve must operate freely.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAPS: .035" (.033-.038").
Spark Plugs - AC No. 45 Std. (AC No. 44 Extra HP Engines). 14 mm. Torque to 25 ft. lbs.

COIL: Delco-Remy 1115087 (Std.), 1115099 (Extra HP Engines with Synchro-mesh Trans.).
Ignition Current - (1115087) 1.2 amps. idling, 3.5 amps. stopped; (1115099) 1.8 amps. idling, 4 amps. stopped.
Resistor - Delco-Remy (1115087 Coil) 1935134, 1.40-1.62 Ohms. (1115099 Coil) 1931385, .27-.29 Ohms.

► *COIL RESISTOR NOTE:* Resistor is connected in lead between ignition switch and coil. Resistor is by-passed during cranking by second lead from ignition switch to coil side of resistor.

DISTRIBUTOR: Delco-Remy.

Application	Delco-Remy No.
Std. Engine	1110871
Triple Carb. Eng.	1110871
Extra HP Eng. (Hydra-Matic)	1110871
Extra HP Eng. (Synchro-mesh)(Early)	1110888
Extra HP Eng. (Synchro-mesh)(Later)	1110897
Fuel Injection Eng.	1110894

► *DISTRIBUTOR NOTE: Different types used as follows:*
Models 1110871 & 1110894 - External adjustment "window" type.
See "Delco-Remy Window Distributor" in Electrical Section.
Models 1110888 & 1110897 - Double breaker type with conventional distributor cap (not window type). Vacuum spark control not used (centrifugal weight advance only).
Condenser - Delco-Remy 1932004 (All Distributors).
Capacity - .18-.23 mfd.
Contact Point Set - Delco-Remy 1931988 (1110871 & 1110894 Distr.), No. 1918148 (1110888 & 1110897 Distr., Two used.).
Breaker Gap (1110871 & 1110894) - *NOTE* - When cam angle correctly set (see below), breaker gap will be correct (.016").
Breaker Gap (1110888 & 1110897) - .014-.018".
Cam Angle (1110871 & 1110894) - 28-32°. Set to 30°.

► *BREAKER GAP AND CAM ANGLE NOTE:* Setting cam angle at 30° will provide .016" breaker gap.
Cam Angle (1110888 & 1110897) - Adjust each set of points to 29°±1° with other set of points blocked open with .025" thick insulator. Cam angle for both sets of points operating together will be 34°± 1°.
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Counterclockwise viewed from above.

Automatic Advance (1110871 & 1110894)

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	400	0-4	800
7.5-9.5	1000	15-19	2000
12-14	2125	24-28	4250

Automatic Advance (1110888)

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	500	0-4	1000
5-7	1000	10-14	2000
6-8	1325	12-16	2650

Automatic Advance (1110897)

Degrees	Distr. RPM	Degrees	Eng. RPM
.5-2.5	525	1-5	1050
7-9	1050	14-18	2100
8-10	1400	16-20	2800
9-11	1800	18-22	3600

Vacuum Spark Control: Delco-Remy 1116126 (1110871 & 1110894). *NOTE* - No vacuum control used on 1110888 or 1110897.

Vacuum Advance (1110871 & 1110894)

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6-8
10-12	20-24	14-15¾

IGNITION TIMING

► *TRIPLE CARBURETOR & EXTRA HP ENGINE HARMONIC BALANCER NOTE:* These cars **and early production air conditioned cars with standard engine** have three timing marks on harmonic balancer as follows: 10° BTDC, 6° BTDC and TDC.

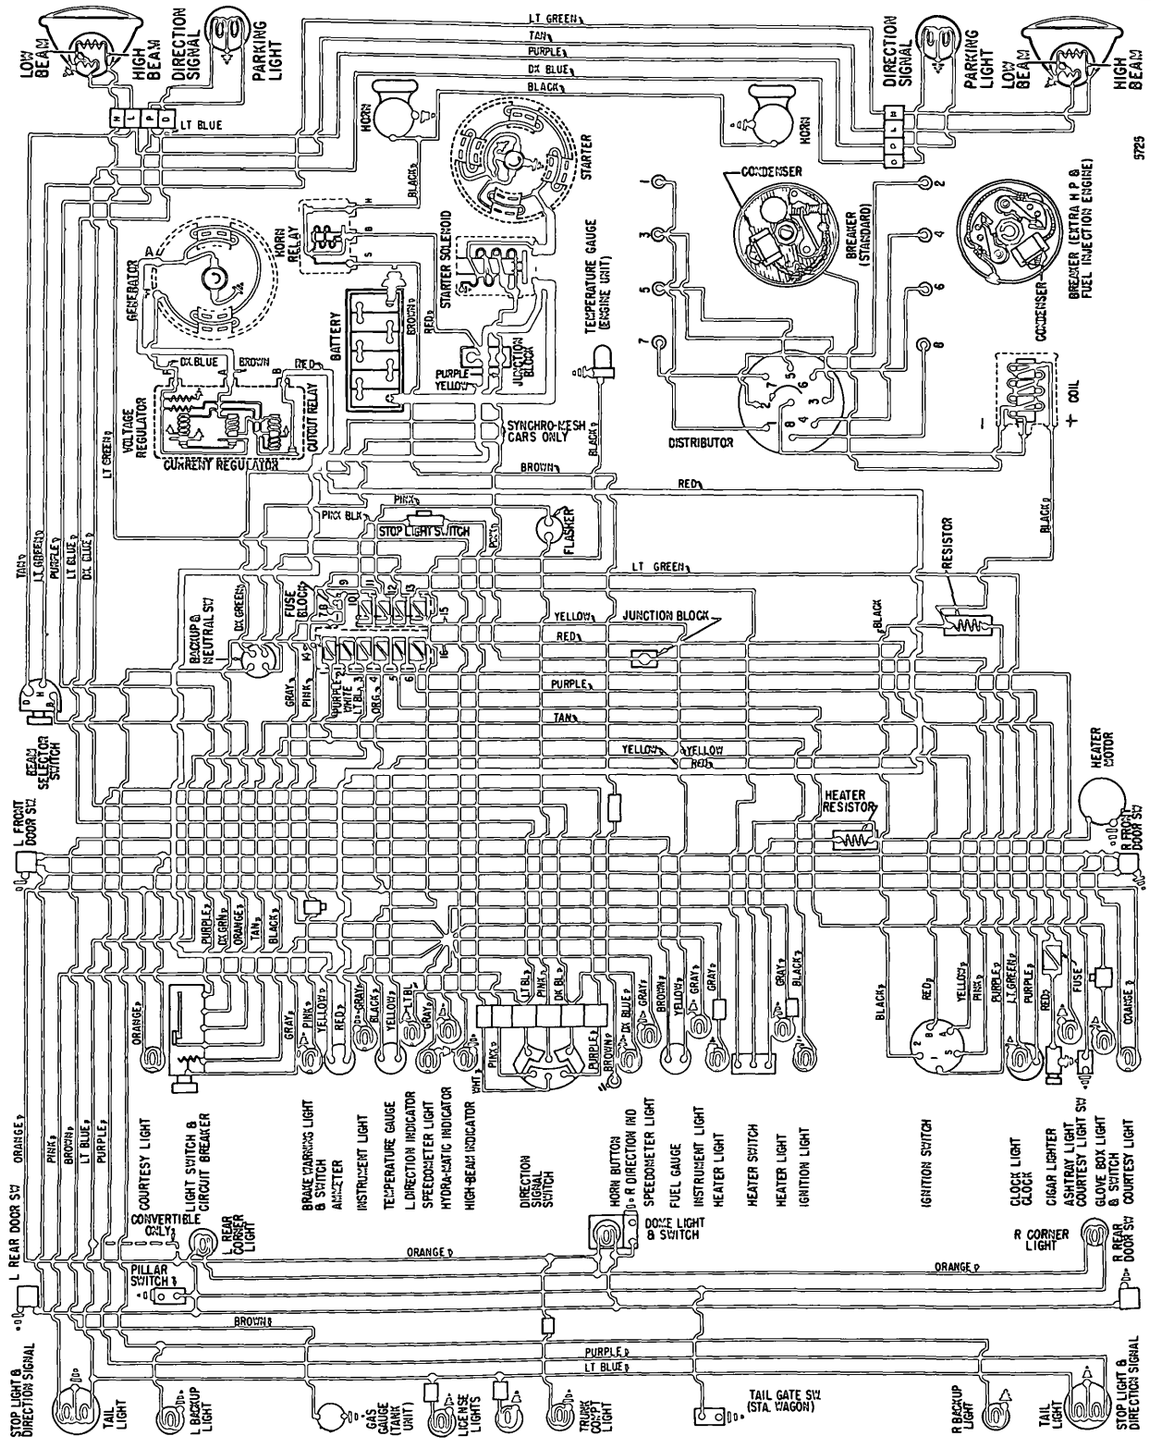
Engine	Std. Ign. Setting
Std. Eng. (Std. & A.C.)	6° BTDC at 430-450 RPM
Triple Carb. Eng. Ⓒ	6° BTDC at 430-450 RPM
Extra HP Engine ②	10° BTDC at 630-670 RPM

Ⓒ - Hydra-Matic Drive Cars.
② - Synchro-mesh Cars only. (Hydra-Matic same as Triple Carb. Engine).

► *TIMING CAUTION:* Set timing with engine at operating temperature and idling at indicated RPM **with vacuum line disconnected.**
Timing Marks (All Std. Engines & All Late Production Std. Engines with Air Conditioning) - Two marks on harmonic balancer, TDC and 6° BTDC. Pointer on timing sprocket cover aligned with correct mark on harmonic balancer.
Timing Marks (All Triple Carb. and Extra HP Engines and Early Production Std. Engines with Air Conditioning) - Three marks on harmonic balancer, TDC, 6° BTDC and 10° BTDC. Pointer on timing sprocket cover aligned with correct mark on harmonic balancer.

CARBURETOR

► *CARBURETOR APPLICATION: Used as follows:*



Model	Carb. Type
Chieftain	Rochester 2-Barrel
Super & Star Chief	Carter or Rochester 4-Barrel
Triple Carb. Option	Three Rochester 2-Barrel
Extra HP Engines	Three Rochester 2-Barrel
Special	Rochester Fuel Injection

► *AIR CLEANER NOTE: Replaceable Paper Element type used with Triple Carburetor Option and Extra Horsepower models. See AIR CLEANER below.*

► *FLOODING CORRECTION NOTE (ALL CARBS.): See individual carburetor stories in Carburetion Section.*

THROTTLE LINKAGE ADJUSTMENT (DUAL-RANGE HYDRA-MATIC DRIVE CARS): With the engine at normal operating temperature, idle speed set at 450-470 RPM, and with transmission selector lever in "N" (neutral), install linkage adjustment pin J-2544 through holes in lever and bracket at rear of left head. Pin should fit freely in holes without lever movement. If free fit not obtained, adjust trunnion nuts on carburetor throttle valve rod until pin is free then tighten nuts securely. Leave gauge pin in hole. Loosen trunnion nuts on transmission throttle control rod and push rod downward until control outer lever is felt to touch end of its travel (top nut must not be touching trunnion). **Shorten throttle control rod two turns** by loosening lower nut two turns and tightening upper nut two turns. Remove gauge pin. With carburetor throttle in full open position and Downshift Return Spring fully extended, adjust throttle control intermediate rod trunnion (at lever on engine bracket) so

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

that accelerator pedal clears floor mat by approximately 1/4" at closest point, tighten trunnion locknuts.

ROCHESTER 2GC 2-BARREL

Rochester 2GC 7009832 (S.M.), 7009831 (Hydra-Matic).

▷ *ROUGH IDLE AND SURGE CORRECTION:* Install new venturi cluster No. 7011561 (replaces 7010503) on Synchro-mesh cars, and modified venturi cluster 7010575 on Hydra-Matic cars. *NOTE* - Letter "A" on carburetor tag of Hydra-Matic and "D" on Synchro-mesh cars indicates modification has been made in production.

▷ *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*

Idle Setting - 1½ turns open from lightly seated position. Turn screws out for richer mixture.

Idle Speed - 450-470 RPM in Neutral (Synchro-mesh), 430-450 RPM in Drive Range (Hydra-Matic), 500-520 RPM (Air Conditioned Cars - with compressor OFF).

Float Level - 1 15/64" ± 1/32" (Gauge J-6629) from bottom of float to gasket on cover with needle valve seated (invert bowl cover assembly and place gauge over float).

Float Drop - 1 29/32" ± 1/8" from gasket on cover to bottom of float at free end with float hanging freely below bowl cover.

Fast Idle: No separate adjustment required (will be correct if hot or slow idle speed correct).

Automatic Choke Setting: Centered (at Index).

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷ *OTHER DATA: See "Rochester 2GC Carburetor" in in Carburetion Section.*

ROCHESTER 4GC 4-BARREL

Rochester 4GC 7009829 (S.M.), 7009830 (Hydra-Matic).

▷ *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 4-3-5-8, LEFT barrels feed 1-4-6-7.*

Idle Mixture & Idle Speed Setting - Same as for Rochester 2GC (above). Idle mixture screws on primary side

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷ *OTHER DATA: See "Rochester 4GC-4-Barrel" Carburetors in Carburetion Section.*

CARTER AFB 4-BARREL

Carter AFB, No. 2506S. New design 4-barrel downdraft type with automatic choke.

▷ *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels feed 1-4-6-7.*

Idle Mixture & Idle Speed Setting - Same as for Rochester 2GC (above). Idle mixture screws on primary side

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷ *OTHER DATA: See "Carter AFB 4-Barrel" Carburetors in Carburetion Section.*

"TRIPLE CARBURETORS"
(Rochester 2GC)

Engine	Rochester Carburetor No. Front	Center	Rear
Hydra-Matic Optl.	7011351	7011350	7011352
Extra HP Engine ©	7011351	7011500	7011352

© - Synchro-mesh cars only. Hydra-Matic cars use same carburetors as listed for "Hydra-Matic Optl.".

For complete adjustment data on these carburetors (including linkage adjustment to insure correct synchro-

CONTINUED FROM PRECEDING PAGE

nization), se "Pontiac Triple Carburetors" in Carburetion Section.

ROCHESTER "RAMJET" (Optional)

S e "Rochester Ramjet Fuel Injection" in Carburetion S ction.

AIR CLEANER: Oil-wetted type (Std.), Heavy Duty Oil-bath type (Optl.), Replaceable Paper Element type (Triple Carb. & Extra HP. Engines).

►*PAPER ELEMENT TYPE AIR CLEANER CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.*

FUEL PUMP PRESSURE: 4-5 lbs. at 450-1000 RPM.

►*FUEL PUMP DRIVE NOTE:* Pump drive eccentric on forward end of camshaft has bushing (.010" clearance on eccentric) for pump drive. Bushing must be installed with flanged end toward camshaft sprocket.

CARB. EQUIPMENT

Fu l Pump: AC No. 4123 (Early), No. 4417 (Later). Fuel & Vacuum (With Vacuum Wipers). No. 4328, Fuel only (With Electric Wipers).

►*FUEL PUMP PRODUCTION CHANGE:* Two types of Fuel & Vacuum pumps used. Early type has 5/16" pipe fittings. later type has 3/8" fittings.

►*FUEL PUMP DRIVE NOTE:* Pump drive eccentric on forward end of camshaft has bushing (.010" clearance on eccentric) for pump drive. Bushing must be installed with flanged end toward camshaft sprocket.

Pressure - 4-5 lbs. at 450-1000 RPM.

Fuel Filter: Two used, one as part of Fuel Gauge Tank Unit, the other at inlet side of carburetor.

See "Fuel System Notes" in Pontiac Special Data.

Gas line Gauge: AC Electric type.

Dash Unit - AC No. 1518594.

Tank Unit - AC No. 1518394 (Exc. Sta. Wgn.), No. 1518812 (2-door Sta. Wgn.), No. 1518813 (4-door Sta. Wgn.).

See "Fuel Gauges" in Carburetion Section.

BATTERY

Synchro-mesh Cars - Delco No. 2SMR53. 12 volt, 9 plate, 53 ampere hour capacity (20 hr. rate).

Hydra-Matic Cars - Delco No. 558. 12 volt, 9 plate, 60 ampere hour capacity (20 hr. rate).

Heavy Duty - Delco No. 3SMR72. 12 volt, 11 plate, 72 ampere hour capacity (20 hr. rate).

Battery Ground - Negative.

Engine Ground - Battery ground extends from fender to engine block.

STARTER

Delco-Remy 1107661. Armature - 1932185.

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs. minimum.

P rformanc Data

Torque	RPM	Volts	① Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	3.5	300-360

① - Includes Solenoid.

Starting Switch: Delco-Remy Solenoid No. 1119798 (no relay) mounted on starter and controlled by Ignition & Starter Switch, Delco-Remy No. 1116533. Neutral Safety & Back-up Switch Delco-Remy No. 1998129 used with Hydra-Matic Trans.

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1998129 located at lower end of steering column. Connected in starter circuit so that starter operates only when selector lever is in "N" Neutral or "P" park positions.

Adjustment - *See "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

GENERATOR

Delco-Remy. Application as follows:

Model	Generator No.	Armature No.
Standard 25 Amp.	1100304	1928952
Special 25 Amp.	1100333	1928952
Air Cond. 35 Amp.	1102073	1932900
A.C. Special 35 Amp.	1102071	1932900
Heavy Duty 35 Amp.	1102070	1932900
H.D. Special 35 Amp.	1102079	1932900
Heavy Duty 40 Amp.	1102074	1935778
H.D. Special 40 Amp.	1102077	1935778

Performance Data

Generator	Amperes	Volts	RPM
1100304, 333	25	14.0	2570
1102070,71,73,79	35	14.0	2510
1102074, 77	40	14.0	2320

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.5-1.62 Amps. (1100304,333); 1.69-1.79 Amps. (1102070,71,73,79); 2.66-2.86 Amps. (1102074, 77), at 12 volts (80°F).

Belt Adjustment: ¼" deflection with approximately 8 lbs. (Std.), 14 lbs. (Air Cond.), pressure midway between generator and fan pulleys

REGULATOR

Delco-Remy No.	Used with Generator
1119000	1100304,333
1119002	1102070,71,73,79
1119163	1102074,77

►*1119163 REGULATOR NOTE:* This type regulator has double contacts for voltage regulation.

►*NOTE - Specifications below are "Normal Settings".*

Cutout Relay

Cuts In - 11.8-13.5 volts (hot).

Contact Gap - .020".

Air Gap - .020" (with contacts just closed).

Voltage Regulator

Setting (1119000 & 1119002) - 13.8-14.8 volts at 125° (ambient temperature).

Setting (1119163) - 14.0-14.6 volts (operating on lower contacts). .3-.5 volts Lower (operating on upper contacts).

Contact Gap (1119163) - .016".

Air Gap - .080" (1119163) .075" (Others) with armature pressed down to point where contacts just touching.

Checking & Adjusting - *See "Delco-Remy 12 volt Regulators" in Electrical Section.*

Curr nt Regulator

S tting (1119000) - 23-27 amps. (hot).

Setting (1119002) - 32-37 amps. (hot).

S tting (1119163) - 37-42 amps. (hot).

Air Gap - .075" with armature pressed down to point where contacts just touching.

Ch cking & Adjusting - *See "Delco-Remy 12 volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Directional Signals: *See Electrical Section.*

Autronic Eye: *See Electrical Section.*

Lighting Switch Removal: Remove one battery cable from battery. Pull headlight switch knob to "on" position, push latch button on side of switch assembly and pull out switch knob assembly. Screw bushing from switch assembly allowing switch assembly to be removed from instrument panel.

Stop Light Switch Location: Mechanical type switch located on bracket attached to steering column behind instrument panel.

Back-Up Light Switch: Located on steering column and actuated by gearshift lower lever.

FUSES: Fuses listed below (except as noted) are located on a fuse block behind instrument panel on dash to left of steering column. Circuits numbered on wiring diagram and fused as follows:

1) 4 Ampere. Ignition & Instrument Panel lights.
2) 7.5 Ampere. Ash Tray & Fender Ornament lights.
3) 7.5 Ampere. Tail & License Plate lights.
4) 7.5 Ampere. Dome, Courtesy & Trunk lights.
5) 7.5 Ampere. Glove Compt. & Underhood lights.
6) 7.5 Ampere. Clock Motor & Spot light.
7) 7.5 Ampere. Air Cond. & Compass lights.
10) 7.5 Ampere. Stop Light & Air Cond.
11) 7.5 Ampere. Directional Signal & Brake light.
12) 7.5 Ampere. Radio & Back-Up light.
13) 7.5 Ampere. Heater & Rear Defroster.

Electric Antenna - 14 Ampere. Located in fuse holder above fuse block.

Air Conditioner - 30 Ampere. In addition to Stop Light fuse. Located in holder in lead between BAT terminal of Voltage Re gulator and Air Conditioner relay.

LIGHTING THERMOSTATIC CIRCUIT BREAKER: 22 Ampere, located in lighting switch.

Horn Relay: Delco-Remy 1116920.

Air Gap - .014". **Point Opening** - .027".

Closing Voltage - 5.0-9.5 volts.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for Access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: Own. V8, Valve-in-head. All engines are basically the same with modifications as indicated.

Engine	Bore	Stroke	Displac m nt	Rated HP
All	3.94"	3.56"	347 cu. ins.	49.6

Engine	Compr. Rati	D vel ped HP
Chieftain ①	8.5-1	227 at 4600 RPM
Chieftain ②	10.0-1	252 at 4600 RPM
Super & Star Chief ①	8.5-1	244 at 4800 RPM
Super & Star Chief ②	10.0-1	270 at 4800 RPM
Triple Carb. Optl. ②	10.0-1	290 at 5000 RPM
Extra HP Engine	10.0-1	317 at 5200 RPM

① - Synchro-mesh Cars. ② - Hydra-Matic Cars.

Compr ssi n & Vacuum R ading - *See TUNE-UP.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*ENGINE OPERATION IN LOW OCTANE AREAS (Foreign Travel):* Two compression ratios used. 10.0-1 (Hydra-Matic), 8.5-1 (Synchro-mesh). Use 97 octane ratio (Research Method), with 10.0-1 compression ratio. Use 90 octane ratio with 8.5-1 compression ratio. *NOTE* - 10.0-1 compression ratio can be reduced to 7.8-1 by installing recessed piston & pin assembly. Standard piston furnished in three sizes - 3.936" part No. 524154, 3.937" No. 524155, 3.938" No. 524156. Choose piston to obtain .0007-.0017" clearance between skirt of piston and cylinder bore.

ENGINE REMOVAL: *See "Engine" in Pontiac Special Data.*

OIL PAN REMOVAL: Remove right and left engine side aprons. Remove two idler lever support screws and lower the steering linkage. Disconnect exhaust crossover pipe at left exhaust manifold and from exhaust pipe at right exhaust manifold connector, remove crossover pipe by jockeying it out. Remove flywheel housing front shield and housing lower cover. Loosen crankcase ventilator outlet pipe and swing brace out of the way.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Pontiac Special Data.*

►*CYLINDER HEAD REMOVAL NOTE:* On cars with defroster No. 7 pushrod cannot be removed. Raise pushrod and tape it in place, then remove pushrod with cylinder head.

TIGHTENING TORQUES: *See "Tightening Specifications" in Pontiac Special Data.*

PISTONS

Aluminum alloy, tin plated, with steel band for added strength and to control expansion. Pin is offset to right side of engine 1/16".

►*PISTON NON-INTERCHANGEABILITY CAUTION:* Different pistons used in Low (8.5-1) & High (10.0-1) compression engines identified as follows: Low Compression-Piston heads dished or recessed and pistons marked "L" on rear side near pin boss (do not confuse this mark with two "F" marks on opposite pin boss indicating front side of piston). High Compression - Pistons have flat head.

Removal - Pistons and rods removed from above.

Replac ment Pistons: Furnished Std. (3.936", 3.937", 3.938"), and .005", .010", .020", .030" Oversize in both Flat Top or Recessed Head.

Fitting New Pistons: Clearance is .0007-.0017" at bottom of skirt. Fit pistons with .0015" X ½" feeler. Pull to withdraw feeler should be 8-15 lbs.

Installing Pistons: Install pistons with notch in piston head and "F" mark at piston boss toward front of engine. *See Rod Installation.*

PISTON PINS

Floating type, with lock ring at each end.

Diam ter - .9803-.9807". **Length** - 3.13".

Pin Fit in Pist n - .0000-.0004" loose with pin and bosses clean and dry. When clearance is at mean limit (.0002") pin can be inserted with light hand pressure, when at low limit (.0000") considerable pressure will be required (pin can be tapped into place with brass drift).

Pin Fit in R d - .0001-.0006" loose, with pin and bushing dry.

Replacement pins: Furnished in Std. and .001", .003" Oversize.

PISTON RINGS

Upper compression ring is chrome plated, lower compression ring is lubrited. Both compression rings are taper faced and have either a chamfer or a step on inside diameter of top side.

Ring	Width	End Gap	Side Clearance
Compr. (1)	.078"	.010-.020"	.0015-.003"
Compr. (2)	.078"	.008-.020"	.0015-.0035"
Oil	.181-.188"	.015-.055"	.0025-.0095"

Installing Rings: Step or chamfer on inside diameter of compression rings must be upward.

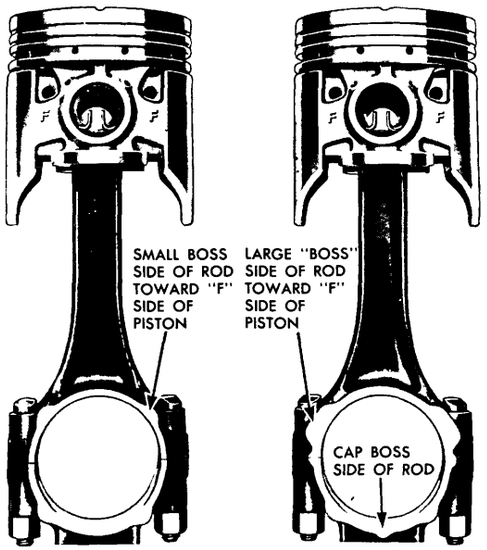
Replacement Rings: Std. and .005", .010", .020", .030" Oversize.

CONNECTING RODS

Length - 6.623-6.627" (center-to-center).

Crankpin Journal Diameter - 2.2488-2.2498".

Connecting Rod Upper Bushing (Piston Pin) Removal & Installation - *See "Connecting Rods & Bearings" in Pontiac Special Data.*



Lower Bearing - Replaceable precision type.

Clearance - .0009-.0029" (new).

Sideplay - .006-.011".

Replacement Bearings: Std. size, .001", .002" Undersize.

Installing Rods: Install rods **2-4-6-8 (right bank)** with machined boss at lower end of rod toward the **rear.** Install rods **1-3-5-7 (left bank)** with boss toward the **front** of engine. When installed, machined bosses on rods will face each other. *See Pistons above.*

PONTIAC PISTON & R D ASSY.

CRANKSHAFT

Journal Diam t r - 2.623-2.624". Five bearings.

Bearings - Durex, steel backed inserts. No shims.

Clearance - .0005-.003" (Exc. rear), .0008-.0033" (rear).

End Thrust: Taken by No. 4 (rear center) main bearing.

End Play - .0035-.0085".

Replacement Bearings: Furnished Std. and .001", .002" Undersize.

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Pontiac Special Data.*

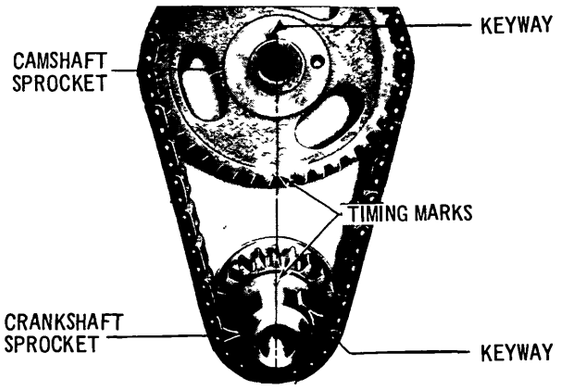
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Pontiac Special Data.*

Vibration Dampener Removal & Installation: *See "Vibration Dampener" in Pontiac Special Data.*

CAMSHAFT

►*STANDARD ENGINE NOTE:* Different camshafts used on Synchro-mesh (8.5-1) & Hydra-Matic (10.0-1). Engines identified by figure stamped on forward end of camshaft, Synchro-mesh - 0, Hydra-Matic - 2.

Journal Diameter - 1.8987-1.8997". Five bearings.



Clearance - .0015-.0030". **Endplay** - .003-.007".

End Thrust - Taken by thrust plate behind camshaft sprocket. Replace if worn or grooved.

Timing Chain: Length - 60 links.

Timing Chain Installation - *See "Timing Chain" in Pontiac Special Data.*

Camshaft Setting: Both sprockets marked "0". Mesh chain with sprockets turned so that marks are adjacent and in line across shaft centers.

PONTIAC VALVE TIMING MARKS

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Pontiac Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Pontiac Special Data.*

VALVES

►*VALVE ADJUSTMENT NOTE: Because of design, it is no longer necessary to initially adjust the tapp t cl arance when cylinder head or valve system is disturbed. Se "Rocker Arms" below.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Tappet Clearance: .018" Int. & Exh. Cold (Extra HP Eng. with mechanical lifters). None in service (Hydraulic Lifters) Others.

Valves:	Head Diam.	Stem Diam. ①	Length
Intake	1.88"	.3415-.3422"	5.35"
Exhaust	1.60"	.3410-.3417"	5.34"

Valves	Seat Angle	Lift	Stem Clearance
Intake	30° ②	③	.001-.0027"
Exhaust	45° ②	③	.0015-.0032"

① - Std. See "Replacement Valves" below.
② - Valve Face Angle: Intake 29°, Exhaust 44°.

③ Valve Lift

Engine	Intake Lift	Exhaust Lift
Synchro-mesh (8.5-1)	.373"	.373"
Hydra-Matic (10.0-1)	.373"	.409"
Extra HP (Hydr. Lifters)	.411"	.411"
Extra HP (Mech. Lifters)	.435"	.435".

Valve Seat Width - Intake 3/64-1/16", Exhaust 1/16".

Replacement Valves: Furnished Std. and .001" (Yellow), .003" (Red), .005" (White) Oversize. Color inked on top of valve head.

Valve Stem Oil Seal: Neoprene seal installed in second groove on valve stems (under valve locks).

Valve Spring Shields: Cup shaped shield used over upper end of valve spring on all cars except late Extra HP engines. *NOTE* - This shield not necessary for high speed operation on these engines.

Checking Valve Stem Length: *See "Valve System" in Pontiac Special Data.*

Valve Springs: Inner and outer springs used.

Standard & Triple Carb. Optl. Engine			
Inner Spring		Outer Spring	
Pressure	Length	Pressure	Length
23-29 lbs.	1.483"	55-61 lbs.	1.533"
54-60 lbs.	1.153"	98-106 lbs.	1.203"
Extra HP Engine (Hyd. Lifters)			
32 lbs.	1.48"	60 lbs.	1.52"
96 lbs.	1.08"	128 lbs.	1.11"
Extra HP Engine (Mech. Lifters)			
55 lbs.	1.48"	60 lbs.	1.52"
120 lbs.	1.06"	131 lbs.	1.10"

Valve Guides: Cast integral with cylinder head. When valve stem clearance excessive, ream guides using Valve Guide Reamer J-5830-1 (.003"), J-6621 (.005"). *NOTE* - When installing .005" oversize valves, use .003" reamer first then follow with .005" reamer and always reface valve and valve seat after reaming valve guide.

Valve Clearance in Guide - .001-.0027" (Intake), .0015-.0032" (Exhaust). Oversize reamers ream guide to provide these clearances.

► *VENTED INTAKE VALVE GUIDE:* Intake valve guide vented to atmosphere near upper end by hole drilled through head. Valve stem is relieved at this point.

Valve Lifters: Hydraulic lifters standard all models, Mechanical lifters optional on Extra HP engine.

Hydraulic Lifter: Diameter - .8424-.8427". **Length** - 2.000". **Clearance (In Lifter Boss)** - .0013-.0028".

Hydraulic Lifter Overhaul - *See "Valve System" in Pontiac Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.

Installation of Rocker Arm to Stud - Tighten rocker arm stud nut to 15 ft. lbs. torque. This will insure correct position of rocker arm in respect to pushrod and valve stem.

Rocker Arm Stud Replacement - *See "Valve System" in Pontiac Special Data.*

Rocker Arm Lubrication: Oil from cylinder head oil galleries flows through hollow rocker arm studs to 1/16" hole at upper end of stud to lubricate ball seat and flows through groove in ball to fill rocker arm. Oil flows from hydraulic lifter boss through hollow pushrods for pushrod end lubrication.

Oil Passage Plug Removal & Installation - With rocker arm cover removed, insert easy-out in hole in plug, turn counterclockwise and pull out. Coat plug with gasket paste and drive in place with flat piece of metal or hard wood until plug is flush with outer surrounding surface.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

► *VALVE TIMING NOTE:* Valve timing below is correct with lifter on end of ramps on cam (Hydraulic Lifters), or with .023" tappet clearance (Mechanical Lifters).

Synchro-mesh (8.5-1) Engine

Intake - Opens 22° BTDC. Close 67° ALDC.
Exhaust - Opens 63° BLDC. Close 27° ATDC.

Hydra-Matic (10.0-1) Engine

Intake - Opens 22° BTDC. Close 67° ALDC.
Exhaust - Opens 69° BLDC. Close 31° ATDC.

Extra HP (Hyd. Lifters)

Intake - Opens 29° BTDC. Close 74° ALDC.
Exhaust - Opens 82° BLDC. Close 31° ATDC.

Extra HP (Mech. Lifters)

Intake - Opens 27° BTDC. Close 63° ALDC.
Exhaust - Opens 59° BLDC. Close 31° ATDC.

OILING SYSTEM

Crankcase Capacity: 5 qts. refill. Add 1 qt. when changing filter element.

Normal Oil Pressure: 35-45 lbs. above 40 MPH.

Pressure Regulator - In oil pump body. Not adjustable.

Oil Pump: Gear type, located on right rear bottom of cylinder crankcase and driven by distributor drive gear. Distributor timing is not affected by removal and installation of pump.

Pump Overhaul - *See "Oiling System" in Pontiac Special Data.*

Oil Filter: Full Flow type. Replace element every 15,000 miles or once a year. Use only AC PF-122 filter element.

Crankcase Ventilation: Filter element in oil filler caps in each rocker arm cover, and ventilator pipe at rear of engine. Clean filter elements every 2,000 miles by plunging in gasoline or kerosene. *NOTE* - Filter element for outlet pipe available as an accessory.

► *VENTILATOR OUTLET PIPE CAUTION:* If pipe is removed from pushrod cover, make sure that when it is installed, it is not pushed down into cover beyond the two locating points on pipe. Excessive oil consumption at high speeds will result.

Oil Pressure Gauge: AC No. 1508548. Not electric.

COOLING

Water Capacity: With ut Heater - 21½ qts.
With Underseat Heater - 23 qts.
With Air Conditioning - 22½ qts.
With Underseat Heater & Air Cond. - 23¾ qts.

Pressure Valve: AC No. RC-6 (13 lbs. less Air Cond.), AC No. RC-15 (15 lbs. with Air Cond.). Radiator filler cap.

Thermostat: Pellet type 170° thermostat in water outlet passage in intake manifold.

Water Pump: Packless, sealed ball bearing shaft. *See "Pontiac" in Water Pump Section.*

Temperature Gauge: AC Thermo-gauge. Electric type.
Dash Unit - AC No. 1513276.
Engine Unit - AC No. 1513130.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck. Model 10.5A9. Assembly No. 361423 (Std.), No. 361452 (Bonneville). Single plate.
See "Borg & Beck" in Clutch Section.
Clutch Disc - Borg & Beck No. 284814 (All Models).

Pedal Adjustment: Adjust stop screw on pedal to provide 4 3/8-4 5/8" between bottom of pedal and floor mat. Set clutch fork to countershaft rod to provide ¾-1 1/8" free movement of clutch pedal.

Overcenter Spring Adjustment - Remove overcenter spring, spring extension, and pushrod. Loosen lock screw which clamps spring lever to countershaft. Install Gauge J-5819, inserting pins which are closest together into holes in overcenter spring link and lever from which pushrod was removed. Then, while applying rotation to clutch countershaft to hold clutch pedal against stop, rotate overcenter spring lever until third pin in gauge can be inserted into overcenter spring lever. Tighten lockscrew securely, and replace spring, spring extension, and pushrod.

Removal: Remove transmission (see Transmission Removal below), remove clutch bearing support spring washer (in rear face of clutch housing) and remove clutch housing bottom cover and control shaft inner bracket. Remove release bearing support and release bearing. Tap bearing support from inside clutch housing to aid removal *(CAUTION* - Avoid striking tubular portion of support). Mark flywheel and clutch cover (to insure installation in same manner to maintain balance), remove clutch cover bolts evenly, move clutch assembly away from flywheel at bottom and withdraw driven member. Lower clutch assembly out of car.

Clutch Installation Note - Position clutch disc so that long end of hub is in flywheel and cover assembly marks line up with marks on flywheel. Use spare transmission main drive gear in spline of driven disc to insure proper alignment and tighten cover bolts one turn at a time until tight. Coat entire outer diameter of release bearing support with high melting point wheel bearing grease. Do not overlubricate. Confine grease to inner diameter only of release bearing. Use new gasket and install support and bearing. Install bearing support spring washer. Coat release fork fingers and release fork ball fulcrum with same type grease and install fork. Lockwasher must be under screw fastening fork ball fulcrum to clutch housing.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SYNCHRO-MESH TRANSMISSION

Own. All helical gear type.
See "Pontiac Synchro-mesh" in Transmission Section.

Transmissi n C ntr ls: *See "Transmission Controls" in Transmission S ction.*

R m val: 1) Disconnect speedometer cable, gearshift selector rod, and control rod.
2) Disconnect rear universal joint (use wire or rubber band to keep trunnions from slipping off spider). Pull propellor shaft off transmission.
3) Remove shift lever spring yoke and extension to remove upper transmission capscrew. Remove shift lever screw (lever in neutral) and remove lever.
4) Remove transmission outer lever to remove lower transmission capscrew. Remove other upper capscrew and install guide pins in upper capscrew positions. Remove lower capscrew, slide transmission back on guide pins with rear bearing support in frame "X" member until main drive gear is free and lower transmission to floor.

Installati n N t : Use guide pins in two upper transmission capscrew positions to avoid damage to clutch release bearing tubular support when sliding transmission into position.

HYDRA-MATIC DRIVE

"Strat -Flight" Dual Coupling. Four speed automatic transmission and fluid coupling.

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: S "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "Dual Coupling Hydra-Matic Driv " in Transmission Section.*

Lubrication - Check fluid level every 2000 miles, drain and refill every 25,000 miles. Use only Automatic Transmission Fluid Type "A".

Ch cking Fluid L v l - Check level with transmission warm and engine idling with selector lever in "P" or "N" position. Maintain level at "Full" mark on dipstick.

Capacity - 9 qts. refill, 11½ qts. after overhaul.

Thr ttl Linkag Adjustment: *See CARBURETOR above.*

► *OTHER HYDRA-MATIC SERVICE DATA: See "Dual Coupling Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Saginaw. Needle bearing type.

► *CAUTION:* Rear universal joint companion flange nut controls rear axle pinion bearing preload (must be readjusted after nut is loosened). *See "Pontiac Hypoid" in Rear Axle S ction.*

R plac m nt Univ rsal Joints - Propellor shafts will only be furnished with front and rear universal joints as an assembly.

REAR AXLE

Own. Hypoid gear, semi-floating with Hotchkiss Drive.
S "Pontiac Hyp id" in R ar Axl S ction.

Axl Id ntificati n - Ratio can be identified by color marking on ends of axle shaft or a code number stamped on pad on differential carrier. *See Code No. & Color Markings in table below.*

Axle Ratios & Code Markings

Model	Ratio	Code No.	Color
S-M (Std.) All	3.42-1(41-12)	8	Gray
(Hills) All	3.64-1(40-11)	6	Blue
(H.D.) S-28	3.90-1(39-10)	4	Red
H-M (Std.)	3.23-1(42-13)	9	Brown
(Plains) ①	3.08-1(40-13)	0	Yellow

① - Sedans & Catalina Coupes.

Backlash - .003-.012" (new), .012" (used).

Axle Shaft Removal: Remove wheel, brake drum, four brake backing plate bolt nuts, static collector, and loosen bearing retainer (do not move backing plate or brake line may be damaged). Pull shaft with Puller J-942 (do not drag axle shaft on seal).

Wheel Bearing Adjustment: None.

Differential Carrier Assembly Removal: Disconnect rear universal and wire trunnion in place (do not disengage spline joint at transmission), remove axle shafts and carrier flange capscrews. Withdraw carrier assembly from housing.

► *CAUTION: Rear universal joint companion flange nut controls rear axle pinion bearing preload. Readjust whenever nut loosened.*

SHOCK ABSORBERS

Delco. Direct acting, non-adjustable, sealed (not refillable). Service by replacement.

Model	Front	Rear
Standard	5522515	5524031
Taxi, Police, H.D.	5352226	5513346

FRONT SUSPENSION

Independent. Shock absorber mounted within front coil spring.
See "Pontiac" in Suspension & Wheel Alignment Section.

Kingpin Inclination - 1°20' at 0° camber.

Caster - Neg. 1°±½°.

Camber - Pos. ½°±½°.

Toe-In - 0 to 1/16".

Toe-Out on Turns - Outer wheel 20°, Inner wheel should be 22.5°.

STEERING

Manual: Saginaw Ball Bearing Worm & Nut. Recirculating ball worm and nut.
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Saginaw (In Line). *See 'Saginaw (In Line)" Power Steering in Steering Section.*

St ering Linkag : *S e "Ste ring Linkag " in St ering S ction.*

St ering Wh l & H rn Butt n R m val: *S "Saginaw Ball B aring Worm & Nut" in Steering Section.*

St ring G ar R m val: *S e "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Bendix Hydraulic. Duo-servo, single anchor (without eccentric adjustment). Hand brake applies rear wheel service brakes

See "Bendix Hydraulic Single Anchor (Without Eccentric)" in Brake Section.

Drum Diameter - 12" (front), 11" (rear).

Wheel Cyl. Diameter - 1 1/16" (front), 15/16" (rear).

Lining Width & Length

	Front Wheel	Rear Wh l
Primary	2.25" X 10.05"	1.75" X 9.29"
Secondary	2.25" X 12.92"	1.75" X 11.93"

Lining Thickness - 13/64".

Clearance - Adjusting screw backed off 14 notches from point where wheel can just be turned by hand.

Standard Master Cylinder: Forward of brake pedal on engine side of fire wall.

Checking Fluid Level—Maintain fluid level in master cylinder reservoir to 7/8" from gasket surface of filler neck.

Power Brakes: Moraine or Bendix Vacuum Power Unit.
Moraine - *See "Moraine Power Unit" in Brake Secti n.*
Bendix - *See "Bendix Power Unit (Hydraulic Reacti n Control)" in Brake Section.*

Checking Fluid Level—Maintain fluid level in master cylinder reservoir to within ½" of top of filler cap opening.

Removal of Power Unit—Disconnect upper end of vacuum hose attached to inlet at vacuum cylinder, and hydraulic lines at master cylinder. Disconnect pushrod from pedal and wires from stop light switch. Remove nuts from U-bolt retaining pedal pivot bracket to steering column and remove pedal and bracket (with stop light switch assembly attached). Remove clutch pedal and steering column seals at floorboard. On Hydra-Matic cars, remove screws retaining power brake unit to floor pan and remove mounting plate with power unit attached. On Synchro-mesh cars, remove screws retaining power unit to mounting plate (power unit will rest on frame). Remove screws attaching mounting plate to floor pan and remove mounting plate, "jockeying" it as necessary to clear clutch pedal. Remove power unit. *CAUTION*—Do not carry or support brake unit by pushrod as pushrod may be pulled out of cylinder.

MISC. MECHANICAL

Windshield Wiper: Vacuum or electric type.
See "Windshield Wipers" in Miscellaneous Section.

Air Conditioning: Harrison. *See "Frigidaire & Harrison" Air Conditioning in Miscellaneous Section.*

Power Top Control: Hydro-Lectric with reversible pump motor. *See 'Power Top Controls" in Miscellaneous Section.*

Power Window Regulators: Electric type with individual motors in each window. *S "Power Window Regulators" in Miscellaneous Section.*

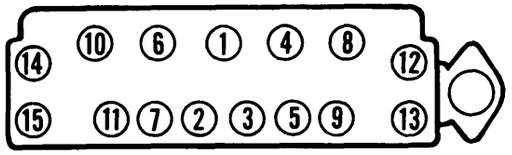
P w r S at Adjust rs: Six-way electric type. Fore & Aft, Up & Down, and Tilting movement provided through three switches and two motors. *See "Power Seat Adjusters" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

6 CYL. ENGINE

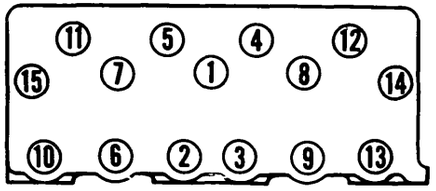
	Ft Lbs
Cylinder Head	60-65
Main Bearing Caps	66-70
Flywheel	50-55
Vibration Damper	70-80
Con Rod Caps	27-30

V8 ENGINE



Cylinder Head	60-65
Main Bearing Cap (Rear)	50-55
Main Bearing Cap (Others)	80-85
Con Rod Caps	46-50

CYLINDER HEAD & MANIFOLD



6 CYL. ENGINE

CYLINDER HEAD INSTALLATION: Use torque indicating wrench to tighten cylinder head studs in sequence shown in cylinder head diagram. Torque specifications are for engine at operating temperature.

Cylinder Head Gasket - Always use new gasket Coat gasket with non-hardening gasket paste to insure tight seal between cylinder head and block.

6 CYL. ENGINE CYLINDER HEAD

V8 ENGINE CYLINDER HEAD

V8 ENGINE

CYLINDER HEAD INSTALLATION: Cylinder block has two sleeve locating dowels to assist in lining up cylinder head and gasket during installation. Coat gasket with non-hardening gasket paste, install gasket with marks "AM" and "TOP" upward. Install cylinder head, pushrods, and rocker arm assembly *(CAUTION* - Special drilled capscrew must be installed in rear rocker arm support bracket to provide lubrication for rocker arms). Tighten head bolts in sequence shown in diagram to correct torque. See Tightening Specifications.

ORIGINAL BORE & PISTONS

6 CYL. ENGINE

ORIGINAL BORE LETTER CODE· A three letter code stamped adjacent to engine number indicates as follows

Letter Sequence Code

First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code

Letter "A"	Standard
Letter "B"	010 Undersize
Letter "C"	010 Oversize
Letter "D"	001 Undersize

ENGINES UNMARKED ARE STANDARD SIZE.

PISTON PINS

ALL ENGINES

PISTON PIN: Pin is press fit in connecting rod and no clamp bolt or locking rings are used to retain the pin Piston pin must be removed and installed as detailed below to prevent distortion or damage to piston.

Removal - Remove pins with special Piston Pin Remover J-6360 and an arbor press. Place piston in remover support so pin will enter support when pressed out with piloted driver.

Installation - Place piston pin pilot in support, insert piston and connecting rod. This aligns piston and connecting rod piston pin bores Press piston pin into connecting rod and piston assembly until lower pilot bottoms in support which will properly center rod on pin

► *CAUTION* Pin must be tight press fit in connecting rod.

ORIGINAL BEARING SIZES

6 CYL. ENGINE

ORIGINAL BEARING LETTER CODE· A three letter code stamped adjacent to engine number indicates as follows

Letter Sequence Code

First letter	Size of Bore
Second letter	Size of Main Bearings
Third letter	Size of Con Rod Bearings

Letter Size Code

Letter "A"	Standard
Letter "B"	010 ' Undersize
Letter "C"	010 Oversize
Letter "D"	001 Undersize

ENGINES UNMARKED ARE STANDARD SIZE.

CRANKSHAFT & MAIN BEARINGS

6 CYL. ENGINE

CRANKSHAFT END THRUST WASHER: Crankshaft end thrust taken by flanged edges of front bearing A steel thrust washer is assembled between rear face of timing chain sprocket and flanged face of front bearing Washer keyed to shaft by Woodruff key which also secures sprocket on shaft When washer installed, chamfered edge on inner diameter should face toward rear for tight fit against bearing journal

6 CYL. ENGINE

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Packing in groove in block and cap behind oil slinger on crankshaft Cap sealed with rubber plugs in groove on each side where cap fitted in recess in block Use Tool J-1610 to install packing in groove in block and cap Place packing in groove (with bearing shell removed), place small diameter of tool over packing, hit end of tool with lead hammer to seat packing, cut ends of packing flush with bearing cap seat, remove tool Repeat operation for groove in block Install rubber seal plugs on each side of bearing cap (where angle seal used, make certain that seal also seated in horizontal groove in block)

V8 ENGINE

CRANKSHAFT REAR MAIN BEARING OIL SEAL: Install hemp packing in block and in bearing cap using Tool J-3048-A to seat packing in groove Trim excess packing off flush with face of cap Rubber seals are installed in side grooves of bearing cap

VIBRATION DAMPENER

6 CYL. ENGINE

REMOVAL: Remove fan blade assembly and pull vibration damper with a suitable puller

INSTALLATION: To install hub assembly, install large lockwasher with notches on inner edge, cork seal ring, rubber seal ring and hub retainer in recess in hub Install hex head lockscrew with helical lockwasher under it, in screw hole in end of crankshaft and tighten screw securely Rubber block retaining bolt nuts on front face of damper hub are drawn up until shoulders bottom on hub (30-35 ft lbs torque) *CAUTION* - When installing vibration damper on hub, timing marks must be aligned with hub key-way and on same side

V8 ENGINE

REMOVAL: *(NOTE* - Vibration damper can be removed without removing radiator core) Remove fan blade assembly and pull vibration damper with a suitable puller A puller may be fabricated in the shop by threading a 1" x 5" (N C Thread) jack screw into a steel plate ½" thick, with a 13/32" wide slot in each end of plate Use two screws 3½" long with 2" of 3/8 x 16 U N C 2B-T thread in the slots Stake a ½" ball bearing in end of jack screw to prevent damage to crankshaft

INSTALLATION: Installation procedures are the same as for 6 cyl engine (above)

ENGINE FRONT COVER

6 CYL. ENGINE

ENGINE FRONT COVER: Removal - Remove fan blade assembly, vibration damper (see above), and screws holding cover to block Remove cover

Installation - *See "Crankshaft Front Oil Seal" b l w*

CRANKSHAFT FRONT OIL SEAL: Drive old seal out from rear A felt oil seal is fitted in the timing chain cover which bears against vibration damper hub Seal seat in hub has inner edge turned up to form a shedder on inside of cover An oil slinger is assembled behind vibration damper hub which extends over outer edge of oil shedder To prevent damage to seal, cover must be properly aligned Do this by leaving cover to block screws loose until vibration damper has been partially installed, then tighten cover screws Install new seal and retainer from front

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

V8 ENGINE

ENGINE FRONT COVER: Removal - Remove water pump, fuel pump assembly and vibration damper. Remove cover-to-cylinder block screws and remove cover.

Installation - Locate dowels in cylinder block and leave cover screws loose until vibration damper is partially installed. This prevents damage to oil seal and aligns cover properly. Then tighten cover screws and install fuel and water pumps.

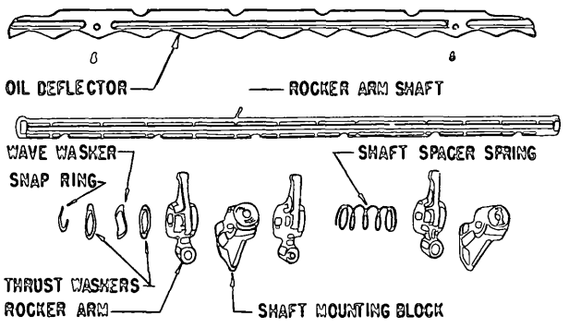
CRANKSHAFT FRONT OIL SEAL: Oil seal is installed in timing chain cover at vibration damper hub. To replace seal, remove cover (see above), old seal, and install new seal

CAMSHAFT & BEARINGS

6 CYL. ENGINE

CAMSHAFT REMOVAL: Camshaft bearings are "step-bored", being larger at front bearing than at rear, to permit easy removal and installation of camshaft. To simplify camshaft removal, remove radiator and grille assemblies. Then raise front of engine slightly.

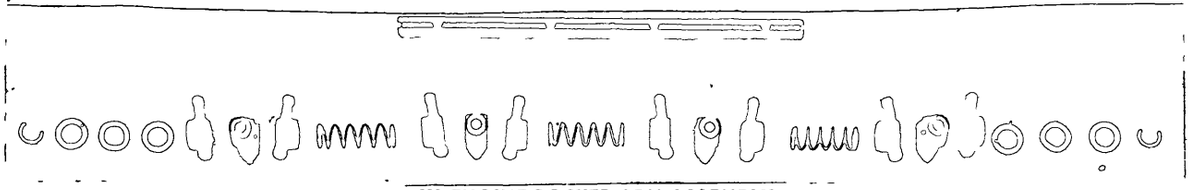
V8 ENGINE



CAMSHAFT REMOVAL: Remove spark plug wires, cylinder head covers, and rocker arm assemblies. Remove intake manifold and carburetor. Remove all pushrods and hydraulic valve lifters (*CAUTION* - Keep these parts in order so they can be installed in same relative positions). Remove fuel pump. Remove vibration dampener and timing chain cover. Remove water pump and cylinder head water distribution manifold. Crank engine until timing marks on chain sprockets line up on vertical line through shaft centers. Remove fuel pump eccentric, remove both sprockets and timing chain as an assembly. Remove camshaft retainer thrust plate and thrust spacer. Carefully withdraw camshaft through front of engine.

VALVE SYSTEM

ROCKER ARMS



6 CYL. ENGINE

ROCKER ARM ASSEMBLY: Rocker arm shaft is one piece type and entire rocker arm assembly can be removed after taking out mounting bolts in shaft brackets.

6 CYL. ROCKER ARM ASSEMBLY

Disassembly & Inspection: Remove snap ring on end of shaft, slide thrustwashers, wave washer, rocker arms, mounting brackets, and springs off shaft. Inspect all parts for wear, see that end plugs are tight in shaft.

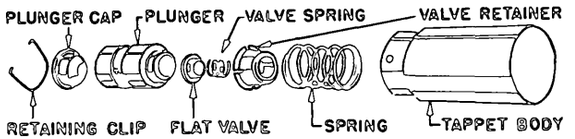
V8 ENGINE ROCKER ARM ASSEMBLY

Reassembly & Installation: Install all parts in same relative positions (*CAUTION* - Rocker arms are "Right" and "Left" and must not be interchanged). Install assembly with rocker arm lubricating holes in shaft down or toward cylinder head. Make certain that baffle installed on rocker shaft supports does not interfere with rocker arm.

V8 ENGINE

ROCKER ARM ASSEMBLY: Complete assembly mounted on cylinder head by four long cylinder head retaining capscrews (*CAUTION* - Rear bolt is special hollowtype for rocker arm lubrication). Assembly can be removed by taking out the retaining screws.

Disassembly & Inspection: Remove snap ring on end of shaft and slide all parts off shaft. Keep all parts in order so they can be reassembled in same relative positions. Clean and inspect all parts for wear. Inspect rocker arm radius at valve stem end for wear and replace worn rocker arms. Make certain that plugs are tight in ends of shaft.



Reassembly & Installation: Install all parts in same relative positions (*CAUTION* - Rocker arms are "Right" and "Left" and will not contact valve stem properly if interchanged). When installing assembly, make certain that special hollow bolt installed in rear support bracket (necessary for correct rocker arm lubrication).

HYDRAULIC LIFTERS

V8 ENGINE

HYDRAULIC VALVE LIFTERS: Removal-Remove valve rocker covers and rocker arm shaft mounting bracket bolts and lift off rocker arm assembly. Remove upper valve tappet cover and breather tube and then remove lower tappet cover. Remove pushrods and hydraulic valve lifters keeping pushrods and lifters in sequence so they can be replaced in same relative position.

Disassembly: Press down on valve pushrod socket and use a pair of needle nose pliers to remove the lock ring. Remove pushrod socket, plunger, and plunger spring. Remove check valve assembly from plunger being careful not to lose the small flat valve and coil spring. (*CAUTION-Disassemble one lifter at a time to avoid mixing plungers and bodies. These parts are selectively fitted and must not be interchanged).* Use clean solvent and thoroughly wash all parts. Remove all varnish and gum deposits.

V8 HYDRAULIC VALVE LIFTER

Inspection: Inspect the plunger and wall of body for scratches (if plunger or body is scratched, replace complete unit). Try the plunger for fit in body. If check valve removed from plunger, inspect flat disc valve, spring and seat.

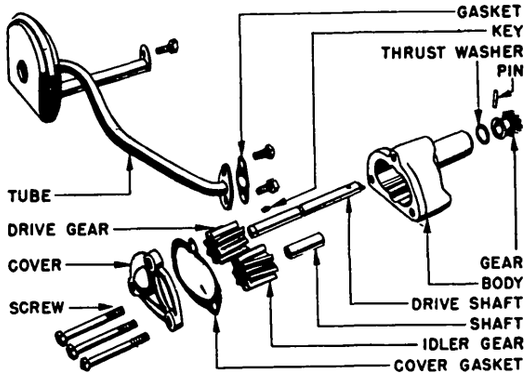
Reassembly: Reverse disassembly procedure. See illustration for correct sequence.

Testing: Fill body with kerosene and install plunger return spring, plunger assembly, and pushrod socket (do not install snap ring). Place lifter between jaws of Checking Tool J-5978 and check leak-down by depressing tool. A decided resistance should be felt. If lifter leaks down rapidly, or collapses immediately, it should be rechecked and/or replaced with a complete new lifter assembly. Normal lifter should require 10-45 seconds to leak down when filled with kerosene (.125" travel with 50 lb. load).

Installation: Lifters should be pre-lubricated and installed in engine WITHOUT being filled with oil. They will normally charge themselves in 3 to 8 minutes of engine operation.

OILING SYSTEM

OIL PUMP



6 CYL. ENGINE

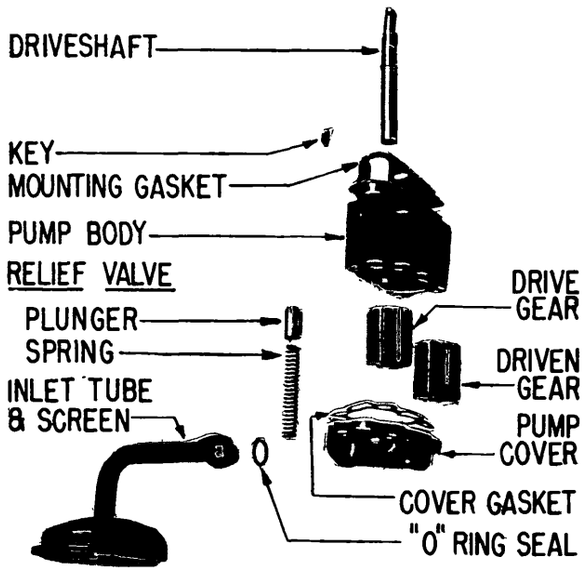
OIL PUMP: Removal - Pump mounted externally on right side of engine. Remove pump by taking out three capscrews in pump cover.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Overhaul: Remove pump cover and gasket. Lift out pump drive gear, idler gear, and idler gear shaft. Remove key from keyway in shaft. Remove shaft and driving gear assembly through upper end of pump body (*NOTE* - Driving gear is held on shaft by a pin). Remove thrustwasher from shaft. Reassemble pump by reversing this disassembly procedure.

6 CYL. ENGINE OIL PUMP



V8 ENGINE

OIL PUMP: Removal - Remove oil pan and screws retaining oil pump to rear main bearing cap, remove oil pump. *NOTE* - Oil pump is driven by distributor drive shaft so removal of oil pump does not affect ignition timing.

Disassembly - Remove inlet tube and screen assembly from pump cover. Remove cover retaining screws, cover, pump gears, relief valve spring and plunger.

Inspection - Check gear to cover clearance by placing straight edge across pump body with gears in operational cavity. Clearance should not exceed .004". A clearance of .008" maximum should exist between gears and walls of gear cavity opposite point of gear mesh.

Reassembly & Installation - Reverse disassembly procedure. Before installing pump on engine, check for free operation.

V8 ENGINE OIL PUMP

MODEL IDENTIFICATION

Mdl	Mod I Identification
6 Cyl.	5710

SERIAL NUMBER: Stamped on plate attached to right side of dash under hood.
Starting Serial No.- D-341001 (U.S.), DT-8501 (Canada).

ENGINE NUMBER: (Exc. with A.C.) Right side, front of block. (With A.C.) Left side, front of block.
Starting Engine No. - B-73001 (Single Throat Carb.), CB-2001 (Dual Throat Carb.).
►*ENGINE NUMBER LETTERS (Following Engine Number): Identified as follows:* First letter is size of bore, second letter is size of main bearings, and third letter is size of connecting rod bearings. Engines not so marked are standard in all respects.
"A" - Standard. "C" - .010" Oversize.
"B" - .010" Undersize. "D" - .001" Undersize.

TUNE-UP

COMPRESSION PRESSURE: 120 lbs. at cranking speed.
VACUUM READING: 18-21" at idling speed.
VALVE TAPPET CLEARANCE: .012" Int., .016" Exh., hot and running.
MANIFOLD HEAT CONTROL: None used.

IGNITION

FIRING ORDER: 1–5–3–6–2–4.
SPARK PLUG GAP: .035".
Spark Plug - Auto-Lite AL-7 or Champion H-10 14 mm Torque to 30 ft lbs
COIL: Delc -Remy 1115087.
Resistor - Delco-Remy 1927809. 1.4-1.65 Ohms at 75°F.
►*COIL RESISTOR NOTE.* Connected in series between battery and coil. Resistor is by-passed during cranking by solenoid, making direct lead from battery to coil.
►*RESISTOR SHORTING CORRECTION:* Beginning Serial No D-371199, reinforcement and friction washer Part No 8000165, added to primary resistor mounting to prevent shorting to ground Screw No 8000103 also used
DISTRIBUTOR: Delco-Remy No. 1110244.
Condenser - Delco-Remy 1879604. **Capacity** - .18-.23 mfd.
Contact Point Set - Delco-Remy 1918148.
Breaker Gap - 016".
Cam Angle - 28-35° (Set to 30°).
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Counter-clockwise viewed from above.

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		425	0-4		850
9-11		1000	18-22		2000
12-14		1700	24-28		3400

Vacuum Spark Cntrl - Delco-Remy No. 1116121.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
Start	0	6-8
7.5	15	16¾

IGNITION TIMING

Setting - TDC. *NOTE* - 5° BTDC optional with Automatic Transmission or where local fuel octane permits.
Timing Mark - On vibration damper.

CARBURETOR

►*CARBURETOR APPLICATION: Carter AS Single Barrel Carburetor is Standard, Carter WCD Dual Barrel Carburetor is Optional.*
Throttle Linkage Adjustment (Hydra-Matic Cars): Adjust engine idle speed to 475 RPM (500 RPM on Air Conditioned Cars with compressor operating) With engine temperature at 150-160°F, transmission warm, and selector lever in Neutral, adjust as follows.
1) Disconnect throttle rod at throttle lever on side of transmission case Clean back face of transmission case, place Gauge J-2545-D flush against machined surface of case with edge of gauge against transmission side cover Throttle lever stud should fit freely in notch in gauge Adjust by using Bending Tool J-3310 to bend lever as necessary Remove gauge reconnect throttle rod (install wave washer flat washer, and cotter pin)
2) Disconnect transmission throttle rod at bellcrank on bracket on cylinder head disconnect carburetor-to-bellcrank rod at bellcrank Install aligning pin through hole in bellcrank and bracket (Pin can be made from piece of 3/16" diameter rod)
3) Adjust carburetor-to-bellcrank rod so that rod can be connected with carburetor throttle valve closed to hot or slow idle speed position Connect rod
4) Adjust transmission throttle rod so that forward end fits freely in hole in bellcrank, then **shorten rod 3 full turns,** connect rod to bellcrank remove aligning pin Road test car and check test patterns *NOTE* - Shifting points can be changed by further adjustment of transmission throttle rod (shorten rod if shift points too low, lengthen rod if shift points too high)
Throttle Linkage Adjustment (Flash-O-Matic Cars): None required Transmission shift points controlled by Vacuum & Solenoid Unit on transmission case

CARTER AS

Carter AS No. 2580S or 2665S (Std. & O.D. Trans.), No. 2564S or 2664S (Auto. Trans.). Single barrel, downdraft type *NOTE* - Only 2564S & 2664S furnished for replacement
►*ENGINE SURGE CORRECTION (AS-2580S CARB.)* Surge condition may be encountered at steady throttle speed of 25-60 MPH., on cars equipped with above carburetor date coded "J-6" or prior. To alleviate condition, install metering rod, Part No. 3200432 (Carter No. 75-1366). Rods must just bottom in the jet wells with throttle valve wide open.
Idle Setting - ¼-1¼ turns open. Turn screw out for richer mixture.
Idle Speed - 550 RPM (Std. & O.D.), 475 RPM (Auto. Trans. in Neutral), 500 RPM (With Air Conditioning turned "ON").
Float Level - ¼" (Gauge T109-282) from top of each float (at free end) to top of casting. To adjust, bend float lip. There should be .010-.015" clearance between overlapping tangs on float levers. To adjust, bend long tang on left hand float.
Accel rating Pump - No seasonal adjustment.
Fast Idle· 030" (Gauge T109-29) between lower edge of valve and bore with fast idle link on high step of cam, To adjust bend choke connector rod.
Automatic Chok : Set 2 points rich.
►*OTHER DATA: See "Carter AS Carburetors" in Carburetion Section*

CARTER WCD

Carter WCD No. 2350S (Power Pack, Std. & O.D. Trans.), 2586S (Power Pack, Auto. Trans.). Dual, downdraft type
►*MANIFOLD FUEL DISTRIBUTION: Both barrels feed all cylinders.*
Idle Setting - ½-1½ turns open. Turn screws out for richer mixture.
Idle Speed - 550 RPM (Std. & O.D.), 475 RPM (Auto. Trans. in Neutral), 500 RPM (With Air Conditioning turned "ON").
Float Level - 5/32" (Gauge T109-196). Distance from top of each float and machined surface of casting.
Accelerating Pump - No seasonal adjustment.
Fast Idle: .020" (Gauge T109-29) between throttle valve and bore (side opposite idle port) with choke fully closed.
Automatic Choke: Centered (at Index).
►*OTHER DATA: See "Carter WCD Carburetors" in Carburetion Section*
FUEL PUMP PRESSURE: 3½-5¼ lbs at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: Carter M2379SA Fuel & Vacuum
Pressure - 3½-5¼ lbs at 500 RPM
See "Fuel Pumps" in Carburetion Section
Gasoline Gauge: King-Seeley Electric Constant-voltage ("CV") type with gauge voltage regulator, King-Seeley No 46439
Dash Unit - King-Seeley No 49474
Tank Unit - King-Seeley No 44606
See "Fuel Gauges" in Carburetion Section

BATTERY

Standard - Auto-Lite. 11-HS-45. 12 Volt 11 plate 45 ampere hour capacity (20 hr rate)
Air Conditioned Cars - Auto-Lite 11-HS-60. 12 Volt, 11 plate 60 ampere hour capacity (20 hr rate)
Battery Ground - Negative
Engine Ground - Transmission case to rear engine crossmember right side

STARTER

Delco-Remy No. 1107647. Armature 1926626.
Drive - Overrunning clutch (solenoid pinion shift)
Rotation - Counterclockwise at commutator end
Brush Spring Tension - 35 ozs

Performance Data

Torque	RPM	Volts	Amperes
0 ft lbs	6900	10 3	75
10 5 ft lbs	Lock	5 8	435

Starter Switch: Delco-Remy Solenoid Switch 1119793 mounted on starter and controlled by combination Ignition & Starter Switch (Std & Overdrive Cars), or by Delco-Remy Switch 1996085 mounted on lower end of steering column and actuated by raising selector lever upward in "Neutral" (Hydra-Matic Cars), in "Neutral" or "Park" (Flash-O-Matic Cars)

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

GENERATOR

Delco-Remy 1100304 (Std.), 1102018 (Air Cond.Cars).
Armature - Delco-Remy 1928952 (1100304 Gen.), 1923535 (1102018 Gen.).

Performance Data (Cold)

Generator	Amperes	Volts	RPM
1100304	25	14.0	2570
1102018	30	14.0	2210

Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 28 ozs.
Field Current - 1.50-1.62 amperes (1100304), 1.48-1.62 amperes (1102018), 12 volts at 80°F.
Belt Adjustment: ½" deflection with 25 lbs. pressure applied midway between fan and generator pulleys.

REGULATOR

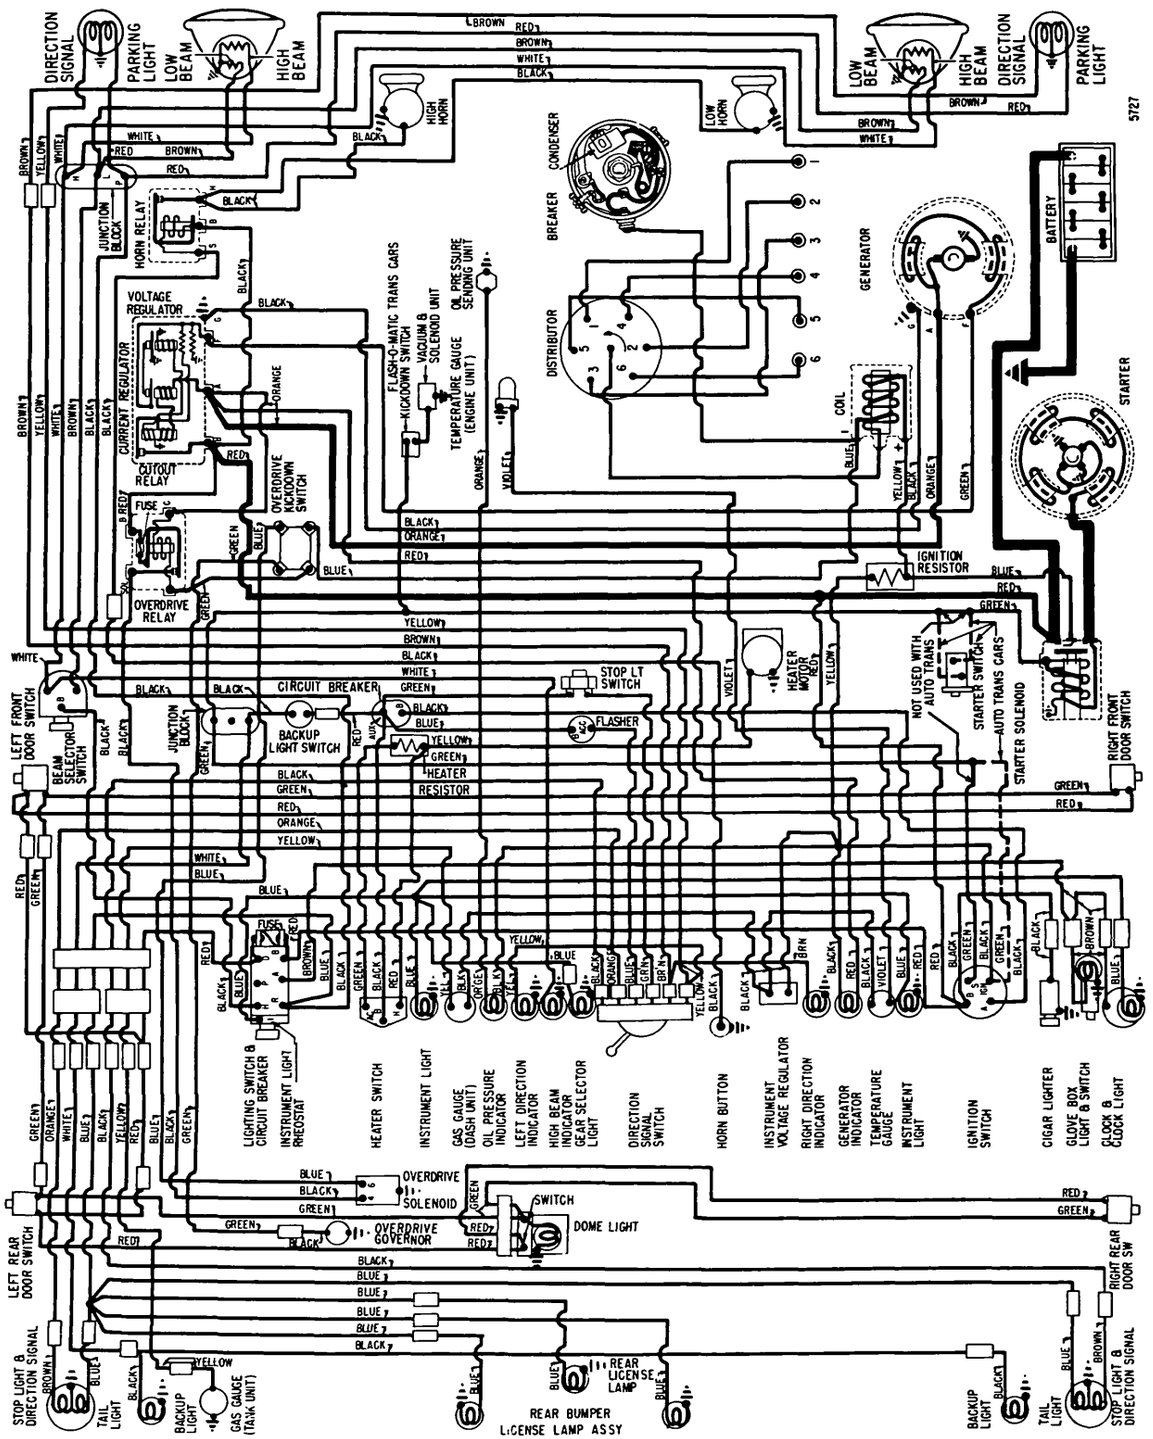
Delco-Remy No. 1119122 (1100304 Gen.), 1119003 (1102018 Gen.). *NOTE - Specifications are "Normal" settings.*

Cut-Out Relay

Cuts In - 11.8-13.5 volts.
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting - 13.8-14.8 volts (hot).
Air Gap - .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section.*



Current Regulator

Setting (1119122) - 23-27 amperes (Hot).
Setting (1119003) - 27-33 amperes (Hot).
Air Gap - .075" with armature pressed down to point where contacts just touch
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Light Switch Removal: Disconnect battery. With switch in "OFF" position, press button release on top of light switch assembly, and pull knob and shaft clear of switch. Remove slotted nut, pull switch to rear of instrument panel.
Stop Light Switch: Located at tee fitting in line to left front brake.
FUSES: Overdrive, 15 ampere, on Overdrive Relay.
Dome, Glove Box, Courtesy Lights, 7.5 amperes, on rear of headlight switch.
CIRCUIT BREAKERS: Three used as follows:
Headlights - 12 ampere. Part of headlight switch.
Park, Tail, License & Instrument Lights - 12 ampere. Part of headlight switch.
Stop, Turn Signals, Map, Oil Pressure, & Generator Charge Indicator - 30 ampere. Auxiliary circuit breaker inside body cowl on left side.
Horn Relay: Rambler No. 3145684.

CONTINUED FROM PRECEDING PAGE

ENGINE

▷*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditi ning system or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 6 Cyl. valve-in-head.

Bore	Stroke	Displacement
3 1/8"	4¼"	195.6 cu. ins.
Compr Ratio	**Rated HP**	**Developed HP**
7.47-1	23.44	120 at 4200 RPM

Compression & Vacuum Reading—*See TUNE-UP.*

OIL PAN REMOVAL: Remove steering linkage cross tie rod before removing pan.

TIGHTENING TORQUES: *See "Tightening Specifications" in Rambler Special Data.*

CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Rambler Special Data.*

PISTONS

Aluminum alloy, solid skirt, tin plated type with contoured top. *NOTE* - Pistons are new three-rmg type.

Original Bore & Piston Sizes - *See "Original Bore & Pistons" in Rambler Special Data.*

Removal - Pistons & rods removed from above.

Fitting New Pistons: Piston to bore clearance .0006-.0017" (Skirt Top), .0006-.0012" (Skirt Bottom). Piston properly fitted should support its own weight with piston and bore dry.

Replacement Pistons: Standard, .002", .005" and .010" oversize. Furnished with fitted pins.

Installing Pistons: Notch in perimeter must be to front of engine.

PISTON PINS

Press fit in connecting rod. No locking device.

Diameter - .8597". Length - 2¾".

Clearance in Piston - Palm press fit in piston at room temperature.

Pin Removal & Installation - *See "Piston Pins" in Rambler Special Data.*

NOTE - Fitted pins furnished with new pistons.

PISTON RINGS

NOTE - Two compression rings and one three-piece oil control ring used. Supersedes four rings previously used.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0933"	.010-.020"	.003-.005"
Compr. #2	.0930"	.010-.020"	.003-.005"
Oil #3 ①	.0245"	.015-.055"	.0001-.0084"

① Three-piece steel rail.

Replacement Rings: Sets of Standard & .020" oversize.

Installing Rings: Stepped inner edges of both compression rings must be up.

CONNECTING RODS

Length—6.625" center-to-center. Weight—25 ozs.

Crankpin Journal Diameter—2.0948"-2.0955".

Original Bearing Sizes—*See "Original Bearing Sizes" in Rambler Special Data.*

Bearings—Steel-backed babbitt. No shims.

Clearance—.001"-.0015". Side Play—.005"-.015".

Replacement Bearings: Std., .001", .002", .010", .012" Undersize.

Installing Rods: Identification marks (raised surface on center of rod and cap) toward front of engine.

CRANKSHAFT

Journal Diameter—2.4791"-2.4798". Four Bearing.

Original Bearing Sizes—*See "Original Bearing Sizes" in Rambler Special Data.*

Bearings—Steel backed babbitt. No shims.

Clearance—.001"-.0015".

Replacement Bearings: Std., .002", .010", .012" Undersize.

End Thrust: Taken by flanged front main bearing.

End Play—.003"-.008".

Rear Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Rambler Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Rambler Special Data.*

VIBRATION DAMPENER REMOVAL & INSTALLATION: *See "Vibration Dampener" in Rambler Special Data.*

CAMSHAFT

Bearings - Steel-backed babbit bushings.

Clearance - .001"-.003".

End Thrust: Thrust plate on front face of engine between No. 1 bearing and camshaft sprocket.

Endplay - .004-.008".

Timing Chain: Morse non-adjustable type. Width 1", Pitch 3/8", Length 22½" or 60 links.

Camshaft Setting: Install chain with punch mark on camshaft sprocket and mark on crankshaft sprocket adjacent and in line with each other across centerline of sprockets.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Rambler Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Rambler Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Rambler Special Data.*

VALVES

Tappet Clearance: Intake .012", Exhaust .016" (Running Hot).

Valve	Head Diam.	Stem Diam.	Length
Intake	1.594"	.3412-.3417"	4.759"
Exhaust	1.343"	.3407-.3412"	4.759"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45° ①	.372"	.002-.0035"
Exhaust	45° ①	.369"	.0025-.004"

① Valve face angle 44°.

▷*VALVE GRINDING CAUTION:* Replace valves when refacing reduces distance from top of valve face to top of valve to less than 1/32".

Valve Seat Width - 5/64-3/32".

Valve Stem Oil Seal - Rubber deflectors mounted on all valve stems at upper end of guide.

Valve Springs: Free Length - 2 3/8".

Valve Spring Specifications

Valve	Lbs. Pressure	Length
Closed	65-70	1.13/16"
Open	115-125	1 7/16"

Valve Guides: Use Tool J-1429-A to remove and replace guides. Guides should extend ⅜" above cylinder head.

Rocker Arm Assembly: *See "Valve System" in Rambler Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valve - Open 12°30' BTDC, Close 51°30'ALDC.

Exhaust Valve - Open 53°30' BLDC, Close 10°30'ATDC.

Valve Timing Check - Set valves on No. 1 cylinder at .003" lash. With No. 6 piston at TDC in firing position, timing will be correct if exhaust valve opens the same amount before DC on vibration dampener as intake valve opens after DC as engine is rocked back and forth over DC.

OILING SYSTEM

Crankcase Capacity: 4 qts. refill, 1 qt. addt'l with filter change.

Normal Oil Pressure: 30 lbs. at 20 MPH. 12 lbs. minimum at 600 RPM.

Pressure Regulator Valve - Non-adjustable spring loaded valve located in cylinder block where oil enters oil distribution channel.

Oil Pressure Indicator: Light on instrument panel goes on when ignition switch is turned on, goes out as oil pressure reaches pressure of gauge. Sending unit Rambler No. 3142826 (6½ lbs.), or No. 3200422 (4 lbs.), located on right rear side of engine block.

Oil Pump: Gear type. Mounted on right side of engine. *See "Oiling System" in Rambler Special Data.*

Oil Filter: Partial Flow type. Replace element every 5000 miles or sooner as needed.

Replacement Filter Element - Rambler No. 8990068.

Crankcase Ventilation: Filter in crankcase filler cap, and vent in rocker arm cover.

COOLING

Water Capacity: 10 qts., with heater 11 qts.

Pressure Valve: 7 lb. Radiator Filler Cap Rambler No. 3142965 (less Air Conditioning), 13 lb. No. 3141371 (with Air Conditioning).

Thermostat: Choke type. 170° (Std.) Rambler No. 3131817. 180° (Optl.) No. 3131985 for use with permanent antifreeze.

Water Pump: Centrifugal, double row ball bearing type. Requires no lubrication. Serviced as an assembly.

Temperature Gauge: King-Seeley "CV" electric type.

Dash Unit - K-S No. 49476 (Rambler No. 3119193).

Engine Unit - K-S No. 44200 (Rambler No. 5304502).

NOTE - Rambler No. 3200032 used on Air Cond. Cars. *See "Temperature Gauges" in Miscellaneous Section.*

CLUTCH

Borg & Beck 8.5A7. Assy No. 361416. Single Plate. *See "Borg & Beck" in Clutch Section.*

Clutch Disc No.	Borg & Beck	Rambler No.
Standard	382394	3144937
Overdrive	382490	3147133

▷*1957 CLUTCH BEAM INNER PIVOT CAUTION:* High pressure lubrication of clutch beam inner pivot may force fabrica insulated bearing support off inner pivot. To correct, remove inner pivot from clutch beam and grind a flat on outside diameter of pivot. Diameter should be .462-.465". This condition corrected at Serial No. D-342820.

Pedal Adjustment: Freeplay should be 1½-¾". Adjust at connecting link between throwout lever and release idler shaft assembly.

Removal: Remove transmission (see below), disconnect linkage, remove clutch housing and pan. Punch mark flywheel, clutch cover and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SYNCHRO-MESH TRANSMISSION

►*LIMITED PRODUCTION TRANSMISSION CHANGE NOTE:* Effective Serial No. D-354549 through Serial No. D-356529, 1956 transmission Part No. 3145434 and propeller shaft Part No. 3119151 were used in **Warner.** 3 speed, helical gear type.

See "Warner Transmissions" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect brake tube at bracket underside of body, torque tube at rear of transmission, hand brake cable at bell crank and brake cable housing at the rear brake cable bracket. Move rear axle to rear to remove universal joint from transmission shaft. Disconnect speedometer cable and shifter rods. On overdrive cars, disconnect wires at solenoid, governor and overdrive cable at lever. Use two guide pins in place of two upper capscrews to guide transmission back to clear pilot bearing and clutch disc.

OVERDRIVE

Warner R10—*See "Warner R10" in Transmission Section.*

Overdrive Control: *See "Warner R10-R11 Overdrive Controls" in Transmission Section.*

HYDRA-MATIC DRIVE

Dual Range four speed automatic transmission with fluid coupling.

See "Hydra-Matic Drive" in Transmission Section.

►*1957 APPLICATION & MODIFICATION NOTE:* Hydra-Matic transmission used through Serial No. D-367710. Modified units identified by letter "V" after transmission serial number used between Serial Nos. D-362700 and D-367485.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Hydra-Matic Drive" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication - Check fluid every 1000 miles, drain and refill at 25,000 mile intervals, using Automatic Transmission Fluid Type "A".

Checking Fluid Level - Set hand brake, place selector lever in "N" position, start engine and idle for a minimum of 2 minutes after transmission has reached normal operating temperature. With selector lever in "N" position, remove dipstick and check fluid level (dipstick located at right side of engine). Add fluid to bring level to "F" mark.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Hydra-Matic Drive" in Transmission Section.*

FLASH-O-MATIC TRANSMISSION

Warner Automatic Transmission with torque converter, 3-speed planetary gear system, and dual forward driving range. **Throttle linkage** adjustment controlled by vacuum and solenoid unit at rear of transmission.

►*1957 APPLICATION NOTE:* Effective Serial No. D-367711 this transmission supersedes Hydra-Matic Drive.

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "Flash-O-Matic Transmission" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Flash-O-Matic Transmission" in Transmission Section.*

Lubrication - Check fluid every 1000 miles, drain and refill at 15,000 mile intervals, using Automatic Transmission Fluid Type "A".

Capacity - 8½ quarts.

Checking Fluid Level - Place selector lever in "P" position and set hand brake. Start engine and operate until engine and transmission reach operating temperature. Move selector lever from "P" to "R" and then to "D-2" positions. Check fluid level with dipstick (located at right side of engine). Add fluid to bring level to "F" mark. (Approximately 1½ pints fluid required between "L" and "F" marks).

►*OTHER FLASH-O-MATIC SERVICE DATA: See "Flash-O-Matic Transmission" in Transmission Section.*

UNIVERSALS

Detroit or Mechanics - One used at transmission end.

Torque Tube Bracket Adjustment (Std. & O.D. Transmission Cars Only) - *See "Hudson & Nash Hypoid" in Rear Axle Section.*

REAR AXLE

Own. Semi-floating, hypoid type with torque tube drive.

See "Hudson & Nash Hypoid" in Rear Axle Section.

Axle Ratio - Std. 3.8-1 (9-34), **Overdrive** 4.4-1 (8-35), **Auto. Trans.** 3.3-1 (13-43).

Backlash - .002-.006". Shim Adjustment.

Axle Shaft Removal: Remove wheel, pull drum (use hub puller J-1644-B or J-736-B). Remove brake support plate, slide plate, oil seal, and shims off axle. Attach special puller J-2498-A to axle shaft and remove shaft from housing.

Rear Suspension: *See "Hudson & Nash" in Suspensions & Wheel Alignment Section.*

Rear Axle Assembly Removal: Drain lubricant, raise and support rear of body. Disconnect hand brake cable at bellcrank, and hand brake cable housing at bracket. Disconnect torque tube from transmission, rear brake hose at bracket on body floor pan, shock absorbers from brackets and rear axle stabilizer bar at rear axle tube. Roll axle free from car.

Wheel Bearing Adjustment: Shims behind brake backing plate.

SHOCK ABSORBERS

Delco. Direct acting type. Serviced by replacement.

Front - Rambler 3119821. **Rear** - Rambler 3119822.

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs located between upper end of steering knuckle pin and seat in outer wheel house panel.

See "Rambler" in Suspensions & Wheel Alignment Sect.

►*FRONT SUSPENSION SPRING NOTE:* Heavier spring used for Air Conditioned cars. *See "Rambler" in Suspension & Wheel Alignment Section.*

King Pin Inclination - 6½°.

Caster (Std.) - ½° desired. Limits 0° to ½°.

(Pwr. Strg.) - 1° desired. Limits ½° to 1°.

Camber - 0° desired. Limits ¼° Neg. to ¼° Pos.

Toe-In - 1/16" to 3/16". *CAUTION* - When adjusting toe-in on Power Steering Cars, operate engine to supply oil pressure which will center spool in power cylinder valve.

Toe-Out on Turns - Outer wheel 22°, inner wheel 25°.

STEERING

Manual: Gemmer. Worm & Roller with push pull adjustments.

See "Gemmer Worm & Roller" in Steering Section.

Power Steering: Monroe "Power Guide". Linkage type.

See "Monroe Power Guide" in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Bendix (Lockheed) Self-Centering (prior to Serial No. D-360492). Self-centering type with non-adjustable anchor ramps for each shoe. Hand lever applies rear wheel service brakes.

See "Bendix (Lockheed) Self-Centering" in Brake Sect.

Drum Diameter - 9".

Wheel Cylinder Diameter - 1 1/16" (Front), 7/8" (Rear).

Replacement Linings & Shoes - Linings and shoes with linings furnished in standard size only.

Lining Width & Length	Front Wheel	Rear Wheel
Primary Shoes	2½" x 9 7/8"	2" x 9 7/8"
Secondary Shoes	2¼" x 9 21/32"	1¾" x 7 21/32"

Clearance - All shoes just free of drag with brakes centralized (with slight drag on shoes rotate wheel in both directions). Eccentric adjustment for each shoe.

Wagner-Lockheed Self-Centering (Effective Serial No. D-360492). Self-centering type with Bendix type shoes. Star wheel adjusting screw for each wheel. Hand lever applies rear wheel service brakes.

See "Wagner-Lockheed Self-Centering" in Brake Sect.

Drum Diameter - 9".

Wheel Cylinder Diameter - 1" (Front), 13/16" (Rear).

Replacement Linings & Shoes - Linings and shoes with linings furnished in standard size only.

Lining Width & Length	Front Wheel	Rear Wheel
Primary Shoes	2¼" x 6 31/32"	2" x 7¼"
Secondary Shoes	2½" x 9 1/16"	2" x 9 11/32"

Clearance - Adjusting screw backed off 8 notches from shoes locked against drum until free of drag.

Standard Master Cylinder: In engine compartment under steering column.

Checking Fluid - Fill from engine compartment. Check at 1000 mile intervals.

Removal - Remove from beneath car. Not necessary to disturb other parts.

Power Brakes: Bendix Power Unit, Hydraulic Reaction Type. *See "Bendix Power Unit" in Brake Section.*

Checking Fluid - Same as for standard master cylinder.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Nash-Hudson Air Conditioning. Thermostatic control with magnetic clutch on compressor unit. *See "Nash-Hudson Air Conditioning" in Misc. Section.*

MODEL IDENTIFICATION

Model	Model Identification
V8	5720
Rebel	5730

SERIAL NUMBER: Stamped on plate attached to right side of cowl under hood.

Starting Serial No. - V8 - A-1001 (U.S.), AT-1001 (Canada); **Rebel** - F-1001 (U.S.), FT-1001 (Canada).

ENGINE NUMBER: Stamped on lower right front corner of block.

Starting Engine No. - V8 (2-Bbl. Carb.) - G-7501, **V8 (4-Bbl. Carb.)** - CG-1001, **Rebel** - CN-1001.

TUNE-UP

COMPRESSION PRESSURE: 140 lbs. at cranking speed,
VACUUM READING: 18-21" at idling speed.
VALVE TAPPET CLEARANCE: .012" Intake, .014" Exhaust, hot and running.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located between left bank exhaust manifold and exhaust cross-over pipe (exhaust gases diverted through heat passages in manifold when valve closed).

IGNITION

►*V8 DISTRIBUTOR PRODUCTION CHANGE: Delco-Remy Distributor No. 1110884, external adjustment "Window" type replaced No. 1110863 effective at Eng. No. G-11925, EXCEPT between Eng. Nos. G-17522 and G-17842.*

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plug - Auto-Lite AL-7 or Champion H-10. 14 mm. Torque to 30 ft. lbs.

COIL: Delco-Remy 1115087.

Resistor - Delco-Remy 1927809.

►*COIL RESISTOR NOTE:* Connected in series between battery and coil. Resistor is by-passed during cranking by solenoid, making direct lead from battery to coil.

►*RESISTOR SHORTING CORRECTION:* Effective Serial Nos. A-12537 and F-1062, reinforcement and friction washer, Part No. 8000165, added to primary resistor mounting to prevent shorting to ground. Screw, Part No. 8000103, also required.

DISTRIBUTOR: Delco-Remy No. 1110863 (Before Eng. No. G-11925 & between Eng. Nos. G-17522 & G-17842), No. 1110884 (Effective Eng. No. G-11925) - V8; No. 1110887 - Rebel. *NOTE* - Nos. 1110884 and 1110887 are "window type" with external adjustment. *See "Delco-Remy Window Distributor" in Electrical Section.*

Condenser - Delco-Remy 1869704 (1110863 Distr.), 1932004 (1110884 & 1110887 Distr.). **Capacity** - .18-.23 mfd.

Contact Point Set - Delco-Remy 1918148 (1110863 Distr.), 1931988 (1110884 & 1110887 Distr.).

Cam Angle - (1110863) 28-35°, (1110884 & 1110887) 28-32°. Set to 30°.

►*BREAKER GAP AND CAM ANGLE NOTE (WINDOW DISTRIBUTORS): Setting cam angle at 30° will provide .016" breaker gap.*

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance - 1110863

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	350	1-5	700
2-4	400	4-8	800

IGNITION TIMING

Setting - 5° BTDC. *NOTE* - 7° BTDC with overdrive, 10° BTDC with automatic transmission or where fuel octane permits.

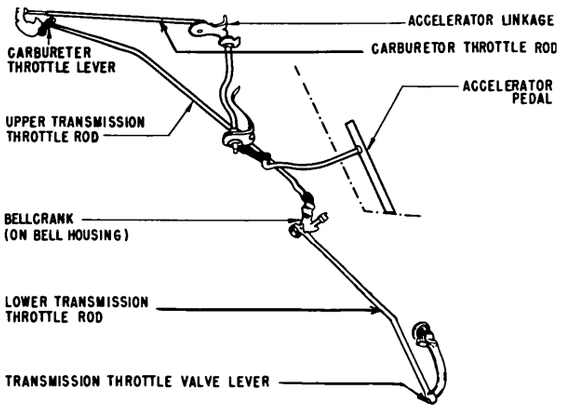
Timing Mark - Timing indicator on front cover and 5° mark on vibration damper.

CARBURETOR

►*CARBURETOR APPLICATION: Carter 2 and 4-barrel used as follows:*

Model	Carburetor
V8	WGD 2352S,SA
V8 (Power Pack)	WCFB 2593S,SA
"Rebel" (Std.)	WCFB 2593S,SA
"Rebel" (Optional)	Bendix Electrojector

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*



THROTTLE LINKAGE ADJUSTMENT (HYDRA-MATIC CARS):

Make adjustments in the following order:

1) – Disconnect throttle valve rod from throttle valve lever on transmission case, disconnect vent pipe at lower left of case. Hold throttle lever to rear against stop. Distance from machined surface on rear of case to center of pin on throttle lever should be 5 9/16". Bend lever to correct position.

2) – Measure length of lower throttle valve rod from center of lower hole to outer surface of upper end. Length should be 16 1/8" (plus 0", minus 1/32"). Adjust by bending rod.

3) – Set carburetor throttle at slow idle (closed throttle). Adjust upper throttle rod at carburetor throttle rod bracket so that rod enters hole in bracket freely; then

FLASHAWAY HYDRA-MATIC THROTTLE LINKAGE

lengthen rod by turning adjusting end one full turn to left, tighten locknut and connect rod.

CARTER WGD

Carter WGD 2352S, SA. Dual downdraft type

►*CARBURETOR PRODUCTION CHANGE: Carburetor 2352SA has the following new parts: Metering Rod No. 75-1285; Pump Plunger Rod & Check Assy. No. 64-181S; Upper Pump Spring No. 61-413.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2–3–5–8, LEFT barrel 1–4–6–7.*

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

Idle Setting - ½-1½ turns open. Turn screws out for richer mixture.

Idle Speed - (Std. & O.D.) 550 RPM, (Auto. Trans.) 425 RPM in Neutral, 450 RPM (With Air Conditioning "ON").

Float Level - 7/32" (Gauge T109-106) between top of float and bowl cover, gasket removed, cover inverted and needle seated. Adjust by bending float arm.

Fast Idle: .023" between throttle valve and bore (side opposite idle port), with choke valve fully closed (Gauge T109-189). Adjust by bending choke connector rod at lower angle. *NOTE* - This fast idle setting will provide 1700-1800 RPM engine fast idle speed.

Automatic Choke: Centered (at index).

►*OTHER DATA: See "Carter WGD Dual Carburetors" in Carburetion Section.*

CARTER WCFB

Carter WCFB 2593S,SA. 4-barrel carburetor with automatic choke.

►*ROUGH ENGINE IDLE:* May be caused by air leak in left primary throttle bore. *See "Carter WCFB Carburetors" in Carburetion Section.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels Cyl. 1-4-6-7.*

Idle Setting - ¼-1¼ turns open. Turn screws out for richer mixture.

Idle Speed - 550 RPM (Std. & O.D.), 425 RPM (Auto. Trans. in Neutral), 475 RPM (Auto. Trans. & A.C "ON").

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

► *OTHER DATA: See "Carter WCFB Carburetors" in Carburetion Section.*

BENDIX "ELECTROJECTER" (Optional)

See "Bendix Electrojecter" in Carburetion Section.

FUEL PUMP PRESSURE: 4-5½ lbs.

CARB. EQUIPMENT

Fuel Pump: Fuel and vacuum.
Replacement Pump - Carter No. M2433SA.
Pressure - 4-5½ lbs. maximum.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: King-Seeley Electric Constant-voltage ("CV") type with gauge voltage regulator, King-Seeley No. 46439
Dash Unit - King-Seeley No. 49474.
Tank Unit - King-Seeley No. 44606
See "Fuel Gauges" in Carburetion Section

BATTERY

V8 Standard - Auto-Lite 11-HS-50. 12 Volt. 11 plate, 50 ampere hour capacity (20 hr. rate).
V8 Air Conditioned & "Rebel" - Auto-Lite 11-HS-60. 12 Volte. 11 plate, 60 ampere hour capacity (20 hr. rate)
Battery Ground - Negative.
Engine Ground - Transmission case to rear engine crossmember, right side.

STARTER

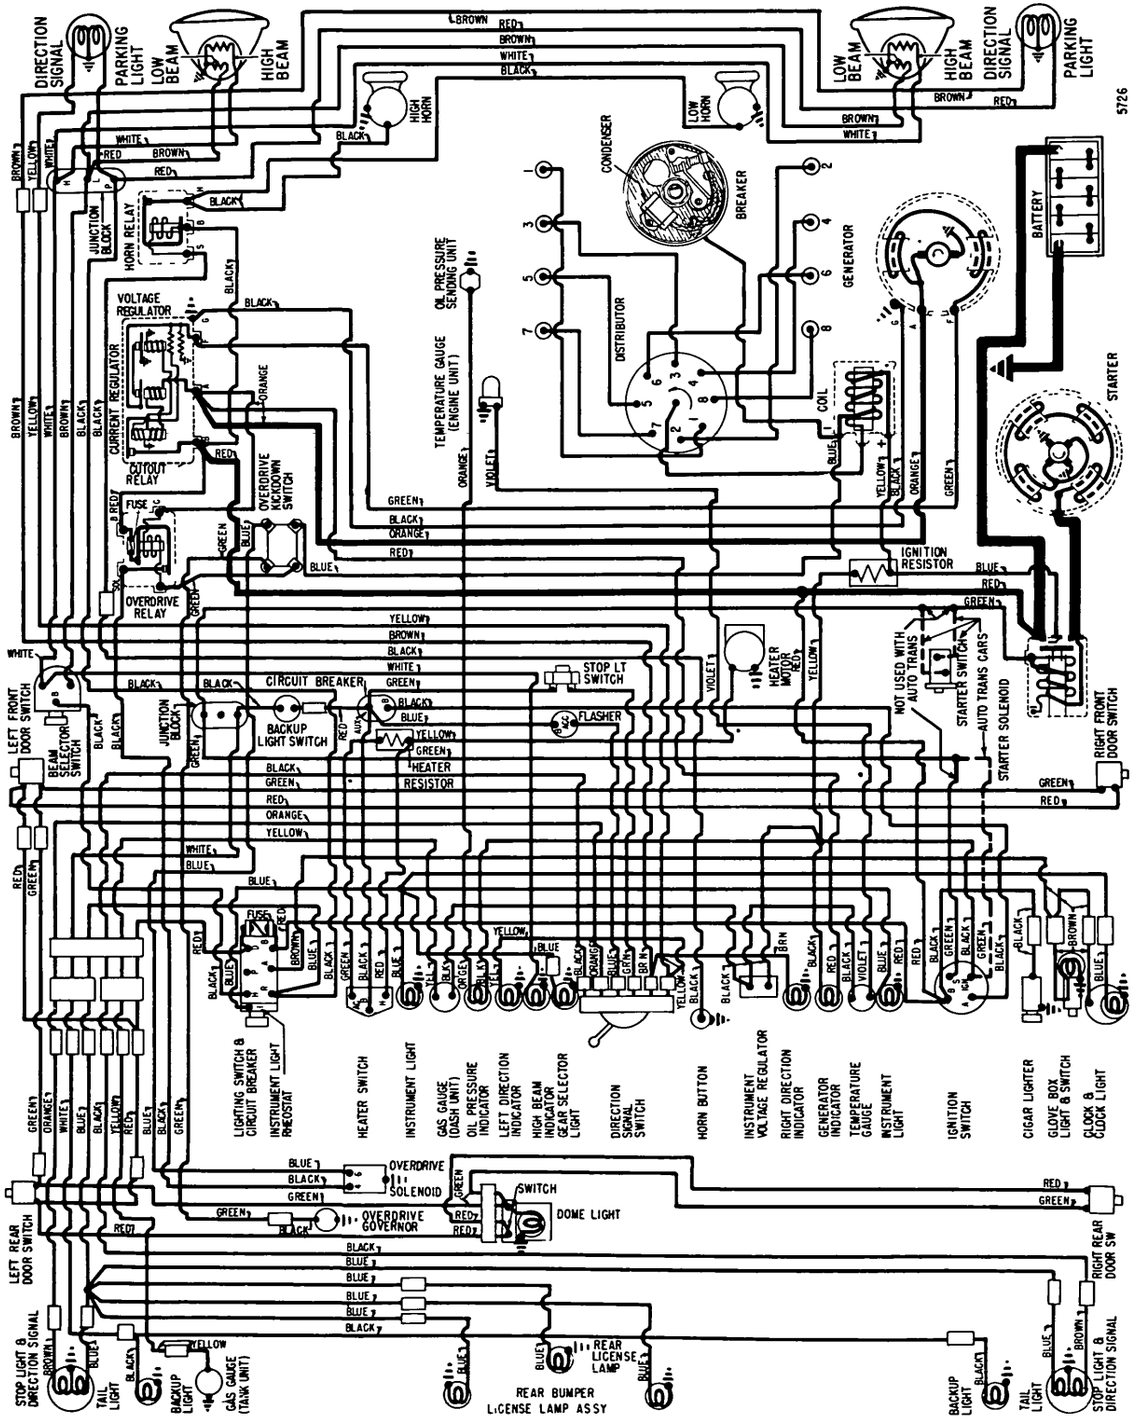
Delco-Remy No. 1107648 Armature 1926626.
Drive - Overrunning clutch (solenoid pinion shift)
Rotation - Counterclockwise at commutator end
Brush Spring Tension - 35 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.. .	6900	10 3	75
10 5 ft. lbs.	Lock	5 8	435

Starter Switch: Delco-Remy Solenoid Switch 1119760 mounted on starter and controlled by combination Ignition & Starter Switch (Std. & Overdrive Cars), or by Delco-Remy Switch 1996085 mounted on lower end of steering column and actuated by raising selector lever upward in "Neutral" (Hydra-Matic Cars), in "Neutral" or "Park" (Flash-O-Matic Cars)

GENERATOR



Delco-Remy 1100304 (V8 Std.), 1102018 (Rebel & V8 Air Cond. Cars).
Armature - Delco-Remy 1928952 (1100304 Gen.), 1923535 (1102018 Gen.)

Performance Data (Cold)

Generator	Amperes	Volts	RPM
1100304	25	14.0	2570
1102018	30	14 0	2210

Rotation - Counterclockwise at commutator end
Brush Spring T nsi n - 28 ozs.
Fi ld Curr nt - 1 50-1 62 amperes (1100304), 1 48-1 62 amperes (1102018), 12 volts at 80°F
B lt Adjustm nt: ½" deflection with 25 lbs. pressure applied midway between fan and generator pulleys.

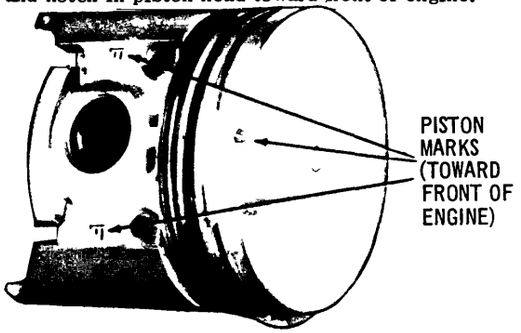
Rebel②	9 5-1	51 2	288 at 4700 RPM



①Standard ②Fuel Injection

C mpression & Vacuum Reading - *See TUNE-UP*

CYLINDER HEAD INSTALLATION: *S "Cylind r H ad & Manifolds" in Rambl r Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Rambler Special Data.*

PISTONS

Aluminum alloy, slipper type, tapered skirt, cam ground with steel reinforcement. Piston pin offset toward thrust side of piston.
Weight - 18 ozs (V8), 23 45 ozs ("Rebel")
Removal - Piston and rods removed from above
Clearance . 0009- 0025" (Skirt Top), 0009- 0015" (Skirt Bottom)
Replacement of Pistons: Std., .002", .005", .010", .020", .030", .040" Oversize.
Installing Pistons: Install with "F" cast in piston strut and notch in piston head toward front of engine.

PISTON PINS

Press fit in connecting rod. No locking device.
Diameter - 9307" **Length** - 3 1870"
Pin Fit in Piston – Palm press fit at room temperature.
Pin Removal & Installation – *See "Piston Pins" in Rambler Special Data.*
Replacement Pins: Std., .003", .005" Oversize.

PISTON RINGS

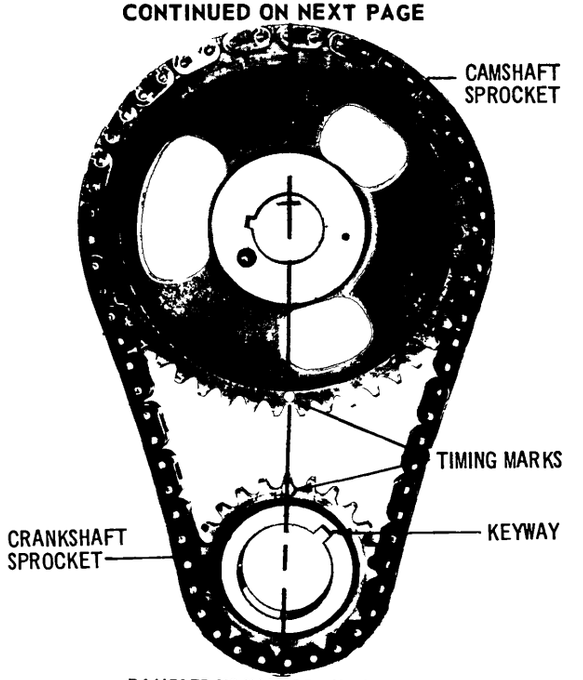
Three rings (two compression & one oil) used. Upper ring is chrome plated. Oil control ring is three piece type (two oil control wiper rails with a segmented steel spacer between them).

Ring	Width	End Gap	Side Clearance
Compr #1	0778"	010- 020"	002 - 006"
Compr #2	0778"	010- 020"	002 006"
Oil #3	0245"	015- 055"	0001- 0079"

Replacement Rings: Sets of Std , 020" & 030" oversize
Installing Rings: Stepped inner edges of both compression rings must be up

CONNECTING RODS

Crankpin Journal Diameter – 2.2483-2.2490".
Length - 6 3750" center-to-center **Weight** - 27 6 ozs
Lower Bearing – Precision, steel-backed, babbitt.
Clearance – .0007-.0028". Side Clearance – 004-.012".
Replacement Bearings: Std , 001", 002", 010" & 012" Undersize
Installing R ds: Assemble connecting rod with notch in piston and connecting rod identification mark to front of engine. Cylinder numbers on connecting rod should be toward outside of bank in which they are installed.



CRANKSHAFT

J urnal Diamet r – 2.4983" - 2.4990". Five bearings.
Bearings – Precision, steel-backed, babbitt.
Clearance – .0006"-.0032".
Replacement Bearings: Std,, 001", 002", 010" & 012" Undersize
End Thrust: Taken by No. 1 flanged bearing.
Endplay – .003-.007".
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Rambler Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" Rambler Special Data.*
VIBRATION DAMPER REMOVAL & INSTALLATION: *See "Vibration Damper" in Rambler Special Data*

CAMSHAFT

►*1957 CAMSHAFT REPLACEMENT CAUTION* Camshafts designed for use with mechanical lifters not interchangeable with those designed for hydraulic lifters Mechanical lifter shafts identified by white paint on area ahead of oil pump and distributor drive gear Hydraulic lifter shafts have no identifying marks
Bearings - Five steel-backed babbitt lined bushings pressed in block and line reamed
Clearance - 001- 003"
End Thrust: Taken by thrust plate behind camshaft sprocket
End Play - 003- 006"
Timing Chain: Morse non-adjustable type **Width** 875", **Pitch** 375", **Length** 23¼" or 62 links
Camshaft Setting: Both sprockets marked "O" Mesh chain with sprockets turned so that marks are adjacent and in line with straight edge across shaft centers To check assembly, rotate crankshaft until tim-

CONTINUED ON NEXT PAGE

RAMBLER V8 VALVE TIMING MARKS

CONTINUED FROM PRECEDING PAGE

ing mark on camshaft sprocket is on horizontal line at either 3 or 9 o'clock position. There should be 10 links or 20 pins between timing marks

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Rambler Special Data*

Engine Front Cover Removal: *See "Engine Front Cover" in Rambler Special Data*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Rambler Special Data*

VALVES

Tappet Clearance: 012" (Intake), 014" (Exhaust) Hot.

►*1957 RAMBLER V8 TAPPET NOTE: Either mechanical or hydraulic valve lifters used on cars between Engine Serial Nos. G-9401 and G-9550.*

Valve	Head Diameter	Stem Diameter
Intake	1 787"	3412"- 3417"
Exhaust	1 406"	3407"- 3412"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°①	③	0013"- 0028"
Exhaust	45°②	④	0018"- 0033"

①- Face Angle 29°. ②- Face Angle 44°.
③- 381" (V8), 375" (Rebel)
④- 380" (V8), 375" (Rebel)

Valve Seat Width – .078-.093" (Intake), **.093-.104"** (Exhaust).

Valve Stem Seals – Rubber deflector installed on valve stem and over top of guide on all valves.

Valve Springs: Install springs with closed coil end against cylinder head. **Free Length - 2.20".**

Valve Spring Specifications

Valves	Spring Pressure	Spring Length
Closed	85 - 91 lbs.	1 13/16"
Open	150 -160 lbs.	1 7/16"

Valve Guides: Drive old guides out, drive new guides in to height of ¾" ± 1/64" above cylinder head (measure from top of guide to flat machined surface of lower spring retainer on head). Ream all guides to I.D. of .3430-.3440" after installation.

Valve Lifters: Mechanical. Barrel type. *NOTE - Either mechanical or hydraulic lifters used between Engine Serial Nos. G-9401 and G-9550 on V8*

Valve Lifters: Hydraulic type.

Hydraulic Valve Lifter Removal, Overhaul & Testing – *See "Valve System" in Rambler Special Data.*

Rocker Arm Assembly: *See "Valve System" in Rambler Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves–Open 12°30' BTDC. Close 51°30' ALDC.

Exhaust Valves– Open 53°30' BLDC. Close 10°30' ATDC.

Valve Timing Check: Remove valve compartment cover and spark plugs. Crank engine until #6 piston in right bank is on TDC of compression stroke (#1 piston will be on TDC of exhaust stroke in overlap position). Rotate crankshaft 90° counter-clockwise. Install dial indicator on #1 intake rocker arm pushrod end. Crank engine in a clockwise direction until dial indicator dicates pushrod movement, (hydraulic lifter should be fully charged for this check). At time indicator moves, ignition timing pointer on front cover should align with a point approximately 25/32" before TDC position on vibration damper. *NOTE* – If more than ½" variance in either direction, remove timing chain cover and inspect installation. Replace if deflection exceeds 1/2".

OILING SYSTEM

Crankcase Capacity: 5 qts. refill, 1 qt. addt'l with filter change.

Crankcase Capacity: 5 qts. refill, 1 qt. addt'l with filter change.

Normal Oil Pressure: 10 lbs. minimum at 600 RPM

Pressure Regulator - In oil pump. Opens at 55-60 lbs. Not adjustable.

Oil Pressure Indicator: Light on instrument panel goes on when ignition switch is turned on, goes out as oil pressure reaches pressure of gauge Sending unit Nash No 3142826 (6½ lbs.) or No. 3200422 (4 lbs.), located on left rear side of engine block.

Oil Pump: Gear type Mounted on rear main bearing cap and driven by distributor drive shaft. *NOTE* - Removal of oil pump does not disturb ignition timing

Oil Pump Removal, Overhaul & Installation - *See "Oiling System" in Rambler Special Data.*

Oil Filter: Partial Flow type. Replace element every 4000 miles or sooner as needed.

Replacement Filter Element - Rambler No. 8990050 or No. 8990346.

Crankcase Ventilation: Filter element in oil filler cap (air inlet) and outlet pipe in valve tappet cover.

COOLING

Water Capacity: 20 quarts, add 1 quart for heater (V8)

Pressure Valve: Radiator filler cap. 7 lbs. (Std.) 13 lbs. (Air Cond.)

Thermostat: Choke type. Rambler No. 3132708 (150°), No. 3131817 (167°-173°) *NOTE* - No. 3131985 (177°-182°) for use with permanent anti-freeze only.

Water Pump: Centrifugal, double row ball bearing type. Requires no lubrication. Serviced as an assembly.

Temperature Gauge: King-Seeley "CV". Electric type.

Dash Unit - K-S No. 49476 (Rambler No. 3119196)

Engine Unit - K-S No. 44200 (Rambler No. 5304502)

NOTE - Rambler No. 3200062 used on Air Cond. Cars.

See "Temperature Gauges" in Miscellaneous Section

CLUTCH

Borg & Beck. Single plate. Used as follows:

Car Model	Clutch Model	Assy. No.
V8 (Std.)	10A7	361436
V8 (Heavy Duty)	10A7	361407
"Rebel" (Std)	10 5A6	361442
"Rebel" (Hvy. Dty.)	... 10 5A6	361449

See "Borg & Beck" in Clutch Section.

Clutch Disc No.	Borg & Beck	Rambler No.
V8 (Std.)	CD752	3125822
V8 (Heavy Duty)	381806	3147552
"Rebel" (All)	382574	3150449

►*1957 CLUTCH BEAM INNER PIVOT CAUTION:* High pressure lubrication of clutch beam inner pivot may force fabrica insulated bearing support off inner pivot. To correct, remove inner pivot from clutch beam and grind a flat on outside diameter of pivot. Diameter should be .462- 465" This condition corrected at Serial No. D-342820

Pedal Adjustment: Freeplay should be ½-¾". Adjust at connecting link between throwout lever and release idler shaft assembly. Lengthening link reduces freeplay.

Removal: Remove transmission (see below), disconnect linkage, remove clutch housing and pan. Punch mark flywheel, clutch cover and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange.

SYNCHRO-MESH TRANSMISSION

Warner. Three-speed, helical gear type.

See "Warner Transmission" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Disconnect hydraulic brake tube bracket on underside of body, torque tube at rear of transmission, hand brake cable and housing, speedometer cable, and shifter rods Disconnect overdrive control cable and electrical control wires from solenoid and governor where so equipped. Move rear axle to rear to separate universal joint Remove two upper transmission-to-bell housing bolts and install special guide pins (Tool J-1434) in their place. Remove lower bolts, slide transmission out.

OVERDRIVE

Warner R10. *See "Warner R10 Ov rdriv " in Transmission Section.*

Overdrive Control: *See "Warner R10 & R11 Ov rdriv Control" in Transmission S ction.*

HYDRA-MATIC DRIVE

"Flashaway" Hydra-Matic. New four speed, hydraulically controlled transmission with two fluid couplings. *See "Dual Coupling Hydra-Matic Driv " in Transmissi n Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual C upling Hydra-Matic Driv " in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: Se "Dual Coupling Hydra-Matic Drive" in Transmission S cti n.*

Lubrication – Check fluid every 1,000 miles. Drain and refill every 25,000 miles (remove oil pan and clean oil screen). Use Automatic Transmission Fluid type "A" ("AQ-ATF").

Checking Fluid Level – Bring transmission to normal operating temperature. Idle engine to 425 RPM, with selector lever in "P" (Park) position, with car on level floor. Remove fluid level indicator, wipe clean, reinsert it, then remove it again and note reading.

Throttle Linkage Adjustment: *See CARBURETOR abov*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Dual-Coupling Hydra-Matic Drive" in Transmission Section*

UNIVERSALS

Detroit r Mechanics. One universal used at front end of propeller shaft

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

REAR AXLE

Own. Semi-floating, hypoid gear with torque tube drive.

►*1957 REAR AXLE PRODUCTION CHANGE NOTE:* Spicer type rear axles used beginning Serial No. A-11296. Cutoff point Serial No. A-12139 (Standard Transmission), Serial No. A-11429 (Overdrive Transmission). Identified by number "44" cast on housing.
See "Hudson & Nash Hypoid" and "Spicer Hypoid" in Rear Axl Section.

V8	Spicer - Axle Ratios - Own
Standard	4.1-1 (11-45) 4.1-1 (10-41)
Overdrive	4.5-1 (11-50) 4.4-1 (9-40)
Hydra-Matic	3.5-1 (13-46) 3.5-1 (11-39)
"R b l"	
Standard	4.1-1 (10-41)
Overdrive	4.1-1 (10-41)
Hydra-Matic	3.15-1 (13-41)

Axl Shaft Removal: Remove wheel, pull drum (use Hub Puller J-1644). Disconnect brake line and cable. Remove backing plate mounting bolt nuts, take off oil seal retainer, backing plate and wheel bearing adjusting shims (check thickness of shims, and replace same amount when reassembling). Withdraw shaft using Puller J-2498; do not drag on inner seal.

R ar Axle Assembly R m val: Raise and support rear end of car. Disconnect rear brake cables at center equalizer. Disconnect torque tube at rear of transmission. Disconnect brake hose and shock absorbers at axle end (let hang from body). Roll axle free.

Wh l B aring Adjustm nt: Shims behind brake backing plate. *NOTE* - Adjust axle shaft endplay on **Right Hand Sid Only.**

SHOCK ABSORBERS

V8 - D lc . Direct acting type Serviced by replacement.
Fr nt - Rambler 3119821. **Rear** - Rambler 3119822.
"Reb l" - Gabri l Adjust matic type. Serviced by replacement. **Fr nt** - Rambler No. 3152754. **Rear** - Rambler No. 3152753.

Sh ck Abs rber Adjustm nt ("R b l") - Disconnect shock absorber. Compress by hand completely and rotate until internal couplings are mated. Match arrow of cylinder with desired arrow of dust cover. Extend shock absorber and reconnect.

FRONT SUSPENSION

Independent. Linked parallelogram type with coil springs located between upper end of steering knuckle pin and seat in outer wheel house panel.
See "Rambler" in Suspensions & Wheel Alignment Section.

►*FRONT SUSPENSION SPRING NOTE:* Heavier springs used for Air Conditioned cars. *See "Rambler" in Suspensions & Wheel Alignment Section.*

King Pin Inclination - 6½°.

Caster (Std.) - ½° desired. Limits ½° Pos. to 0°.

Caster (Power Steering) - 1° desired. Limits ½° Pos. to 1° Pos.

Camber - 0° desired. Limits ¼° Neg. to ¼° Pos.

Toe-In - 1/16" to 3/16". *CAUTION* - When adjusting toe-in on Power Steering Cars, operate engine to supply oil pressure which will center spool in power cylinder valve.

Toe-Out on Turns - Outer wheel 22°, inner wheel 25°.

STEERING

Manual: Gemmer. Worm & Roller with push pull adjustments.
See "Gemmer Worm & Roller" in Steering Section.

Power Steering: Monroe "Power Guide". Linkage type.
See "Monroe Power Guide" in Steering Section.

►*1957 STEERING GEAR PRODUCTION CHANGE:* Effective Serial No. A-9035 cross shaft needle bearings and thrust bearings on either side of cross-shaft roller were incorporated.

►*POWER STEERING NOISE CORRECTION: See "Monroe Power Guide" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

St ring Wh l & H rn Butt n R m val: *See "Gemmer Steering Gears" in Steering Section.*

Steering Gear Removal: *See "Gemmer Steering Gears" in Steering Section.*

BRAKES

Wagner-Lockheed Self-Centering. Self-centering type with Bendix type shoes. Star wheel adjusting screw for each wheel. Hand lever applies rear wheel service brakes.
See "Wagner-Lockheed Self-Centering" in Brake Section.

Drum Diameter - 9". *NOTE* - "Rebel" has special flanged drums for increased heat dissipation.

Wheel Cylinder Diameter - 1" (Front), 13/16" (Rear).

Replacement Linings & Shoes - Linings and shoes with linings furnished in standard size only.

Lining Width & Length	Front Wheel	Rear Whe l
Primary Shoes	2¼" x 6 31/32"	2" x 7¼"
Secondary Shoes	2½" x 9 1/16"	2" x 9 11/32"

Clearance - Adjusting screw backed off 8 notches from shoes locked against drum until free of drag.

Standard Master Cylinder: In engine compartment under steering column.

Checking Fluid - Fill from engine compartment. Check at 1000 mile intervals.

Removal - Remove from beneath car. Not necessary to disturb other parts.

Power Brakes: Bendix Power Unit, Hydraulic Reacti n Type. *See "Bendix Power Unit" in Brake Section.*

Checking Fluid - Same as for standard master cylinder.

Removal - Same as for standard master cylinder.

MISC. MECHANICAL

Windshield Wipers: Vacuum Link & Arm type. *See "Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Nash-Hudson Air Conditioning: Thermostatic control with magnetic clutch on compressor unit. *See "Nash-Hudson Air Conditioning" in Misc. Section.*

TIGHTENING SPECIFICATIONS

ENGINE

CHAMPION

ENGINE REMOVAL *NOTE*-If same engine block is to be reinstalled, engine should be disconnected at junction of clutch housing or torque converter housing (torque converter should be disconnected from engine drive plate so that converter will remain on transmission splines when engine removed). If new block to be installed, clutch housing or converter housing can be removed with engine, after removing transmission (this will allow housing alignment to be checked before engine reinstalled).

1) Remove hood and upper air deflector. On sedans and station wagons, remove radiator core Disconnect Climatizer hoses (if so equipped) from water pump and cylinder head elbows. On coupe models, remove fan blade assembly and shroud (see Cooling System below). Disconnect and remove battery, remove carburetor air cleaner.

2) Disconnect windshield wiper hose and oil pressure gauge line from the flexible coupling Disconnect cables from generator, starter solenoid, ignition coil, and heat indicator engine unit

3) Remove cotter key and take out clevis pin connecting accelerator cross shaft to bellcrank rod. Remove lower stud nut from engine front support insulators and disconnect engine ground strap from right front engine support bracket

4) Remove exhaust pipe flange to manifold nuts, remove U-clamp at clutch or converter housing bracket, and lower exhaust pipe off manifold studs. Remove the starter motor. On coupe models, turn front wheels all the way to the right. On sedans and station wagons, disconnect one end of the front tie rod, remove shaft from steering bellcrank and remove bellcrank out of way to provide clearance for oil pan. Disconnect gas tank to fuel pump line at flexible coupling.

5) Remove center (No. 1) cylinder head capscrew and replace it with an engine lifting eyebolt. Attach lifting device and raise engine just enough to take weight off front supports.

6) On automatic transmission models, disconnect accelerator bellcrank-to-transmission rod. Remove converter housing lower plate, and disconnect torque converter from converter drive plate *(see "Automatic" or "Flightomatic" Transmission in Transmission Section).*

7) Remove clutch housing to engine bolts and drive out clutch housing dowel pins. Raise engine slightly and move it forward sharply to break it loose from clutch housing. Continue to push engine forward until transmission spline clears clutch assembly, then lift engine out of car.

ALL V8 CARS

ENGINE REMOVAL *NOTE*-If same engine block is to be reinstalled, engine should be disconnected at junction of clutch housing or torque converter housing (torque converter should be disconnected from engine drive plate so that converter will remain on transmission splines when engine removed). If new block to be installed, clutch housing should be removed with the engine for checking alignment. On cars with air conditioning, remove compressor mounting bracket and compressor as an assembly without disconnecting refrigerant lines (see Compressor Removal under "Studebaker Air Conditioning" in Miscellaneous Section). Move assembly to position on front of right fender, being careful to keep compressor crankcase lower than compressor cylinder head, so that oil will not leak into chamber above compressor pistons.

1) Remove hood, upper air deflector and fan shroud. Disconnect and remove battery On sedan and station wagon models, remove radiator core and water pump manifold. On coupe and hardtop models, remove fan blade assembly. Disconnect Climatizer hoses (if so equipped) from water manifold. Remove generator and fan belt

2) Remove starter and remove exhaust crossover pipe. On sedan and station wagon models, remove steering bellcrank shaft. On coupe and hardtop models, turn steering gear all the way to left to provide clearance.

3) Remove carburetor air cleaner, fuel pump to carburetor pipe, and the spark modifier pipe. Unhook spark plug wires, remove spark plug cable support brackets from rocker arm cover, remove distributor clamp screw and remove distributor. Disconnect fuel pump inlet line at flexible coupling, and disconnect any vacuum connections at intake manifold

4) Disconnect oil pressure gauge line at flexible coupling and disconnect wires at heat indicator gauge and ignition coil. Disconnect accelerator pushrod at throttle control bellcrank. On cars equipped with overdrive, disconnect wire at kick-down switch. On cars with Automatic Drive, disconnect the wire at anti-creep switch and disconnect accelerator bellcrank to transmission rod at bellcrank. Remove converter drive plate to torque converter bolts *(see "Studebaker "Flight matic" Transmissi n in Trans. S cti n.*

5) Remove upper stud nuts from engine front support insulators and disconnect engine ground strap. Place a sling under intake manifold, attach hoist and raise engine just enough to take weight off engine supports. Remove clutch housing to engine bolts and take off the clutch housing front cover plate.

6) If clutch housing to be removed with engine, remove transmission. Remove the two capscrews holding clutch operating shaft, bracket, and bearing assembly to transmission case. Remove cotter key and clevis pin from inner end of clutch operating shaft sleeve and move clutch operating shaft away from clutch release shaft.

7) On cars equipped with Flightomatic Transmission remove the four engine rear support insulator capscrews which hold insulators to converter housing. On models equipped with overdrive or standard transmission, remove the two bolts which hold insulator and cage assembly to engine rear support crossmember.

8) On coupe and hardtop models, turn wheels to right to move steering bellcrank off to the side to provide additional clearance for oil pan. Push engine sharply forward to disengage clutch housing dowels. Continue to push engine forward until transmission spline is clear, then raise engine out of car.

OIL PAN

ALL MODELS

OIL PAN REMOVAL (CHAMPION): Remove oil level gauge. Raise car and support it with stands, drain oil. On long wheelbase models, swing wheels to right to move steering bellcrank out of way. On short wheelbase models, disconnect tie rods and reach rod from steering bellcrank, remove retaining pinch bolt, and remove bellcrank from shaft. On all models, remove oil pan capscrews and remove pan.

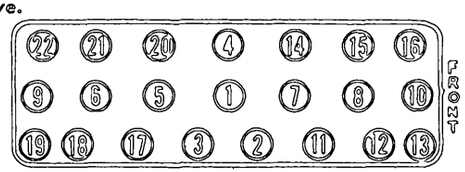
OIL PAN REMOVAL (COMMANDER & PRESIDENT): Remove oil level gauge and adapter tube. Disconnect one battery cable. Raise car, drain oil and remove starter. On coupe and hardtop models, swing wheels to right to move steering bellcrank out of way On sedans and station wagons, remove steering bellcrank assembly. Remove exhaust crossover pipe. Remove oil pan cap screws and remove pan.

INSTALLATION (ALL MODELS): For installation of oil pan, the filler block must be removed. Remove the four screws holding filler block to engine front cover (V8), or to engine front plate (6 Cyl.). With a thin spatula or putty knife, carefully separate filler block from engine front cover gasket (V8) or engine front plate gasket (6 Cyl.). If this gasket is damaged, cut away the exposed portion of the gasket. Then cut the required amount from a new gasket and fit it in place as necessary using Perfect Seal or its equivalent to secure gasket in place. Apply a sealer to threads of the four front cover or front plate to filler block cap screws. Install filler block with a screw in one of the upper holes. Using a hardwood stick, pry upward against filler block and install a screw in the opposite upper hole. Install two remaining screws and tighten all four screws until heads just contact lockwasher.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

With all gaskets in position, install the oil pan and tighten the screws evenly. Then tighten the four filler block screws. Complete the installation by reversing removal procedure.

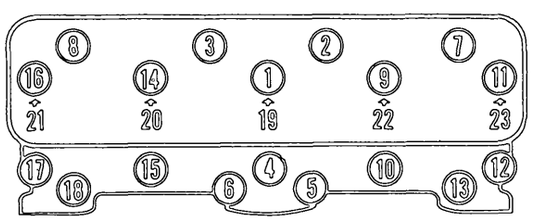


CYLINDER HEAD & MANIFOLD

ALL MODELS

CYLINDER HEAD GASKET: Coat lower face of gasket and face of cylinder head with Perfect Seal gasket cement before installing (use sparingly and see that it does not enter screw holes and water passage openings).

CHAMPION



CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head capscrews, tighten in correct sequence as shown in diagram. With engine cold, tighten all nuts evenly to correct tension. Then run engine until it is thoroughly warmed up and recheck all capscrews (additional tightening may be necessary for correct tension).
Tightening Torques–*See "Tightening Specifications" above.*

CHAMPION CYLINDER HEAD

ALL V8 CARS

CYLINDER HEAD INTERCHANGEABILITY (RIGHT TO LEFT BANK): Both cylinder heads are identical (water pump ports are provided at front and rear of all heads). It is necessary to block off the rear port not in use with a dummy plate and gasket. *NOTE*–Heat indicator engine unit must be mounted in the water outlet opening cover plate at rear of the left bank cylinder head.

ALL V8 ENGINES CYLINDER HEAD

ALL V8 CARS

CYLINDER HEAD INSTALLATION: Clean all threads using a tap and die. Check head for warping (*NOTE*–If necessary, head can be planed .015". Apply gasket compound to gasket and install. (*CAUTION–Be sure main oil gallery-to-rocker arm assembly oil passage at rear of the right bank (on front of left bank) is not blocked by gasket).* Install cylinder head on the hollow dowel. Dip capscrews in engine oil and install the nine short screws in the two outer rows of holes and the five medium length screws in the center row of holes and tighten finger tight. Install rocker arm assembly (see "Rocker Arm Assembly"). Install and tighten long head screws finger tight. Insert rocker arm assembly capscrews through rocker arm brackets. Tighten all cylinder head capscrews in correct sequence as shown in diagram. Tighten water pump manifold screws alternately until they are tight.
Tightening Torques–*See "Tightening Specifications".*

ORIGINAL BORE & PISTONS

ALL MODELS

ORIGINAL BORE & PISTON SIZES: Cylinder bore sizes are marked by a figure stamped on top face of cylinder block next to each cylinder bore as indicated below. Replacement pistons corresponding to these sizes are available under the part number for standard size pistons. The oversize is marked on the top of each piston. *NOTE–When replacing pistons in an engine which has been in use, the cylinder bore markings can no longer be used as a guide. It is important that pistons be selected to fit the cylinder bore. See "Fitting Pistons" on car model page.*

Cylinder & Piston Markings: Cylinder bores may vary in size from Standard to .0025" oversize in increments of .0005". Champion bore sizes vary from 3.000" (stamped "0"), to 3.0025" (stamped "25"). V8 engine bore sizes vary from 3.5625" (stamped "25"), to 3.5645" (stamped "45").

PISTON PINS

ALL MODELS

PISTON PIN REMOVAL & INSTALLATION: Use Tool J-1293-A (Champion), J-1293-C (V8 Engines).
Removal–Place rod and piston assembly on assembling fixture. Remove lock nut and star washer from clamp screw, and by tightening lock nut on other end of clamp screw, remove clamp screw, remove the screw from connecting rod. Then slide piston and connecting rod off piston pin.
Installation–Place piston pin on assembling fixture, slide piston and connecting rod into position. (Oil squirt hole and number on connecting rod should be on the solid side of the piston). Insert piston pin clamp screw in connecting rod, install star washer and locknut, and tighten nut securely.

6 Cylinder Engines – On connecting rods Nos. 1, 3, and 5 the clampscrew nut is installed on the T-slot side of the piston. On Nos. 2, 4, and 6 the nut is installed on the solid side of the piston. When installing the screw regardless of the number of the rod, if the rod is held with the offset of the rod to the left and the screw is inserted from the front the nut will be located on the correct side in relation to the piston. Be sure to align the flat surface on the piston pin with the flat surface on the clamp screw.

V8 Engines – If connecting rod is new and has not been marked, it should be checked to see if it is a left or a right bank rod. Hold rod so oil holes face you. All rods are offset at crankpin end. When held as above, left bank rods have offset or widest part of rod to the right; a right bank rod would have offset to left. Stamp correct number on rod and rod cap on oil hole side if even numbered or right bank rod, and on side away from oil hole if odd numbered or left bank rod. Be sure that when pin is inserted nut will be installed on slotted side of piston and that flat surface of clampscrew mates properly with flat surface of piston pin.

PISTON RINGS

ALL MODELS

Replacement Rings: Three types of Perfect Circle piston rings available for service replacement:
Standard Production Type Sets–Plain iron rings without chrome plating. To be used on relatively new engines. Furnished Std. and .020", .030", .040" Oversize.
Chrome Top Ring Sets–Same as standard ring set except that top ring is solid chrome-plated to increase ring life and oil control. Used on relatively new engines or after a rebore job, especially where heavy duty service is anticipated. Furnished Std. and .020", .030", .040" O.S.
"2 in 1" Chrome Sets–Set contains solid chrome-plated top ring and, in addition, an oil ring assembly made up of two chrome-plated steel rails, one cast iron separator or spacer and two complete sets of expander rings, one "Normal Pressure" set and one "Hi-Pressure" set. "Normal Pressure" set used where taper of bore does not exceed .006". "Hi-Pressure" set used where taper exceeds this limit. In general, use "2 in 1" set for all except new and rebored engines. Furnished Std. & .020", .030" O.S.
"2 IN 1" CHROME RING SET INSTALLATION CAUTION: Distribute oil control ring expander, separator, and ring rail gaps as follows: Place expander spring in ring groove with gap positioned above end of piston pin. Install one steel section with gap approximately 90° from spring gap. Install cast iron separator with gap approximately 90° from steel rail gap. Install remaining steel section with gap approximately 180° from gap of first steel rail. *NOTE*–Gap in rails and separator must not straddle humps on expander spring.

CRANKSHAFT & MAIN BEARINGS

ALL MODELS

REAR MAIN BEARING OIL SEAL INSTALLATION: *NOTE*–Seal assembly consists of three types used together: (1) Cork Seals between sides of bearing cap and block, (2) Neoprene seals in groove in face of bearing cap, (3) "Brummer" type seal on crankshaft journal (installed in block and bearing cap). Install seals as follows:
Neoprene Seals–Place new seals in cross grooves of bearing cap with inner end of seal not more than 1/16" from inner end of groove, press seals firmly and uniformly into grooves and trim outer ends flush with sides of bearing cap. *CAUTION*–Seals must not be more than 1/16" from inner edge of bearing cap and must not be so long as to interfere with Brummer seal.
"Brummer" Type Seal–Remove old seal, thoroughly clean seal channel just forward of rear flange by using a swab saturated with alcohol or similar solvent, dry channel thoroughly. Blunt the sharp edge of the flange on which the seal is mounted using the flat

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

side of a screwdriver blade or similar tool (this will prevent scuffing inner edge of seal during installation). Install seal DRY as follows: Insert upper half between crankshaft and block at the rear flange with the wiping lip of the seal pointing forward or away from the flywheel, work seal around crankshaft until ends are horizontal and in line with the bearing cap face (see V8 Engine Note below), use great care to avoid scuffing the soft center sealing cushion at the bottom of the seal groove. Install lower half of seal on bearing cap flange, oil wiping edge of seal and crankshaft journal, install bearing cap and tighten bearing cap bolts to correct torque.

Cork Seals—After bearing cap installed, drive new cork seals down into grooves between sides of bearing cap and block (use drift and light hammer). *CAUTION*—Use care not to split or damage these seals.

Oil Leak Check—After installing new seals, run engine for approximately 45 minutes, then check for oil leaks.

▷*V8 ENGINE NOTE:* To facilitate installation of the upper half of the Brummer seal, the three intermediate bearing cap screws can be loosened two turns. *CAUTION*—Do not loosen these intermediate bearing caps more than indicated or front bearing may be damaged.

ENGINE FRONT COVER

CHAMPION

ENGINE FRONT COVER: Removal—Remove fan shroud, radiator core, and vibration dampener. Using Puller Set HM-925, remove the crankshaft pulley (use HM-925-12 to prevent damage to crankshaft threads). Take out cover retaining screws and bolts and remove the cover.

Engine Front Cover Seal (Crankshaft Front Seal) Installation: Install new felt oil seal in cover, using hub of crankshaft pulley to seat it in recess in cover.

Engine Front Cover Installation: Install cover on engine using a new gasket. Install all the retaining bolts, leaving them finger tight so cover can center itself as the crankshaft pulley is installed. Using Pusher Set J-4704, press crankshaft pulley into position. Tighten cover bolts and screws securely and install vibration dampener, radiator core and shroud.

ALL V8 CARS

ENGINE FRONT COVER: Removal—Drain cooling system and remove fan shroud and radiator core. Remove fan belt and power steering belt (if so equipped). Remove fan blade assembly and take off the water manifold. Remove fuel pump to carburetor pipe and remove fuel pump. Remove vibration dampener and fan pulley hub (on Power Steering cars a second pulley is used). Remove cover screws and remove cover.

Engine Front Cover Seal (Crankshaft Front Seal) Installation: Remove felt oil seal with an ice pick and clean out the recess in cover before installing new seal *(NOTE—Do not remove the four self tapping screws h lding the seal retainer plate in position).* Install a new seal and wet it with clean engine oil. Insert crankshaft pulley hub to locate seal in center position.

Engine Front Cover Installation: Install cover on engine, using a new gasket, and install cover screws, but do not tighten. Using Pusher Set J-4704, install crankshaft pulley hub to locate hub and center cover properly. Tighten cover screws. Install fuel pump and the fuel pump to carburetor pipe. Assemble and install vibration dampener and tighten retaining screws to proper torque. Install water manifold assembly using new gaskets, and replace fan blade assembly. Install fan belt and adjust it to proper tension. Install power steering belt (if so equipped) and adjust it to proper tension. Install radiator core and fan shroud.

CAMSHAFT & BEARINGS

CHAMPION

CAMSHAFT REMOVAL (Champion): *NOTE—Camshaft can be removed with the engine in the chassis by removing fender, grille, and radiator core as an assembly.* Remove cylinder head, manifold assembly and valve cover plates. Take out valve locks, valves and valve spring retainers. Turn cylinder block over so that valve lifters will fall free of camshaft. If engine not removed from car, tie or block valve lifters so they will not interfere with cam lobes during removal. Remove oil pan, oil pump, and oil pump drive shaft. Remove vibration dampener, fan drive pulley and engine front cover. Unless camshaft is to be replaced, it is not necessary to remove camshaft gear. Turn crankshaft until camshaft thrust plate cap screws are visible through spokes of timing gear. Remove capscrews and lockwashers retaining thrust plate and carefully slide camshaft and gear out of cylinder block, being careful not to nick or scratch camshaft journals, lobes, or bearings.

ALL V8 CARS

CAMSHAFT REMOVAL (Engine in Car): As follows: Turn crankshaft until timing mark shows directly under pointer on engine front cover and distributor rotor is in the No. 6 firing position (in this position the timing mark on the camshaft gear is aligned between the marks on the crankshaft gear). On coupe and hardtop models, remove the fan shroud. On all models remove the radiator core, fan blade assembly and water manifold. Remove rocker arm covers, rocker arm assemblies and pushrods. Remove carburetor and intake manifold assembly. Remove breather pipe, valve lifter cover, and take out the valve lifters. Remove fuel pump and take off engine front cover (see "Engine Front Cover" above). Turn camshaft just enough to expose thrust plate retaining screws and remove screws. Turn gear back to align timing marks of the two gears. Remove camshaft and gear as an assembly, being careful not to damage camshaft bearings. *CAUTION—With camshaft removed, do not move crankshaft or disturb position of distributor rotor.*

TIMING GEARS

ALL MODELS

TIMING GEAR REMOVAL: Remove engine front cover (see above). Remove gear retaining screw, lockand flatwashers. On V8 engines remove fuel pump cam and lockplate. With Puller HM-925 remove camshaft gear. Remove crankshaft pulley key and oil slinger and then crankshaft gear with same tool. Use Adapter Plug HM-925-12 to protect crankshaft threads.

VALVE SYSTEM

VALVE GUIDES

ALL V8 CARS

VALVE GUIDE REMOVAL AND INSTALLATION: Valve guide tool J-4673 is used to remove and install the valve guides. Drive guide out of cylinder head from the combustion chamber side.

▷*NOTE:* Intake and exhaust valve guides not interchangeable. Intake guides are longer.

Installation—Coat valve guide lightly with white lead and start chamfered end into cylinder head from the combustion chamber side. Place the installing plate on the face of the head so that the long side of the plate is paralliel to the end of the head and the bore of the plate centered over the guide bore. The plate is marked "Intake" on one side and "Exhaust" on the other side. Be sure that the exposed mark of the plate corresponds to the valve guide being installed so that the depth of the counterbore of the plate will control the depth to which the guide is driven into the head. Insert the driver through the plate and into the guide. Drive the guide into the head until the shoulder of the driver contacts the bottom of the counterbore in the plate.

ROCKER ARMS

ALL V8 CARS

ROCKER ARM ASSEMBLY: Two identical hollow steel shafts (ends plugged) are used. Four removable supports doweled to each shaft with cylinder head capscrews. Three springs used to position rocker arms against supports. Lubrication is supplied by oil from the main oil galleys to a passage in the cylinder head which leads the oil up around the relieved capscrew shank in the rocker arm front support on the left bank and the rocker arm rear support on the right bank. The bracket is drilled to connect the capscrew hole with the rocker arm shaft hole. The oil flows under pressure to the rocker arms and through holes drilled in the rocker arms to the adjusting screws and through the center of the adjusting screws to the push rods.

▷*DISASSEMBLY CAUTION:* Mark rocker arms, brackets, and the rocker arm shaft so that they can be reassembled in their original position.

Reassembly—Make certain the oil holes and grooves in the rocker arm shaft and the oil holes in the brackets rocker arms and adjusting screws are clean. Check rocker arms and shaft clearance which should be .0005" to .0025". Test springs. It should require 9-1/2 to 10-1/2 lbs. to compress springs to 2-1/32". If not within these limits, replace spring. Place a spring washer between two flat washers and install on one end of the rocker arm shaft and install a new cotter pin in the shaft. Place a rocker arm on the shaft next to the inner flat washer. (*CAUTION*—The oil groove

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

side of the shaft must be at the bottom of the rocker arm and the adjusting screw end of the rocker arm be on the same side of the shaft as the cylinder head capscrew groove in the shaft). Place a shaft bracket on the shaft so that the bottom of the bracket is on the oil groove side of the shaft and align the cylinder head capscrew hole in the bracket with the capscrew groove in the shaft. Insert a capscrew through the bracket. Clamp the bracket in a vise. and install the second rocker arm on the shaft, positioning it in the same way as the first rocker arm. Slide a spacer spring on the shaft and, holding the spring compressed, slide the third rocker arm and the second bracket on the shaft and position it in the same way as the first bracket. Align the screw hole in the bracket with the groove in the shaft, insert a capscrew and release the spring. Install the rest of the rocker arms, springs and brackets in the same manner. Slip the two flat washers with the spring washer between them, on the end of the shaft and install a new cotter pin in the shaft. If correctly assembled, when installed on the engine, the flat side on the end of the rocker arm shaft will be at the rear on the right bank and at the front on the left bank.

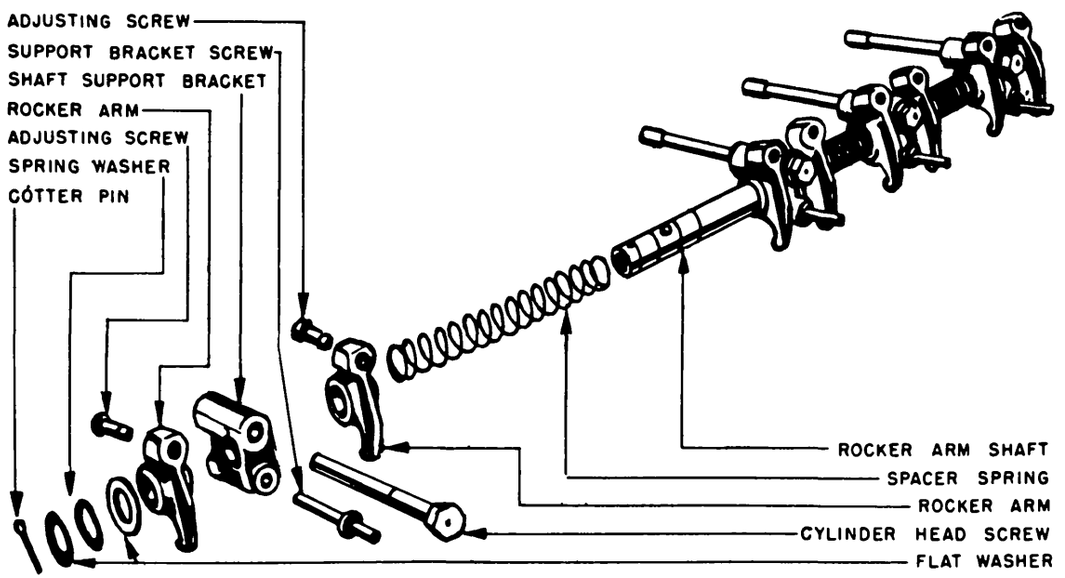
VALVE LIFTER

ALL MODELS

VALVE LIFTER INSTALLATION: Thoroughly clean lifter bores in cylinder block and inspect for smoothness. With lifter and bore clean and dry, check lifter fit and select correct lifter size. Lifters furnished Std., .001", .005" oversize. See ".005" Oversize Lifter Installation" below.

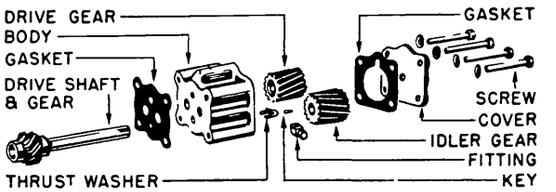
Ch cking Lifter Fit in B re—When properly fitted, the valve lifter should just slide into place from its own weight. If .001" oversize lifter does not restore proper clearance, bore must be reamed to .005" oversize, and .005" oversize lifters installed.

.005" OVERSIZE VALVE LIFTER INSTALLATION: Special reamers are required for reaming engine block lifter bores as follows: 32L-STB (Champion 6 Cyl.), 1352-STB (All V8 engines).



OILING SYSTEM

OIL PUMP



CHAMPION

OIL PUMP: Removal & Disassembly—Disconnect oil pressure pipe. After removing four cover screws and washers, remove pump body cover, gasket and idler gear. Remove drive gear using tool J-2959. Remove Woodruff key and horseshoe shaped thrust washer to permit removal of oil pump body and gasket. If it is necessary to remove pump drive shaft and gear, the oil pan must be removed. Turn crankshaft away from No. 1 TDC position (to provide clearance between counterweight and engine block). Remove distributor and push oil pump drive shaft inward, and remove it from the crankcase. To remove gear from oil pump drive shaft, press out the gear-to-shaft pin and then press shaft out of gear.

Inspection: Inspect pump cover for flatness and deep scratches or score marks. Check clearance between oil pump gears and pump body by placing a .005" feeler gauge between teeth of oil pump gear and body on each side of pump. The pump should be locked tight. The total clearance should not exceed .010". If pump gears can be rotated with the two .005" feelers in place, the pump body is worn and should be replaced. Check gears for smoothness, deep scratches and score marks. Replace all defective parts. Clearance between end of gears and cover plate must not exceed .007". To check this clearance, the lower ends of the gears should be exactly flush with the lower surface of pump body when gears are resting against the upper part of pump body. A new gasket .004-.006" thick, when compressed will provide proper clearance.

V8 ENGINE ROCKER ARM ASSEMBLY

CHAMPION OIL PUMP

Installation & Reassembly: *(CAUTION—If oil pump drive shaft removed, install EXACTLY as described below to obtain correct ignition timing).*

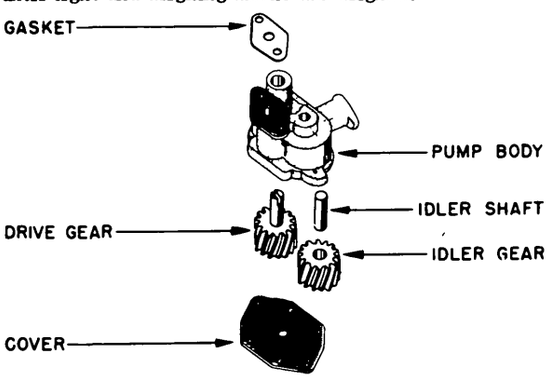
Oil Pump Drive Shaft Installation - Install drive shaft, temporarily engaging camshaft gear and oil pump drive gear with crankshaft turned away from No. 1 TDC position (necessary to provide clearance at crankshaft center counterweight). Then turn the crankshaft until No. 1 piston is on compression stroke and "UDC 1-6" mark on vibration dampener is directly under pointer on engine front cover. Slide the oil pump drive shaft away from camshaft to disengage the camshaft gear and turn drive shaft until keyway is pointing directly upward when the two gears start to engage. Pull the shaft into position so that the two gears fully mesh (the drive shaft will rotate so that the keyway is toward rear of engine). Install distributor to hold oil pump drive shaft in position while installing remainder of pump assembly (with slot in end of distributor shaft engaged, rotor should line up with No. 1 terminal in distributor cap).

Oil Pump Assembly—Dip each part of pump in clean engine oil before assembly. Place a new gasket and oil pump body over pump shaft and install horseshoe washer, woodruff key, and drive gear. Install idler gear, new cover gasket, and pump body cover. Secure entire assembly in place with the four cover screws Remove oil pressure pipe fitting from pump body and prime pump with clean engine oil. Install fitting and oil pressure pipe.

ALL V8 CARS

OIL PUMP: Removal—Remove oil pan and take out the two oil pump retaining nuts and lockwashers. Slip pump assembly off mounting pad studs and remove gasket.

Disassembly: If necessary to replace strainer, straighten tab, and slip strainer off pipe. If floating strainer is to be cleaned, remove pump and strainer assembly. Do not remove the strainer by bending retaining tab. *(NOTE—the floating oil strainer is serviced only as an assembly and should not be disassembled).* Remove cover screws and pump body cover. Remove idler



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

gear, drive gear and shaft (do not disassemble drive gear and shaft). Clean oil strainer with solvent and dry it thoroughly.

Inspection: Inspect pump cover for deep scratches or scores and for flatness. Check clearance between oil pump gears and pump body by placing a .005" feeler gauge between teeth of oil pump gear and body on each side of pump. If pump gears can be rotated with the two .005" feelers in place, the pump body is worn and should be replaced. Check gears for smoothness, deep scratches and score marks. Replace all defective parts. With weight of gears resting against upper part of pump body, place a straightedge across face of pump body and measure distance between gear face and straightedge. This clearance should not exceed .007".

Reassembly: Place drive gear and shaft assembly in pump body. Install idler gear on idler shaft. Install pump body cover and cover screws (no gasket is used between body and cover). Insert pipe of floating oil strainer in cover inlet finger tight and set up strainer to get its proper position. While holding assembly so strainer is up against upper stop, lower surface of strainer should be parallel with pump cover and 1 7/8" below cover. Scribe aligning marks on pump body and pipe. Then, using suitable pipe wrench, tighten pipe until tight and aligning marks are aligned.

V8 ENGINE OIL PUMP

Installation: Clean all traces of old gasket off pump mounting flange and rear bearing cap pad. Install a new gasket and position slot in pump drive gear shaft so it will mate with tongue of the oil pump drive shaft and coupling, and install pump on mounting studs. Install nuts and lockwashers and tighten securely to 13-17 ft. lbs.

COOLING SYSTEM

RADIATOR & FAN SHROUD REMOVAL & INSTALLATION: Shroud (Coupe & Hardtop) - Drain radiator and remove inlet hose. Remove wiring junction block from fan shroud. Pry open wiring harness clips and move harness out of way. Remove fan-to-hub screws and remove fan blades. Remove four capscrews holding shroud to radiator core support and remove fan shroud. To install, reverse removal procedures.

Radiator (All Models) - Drain cooling system disconnect battery and tie up hood. Remove horn relay and headlamp junction block screws, and free wires across top of shroud from clips. Except on Champion models, remove gasoline pipe clip screw. If car has power steering, free upper hose from hose support. Remove fan blade assembly. Disconnect upper and lower hoses from radiator. Remove screws and remove radiator core. To reinstall, reverse removal procedure.

IGNITION NOTES

ALL V8 CARS

DISTRIBUTOR DRIVE SHAFT ASSEMBLY: Removal—Turn crankshaft until "IGN" mark on vibration dampener is directly under pointer on engine front cover and distributor rotor is in line with No. 1 spark plug terminal of cap. Remove cap from distributor housing and carburetor air cleaner from carburetor. Disconnect coil-to-distributor secondary cable at coil. Remove spark plug cables, cable brackets and distributor cap as a unit. Disconnect coil-to-distributor primary wire at distributor. Disconnect spark modifier pipe. Remove distributor clamp capscrew and lift distributor out of cylinder block.

Installation: The "IGN" mark on vibration dampener must be directly beneath pointer. Position distributor so that spark modifier is to front and pointing slightly toward right. Turn rotor approximately 30° clockwise and insert the oil pump drive shaft and coupling into cylinder block opening. When the teeth on the distributor shaft gear contact the teeth on the camshaft gear, the rotor will turn counter-clockwise, and as the teeth mesh, the distributor assembly will seat on the cylinder block. At the same time the tongue of the oil pump drive shaft will enter the groove of the oil pump shaft. The rotor will now point directly forward and be in line with the No. 1 terminal of the distributor cap. (NOTE—Very slight misalignment may cause difficulty in engaging the oil pump drive shaft tongue with the groove of the oil pump shaft). After the distributor gear is in mesh with the camshaft gear, the engine may be cranked to give proper alignment. Maintain a light pressure on the distributor while cranking the engine to facilitate the engagement. Install distributor clamp and capscrew. Connect the coil-to-distributor cable. Connect spark modifier pipe. Install spark plug cables, cable brackets and secure cap with retainer springs. Connect coil-to-distributor secondary cable. Install carburetor air cleaner. Check timing.

PROPELLER SHAFT

ALL MODELS

PROPELLER SHAFT & SUPPORT BEARING ASSEMBLY: Propeller shaft is a two unit type (separate front & rear shafts) with intermediate bearing in Support Assembly on frame crossmember.

Rear Shaft Removal: Straighten ear of lockplate, loosen grease washer nut and unscrew it from shaft. Mark universal joint flange and rear axle companion flange to assure original position and balance at reassembly. Remove U-bolts holding rear joint bearing cups and cross to rear axle flange. Shift shaft forward and separate joint by prying with a suitable bar between companion flange and universal cross. Hold bearing cups on the cross while separating joint to avoid dropping cups and spilling bearings. Then remove bearing cups and bearings or tape them securely in place on cross. Slide shaft rearward, slipping end of slip yoke out of splines of front shaft. To remove grease washer nut from slip yoke, first remove cork grease washer and washer retainer from within the nut and slide nut off slip yoke. Cork grease washer and washer retainer are split to facilitate removal.

Installation—Reverse removal procedure. Tighten U-bolts and nuts to 14-17 ft. lbs.

Front Shaft Removal: Remove rear shaft and shaft support assembly. Mark front shaft universal joint flange and transmission companion flange. Remove U-bolts holding joint bearing cups and cross to transmission companion flange. Separate joint by prying with suitable bar between companion flange and universal cross. Hold bearing cups on cross while separating joint to avoid spilling bearings. Remove bearing cups and bearings or tape them in place on the cross. Then slide rear end of shaft out of crossmember and remove from chassis.

Installation—Reverse removal procedure. Tighten U-bolts and nuts to 14-17 ft. lbs.

Support Bearing Servicing: Bearing is sealed type (prepacked with lubricant) **and must never be washed in gasoline or other solvents.**

►*CAUTION: Do not re-install support bearing which has been washed in gasoline or solvent.*

Support Bearing Removal: Remove rear shaft. Remove lock plate and spacer from projecting end of front shaft, and remove shield. Remove shaft support stud nuts, lockwashers, and plain washers. Slide bearing and support assembly off front shaft and support cushions. Remove dust shields from front shaft. To remove support bearing from support use a suitable tube which will fit the outer race of the bearing and, with an arbor press, remove the bearing. NOTE—Use care not to damage bearing seal.

Installation—Reverse removal procedure. NOTE—Press bearing into support so that it is laterally centered in the support. Install dust shields on front shaft with concave side of shield against shoulder on shaft. If shaft support cushions removed, be sure to install studs in same holes from which removed.

MODEL IDENTIFICATION

Model	Model Designation
Champion Cus. & Deluxe	57G(F & W)
Champion Pelham	57G(D)
Champion Silver Hawk	57G(C)

SERIAL NUMBER: Located on left front door pillar post.

Assembly Plant	Starting Numbers
South Bend	G-1379201
Canada	G-769101

ENGINE NUMBER: Stamped on pad on upper front left corner of block.
Starting Engine Number – 1202101 (South Bend), C-71401 (Canada).

TUNE-UP

COMPRESSION PRESSURE: 130-150 lbs. at 150 RPM. Variation limit (between cylinders) 10 lbs.
VACUUM READING: 17-18" at idle speed.
VALVE TAPPET CLEARANCE: .016" cold. Intake & Exhaust.
MANIFOLD HEAT CONTROL: Automatic thermostatic type.
Checking Thermostatic Coil Spring – With outer end of coil free from anchor, and valve closed (counter-weight up), hooked end of coil should be 90° clockwise from anchor post at 70°F.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.
SPARK PLUG GAP: .030". Limits .028-.033".
Spark Plug – Champion J7.14 mm. Torque to 25-30 ft. lbs.
COIL: Aut-Lit CAG-4003A (early), CAF-4004 (later).
Ignition Current – 4 Amps. (Idling).
►*IGNITION RESISTOR NOTE: Resistor not used.*
DISTRIBUTOR: Auto-Lit 1AT-4201.
Condenser – Auto-Lite 1AT-2015L. **Capacity** .21-.25 mfg.
Contact Point Set – Auto-Lite 1GW-3028AS.
Breaker Gap – .020".
Cam Angle – 38-40°.
Breaker Arm Spring Tension – 17-20 ozs.
Rotation – Counter-clockwise viewed from above.
►*DISTRIBUTOR SETTING & TIMING NOTE: See "Oil Pump Removal & Installation" under ENGINE below.*

Automatic Advance

Degrees	Distr. RPM	Degrees	Eng. RPM
Start	400	0	800
2	680	4	1360
4	975	8	1950
6	1265	12	2530
7	1400	14	2800

Vacuum Spark Control: Aut-Lite, Integral type.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4
1	2	4-7/8
4	8	7-1/2
8	16	11-1/8
9	18	12

IGNITION TIMING

Setting – 2° BTDC.
Timing Mark – On vibration damper. "IGN" mark in line with pointer (left side of timing cover).
Timing – Disconnect vacuum advance pipe at carburetor. Install plug in carburetor. With engine at idling speed, timing light should show index mark nearest IGN mark, directly under pointer.

CARBURETOR

►*APPLICATION:* Carter BBR1-2724S (Scotsman), Carter WE-2417S (Others)
FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With transmission selector lever in "N" (Neutral) or "P" (Park) position, engine at normal operating temperature, choke wide open, proceed as follows:
1) Disconnect rod which connects accelerator bracket on firewall to auxiliary bellcrank on side of engine.
2) Connect a tachometer to engine and set engine idle speed at 550 RPM by adjusting the carburetor idle speed screw. Disconnect the rod which connects the main bellcrank on firewall to auxiliary bellcrank on engine by removing the main bellcrank ball joint stud from main bellcrank lever. Adjust the screw on main bellcrank to provide a 5/16" clearance between bellcrank and pad (use a 5/16" drill as a guage).
3) Adjust the ball joint on main bellcrank-to-auxiliary bellcrank rod until ball joint freely enters hole in main bellcrank lever. During this adjustment the carburetor idle speed screw must be against its stop and the 5/16" gap at the bellcrank must be maintained.
4) Stop engine and remove the 1/8" pipe plug located near throttle lever on side of transmission and install a pressure gauge. Place selector lever in "D" (Drive) position and run engine at 1000 RPM with rear wheels held stationary by the foot brake. Adjust length of the main bellcrank-to-transmission throttle valve outer lever rod to obtain 80-85 lbs. pressure on gauge. Stop the engine, remove gauge and install the pipe plug in side of transmission. Hold the accelerator bracket arm (on firewall) approximately 3 7/8" from face of firewall and adjust the accelerator-to-auxiliary bellcrank rod clevis until clevis pin freely enters clevis and bracket arm.

CARTER WE No. 2417S

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*
Idle Setting – ½-1½ turns open. Turn screw out for richer mixture.
Idle Speed – 550 RPM. (With selector lever in "N" or "P" position.
Float Level – 3/8" measured from top of projection on bowl cover to top of soldered seam on free end of float with needle valve seated and bowl cover inverted.
Accelerating Pump – No seasonal adjustment.
Fast Idle: .046" Throttle valve opening with choke valve closed. To check, crack throttle valve, hold choke closed, measure on side opposite idle ports (Gauge T109-188). Adjust by bending connector rod.
Automatic Choke Setting: 1 Point Lean.
►*OTHER DATA: See "Carter WE Carburetors" in Carburetion Section*

CARTER BBR1-2724S

Idle Setting - ½ to 1½ turns open. Turn screw out for richer mixture.
Idle Speed - 550-600 RPM
Float Level - 5/64" ± 1/64" below top surface of body casting.
Accelerating Pump - Seasonal setting. Inner hole for summer, outer hole for winter.
Fast Idle: Cam rotated to fast idle position when choke valve closed. No adjustment.
Choke Setting: Manual type.
►*OTHER DATA. See "Carter BBR1 Carburetors" in Carburetion Section.*
FUEL PUMP PRESSURE: 3½-5½ lbs.

CARB. EQUIPMENT

Fuel Pump: AC No. 4156. Fuel only.
Fuel Pump Pressure: 3½-5 lbs.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: Electric type.
Dash Unit - Studebaker No. 1542342 (Sedans & Sta. Wgn.), No. 1539880 (Hard Top "Hawk").
Tank Unit - Studebaker No. 1540262 (Sedans), No. 1540263 (Hard Top "Hawk" & Sta. Wgn.).
See "Fuel Gauges" in Carburetion Section.
Air Cleaner: Oil Wetted type (Scotsman), Dry type (Others - Std.) Oil Bath type (Others - Optl.)
►*CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.

BATTERY

Willard HDW-2SM-50. *12 Volt,* 9 plate, 50 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
►*CAUTION: This is reversed from previous models.*
Engine Ground - Left front of engine.

STARTER

Auto-Lite MBG-4103. *12 Volt.* **Armature** MZ-2367.
Drive - Bendix A-3519. Barrel-Anchor Plate type.
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension – 42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.0	.50 max.
5.2 ft. lbs. min.	Lock	4.0	235 max.

Starter Switch; Magnetic Switch mounted on starter and controlled by combination Starter & Ignition Switch. *NOTE* - Automatic drive cars have Neutral Safety and Back-up Light Switch.
Automatic Transmission Neutral Safety Switch: Delco-Remy 1998038 (without Power Steering), No. 1998059 (with Power Steering). Mounted on lower end of steering column. Starter will operate only when selector lever is in "N" or "P" position.
Adjustment - See "Flightomatic Transmission" in Transmission Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

GENERATOR

Aut -Lite GJC-7002-F. Armature GJC-2030-F.

Performance Data

Amperes	Volts	RPM
0.0	12.8	1225-1325
30.0	15.0	2050-2250
35.0	15.0	2250-2650

Brush Spring Tension - 18-36 ozs.
Fi ld Current - 1.2-1.3 amps. at 10.0 volts (70°F.).
M t ring Current - 3.4-3.9 amps. at 10.0 volts (70°F.).
R tation - Counter-clockwise at commutator end.
Belt Adjustment: 3/8-1/2" deflection midway between generator and fan pulleys.

REGULATOR

Auto-Lite VRX-6008A.

Cutout Relay

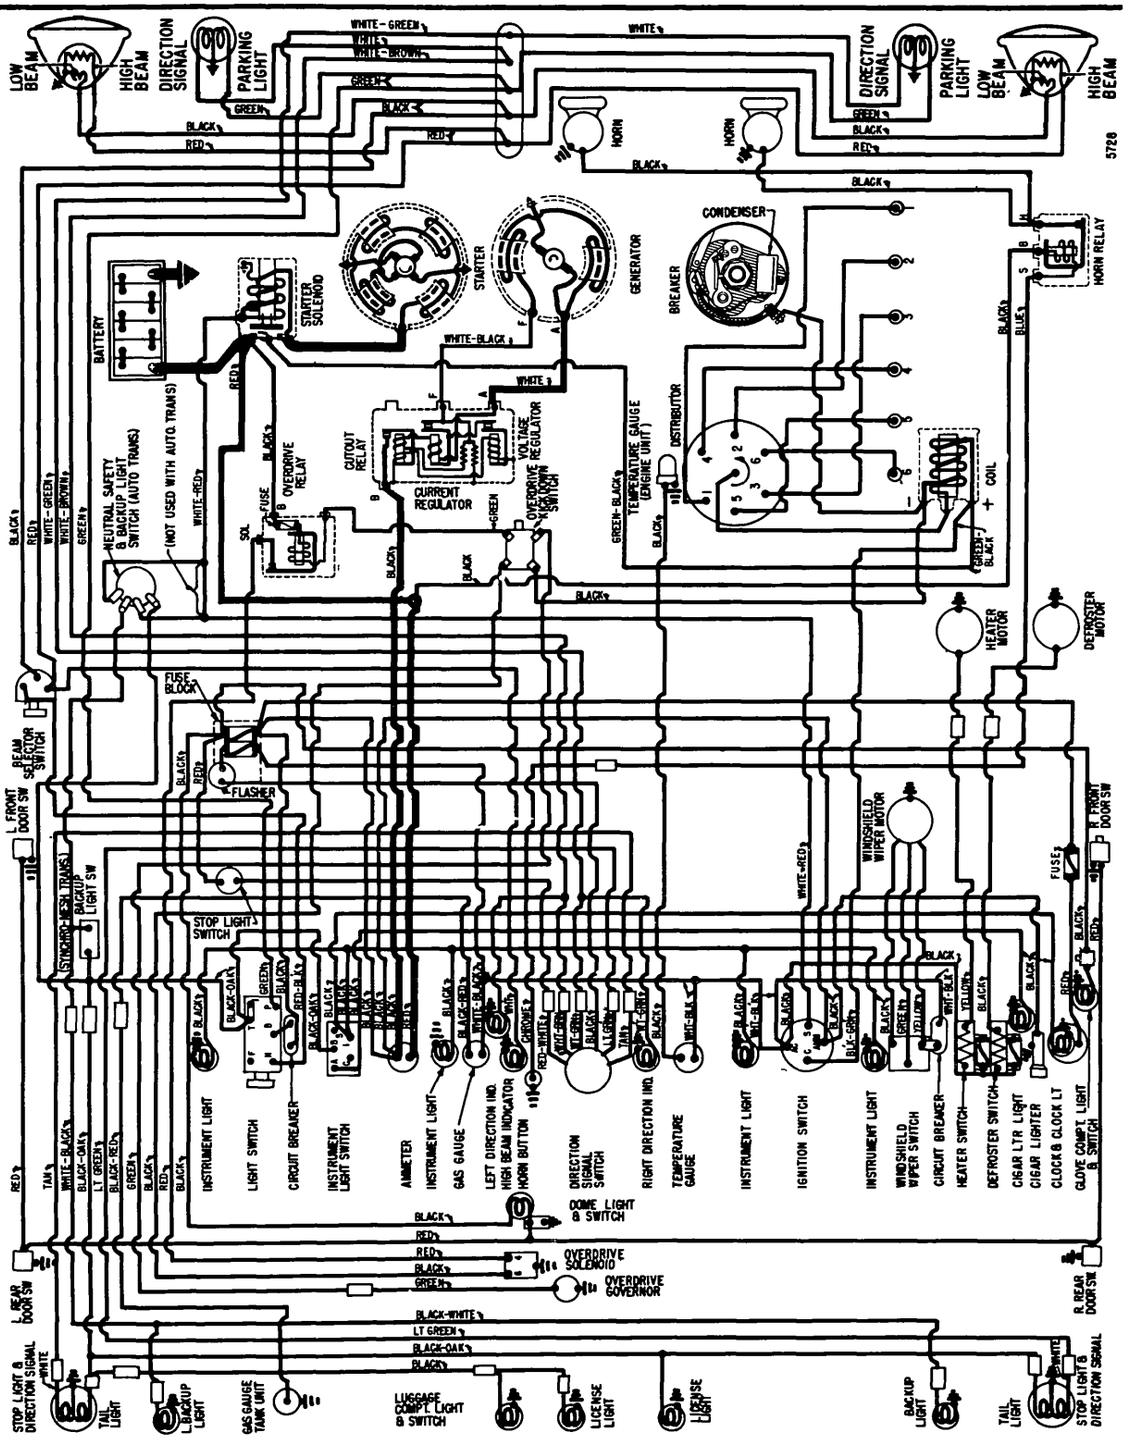
Cuts In - 13.0-13.7 volts.
Cuts Out - 8.2-9.3 volts.
C ntact Gap - .015" minimum.
Air Gap - .031-.034".

Voltage Regulator

Setting - 14.2-14.8 volts at 80°F., unit operating normally while charging at 10 amperes or with a .25 ohm resister between regulator and battery.
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
Checking & Adjusting - *See Electrical Section.*

Current Regulator

► *SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*



Test A Operating Amperes	Test B
36 amps	30 (28-32) amps.

T st A - After 15 minutes operation charging at 10 amps.
T st B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts).
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
Ch cking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

H adlamps: Sealed Beam. *See Electrical Section.*
Dir ction Signal: *See Electrical Section.*
Light Switch Removal: Remove retaining nut. Remove lower panel cover screws and covers. Slide toggle switch back through panel and disconnect wires.
Stop Light Switch: Located on inner side of left frame rail just forward of steering gear housing; except on Power Brake equipped cars, where it is screwed into rear end of power unit, located under hood on left front fender apron.
Fus s: Body & Stop Lights 15 amps. in block in bracket behind instrument panel.
Direction Signal 15 amps. in block in bracket behind instrument panel.
Ov rdriv 15 amps. in relay on dash panel.
Cl ck 1 amp in lead behind instrument panel.
CIRCUIT BREAKERS: Head, Parking, Tail & Instrum nt Lights 18 amps. on headlight switch.

ENGINE

ENGINE SPECIFICATIONS: "Sweepstakes 185". 6 Cyl. "L" head.

Bore	Stroke	Displacement
3"	4-3/8"	185.6 cu. ins.
Compr. Ratio	**Rated HP**	**Developed HP**
7.5-1 ©	21.6	101 at 4000 RPM

© – 8.0-1 Optl. compression ratio.

Compression & Vacuum Reading–*See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Studebaker Special Data.*

OIL PAN REMOVAL: *See "Oiling System" in Studebaker Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Studebaker Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Studebaker Special Data.*

PISTONS

"T" slotted, cam ground, tin plated aluminum alloy. Three ring type.

Original Bore & Pistons–*See "Original Bore & Pistons" in Studebaker Special Data.*

Removal–Pistons and rods removed from above.

Fitting New Pistons: Clearance–Selective feeler fit. Use feeler 1" wide, .002" thick, and 12" long inserted on camshaft side of cylinder bore. Insert inverted piston in bore with slotted side away from camshaft, and bottom edge 1" below top of cylinder bore. Pull required to remove feeler with properly fit piston should be 11 to 16 lbs.

Replacement Pistons: Std. .010", .020", .030" and .040" Oversize.

Installing Pistons: Install piston in cylinder bore with "T" slot away from camshaft side. *See Rod Installation.*

PISTON PINS

Pin is locked in rod by tapered pin and locknut.

Diamter–.7491-.7495". **Length** 2.625".

Clearance in Piston–.0001-.0003" (selective fit). Light thumb push fit at 70°F.

Piston Pin Removal & Installation–*See "Piston Pins" in Studebaker Special Data.*

Replacement Pins: Std. & .0025", .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	3/32"	.007-.017"	.002-.005"
Compr. #2	1/8"	.007-.017"	.002-.005"
Oil	5/32"	.007-.017"	.0015-.004"

Replacement Rings: Std., .020", .030", & .040" Oversize, in sets.

See "Piston Rings" in Studebaker Special Data.

Installing Rings: Top compression ring has step at the inside which must be installed up. Second compression ring has step at outside which must be installed down. Inner and outer oil ring end gaps must not come at the same point.

CONNECTING RODS

Length–(Center-to-center) 6 3/8". **Weight** – 19.04 ozs.

Crankpin Journal Diameter–1.81175-1.81275"

Bearings–Steel backed, Microbabbitt lined, no shims.

Clearance–.0005-.002".

Side Play–.005-.009".

Replacement Bearings: Standard & .001", .005", .010", .020" Undersize.

Installing Rods: Assemble piston and pin on rod so "T" slot of piston on side opposite oil hole in lower end of rod. Insert tapered end of clamp screw toward heavy boss on rod. With "T" slot of piston away from camshaft side, the narrow part of rod offset will be to right on odd numbered rods, to left on even numbered rods. Rods (#1, 3, 5) cannot be interchanged with rods (#2, 4, 6).

►*REPLACEMENT ROD NOTE:* (Unnumbered Rods)–With spit hole toward you, narrow part of offset will be to the right for odd numbered cylinders, and to the left for even numbered cylinders.

CRANKSHAFT

Journal Diameter–3.0623-3.0628". Four bearings.

►*FRONT MAIN BEARING CAP REMOVAL NOTE:* Turn crankshaft until No. 3 and No. 4 pistons are at top of their travel. Remove bearing cap bolts, then remove cap by twisting end away from camshaft toward rear of engine.

Clearance–.0005-.0025".

Replacement Bearings: Std., .001", .010", .020", and .030" Undersize.

End Thrust: Taken by thrust washer assembled between front main bearing and crankshaft gear. Controlled by shims between thrust washer and main bearing journal.

End Play–.003-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT

Journal Diameters – (1) 1.7475-1.7480", (2) 1.7162-1.7170", (3) 1.6857-1.6865", (4) 1.6232-1.6240".

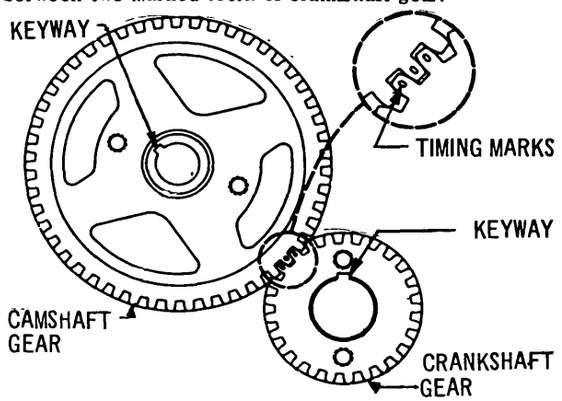
Bearings–Steel backed babbitt lined bushings.

Clearance–No. 1–.0007-.0022", Nos. 2, 3, 4–.0010-.0027".

End Thrust: Taken by thrust plate assembled on front face of engine block behind camshaft gear (spacer assembled on shaft behind gear hub). Tighten capscrews alternately a few turns at a time to prevent distortion of plate.

End Play–.003-.006".

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Studebaker Special Data.*



Timing Gears: Crankshaft gear is Cast Iron, Camshaft gear is Celeron with steel hub.

Timing Gear Removal & Installation–*See "Timing Gears" in Studebaker Special Data.*

Backlash–.001-.003".

Replacement Gears–Camshaft gear furnished in two sizes: Standard & High limit. Crankshaft gear furnished standard size only.

Camshaft Setting: Mesh marked tooth on camshaft gear between two marked teeth of crankshaft gear.

CHAMPION VALVE TIMING MARKS

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

Tappet Clearance: .016" cold. Intake & exhaust.

Valve	Head Diameter	Stem Diameter	Length
Intake	1 11/32"	5/16"	4 11/32"
Exhaust	1 9/32"	5/16"	4 11/32"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0015-.0035"
Exhaust	45°	11/32"	.0015-.0035"

Valve Seat Width– 1/16-3/32".

►*RECONDITIONING VALVE CAUTION:* If reconditioning results in knife edge at top of valve, valve must be replaced.

Valve Springs: Install springs so that flanged edge of retainer fits over flat surface of lower coil spring. Tongue on lower side of retainer must fit in groove in spring retainer lock.

Valve Spring Specifications–93-103 lbs. ± 10% when compressed to a length of 1 5/16".

Valve Guides: Use Tool No. J-2034 and drive old guide down and out from top of block into valve spring chamber. Use Collar J-2034-5, guide pilot J-2034-2 on driver J-2034-1 and drive new guide down until driver bottoms against spacing collar.

Valve Lifters: Mushroom type. Remove from below with camshaft out of engine.

Valve Lifter Installation & Fitting–*See "Valve System" in Studebaker Special Data.*

Replacement Lifters–Std., .001" & .005" Oversize.

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" oversize lifters requiring reaming of lifter bore):* See *"Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves–Open 15° BTDC. Closes 49° ALDC.

Exhaust Valves–Open 54° BLDC. Closes 10° ATDC.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Timing Check—Adjust No. 1 Intake valve at .020" cold. Rotate engine until No. 6 piston is on compression stroke (the IN-OP 1-6 marking on dampener should be several inches from pointer), then while moving lifter up and down continue to rotate crankshaft. Valve timing will be correct if lifter stops moving as above marking is directly below pointer.

OILING SYSTEM

Crankcase Capacity: 5 quarts refill, 1 quart additional with filter change.

Normal Oil Pressure: 40 lbs. at 1400-1600 RPM.

Pressure Regulator Valve: On lower right front corner of engine. For access, remove engine front cover bolt. If spring is weak, replace it (do not stretch spring).

Oil Pressure Indicators: Coupe & Hardtop Models – Direct reading, non-electric type gauge.

Other Than Coupe & Hardtop Models – Red indicator light on instrument panel. If light on at highway speeds, after warm-up, low oil level or other difficulty is indicated.

Oil Pressure Switch – Studebaker No. 1539898.

Oil Pump: Helical gear type. Mounted on right side of crankcase.

Pump Removal, Overhaul & Installation: *See "Oiling System" in Studebaker Special Data.*

Oil Filter: Partial Flow. Either replaceable element or disposable type used. Replace filter or element at 5000 mile intervals or sooner if needed.

Replacement Filter Element: Replaceable element Studebaker No. SP 50090 (Filcron) or No. 50053 (Waste).

Disposable Unit Studebaker No. 1542739.

Crankcase Ventilation: Filter element in oil filler cap (air intake) and in breather pipe at left rear of engine (air outlet). Filter element in breather pipe replaceable.

COOLING

Water Capacity: 11 quarts. 12½ quarts with heater.

Pressure Valve: Radiator filler cap. 13 lb. type.

Thermostat: Choke type. Studebaker No. 440066 (170°) Std., No. 531470 (160°) and No. 532017 (180°) Optional.

Water Pump: Packless, sealed ball bearing type.

See "Studebaker" in Water Pump Section.

Pump Removal - Remove shroud. *See "Cooling System" in Studebaker Special Data.* Loosen generator and remove belt. Remove fan-to-hub capscrews and remove fan blades and pulley. Disconnect Climatizer hose, and generator adjusting arm. Disconnect outlet hose and remove mounting capscrews.

Radiator & Fan Shroud Removal: *See "Cooling System" in Studebaker Special Data.*

Temperature Indicators: Coupe & Hardtop Models - Direct reading, electric type gauge.

Sedans & Station Wagons - Red-green indicator on instrument panel. Electric type. When indicator shows any green, engine is operating at normal temperature. If it turns red through entire range, engine operating temperature is above normal.

Dash Unit - Studebaker No. 1542343 (Sedans & Station Wagons), No. 1539879 (Coupes & Hard Tops).

Engine Unit - Studebaker No. 1539876 (All Models). *See "Temperature Gauges" in Miscellaneous Section.*

CLUTCH

Borg & Beck 9A7. Assy. No. 361365 (U.S.), No. 361379 (Canada). Single plate, dry disc type.

Clutch Disc. No.—Borg & Beck No. 382276.

Pedal Adjustment: Free Travel ½-1". To adjust, unhook pull-back spring on outside of frame rail, loosen locknut at adjusting clevis and remove clevis pin at inner end of pedal shaft, turn clevis on rear end of pedal shaft-to-operating shaft rod for correct clearance, reassemble linkage.

►*HILL-HOLDER NOTE:* Check setting whenever clutch pedal adjusted and adjust Hill-holder to release just as clutch engages. Make sure Hill-holder operating rod installed with rod to inside (toward center of car) of clutch release shaft lever.

Housing Removal: Remove oil level gauge and tube. Remove starter mounting screws (only) and tie starter and cables up out of the way. Remove floor plate and clutch housing top capscrews. Remove transmission. *See "Transmission Removal" under Transmission.* Disconnect pedal rod at operating shaft-to-release sleeve, pull operating shaft out, remove sleeve. Remove two bolts holding rear engine support insulator cage to crossmember. Support engine at rear of oil pan (use block of wood on jack to protect oil pan). Remove crossmember. Remove two clutch housing bolts releasing exhaust pipe support bracket. Loosen clamp bolt and swing bracket out of way. Remove remaining housing bolts and remove housing. *NOTE*—Remove dowel bolts first.

►*INSTALLATION CAUTION:* Align clutch housing to rear engine plate with two tapered drifts, then install the dowel bolts. Draw dowel bolts in place by tightening the nuts—**do not drive them into place.**

Clutch Removal: Remove clutch housing (above), remove six screws evenly to relieve spring pressure, lift off clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Model T96 (Std.) or T96 with R10 Type Overdrive.

See "Warner Synchro-mesh Transmission" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Drain transmission case. Disconnect universal joint from transmission companion flange and remove propeller shaft support stud nuts and plain washer. Move front propeller shaft and support assembly rearward on slip yoke splines. Move end of shaft to one side as far as possible and tie it in position. Disconnect shift rods from shift levers and remove speedometer cable from transmission case. Remove speedometer pinion. Remove capscrews which hold transmission case to clutch housing. Remove clutch operating shaft, bracket, and bearing from the transmission case. Then move case rearward until main drive pinion clears clutch pressure plate and remove unit from car.

NOTE—On Coupes and Hardtops, it will be necessary to remove additional frame crossmember before removing transmission.

OVERDRIVE

Warner R10. Governor controlled, solenoid operation with throttle controlled "kick-down".

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

FLIGHTOMATIC TRANSMISSION

Hydraulic torque converter and a hydraulically controlled automatic three-speed planetary type transmission which provides automatic operation in "D" range, and additional "Lo", "R", and "P" ranges which are controlled manually. In "D" position, the car starts in low gear and progresses to intermediate and high as car speed is increased.

See "Flightomatic" Transmission in Transmission Sect.

►*"NO REVERSE" CORRECTION: See "Flightomatic" Transmission in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Flightomatic" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Flightomatic" Transmission in Transmission Section.*

Lubrication: Check fluid every 1000 miles, drain and refill every 15,000 miles. Use Automatic Transmission Fluid Type "A" (container marked AQ-ATF).

Checking Fluid Level – Place selector lever in "P" position. Start engine and operate it for approximately four minutes or until engine and transmission have reached operating temperature. Remove floor mat from right side and remove oil inspection hole cover. Clean all dirt and foreign material from dipstick. Apply parking brake and foot brake, and move selector lever slowly from "P" position to "R" position, then back to "D" position. Remove dipstick, wipe clean, and install in transmission and **turn clockwise to lock position.** Remove dipstick and read fluid level. Add fluid to bring level to "FULL" mark on dipstick (1½ pints between "LOW" and "FULL" marks on dipstick).

Capacity – 9 qts. Use Automatic Transmission Fluid Type "A" (container marked AQ-ATF).

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER FLIGHTOMATIC DATA: See "Flightomatic" Transmission in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing cross type. Three used with intermediate universal at propeller shaft support bearing on crossmember (see Propeller Shaft).

Propeller Shaft & Support Bearing: Two shafts used:

1) Front shaft with intermediate universal yoke bolted on rear end (no slip-joint).

2) Rear shaft with slip-joint on forward end at intermediate universal.

Propeller Shaft & Support Bearing Removal & Servicing—*See "Propeller Shaft" in Studebaker Special Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

REAR AXLE

Spic r. Semi-floating, hypoid gear, with Hotchkiss Drive

See "Spicer Hypoid" in Rear Axle Section

Transmission	Axl Ratios Standard	Optional
Standard	4 10-1	4 56-1
Overdrive	4 56-1	4 10, 4 88-1
Automatic	3 54-1	4.10-1

NOTE–Rear axle ratio stamped on plate attached to axle by cover capscrew and also on ring and pinion gears

Backlash– 003-.006". Shim adjustment

Axle Shaft R m val: Remove wheel, remove wheel hub (use puller J-1644-B) Take out backing plate retaining bolts, remove outer oil seal Pull backing plate out over end of axle shaft and wire plate to frame (*CAUTION*–Do not lose adjusting shims located between backing plate and axle housing flange), pull axle shaft with puller HM-931

R ar Axle Ass mbly R moval: Remove hub caps,take out cotter pin from axle nut, loosen rear wheel nuts. Place car on stands on frame just ahead of rear springs, Remove wheels, hubs and drums. Disconnect hand brake cable, take out backing plate bolts from backing plates free hydraulic brake line from axle housing clips (do not disconnect brake line from wheel cylinders) Disconnect rear universal (wire caps or use clamp to prevent losing rollers) Remove rear spring "U" bolts, disconnect lower shock absorber links, remove rear axle assembly from car

Wh l B aring Adjustment: Use dial indicator to check axle shaft endplay. Adjust by removing backing plate (see Axle Shaft Removal above), and adding or removing shims located between backing plate and axle housing flange (shims .003", 005", .010", 030" thick).

End Play – .001-.006".

SHOCK ABSORBERS

M nroe or Gabri l. Direct acting, hydraulic type. Serviced by replacement. *NOTE* - Heavy Duty shocks are Gabriel.

Monroe Shocks (Studebaker No.)

	Front	Rear
Station Wagon	1541904	1541913
Others	1541904	1541911

Gabri l Sh cks (Stud bak r N .)

	Fr nt	R ar
Heavy Duty (Non-Adj)	1541958	1541959
Heavy Duty (Adj.)	1541901	1541910

FRONT SUSPENSION

Independent. Coil spring suspension with front shock absorbers located within coil springs *NOTE* - Sedan models have variable rate front springs These have coils closer together at one end and must be installed toward top.

See "Studebaker" in Suspensions & Wheel Alignment Section

Kingpin Inclination - 6° at 0° camber

Caster - Neg 1° to Neg 2½° Not more than ¾° variation between wheels.

Camber - 0° to Pos. 1° ½° more camber favored on driver's side

Toe-In - 1/16"-1/8".

Toe-Out on Turns - With outer wheel at 20°, inner wheel should be turned 22½° - 23½°

STEERING

►*POWER LOSS ON LEFT TURN CORRECTION. See "Saginaw Power Steering (Not In Line)" in Steering Section*

Manual: Ross Cam & Twin Lever Type. *See "Ross Cam & Twin Lever" in Steering Section*

Power Steering: Saginaw (Not In Line). Integral type. *See 'Saginaw Power Steering (Not In Line)" in Steering Section*

Steering Linkage: *See "Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: *See "Ross Cam & Twin Lever" in Steering Section*

Steering Gear Removal: *See "Ross Cam & Twin Lever" in Steering Section*

BRAKES

Wagner Lockheed Hydraulic Self-centering (With Bendix type shoes) Parking lever applies rear wheel service brakes.

See "Wagner Lockheed Self-centering" in Brake Section.

Drums–Diameter (Front) 10", (Rear) 9"

Wheel Cylinder Diameter–(Front) 1", (Rear) 13/16"

►*PRIMARY BRAKE SHOE LINING LENGTH PRODUCTION CHANGE:* Primary shoe lining length has been changed to: 8 5/32" (Front) and 7¼" (Rear) on later cars.

►*FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary is ¼" thick, (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeal. This lining is applied to the full length of the shoe, and is marked "secondary" and "top" and should be installed as marked.

Braking Power – 62% (front wheels), 38% (rear wheels).

Lining, Width & L ngth

	Fr nt Wh l	R ar Wh l
Primary Shoes ①	2" x 10 29/32"	2" x 9 27/32"
Secondary Shoes	2" x 10 29/32"	2" x 9 27/32"

① Early Cars. For later cars See *"Production Change" above*

Thickness–3/16" (all except front wheel secondary), ¼" front wheel secondary

Clearance–Lock shoes against drum then turn adjusting screw back eight notches or more as required to free drum

Hill Holder: Used on Synchro-mesh Trans. Cars. *See "Hill-holder" in Brake Section for data*

Standard Master Cylinder: On frame left side rail at base of brake pedal

Checking Fluid–Access hole in front floor pan at left corner of drivers' seat. Fluid should be maintained at level ½" below top of filler opening

Removal–Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap. Remove brake pedal pullback spring by unhooking it first from frame bracket and then from spring clip which is attached to master cylinder-to-pedal rod Disconnect fluid line or lines at rear of master cylinder (*NOTE*–On cars equipped with Hill-holder, only one line is connected to master cylinder). Remove brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder Insert forward mounting bolt ing bolt to hold Hill-holder while master cylinder is off car.

Power Brakes: Hydrovac Power Unit. Used in conjunction with standard master cylinder and located under hood on left front fender apron.

See "Hydrovac Power Unit" in Brake Section.

Removal–Disconnect vacuum and brake lines, stop light wires, remove power unit-to-bracket mounting bolts

MISC. MECHANICAL

Windshield Wipers: Auto-Lite or Bosch. Electric type. *See "Windshield Wipers" in Miscellaneous Section.*

Power Window Regulators: Electrical, with reversible motors in each window. Individual switches at each door and master switch on left front door. *See "P wer Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Two-way electric type with curved seat tracks for seat adjustment.

See "Power Seat Adjusters" in Miscellanious Section.

MODEL IDENTIFICATION

Model	Model Designation
Comm. Cust. & Deluxe	57B(F & W)
Comm. Parkview	57B(D)
Comm. Provincial	57B(P)
President	57H(F & W)
Pres. Classic	57H(Y)
Pres. Broadmoor	57H(P)
Pres. Silverhawk	57H(C)

SERIAL NUMBER: Stamped on plate on left front door hinge post.

Starting Serial Numbers - As follows:

Assembly Plant	Commander	President
South Bend	8454101	7188901
Canada	8962601	7901501

ENGINE NUMBER: Stamped on cylinder block to left and in front of oil filler pipe.

Starting Engine Numbers — As follows:

Assembly Plant	Commander	President
South Bend	V-390001	P-39601
Canada	VC-10701	PC-1501

TUNE-UP

COMPRESSION PRESSURE: 130-150 lbs. (approximately) at cranking speed (150 RPM).

VACUUM READING: Steady 18-20" at idling.

VALVE TAPPET CLEARANCE: .023-.025" engine hot and idling, .025-.027" engine cold.

MANIFOLD HEAT CONTROL: Automatic Thermostatic type located in right bank exhaust manifold outlet.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders — RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033-.038".

Spark Plug - Champion H-11. Torque to 30 ft. lbs. or seat spark plug on new gasket finger tight, then tighten an additional ½ turn.

COIL: Delco-Remy 1115087 or 1115096.

Ignition Current - 3.8 amps. (idling).

Resistor - Delco-Remy 1931614 (1115087 Coil), 1927809 (1115096 Coil). 1.4-1.65 ohms at 75°F.

►*COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch-to-coil. Resistor is bypassed during cranking by lead from starter-solenoid-to-coil.*

DISTRIBUTOR: Delco-Remy 1110864.

Condenser — Delco-Remy 1869704. **Capacity** .18-.23 mfd.

Contact Point Set — Delco-Remy 1918148.

Breaker Gap — .013-.018".

Cam Angle - 26-33° with .016" gap.

Breaker Arm Spring Tension — 19-23 ozs.

Rotation — Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
0.5-2.5	350	1-3	700
2-4	400	4-8	800
7-9	800	14-18	1600
11-13	1125	22-26	2250

Vacuum Spark Control: Delco-Remy 1116058. Integral type.

Plunger Travel — 11/64-3/16".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	4-6
8	16	10.25-11.50

Distributor Removal & Installation: *See "Ignition Notes" in Studebaker Special Data.*

IGNITION TIMING

Setting — 4° BTDC with vacuum line to distributor disconnected and opening in carburetor plugged. Engine at normal idle speed.

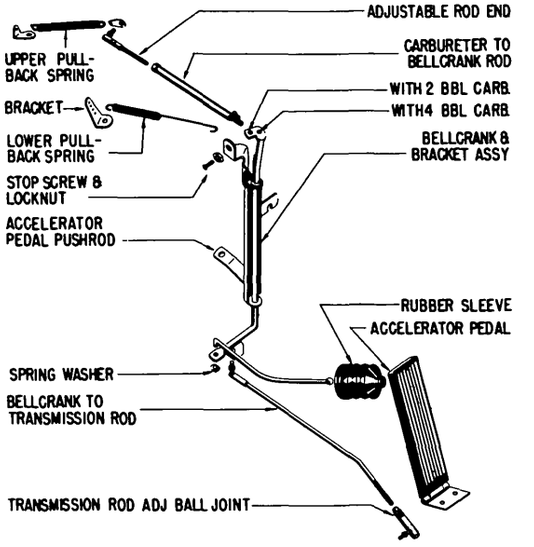
Timing Mark — "IGN" line on vibration dampener aligned with pointer on timing gear cover.

►*IGNITION TIMING CAUTION:* The manufacturer recommends that no attempt be made to time the engine except with a suitable timing light and that timing mark on vibration dampener be directly under pointer. *DO NOT SET TIMING BY THE "PING" METHOD.*

CARBURETOR

►*CARBURETOR APPLICATION: Stromberg 2-barrel and Carter 4-barrel used as follows:*

Model	Optional	Standard
Comm. (All)	Carter	Stromberg
Pres. & Broadmoor	Carter	Stromberg
Pres. (Classic & Silver Streak)		Carter



►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature, choke valve wide open and throttle return check operating correctly, proceed as follows:

1) Adjust engine idle speed to 550 RPM with transmission selector lever in "N" (Neutral) position. Set the stop on the bellcrank (at rear of engine) to provide a 17/64" gap between bellcrank pads (use a 17/64" drill as a gauge). After stop is adjusted, hold in this position. Make sure that the carburetor-to-bellcrank rod ball joint is in the outer hole of the bellcrank pad (away from centerline of engine), and that the ball joint is on the underneath side of the lever.

2) Adjust the carburetor-to-bellcrank rod until the idle speed adjusting screw just begins to leave its stop.

3) After stop is adjusted, hold in this position. *(NOTE - Make sure that carburetor-to-bellcrank rod ball joint is in the inner hole of bellcrank pad on cars with 2-barrel carburetors, and in the outer hole on cars with 4-barrel carburetors. In both cases, the ball joint must be located on the underneath side of bellcrank).* Adjust the carburetor-to-bellcrank rod until the idle speed screw on carburetor throttle lever just begins to leave the stop. Stop the engine and remove the 1/8" pipe plug located near throttle lever on side of transmission and install a pressure gauge. Place selector lever in "D" (Drive) position and run engine at 1000 RPM with rear wheels held stationary by the foot brake. Adjust length of the main bellcrank-to-transmission throttle valve

FLIGHTOMATIC TRANSMISSION THROTTLE LINKAGE

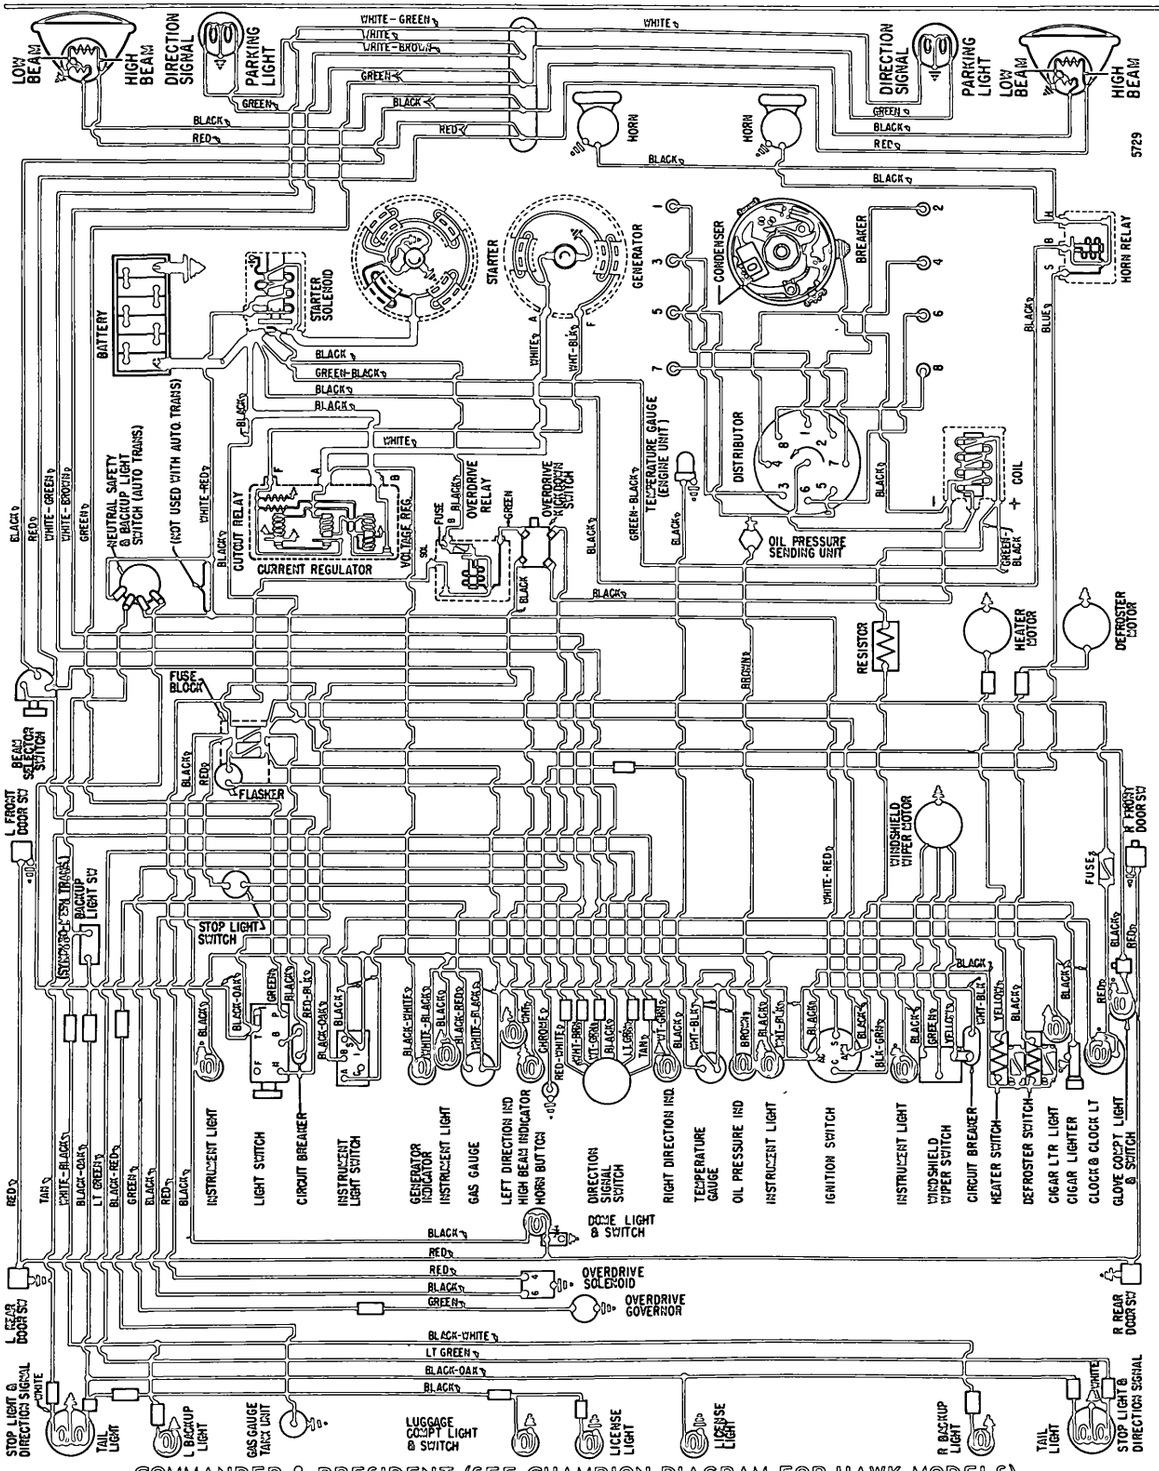
outer lever rod to obtain 80-85 lbs. pressure on gauge (95-100 lbs. pressure on cars with heavy duty transmissions such as used on police cars). Stop the engine, remove gauge, and install the pipe plug in side of transmission.

THROTTLE RETURN CHECK (4-BARREL CARBURETOR) ADJUSTMENT: Loosen throttle return check assembly screw locknut and adjust the return check in the bracket until plunger just breaks contact with with tab on throttle lever. Mark position of check assembly relative to bracket, then turn check assembly **1¾ to 2 turns toward l v r.** Tighten locknut.

THROTTLE RETURN CHECK (2-BARREL CARBURETOR) ADJUSTMENT: Place idle speed adjusting screw on fourth step of fast idle cam (lowest step being No. 1). Adjust throttle return check screw until it just contacts the pad on throttle shaft lever.

STROMBERG WW

Stromberg Series WW, Code 6-117A. Throttle return Check used on all models with Flightomatic Transmissions.



►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1-4-6-7, LEFT barrel 2-3-5-8.*

Idle Setting — Initial setting, 1¾ turns open, final setting approximately midway between missing and rolling points. Set both screws alike, turn screws out for richer mixture.

Idle Speed — 550-600 RPM (with selector lever in neutral "N" position on Flightomatic).

Float Level — 3/16" from top edge of bowl to top of float with needle valve seated. To check, remove air horn and bowl cover, remove gasket, place float lever gauge T-25569 (Studebaker No. J-5475) squarely on top edge of float bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required using bending tool

CONTINUED ON NEXT PAGE

COMMANDER & PRESIDENT (SEE CHAMPION DIAGRAM FOR HAWK MODELS)

CONTINUED FROM PRECEDING PAGE

T-24733 (Studebaker No. KMO-269-S5).

Accelerating Pump – Center hole – Normal Setting. For less fuel install rod in inner hole, for more fuel install rod in outer hole.

Fast Idle Setting: With choke valve closed and fast idle cam in fast idle position, one-half diameter of button at end of throttle stop screw should rest against step of fast idle cam. If contact between button and cam not as indicated, bend choke ear up or down as required.

Automatic Choke Setting: 1 point lean with arrow on cover one notch lean from boss on housing.

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷ *OTHER DATA: See "Stromberg WW Carburetors" in Carburetion Section.*

CARTER WCFB

Carter WCFB 2219SB (Std. & O.D.), 2214SB (Auto. Trans.).

▷ *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 1-4-6-7, LEFT barrels 2-3-5-8.*

Idle Setting - ½-1½ turns open. Turn screws out for richer mixture.

Idle Speed - 550-600 RPM (all models).

Throttle Linkage Adjustment: *See CARBURETOR above.*

▷ *OTHER DATA: See "Carter WCFB Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. M2211S or M2573S. Fuel Only

Pressure - 3½-5½ lbs. (All models).

See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: Electric type.

Dash Unit - Studebaker No. 1542342 (Sedans & Sta. Wgn.), No. 1539880 (Hard Top "Hawk").

Tank Unit - Studebaker No. 1540262 (Sedans), No. 1540263 (Coupes, Hard Tops & Sta. Wgns).

See "Fuel Gauges" in Carburetion Section.

Air Cleaner: DRY TYPE (Plasticized Paper) standard on all Commander Models, President & Broadmoor OIL BATH TYPE Sandard on President Classis & Silver Hawk, Optional on all other models.

▷ *DRY TYPE FILTER CAUTION:* Remove filter element every 1000 miles and shake thoroughly to remove dirt. DO NOT wash element or blow out with compressd air. Replace filter every six months or 10,000 miles

BATTERY

Willard HDW-2SM-50. *12 Volt,* 9 plate, 50 ampere hour capacity (20 hr. rate).

Battery Ground – Negative.

▷ *CAUTION: This is reversed from previous models.*

Engine Ground – Right front of engine.

STARTER

Dolce-Romy 1107650 (Synchro-mosh & Ovardrive), 1107651 (Flightomatic). *12 Volt.* Armature 1933789.

Drive – Bendix "Polo-thru" type.

Rotation – Counter-clockwise at commutator end.

Brush Spring Tension – 35 ozs. minimum

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft. lbs.	Lock	5.8	435

Starting Switch: Magnetic type switch, controlled by combination Ignition & Starting Switch. Turn key full right to start engine.

Automatic Transmission Neutral Safety Switch: Delco-Remy 1998038 (without Power Steering), No. 1998059 (with Power Steering). Mounted on lower end of steering column. Starter will operate only when selector lever is in "N" or "P" position.

Adjustment: *See "Flightomatic" Transmission in Transmission Section.*

GENERATOR

Delco-Remy 1102003. *12 Volt.* **Armature 1923535.**
Maximum Charging Rate – *See Voltage Regulator.*

Performance Data—Cold

Amperes	Volts	RPM
30	14.0	2150

Brush Spring Tension – 28 ozs.
Field Current – 1.48-1.62 amps. at 12.0 volts.
Rotation – Counter-clockwise at commutator end.
Belt Adjustment: Hook a spring scale to belt midway between generator and fan pulleys, then adjust belt tension so that pull of 14 lbs. on scale will lift belt ½".

REGULATOR

Delco-Remy 1119123. *12 Volt. NOTE - Regulator is "1119000 Series". Specifications below are for "Normal" Settings.*

Cutout Relay

Cuts In – 11.8-13.5 volts (hot).
Contact Gap – .020"
Air Gap – .020" with contacts just closed.

Voltage Regulator

Setting – 13.8-14.8 volts (hot).
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting – *See "1119000 Series" Regulator in Electrical Section.*

Current Regulator

Setting – 27-33 amps. (hot).
Air Gap – .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting – *See "1119000 Series" Regulator in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signal: *See Electrical Section.*
Light Switch Removal: Remove switch retaining nut. Push switch sleeve back into panel and disconnect wires from switch.
Stop Light Switch: Located on inner side of left frame rail just forward of steering gear housing. On models with power brakes, switch is screwed into hydraulic cylinder of power brake unit.
FUSES: Body & Stop Lights 15 amps. in block in bracket behind instrument panel.
Direction Signal - 15 amps. in block in bracket behind instrument panel.
Overdrive - 15 amps. in relay on dash panel.
Clock - 1 amp. in lead behind instrument panel
CIRCUIT BREAKERS: Head, Parking, Tail & Instrument Lights - 18 amps. on headlight switch.
Windshield Wiper - 5 amps. in wiper switch.
Horn Relay: Delco-Remy No. 1116781.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting and part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Misc. Sect.*

ENGINE SPECIFICATIONS: "Sweepstakes 259" & "Sweepstakes 289". V8, valve-in-head.

Engine	Bore	Stroke	Displacement
259	3-9/16"	3-1/4"	259.2 cu. ins.
289	3-9/16"	3-5/8"	289 cu. ins.

Engine	Compr. Ratio	Rated HP	Dev. HP
259	8.0-1 ①	40.6	②
289	8.0-1 ①	40.6	③

① – 7.5-1 Optional
② – 180 HP at 4500 RPM with 2-Barrel Carburetor, 195 HP at 4500 RPM with 4-Barrel Carburetor.
③ – 210 HP at 4500 RPM with 2-Barrel Carburetor, 225 HP at 4500 RPM with 4-Barrel Carburetor.

Compression & Vacuum Reading – *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Studebaker Special Data.*

OIL PAN REMOVAL: *See "Oiling System" in Studebaker Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Studebaker Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Studebaker Special Data.*

PISTONS

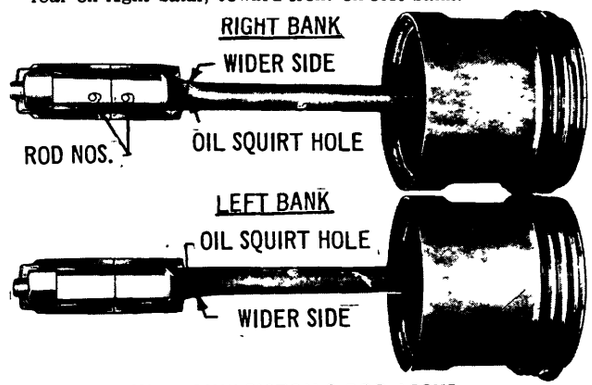
Aluminum alloy, cam ground, T-slot, three ring type. *See "Original Bore & Pistons" in Studebaker Special Data.*

►*PISTON REPLACEMENT CAUTION: "259" & "289" Engine pistons are NOT INTERCHANGEABLE. "Flat Head" piston used on 259" Engine. "Concave Head" Piston used on 289" Engine.*

Weight - 16.2 ozs.
Removal - Pistons & rods remove from above.
Fitting New Pistons: Clearance - Selective feeler fit. Use feeler 1" wide, .002" thick, and 12" long inserted on camshaft side of cylinder bore. Insert inverted piston in bore with slotted side away from camshaft, and bottom edge 1" below top of cylinder bore. Pull required to remove feeler with properly fit piston should be 8-13 lbs.
Replacement Pistons: Std. size & .010", .020", .030", .040" oversize. Pistons furnished with fitted pins.
Installing Pistons: Install piston on rod so that solid side of piston is on same side as oil hole in bearing bore. Install piston in cylinder with the slot toward the left side of engine. *See Rod Installation.*

PISTON PINS

Locked in rod by tapered pin and locknut.
Diameter – .8741-.8745". **Length** – 3 1/16".
Clearance in Piston – .0001-.0003" (selective fit). Light finger push fit at 70° F.
Replacement Pins: Std. size & .0025", .005" oversize.
Removal & Installation: *See "Piston Pins" in Studebaker Special Data.*



PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compression	.077-.078"	.008-.016"	.002-.005"
Oil	.1855-.1865"	.088-.016"	.0015-.005"

Replacement Rings: Sets of Std., .020", .030" and .040" Oversize.
See "Piston Rings" in Studebaker Special Data.
Installing Rings: Install compression rings with chamfered side of ring upward. Gaps of inner and outer oil rings must not come at same point.

CONNECTING RODS

Length - 6 5 8" center-to-center. **Weight** - 23.71 ozs.
Crankpin Journal Diameter - 1.99925-2.00025".
Lower Bearing - Interchangeable. Steel backed, micro-babbitt lined type. No shims.
Clearance - .0005-.002". **Side play** - .008-.013".
Replacement Bearings: Std., .001", .002", .010" and .020" Undersize.
Installing Rods: Number on rod and bearing cap must be on same side. Rod is installed in same numbered cylinder with numbers down toward oil pan (toward right on right bank rods, toward left on left bank rods), and oil squirt hole on all rods toward right of engine. Rods are offset with widest half of bearing toward rear on right bank, toward front on left bank.

V8 ENGINE PISTON & ROD ASSYS.

►*CAUTION:* Install piston and pin on rod so that T-slot of piston is on side opposite oil hole in bearing bore. Insert tapered end of clamp screw so it will be toward heavy boss. Be careful to align flat surface of screw with flat on piston pin. Bearing cap must be assembled on rod with groove in cap and rod on same side.

►*REPLACEMENT ROD IDENTIFICATION NOTE:* Replacement rods are unnumbered. To identify, hold rod upright with oil hole toward you. Wide part of offset will be to right on left bank rods, to left on right bank rods.

CRANKSHAFT

Journal Diameter–2.4995-2.5000".
Clearance–.0005-.0025".
Replacement Bearings: Std. size, .001", .010", .020", .030" undersize.
End Thrust: Taken by thrust plate assembled between front main bearing and crankshaft gear. Controlled by

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

shims between thrust plate and face of main bearing journal. **Endplay**—.003-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT

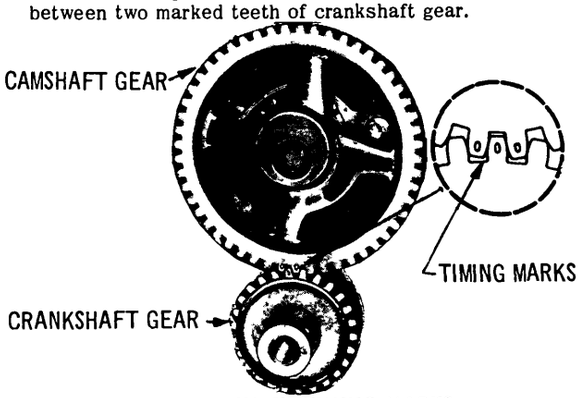
Journal Diameters—(1) 1.86975-1.87075", (2) 1.85375-1.85475", (3) 1.83875-1.83975", (4) 1.82275-1.82375", (5) 1.24475-1.24575".

Bearings—Precision type, steel backed babbitt lined.

Clearance – .00075-.00225" (No. 1), .001-.00275" (Others).

End Thrust: Taken by thrust plate located between front camshaft bearing and camshaft gear.

Endplay—.003-.006".



Camshaft Removal & Installation: *See "Camshaft & Bearings" in Studebaker Special Data.*

Timing Gears: Cast iron crankshaft gear and "Celeron" camshaft gear.

Timing Gear Removal & Installation—*See "Timing Gears" in Studebaker Special Data.*

Backlash—.001-.003".

Camshaft Setting: Mesh marked tooth of camshaft gear between two marked teeth of crankshaft gear.

V8 ENGINE VALVE TIMING MARKS

Engine Front Cover Removal: *See "Engine Front Cover" in Studebaker Special Data.*

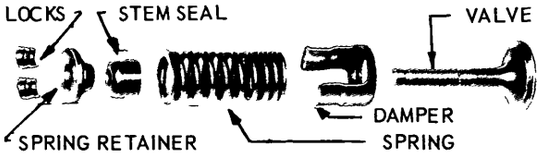
Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

►*ROCKER ARM ADJUSTING SCREW PRODUCTION CHANGE:* Effective Engine No V-396500 (259") and No P-45703 (289") new rocker arm adjusting screw, Part No 1541806, entered production Screw has recessed head to prevent push rod from slipping out of socket if a valve sticks, and to prevent bent push rods

Tappet Clearance: 023-025" (Hot) 025-027" (Cold)

Valve	Head Diam.	Stem Diam.	Stem Clearance
Intake	1-21/32"	11/32"	.0015-.0035"
Exhaust	1-17/32"	11/32"	.0015-.0035"



Seat Angle—45° (all valves). **Lift**—23/64" (all valves).

Valve Seat Width—1/16-3/32".

Valve Stem Oil Seal: "Umbrella" type, rubber seals installed on all exhaust and intake valve stems (with cupped side down toward top of valve guide) within valve spring below spring retainer.

Valve Springs: Single spring used. Replace spring if 10% weaker than pressure given in specifications below. *NOTE* - Damper installed on lower (close-coiled) end of all springs.

Valve Spring Specifications - 106-112 lbs when compressed to 1 43/64"

V8 ENGINE VALVE ASSY.

Valve Guides: Pressed in head from underside.

Guide Removal & Installation—*See "Valve System" in Studebaker Special Data.*

Valve Lifters: Straight barrel type. Remove from above. Not necessary to remove camshaft.

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" oversize lifters requiring reaming of lifter bore): See "Valve System" in Studebaker Special Data.*

Valve Lifter Installation & Fitting—*See "Valve System" in Studebaker Special Data.*

Replacement Lifters—Std. size, .001", .005" oversize.

►*CAUTION—When lifters removed, make sure they are installed in original positions.*

Rocker Arms: *See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves—Open 11° BTDC. Close 54°36' ALDC.

Exhaust Valves—Open 51°36' BLDC. Close 14° ATDC.

Valve Timing Check—Set tappet clearance of No. 1 intake valve at .030". Turn crankshaft until No. 6 piston is on compression stroke and vibration dampener mark "IN.OP.1" is approaching pointer on timing gear cover, continue to turn crankshaft slowly while working No. 1 intake rocker arm up and down to determine point at which all clearance is taken up. Dampener mark "IN.OP.1" should be directly under pointer.

OILING SYSTEM

Crankcase Capacity: 5 qts. (add one quart when filter changed).

Normal Oil Pressure: 40 lbs. at 1400-1600 RPM.

Pressure Regulator Valve – Located on right side at front of engine block slightly above crankcase flange.

Oil Pressure Indicator: Coupe & Hardtop Models - Direct reading, non-electric type gauge

Sedans & Station Wagons - Indicator light on instrument panel

Oil Pressure Switch - Studebaker No 1539898

Oil Pump: Spur gear type Mounted on rear main bearing cap and driven by camshaft gear

Pump Removal, Overhaul & Installation: *See "Oiling System" in Studebaker Special Data*

Oil Filter: Partial Flow Either replaceable element or disposable type used Replace filter or element at 5000 mile intervals or sooner if needed

Replacement Filter Element: Replaceable Element Studebaker No SP 50090 (Filcron) or No 50053 (Waste)

Disposable Unit Studebaker No 1542739

Crankcase Ventilation: Filter element in oil filler cap (air intake) and breather tube at rear of engine (air outlet)

COOLING

Water Capacity: 17 qts (18 5 with heater)

Pressure Valve: Radiator filler cap 13 lb type

Thermostat: Choke type Studebaker No 1540787 (170°) Std , No 533247 (160°) and No 533257 (180°) Optl

Water Pump: Packless sealed ball bearing type *See "Studebaker" in Water Pump Section*

Pump Removal: Drain cooling system Loosen generator remove belt Remove fan-to-hub screws and remove fan and pulley On Coupe and Hardtop models, remove shroud Remove four capscrews retaining pump cover to water pump manifold Remove pump.

Radiator & Fan Shroud Removal: *See "Cooling System" in Studebaker Special Data*

Temperature Indicators: Coupe & Hardtop Models - Direct reading electric type gauge

Sedans & Station Wagons - Red-green indicator on instrument panel Electric type When indicator shows any green engine is operating at normal temperature If it turns red through entire range engine operating temperature is above normal

Dash Unit - Studebaker No 1542343 (Sedans & Station Wagons), No 1539879 (Coupes & Hardtops)

Engine Unit - Studebaker No 1539876 (All Models) *See "Temperature Gauges" in Miscellaneous Section*

CLUTCH

Borg & Beck. Single plate, dry disc type

Series	Clutch Model	Assy No.	Disc No.
Commander	10A7	361454	382650
Pres "Classic"	10A6	361456	382389
Pres (Others)	10A6	361386	382389

See "Borg & Beck" in Clutch Section

Pedal Adjustment: Pedal free travel 1/2-1". To make adjustment, loosen locknut securing clevis to rod connecting release shaft lever to clutch operating shaft lever and remove the clevis pin. Turn clevis to shorten or lengthen rod as necessary for correct pedal free travel. *NOTE—If car is equipped with "Hill-Holder", adjust "Hill-Holder" operating rod as outlined in Brake Section.*

Clutch Housing Removal: Remove starter. Remove floor plate and clutch housing top capscrews. Remove clutch operating shaft. Remove transmission (see Synchro-mesh Transmission Removal below). Remove two bolts holding engine rear support insulator cage to crossmember. Place a small hydraulic jack at rear of oil pan and insert a block between jack pad and oil pan to prevent damage to pan. Raise engine just enough to take weight of engine off crossmember. Remove support crossmember-to-frame bolts and remove cross member. Remove the two clutch housing bolts retaining exhaust pipe support bracket. Loosen clamp bolt and swing support bracket out of way. Remove clutch housing cover plate. Remove remaining housing mounting bolts or capscrews and remove clutch housing.

Clutch Removal: Remove clutch housing (above), remove

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

six screws evenly to release pressure, lift off clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Model T86 (Commander), T86E (President). *See "Warner Synchro-mesh Transmission" in Transmission Section.*

Transmission Controls *See "Transmission Controls" in Transmission Section.*

Removal Drain transmission case Disconnect universal joint from transmission companion flange and remove propeller shaft support stud nuts and plain washer. Move front propeller shaft and support assembly rearward on slip yoke splines Move end of shaft to one side as far as possible and tie it in position Disconnect shift rods from shift levers and remove speedometer cable from transmission case Remove speedometer pinion. Remove capscrews which hold transmission case to clutch housing. Remove clutch operating shaft bracket, and bearing from transmission case. Move case rearward until the main drive pinion clears clutch pressure plate and remove unit from car.

OVERDRIVE

Warner R10 Type (part of T86E Transmission). Governor controlled, with electric solenoid operation and throttle controlled "kickdown"

See "Warner R10" Overdrive in Transmission Section.

Overdrive Controls *See "Overdrive Controls" in Transmission Section.*

Removal Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected

FLIGHTOMATIC TRANSMISSION

Hydraulic torque converter and hydraulically controlled three-speed planetary type transmission which provides automatic operation in "D" range and additional "Lo", "R", and "P" ranges which are controlled manually. In "D" position, the car starts in low gear and progresses to intermediate and high as car speed is increased.

► *See "Flightomatic" Transmission in Transmission Sect.*

► *"NO REVERSE" CORRECTION See "Flightomatic" Transmission in Transmission Section.*

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION See "Flightomatic" Transmission in Transmission Section.*

► *TESTING & TROUBLE SHOOTING See "Flightomatic" Transmission in Transmission Section.*

Lubrication Check fluid level every 1000 miles, drain and refill every 15,000 miles. Use only Automatic Transmission Fluid Type "A" (marked AQ-ATF on container).

Checking Fluid Level – Place selector lever in 'P" position. Start engine and operate it for approximately four minutes or until engine and transmission have reached operating temperature. Remove floor mat from right side and remove oil inspection hole cover. Apply parking brake and foot brake, move selector lever slowly from "P" position to "R" position, then back to "D' position. Remove dipstick and read fluid level. Add fluid to bring level to 'FULL" mark on dipstick (1½ pints between "LOW" and "FULL' marks on dipstick)

Capacity - 9 qts Use Automatic Transmission Fluid Type "A" (marked AQ-ATF on container)

Throttle Linkage Adjustment: *See CARBURETOR above*

► *OTHER FLIGHTOMATIC DATA See "Flightomatic" Transmission in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing cross type. Three used, with intermediate universal at propeller shaft support bearing on crossmember.

Propeller Shaft & Support Bearings· Two shafts used.

1) Front shaft with intermediate universal yoke bolted to rear end (no slip-joint).

2) Rear shaft with slip-joint on forward end at intermediate universal

Propeller Shaft & Support Bearing Removal· *See "Propeller Shaft Notes" in Studebaker Special Data.*

REAR AXLE

Spicer. Semi-floating, hypoid gear with Hotchkiss Drive *See "Spicer-Hypoid" in Rear Axle Section*

► *TWIN-TRACTION DIFFERENTIAL NOTE* Twin-Traction differential is optional with same gear ratios as conventional differential For Service Information *See "Spicer Power-Lock Differential" in Rear Axle Section*

► *TWIN-TRACTION REAR AXLE IDENTIFICATION NOTE* Cars with Twin-Traction Differential will have a Red Sticker on front door rear face just above door lock and small tag attached to differential cover screw with the letter "T" stamped on it

Rear Axle Ratio: Rear axle ratio stamped on plate attached to axle by cover cap screw and also on ring and pinion gears

Standard Ratios

Series	Std.	O.D.	Auto.

③ - 3 54-1 4 27-1 3 73-1

Backlash–.003-.006".

Axle Shaft Removal· Remove wheel and wheel hub (use Puller J-1644-B). Take out backing plate retaining bolts, remove outer oil seal. Pull backing plate out over end of axle shaft and wire to frame out of the way *(CAUTION*–Do not lose adjusting shims located between backing plate and axle housing flange). Pull axle shaft with Puller HM-931.

Rear Axle Assembly Removal Remove hub caps and axle shaft cotter pin. Loosen wheel nuts. Place car on stands (stands under frame just ahead of rear springs) and remove wheels, hubs, and drums. Disconnect brake pipes at wheel cylinders, remove backing plate bolts from both backing plates. Remove brake pipe clamps and capscrew which holds brake pipe tee to housing, remove brake pipe from housing. Remove backing plate and shims (suspend from frame). Remove rear universal joint U-bolts and nuts, disconnect rear propeller shaft and move to one side. Remove rear spring U-bolts and disconnect shock absorbers from spring plate. On President models, disconnect stabilizer shaft from spring plates. Remove rear axle assembly.

Wheel Bearing Adjustment: Use dial indicator to check axle shaft endplay. Adjust by removing backing plate (see Axle Shaft Removal above), and adding or removing shims located between backing plate and axle housing flange (shims furnished .003" .005" .010" .030" thick). **Endplay** – .001-.006".

SHOCK ABSORBERS

Monroe, Delco or Gabriel. Direct acting hydraulic type Serviced by replacement *NOTE* - Heavy Duty shocks are Gabriel

Monroe Shocks (Stud bak r No.)

	Front	Rear
Sedans	1541903	1541911
Station Wagons	1541904	1541913
Coupes & Hardtops	1539526	1539544

Delco Shocks (Stud bak r No.)

	Front	Rear
Coupes & Hardtops	1539986	1539996

Gabriel Shocks (Stud bak r No.)

	Front	Rear
Non-Adjustable	1541958	1541959
Adjustable	1541901	1541910

FRONT SUSPENSION

Independent. Coil spring suspension with shock absorbers mounted within coil springs

See "Studebaker" in Suspensions & Wheel Alignment Section

► *"VARIABLE RATE" FRONT SPRING INSTALLATION CAUTION*· This type used on sedan models Install with closed coils at the top and the coil ends toward the inside (centerline) of car

Kingpin Inclination - 6° at 0° camber

Caster - Neg 1° to Neg 2½° Not more than ¾° variation between wheels

Camber - 0° to Pos 1° ½° more camber favored on driver's side

Toe-In - 1 16-1/8" **Adjust right hand tie rod only** for toe-in after left hand tie rod has been adjusted for straight-ahead position (with steering wheel centered) and center auxiliary tie rod has been adjusted so that steering gear arm and auxiliary steering arm parallel

RHD Car Note - Make toe-in adjustments at left hand tie rod

Toe-Out on Turns - With outer wheel at 20°, inner wheel should be 22½°-23½°

STEERING

► *POWER LOSS ON LEFT TURN CORRECTION See "Saginaw Power Steering (Nut In Line)" in Steering Section*

Manual: Ross Model SL-54 Cam & Single Lever Roller Stud. Roller stud mounted on tapered roller bearings *See "Ross Cam & Single Lever" in Steering Section*

Power Steering: Saginaw (Nut In Line). *See "Saginaw Power Steering (Nut In Line)" in Steering Section*

CONTINUED ON NEXT PAGE

Form 7-A—57F

CONTINUED FROM PRECEDING PAGE

Steering Linkage: S *"Steering Linkag " in Steering Section*
Steering Wheel & Horn Button Removal: *See "Ross Cam & Single L v r" in Steering Section*
Steering Gear R m val: *See "Ross Cam & Single Lever" in St ering S ction*

BRAKES

Wagn r L ckh ed Hydraulic. Self-centering (with Bendix type shoes) Parking brake applies rear wheel service brakes
See "Wagner Lockheed Self-Centering" in Bra ke Section
Drum Diam t r - 11" (Front) 10" (Rear)
Whe l Cylinder Diam ter - 1 1 16" (Front), 7 8" (Rear)
Braking P wer - 62% (Front), 38% (Rear)

►*PRIMARY BRAKE SHOE LINING LENGTH PRODUCTION CHANGE* Primary shoe lining length has been changed to 8 5 32" (Front), and 7¼" (Rear) on later cars

►*FRONT WHEEL SECONDARY LINING NOTE* Front wheel secondary lining is 7/32" thick (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeak This lining is applied to the full length of the shoe and is marked "secondary" and "top" and should be installed as marked

Lining Width & L ngth

	Front Wh ls	R ar Wh ls
Primary Shoes 1	2¼" x 12"	2" x 10 29/32"
Secondary Shoes	2¼" x 12"	2" x 10 29 32"

1 - Early cars For later cars *See "Production Change" above*
Thickness - 3 16" (all except front wheel secondary) 7/32" (front wheel secondary)

Clearance—Lock shoes against drum with adjusting screw, then back off adjusting screw 8 notches, or more notches as required to free drum.
Standard Master Cylinder: On frame left side rail at base of brake pedal.
Checking Fluid—Access hole in front floor pan at left corner of drivers seat. Fluid should be maintained 1/2" below top of filler opening.

Removal—Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap. Remove brake pedal pullback spring by unhooking it first from its frame bracket and then from spring clip attached to master cylinder-to-pedal rod. Disconnect fluid line or lines at rear of master cylinder.

(*NOTE* - One line with Hill-holder). Remove the brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder. Insert forward mounting bolt to Hill-holder while master cylinder is off car.

P wer Brak s: Hydr vac Power Unit. Used with standard master cylinder.
See "Hydrovac Power Unit" in Brake Section.

►*POWER BRAKE NOISE CORRECTION. See "Hydrovac Power Unit" in Brake Section*

Checking Fluid—Same as for Manual Brakes (same master cylinder used).
Removal of Power Unit—Disconnect manifold vacuum supply hose at the power unit and disconnect stop light switch wires Disconnect hydraulic lines from power unit (lines leading to master cylinder and to wheel cylinders). Remove power unit-to-bracket mounting bolts and remove unit from car.

Hill Holder: Used on Synchro-mesh and Overdrive Transmission cars *See "Hill-Holder" in Brake Section*

MISC. MECHANICAL

Windshield Wipers: Auto-Lite or Bosch. Electric type *See "Windshield Wipers" in Miscellaneous Section*
Air Conditioning: *See "Studebaker Air Conditioning" in Miscellaneous Section*
Power Window Regulators: Electrical with individual reversible motors in each window Control switches at each door with a master control switch located on left front door *See "Power Window Regulators" in Miscellaneous Section*
Power Seat Adjusters: Two-way electric type with curved seat tracks for seat adjustment (seat raises and lowers with a tilting action) *See "Power Seat Adjusters" in Miscellaneous Section*

MODEL IDENTIFICATION

Model	Model Identification
Packard Clipper, Town Sedan	57L-Y8
Packard Clipper, Country Sedan	57L-P8
Studebaker Golden Hawk	57H-K7

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post.
Starting Serial Number – (Packard) 57L-1001, (Studebaker) 6,100,001.

ENGINE NUMBER: Stamped on machined pad at left of oil filler tube mounting on top of cylinder block.
Starting Engine Number – (Packard) LS-101, (Studebaker) PS-1001.

TUNE-UP

COMPRESSION PRESSURE: 130-150 lbs. at 150 RPM.

VACUUM READING: Steady 18-21" at idling speed.

VALVE TAPPET CLEARANCE: .023-.025" (Hot), .025-.027" (Cold).

MANIFOLD HEAT CONTROL: Dual exhaust used. Automatic thermostatic type control valve located in right bank exhaust manifold outlet. When control valve is closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders – RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033-.038".
Spark Plug – Champion H-10. 14 mm. Torque to 25-30 ft. lbs.

►*PACKARD AIR CONDITIONED CAR SPARK PLUG REMOVAL:* On RIGHT bank, remove air cleaner, then remove inner rear bolt retaining compressor base to support bracket. This bolt is directly above No. 1 plug. Remove plug with a deep 3/8" drive - 13/16" socket. Then remove remaining three plugs. On LEFT bank, remove battery, then remove plugs.

COIL: Delco-Remy 1115087 or 1115096.
Ignition Current - 3.8 amps. (idling).
Resistor - Delco-Remy 1931614 (1115087 Coil), 1927809 (1115096 Coil). 1.4-1.65 ohms at 75°F

►*COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch to coil Resistor is by-passed during cranking by lead from starter solenoid-to-coil.*

DISTRIBUTOR: Delco-Remy 1110864.
Condenser – Delco-Remy 1869704. **Capacity** .18-.23 mfd.
Contact Point Set – Delco-Remy 1918148.
Breaker Gap – .013-.018".
Cam Angle – 28-34°.
Breaker Arm Spring Tension – 19-23 ozs.
Rotation – Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
0.5-2.5	350	1-5	700
2-4	400	4-8	800
7-9	800	14-18	1600
11-13	1125	22-26	2250

Vacuum Spark Control: Delco-Remy 1116058. integral type.
Plunger Travel – 11/64-3/16".

Vacuum Advanc

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	4-6
8	16	10.25-11.50

Distributor Removal & Installation: *See "Ignition Notes" in Studebaker Special Data.*

IGNITION TIMING

Setting – 4° BTDC with distributor vacuum line disconnected and carburetor connection plugged. Engine should be idled at 600 RPM. *NOTE* – Reset idling speed to 550 RPM after timing completed.
Timing Mark – "IGN" line on vibration dampener aligned with pointer on timing gear cover.

CARBURETOR

Stromberg WW 6-121. Dual downdraft type.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 1-4-6-7, LEFT barrel 2-3-5-8.*

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

►*FUEL PUMP NOTE:* Carter M2573-S Pump used but is modified to accommodate a supercharger. Pump is provided with fitting in cover to permit supercharger pressure to act on diaphragm to increase fuel pressure as required. Pump does not have vent hole and uses a different diaphragm spring.

►*EARLY CARBURETOR "IDLE SETTING" & "IDLE SPEED" NOTE:* To reach adjusting screws on early model carburetors, remove two pipe plugs in forward side of air chamber base (IDLE SETTING), left rear of air chamber cover (IDLE SPEED). Use flexible screwdriver through plug openings. Later model carburetor has extensions for adjusting Idle Setting and Idle Speed. Adjusting screw is outside cover.

►*ENGINE STALLING (Left Turn) CORRECTION & CHANGES TO IMPROVE PERFORMANCE & ECONOMY:* Install New Type Air Horn Gasket No. 1543362 and Baffle No. 1543363 (Baffle between float and float needle valve), to correct left turn stalling. To improve Performance and Economy a 1/4" hole placed in choke butterfly, Choke Stove-to-Carburetor pipe shortened 1-1/4" and choke setting changed to Center on Index Mark. Change in tension of Vacuum Power Piston assembly spring improves economy.

►*HOT ENGINE HARD STARTING CORRECTION: See "Stromberg WW Carburetors" in Carburetion Section.*

Idle Setting – Initial setting, 3/4-1 turn open. Final setting approximately midway between missing and rolling points. Set both screwx alike, turn screws out for richer mixture.

Idle Speed - 575 RPM with transmission in neutral. *NOTE* - This supersedes previous setting of 550 RPM and is to correct hard starting when engine hot.

Float Level – 7/32" from top edge of bowl to top of float with needle valve seated (Guage J-6646).

Accelerating Pump – Center hole – normal setting. For less fuel install rod in inner hole, for more fuel install rod in outer hole.

Fast Idle Setting: Set engine idle speed at 550 RPM. Stop engine. Close choke valve, back off fast idle screw until Idle Speed screw just contacts stop, the turn fast idle screw in 7½ turns. This will give a .030-.031" throttle valve opening.

Automatic Choke Setting: One point lean with arrow on cover one notch lean from boss on housing (Early Cars), Centered on Index (Later Cars with new type choke).

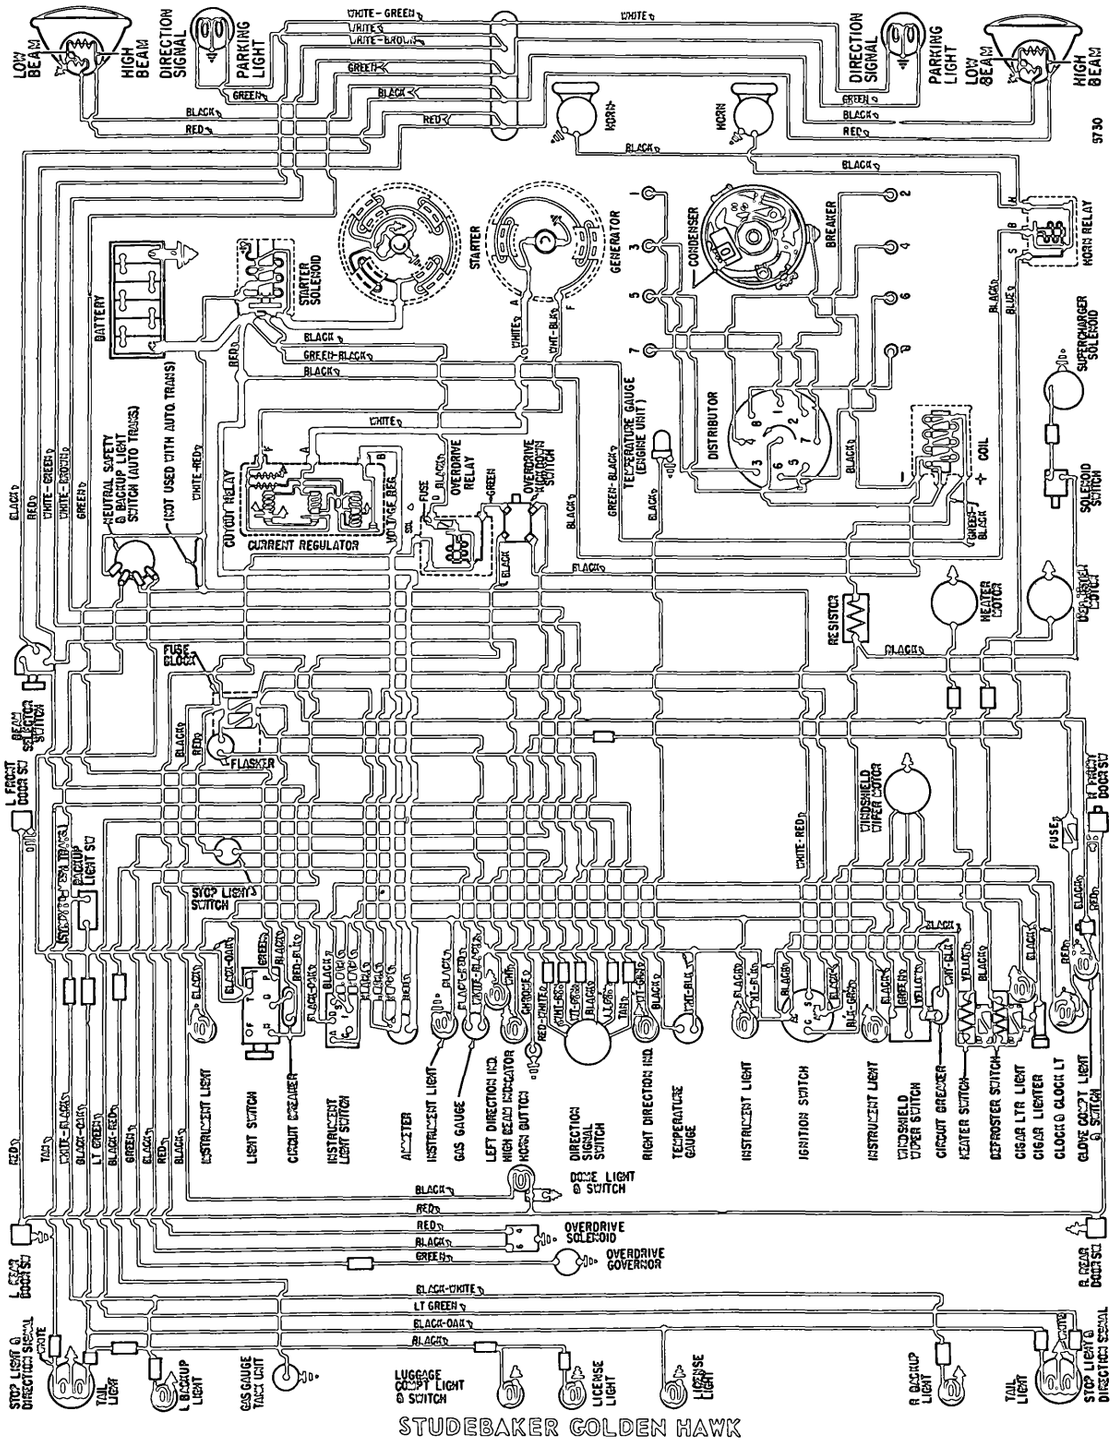
Throttle Return Check Adjustment: Remove carburetor air chamber cover. Loosen return check assembly screw locknut. Adjust assembly in bracket until plunger just breaks contact with tab on throttle lever. Mark position of check assembly with relation to bracket, then turn check assembly 1¾-2 turns toward lever. Tighten locknut, install cover.

Throttle Linkage Adjustment: With engine at normal operating temperature, choke valve wide open and throttle return check operating correctly, proceed as follows:
1) Adjust engine idle speed to 550 RPM with transmission selector lever in "N" (Neutral) position. Set the stop on the bellcrank (at rear of engine) to provide a 17/64" gap between bellcrank pads (use a 17/64" drill as a gauge. After stop is adjusted, hold in this position. Make sure that carburetor-to-bellcrank rod is in the outer hole of bellcrank pad (away from centerline of engine), and that ball joint is on the upper side of bellcrank lever.
2) Adjust carburetor-to-bellcrank rod until idle speed screw on carburetor throttle lever just begins to leave the stop. Stop the engine and remove the 1/8" pipe plug located near throttle lever on side of transmission and install a pressure gauge. Place selector lever in "D" (Drive) position and run engine at 1000 RPM with rear wheels held stationary by the foot brake. Adjust length of the main bellcrank-to-transmission throttle valve outer lever rod to obtain 95-100 lbs. pressure on gauge. Stop the engine, remove gauge, and install the pipe plug in side of transmission.

►*OTHER DATA: See "Stromberg WW Carburetors" in Carburetion Section.*

FUEL PUMP PRESSURE: 6-7 lbs.

SUPERCHARGER



McCulloch VS-575. Variable ratio type. Mounted on bracket located on top of engine water pump manifold at water outlet opening.

►*SUPERCHARGER AIR CHAMBER BASE AND COVER PRODUCTION CHANGE:* Vent valves removed and Idle Mixture Adjusting Screw Extensions Part No. 1542985 (Right), 1542986 (Left) added starting with Engine No. PS-2197 and Serial No. 6101154. Drain Pipe added in base now serves as drain and vent, and used starting with Engine No. PS-2375 and Serial No. 6101368. To replace Base Assembly No. 1542839 on engines prior to No. PS-2375, add Base Drain Pipe Assembly No. 1543107, Pipe Nipple base End No. 1543108 and Drain Pipe-to-Timing Gear Cover Clip No. 182317.

►*AIR CHAMBER VENT VALVE "FLUTTER" AT IDLE SPEED:* When "Flutter" not caused by insufficient supercharger output or too slow an engine idle, check "REST" position of Vent Valve. Distance from top of valve to base or cover should be 1/4". To adjust, bend Vent Valve Flat Spring.

Kick-down Switch Adjustment: Loosen locknuts on each side of switch bracket. With wide open throttle, switch

CONTINUED ON NEXT PAGE

STUDEBAKER GOLDEN HAWK

CONTINUED FROM PRECEDING PAGE

plunger should be depressed and auxiliary throttle outer lever should rest against threaded sleeve of the kick-down switch.

Belt Tensioning Check: With engine at rest or idling, belt should be in bottom of groove (high blower position). With engine running at approximately 1500 RPM, belt should start to leave bottom of groove and begin to climb up. With engine at 3500 RPM (no load), belt should be running near top of pulley (low blower position). With engine at 3500 RPM, manually operate kick-down switch. Belt should go immediately to bottom of pulley groove (high blower position). Releasing kick-down switch should allow belt to return immediately to top (low blower position).

Lubrication: Capacity – 8 ozs. of "Type A" automatic transmission fluid.

Checking Fluid Level – Check oil level every 1000 miles. Maintain oil level between two punch marks on dipstick. Drain and refill every 15,000 miles.

▷ *OTHER DATA. See "McCulloch Supercharger" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. M2623S. Fuel Only.
Pressure - 5-7 lbs.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge (Studebaker Golden Hawk): Direct reading electric type.
Dash Unit - Studebaker No. 1539880.
Tank Unit - Studebaker No. 1542895.
See "Fuel Gauges" in Carburetion Section.

Gasoline Gauge (Packard): King-Seeley "CV" electric type with Gauge Voltage Regulator.
Dash Unit - K-S No. 49546 (Studebaker No. 6484332).
Tank Unit - Studebaker No. 1543524 (Sedans), 1543616 (Station Wagon).
See "Fuel Gauges" in Carburetion Section.

Air Cleaner: DRY TYPE (Plasticized paper).

▷ *DRY TYPE FILTER CAUTION:* Remove filter element every 1000 miles and shake thoroughly to remove dirt. DO NOT wash element or blow out with compressed air. Replace filter every six months or 10,000 miles.

BATTERY

Willard HDW-2SM-50. *12 Volt,* 9 plate, 50 ampere hour capacity (20 hr. rate).
Battery Ground – Negative.
Engine Ground - Rear of engine to dash.

STARTER

Delco-Remy 1107650 (Synchro-mesh & Overdrive), 1107651 (Flightomatic). *12 Volt.* Armature 1933789.
Drive – Bendix "Folo-thru" type.
Rotation – Counter-clockwise at commutator end.
Brush Spring Tension – 35 ozs. minimum

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft. lbs.	Lock	5.8	435

Starting Switch: Magnetic type switch, controlled by combination Ignition & Starting Switch. Turn key full right to start engine.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Aut matic Transmissi n N utral Safety Switch: Delco-Remy 1998038 (without Power Steering), No. 1998059 (with Power Steering). Mounted on lower end of steering column. Starter will operate only when selector lever is in "N" or "P" position.

Adjustment: *See "Flightomatic" Transmission in Transmission Section.*

GENERATOR

Delco-Remy 1102003. *12 Volt.* **Armature 1923535.**

Maximum Charging Rate – *See Voltage Regulator.*

Performance Data –Cold

Amperes	Volts	RPM
30	14.0	2150

Brush Spring Tension – 28 ozs.

Field Current – 1.48-1.62 amps. at 12.0 volts.

Rotation – Counter-clockwise at commutator end.

B lt Adjustment: Hook a spring scale to belt midway between generator and fan pulleys, then adjust belt tension so that pull of 14 lbs. on scale will lift belt ½".

REGULATOR

Delco-Remy 1119123. *12 Volt. NOTE - Regulator is "1119000 Series". Specifications below are for "Normal" Settings.*

Cutout Relay

Cuts In – 11.8-13.5 volts (hot).

Contact Gap – .020"

Air Gap – .020" with contacts just closed.

Voltage Regulator

Setting – 13.8-14.8 volts (hot).

Air Gap – .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting – *See "1119000 Series" Regulator in Electrical Section.*

Current Regulator

Setting – 27-33 amps. (hot).

Air Gap – .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting – *See "1119000 Series" Regulator in Electrical Section.*

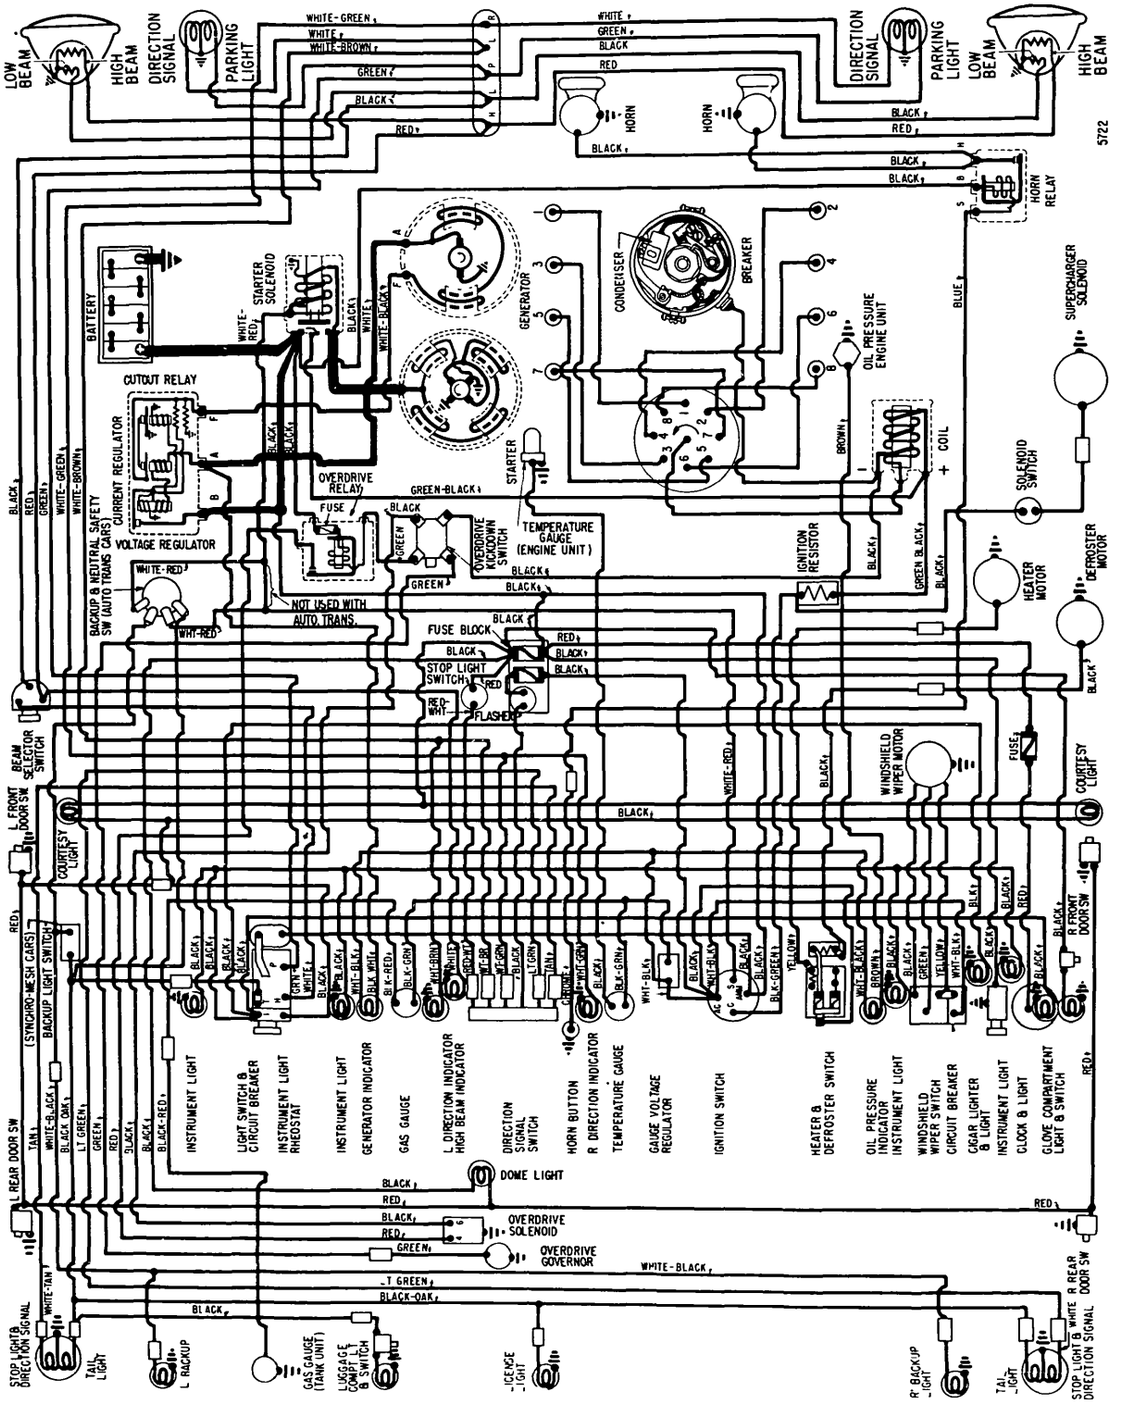
MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*

Directional Signal: *See Electrical Section.*

Light Switch Removal: Packard Clipper - Insert small screwdriver into notch at back edge of knob and press inward toward shaft, at same time pull off knob. Insert special wrench Tool No. J-5986 over light switch shaft. Hex of tool will fit into a concealed nut in bezel which holds switch in place. Turn wrench counterclockwise, remove bezel. Move switch back from panel and remove **Studebaker "Golden Hawk"** - Remove switch retaining nut. Push switch sleeve back into panel and disconnect wires from switch.

FUSES: Body & Stop Lights 15 amps. in block in bracket behind instrument panel.



Direction Signal - 15 amps. in block in bracket behind instrument panel.

Ov rdriv - 15 amps. in relay on dash panel.

Cl ck - 1 amp. in lead behind instrument panel.

CIRCUIT BREAKERS: H ad, Parking, Tail & Instrum nt Lights - 18 amps. on headlight switch.

CONTINUED ON NEXT PAGE

PACKARD CLIPPER

CONTINUED FROM PRECEDING PAGE

Windshield Wiper - 5 amps. in wiper switch.
H rn R lay: Delco-Remy No. 1116781.

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Before disconn cting any part of air conditioning equipment or lines f r acc ss t ngine, see "Air Conditioning S rvic Cautions" in Misc llaneous Section.*

ENGINE SPECIFICATIONS: "Sweepstakes 289". V8, valve-in-head, supercharged.

B r	Str k	Displacement
3 9/16"	3 5/8"	289 cu. ins.

C mpr. Rati	Rat d HP	De veloped HP
7.5-1 Ⓒ	40.6	Ⓢ 275 at 4800 RPM

Ⓒ - 7.0-1 Optional. Ⓢ - Supercharged.

C mpr ssi n & Vacuum R ading – *See TUNE-UP.*

ENGINE REMOVAL: *S e "Engine" in Studebaker Special Data.*

OIL PAN REMOVAL: *S "Oiling System" in Studebaker Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Studebaker Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Studebaker Special Data.*

PISTONS

Aluminum alloy, cam ground, T-slot, three ring type. *See "Original Bore & Pistons" in Studebaker Special Data.*

► *PISTON REPLACEMENT CAUTION: "259" & "289" Engine pistons are NOT INTERCHANGEABLE. "Flat H ad" piston used n 259" Engine. "Concave Head" Piston us d on 289" Engine.*

Weight - 16.2 ozs.

R m val - Pistons & rods remove from above.

Fitting N w Pist ns: Clearance - Selective feeler fit. Use feeler 1" wide, .002" thick, and 12" long inserted on camshaft side of cylinder bore. Insert inverted piston in bore with slotted side away from camshaft, and bottom edge 1" below top of cylinder bore. Pull required to remove feeler with properly fit piston should be 8-13 lbs.

R plac m nt Pist ns: Std. size & .010", .020", .030", .040" oversize. Pistons furnished with fitted pins.

Installing Pist ns: Install piston on rod so that solid side of piston is on same side as oil hole in bearing bore. Install piston in cylinder with the slot toward the left side of engine. *Se Rod Installation.*

PISTON PINS

Locked in rod by tapered pin and locknut.

Diameter – .8741-.8745". **Length** – 3 1/16".

Cl aranc in Pist n – .0001-.0003" (selective fit). Light finger push fit at 70° F.

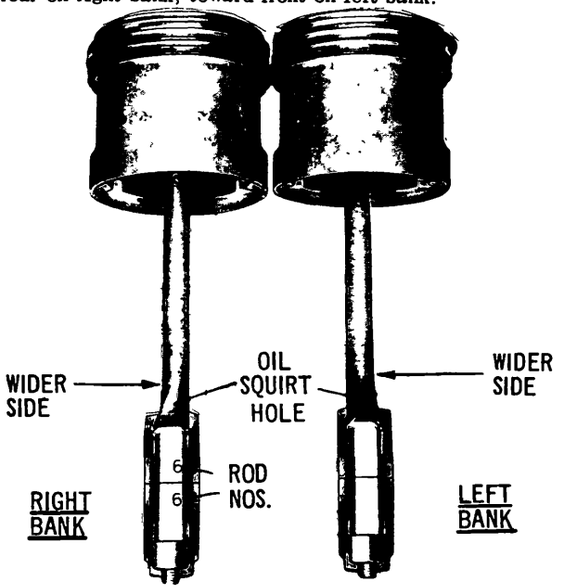
R placem nt Pins: Std. size & .0025", .005" oversize.

Removal & Installati n: *See "Piston Pins" in Studebaker Special Data*

PISTON RINGS

Ring	Width	End Gap	Sid Clearanc
Compression	.077-.078"	.008-.016"	.002-.005"
Oil	1855-.1865"	.088-.016"	.0015-.005"

R plac ment Rings: Sets of Std., .020", .030" and .040" Oversize.
See "Piston Rings" in Stud baker Special Data.



Installing Rings: Install compression rings with chamfered side of ring upward. Gaps of inner and outer oil rings must not come at same point.

CONNECTING RODS

Length - 6 5 8" center-to-center. **Weight** - 23.71 ozs.
Crankpin J ournal Diameter - 1.99925-2.00025".
Lower Bearing - Interchangeable. Steel backed, micro-babbitt lined type. No shims.
Clearance - .0005-.002". **Sideplay** - .008-.013".

Replacement Bearings: Std., .001", .002", .010" and .020" Undersize.

Installing Rods: Number on rod and bearing cap must be on same side. Rod is installed in same numbered cylinder with numbers down toward oil pan (toward right on right bank rods, toward left on left bank rods), and oil squirt hole on all rods toward right of engine. Rods are offset with widest half of bearing toward rear on right bank, toward front on left bank.

PISTON & ROD ASSEMBLIES

► *CAUTION:* Install piston and pin on rod so that T-slot of piston is on side opposite oil hole in bearing bore. Insert tapered end of clamp screw so it will be toward heavy boss. Be careful to align flat surface of screw with flat on piston pin. Bearing cap must be assembled on rod with groove in cap and rod on same side.

► *REPLACEMENT ROD IDENTIFICATION NOTE:* Replacement rods are unnumbered. To identify, hold rod upright with oil hole toward you. Wide part of offset will be to right on left bank rods, to left on right bank rods.

CRANKSHAFT

J urnal Diam t r—2.4995-2.5000".

Cl aranc –.0005-.0025".

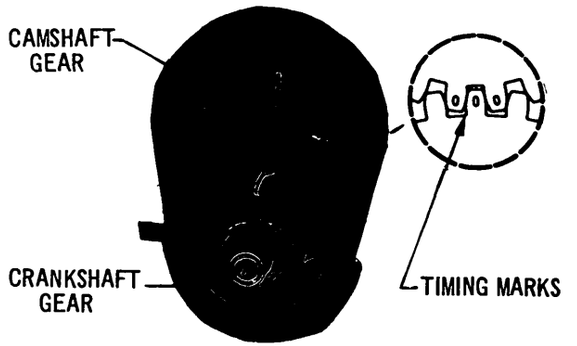
R placement Bearings: Std. size, .001", .010", .020", .030" undersize.

End Thrust: Taken by thrust plate assembled between front main bearing and crankshaft gear. Controlled by shims between thrust plate and face of main bearing journal.
Endplay—.003-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT



Journal Diameters—(1) 1.86975-1.87075", (2) 1.85375-1.85475", (3) 1.83875-1.83975", (4) 1.82275-1.82375", (5) 1.24475-1.24575".
Bearings—Precision type, steel backed babbitt lined.
Clearance – .00075-.00225" (No. 1), .001-.00275" (Others).

End Thrust: Taken by thrust plate located between front camshaft bearing and camshaft gear.
Endplay—.003-.006".

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Studebaker Special Data.*

Timing Gears: Cast iron crankshaft gear and "Celeron" camshaft gear.
Timing Gear Removal & Installation—*See "Timing Gears" in Studebaker Special Data.*
Backlash—.001-.003".

Camshaft Setting: Mesh marked tooth of camshaft gear between two marked teeth of crankshaft gear.

ENGINE VALVE TIMING MARKS

Engine Front Cover Removal: *See "Engine Front Cover" in Studebaker Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

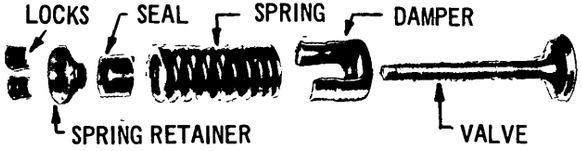
VALVES

► *ROCKER ARM ADJUSTING SCREW PRODUCTION CHANGE:* Effective Engine No. PS-2415 (Studebaker "Golden Hawk") new rocker arm adjusting screw, Part No. 1541806, entered production. Screw has recessed head to prevent push rod from slipping out of socket if a valve sticks, and to prevent bent push rods.

Tappet Clearance: .023-.025" (Hot), .025-.027" (Cold).

Valve	H ad Diam.	Stem Diam.	St m Cl aranc
Intake	1-21/32"	11/32"	.0015-.0035"
Exhaust	1-17/32"	11/32"	.0015-.0035"

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

Seat Angle–45° (all valves). **Lift**–23/64" (all valves).
Valve Seat Width–1/16-3/32".

Valve Stem Oil Seal: "Umbrella" type, rubber seals installed on all exhaust and intake valve stems (with cupped side down toward top of valve guide) within valve spring below spring retainer.

Valve Springs: Single spring used. Replace spring if 10% weaker than pressure given in specifications below. *NOTE* - Damper installed on lower (close-coiled) end of all springs.

Valve Spring Specifications - 106-112 lbs. when compressed to 1 43/64".

V8 ENGINE VALVE ASSY.

Valve Guides: Pressed in head from underside.
Guide Removal & Installation–*See "Valve System" in Studebaker Special Data.*

Valve Lifters: Straight barrel type. Remove from above. Not necessary to remove camshaft.

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" oversize lifters requiring reaming of lifter bore): See "Valve System" in Studebaker Special Data.*

Valve Lifter Installation & Fitting–*See "Valve System" in Studebaker Special Data.*
Replacement Lifters–Std. size, .001", .005" oversize.

►*CAUTION–When lifters removed, make sure they are installed in original positions.*

Rocker Arms: *See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Intake Valves–Open 11° BTDC. Close 54°36' ALDC.
Exhaust Valves–Open 51°36' BLDC. Close 14° ATDC.

Valve Timing Check–Set tappet clearance of No. 1 intake valve at .030". Turn crankshaft until No. 6 piston is on compression stroke and vibration dampener mark "IN.OP.1" is approaching pointer on timing gear cover, continue to turn crankshaft slowly while working No. 1 intake rocker arm up and down to determine point at which all clearance is taken up. Dampener mark "IN.OP.1" should be directly under pointer.

OILING SYSTEM

Crankcase Capacity: 5 quarts refill, 1 quart additional with filter change.

Normal Oil Pressure: 40 lbs. at 1400-1600 RPM.

Pressure Regulator Valve: Located on right side at front of engine block slightly above crankcase flange.

Oil Pressure Indicator: **Studebaker "Golden Hawk"** - Direct reading, non-electric type gauge.
Packard Clipper - Indicator light on instrument panel.
Oil Pressure Switch - Studebaker No. 1539898.

Oil Pump: Spur gear type. Mounted on rear main bearing cap and driven by camshaft gear.

Pump Removal, Overhaul & Installation: *See "Oiling System" in Studebaker Special Data.*

Oil Filter: Partial flow. New disposable type. Replace entire unit at 5000 mile intervals or sooner if needed.
Replacement Filter - Studebaker No. 1542739.

Crankcase Ventilation: Filter element in oil filler cap (air intake) and breather tube at rear of engine (air outlet).

COOLING

Water Capacity: 17 qts. (18.5 with heater).

Pressure Valve: Radiator filler cap. 13 lb. type.

Thermostat: Choke type. Studebaker No. 1540787 (170°) Std., No. 533247 (160°) and No. 533257 (180°) Optional.

Water Pump: Packless, sealed ball bearing type.
See "Studebaker" in Water Pump Section.
Pump Removal - Drain cooling system. Loosen generator, remove belt. Remove fan-to-hub screws and remove fan and pulley. On Studebaker "Golden Hawk" remove fan shroud. Remove four capscrews retaining pump cover to water pump manifold. Remove pump from manifold.

Radiator & Fan Shroud Removal: *See "Cooling System" in Studebaker Special Data.*

Temperature Indicators: **Studebaker "Golden Hawk"** - Direct reading, electric type gauge.
Packard Clipper - King-Seeley "CV" electric type with Gauge Voltage Regulator.
Dash Unit - Studebaker "Golden Hawk" - Studebaker No. 1539879. **Packard Clipper** - King-Seeley No. 49550 (Studebaker No. 6484335).
Engine Unit - Studebaker "Golden Hawk" - Studebaker No. 1542895. **Packard Clipper Sedans** - Studebaker No. 1543524, **Packard Clipper Station Wagons** - Studebaker No. 1543616.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck. Single plate, dry disc type.

Car Models	Clutch Model	Assy. No.	Disc No.
All Models	10.5A8	361451	382643

See "Borg & Beck" in Clutch Section.

Pedal Adjustment: Pedal free travel 1/2-1". To make adjustment, loosen locknut securing clevis to rod connecting release shaft lever to clutch operating shaft lever and remove the clevis pin. Turn clevis to shorten or lengthen rod as necessary for correct pedal free travel. *NOTE–If car is equipped with "Hill-Holder", adjust "Hill-Holder" operating rod as outlined in Brake Section.*

Clutch Housing Removal: Remove starter. Remove floor plate and clutch housing top capscrews. Remove clutch operating shaft. Remove transmission (see Synchro-mesh Transmission Removal below). Remove two bolts holding engine rear support insulator cage to crossmember. Place a small hydraulic jack at rear of oil pan and insert a block between jack pad and oil pan to prevent damage to pan. Raise engine just enough to take weight of engine off crossmember. Remove support crossmember-to-frame bolts and remove cross member. Remove the two clutch housing bolts retaining exhaust pipe support bracket. Loosen clamp bolt and swing support bracket out of way. Remove clutch housing cover plate. Remove remaining housing mounting bolts or capscrews and remove clutch housing.

Clutch Removal: Remove clutch housing (above), remove six screws evenly to release pressure, lift off clutch assembly and driven member.

SYNCHRO-MESH TRANSMISSION

Warner Model T85 with Overdrive, All Models. *See "Warner Synchro-mesh Transmission" in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Drain transmission case. Disconnect universal joint from transmission companion flange and remove propeller shaft support stud nuts and plain washer. Move front propeller shaft and support assembly rearward on slip yoke splines. Move end of shaft to one side as far as possible and tie it in position. Disconnect shift rods from shift levers and remove speedometer cable from transmission case. Remove speedometer pinion. Remove capscrews which hold transmission case to clutch housing. Remove clutch operating shaft, bracket, and bearing from transmission case. Move case rearward until the main drive pinion clears clutch pressure plate and remove unit from car.

OVERDRIVE

Warner R10 Type (part of T85 Transmission Assembly). Governor controlled, with electric solenoid operation and throttle controlled "kickdown". *See "Warner R10 Overdrive" in Transmission Section.*

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cable have been disconnected.

FLIGHTOMATIC TRANSMISSION

Hydraulic torque converter and hydraulically controlled three-speed planetary type transmission which provides automatic operation in "D" range and additional "Lo", "R", and "P" ranges which are controlled manually.

►*"NO REVERSE" CORRECTION: See "Flightomatic" Transmission in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Flightomatic" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Flightomatic" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 15,000 miles. Use only Automatic Transmission Fluid Type "A"

Checking Fluid Level – Place selector lever in "P" position. Start engine and operate it for approximately four minutes or until engine and transmission have reached operating temperature. Remove floor mat from right side and remove oil inspection hole cover. Apply parking brake and foot brake, move selector lever slowly from "P" position to "R" position. then back to "D" position. Remove dipstick and read fluid level. Add fluid to bring level to "FULL" mark on dipstick (1½ pints between "LOW" and "FULL" marks on dipstick).

Capacity - 9 qts. Use Automatic Transmission Fluid Type "A" (marked AQ-ATF on container).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Throttle Linkag Adjustm nt: See *CARBURETOR above*

►*OTHER FLIGHTOMATIC DATA* See *"Flightomatic' Transmissi on in Transmission Section.*

UNIVERSALS

Spic r. Needle bearing cross type. Three used, with intermediate universal at propeller shaft support bearing on crossmember.

Propeller Shaft & Support Bearings. Two shafts used.

1) Front shaft with intermediate universal yoke bolted to rear end (no slip-joint).

2) Rear shaft with slip-joint on forward end at intermediate universal.

Pr p ller Shaft & Support Bearing Removal: See *"Propeller Shaft Notes" in Studebaker Special Data.*

REAR AXLE

Spic r. Semi-floating hypoid gear with Hotchkiss Drive S *"Spic r-Hypoid" in Rear Axle Section*

►*TWIN-TRACTION DIFFERENTIAL NOTE* Twin-Traction differential is optional with same gear ratios as conventional differential For Service Information See *"Spic r Pow r-Lock Differential" in Rear Axle Section*

►*TWIN-TRACTION REAR AXLE IDENTIFICATION NOTE* Cars with Twin-Traction Differential will have a Red Sticker on front door rear face just above door lock and small tag attached to differential cover screw with the letter "T" stamped on it

R ar Axl Rati : Rear axle ratio stamped on plate attached to axle by cover cap screw and also on ring and pinion gears

	Standard		Optional	
Car Mod l	**O.D.**	**Auto.**	**O.D.**	**Auto.**
Packard Clipper	4.27-1	3.31-1	3.92-1	3.07-1
			4.55-1	3.54-1
"Golden Hawk"	4.27-1	3.31-1	①	

① - 3 54-1, 3.92-1, 3.73-1, 4.09-1, 4 55-1.

Backlash—.003-.006".

Axle Shaft Rem val: Remove wheel and wheel hub (use Puller J-1644-B). Take out backing plate retaining bolts, remove outer oil seal. Pull backing plate out over end of axle shaft and wire to frame out of the way (*CAUTION*—Do not lose adjusting shims located between backing plate and axle housing flange). Pull axle shaft with Puller HM-931.

R ar Axle Assembly Removal: Remove hub caps and axle shaft cotter pin. Loosen wheel nuts. Place car on stands (stands under frame just ahead of rear springs) and remove wheels, hubs, and drums. Disconnect brake pipes at wheel cylinders, remove backing plate bolts from both backing plates. Remove brake pipe clamps and capscrew which holds brake pipe tee to housing, remove brake pipe from housing. Remove backing plate and shims (suspend from frame). Remove rear universal joint U-bolts and nuts, disconnect rear propeller shaft and move to one side. Remove rear spring U-bolts and disconnect shock absorbers from spring plate. Remove rear axle assembly.

Wh l B aring Adjustment: Use dial indicator to check axle shaft endplay. Adjust by removing backing plate (see Axle Shaft Removal above), and adding or removing shims located between backing plate and axle housing flange. **Endplay** — .001-.006".

SHOCK ABSORBERS

Monro , Delco, r Gabri l. Direct acting, hydraulic type. Serviced by replacement. *NOTE* - Heavy Duty shocks are Gabriel.

Monroe Shocks (Studebaker No.)

	Front	Rear
Packard Clipper Sedans	1543702	1543704
Packard Station Wagons	1541904	1541913

Adjustable	1541901	1541910

FRONT SUSPENSION

Independent. Coil spring suspension with shock absorbers mounted within coil springs

See *"Studebaker" in Suspensions & Wheel Alignment Section*

►*"VARIABLE RATE" FRONT SPRING INSTALLATION CAUTION* This type used on sedan models Install with closed coils at the top and the coil ends toward the inside (centerline) of car

Kingpin Inclination - 6° at 0° camber

Caster - Neg 1° to Neg 2½° Not more than ¾° variation between wheels

Camber - 0° to Pos 1° ½° more camber favored on driver's side

Toe-In 1/16-1/8" **Adjust right hand tie rod only** for toe-in after left hand tie rod has been adjusted for straight-ahead position (with steering wheel centered) and center auxiliary tie rod has been adjusted so that steering gear arm and auxiliary steering arm parallel

Toe-Out on Turns - With outer wheel at 20° inner wheel should be 22½°-23½°

STEERING

Manual: Ross Model SL-54 Cam & Single Lever Roller Stud. Roller stud mounted on tapered roller bearings See *"Ross Cam & Single Lever" in Steering Section*

Power Steering: Saginaw (Not I n Line). See *"Saginaw Power Steering (Not In Line)" in Steering Section*

►*POWER LOSS ON LEFT TURN CORRECTION* See *"Saginaw Power Steering (Not in Line)" in Steering Section*

Steering Linkage: See *"Steering Linkage" in Steering Section*

Steering Wheel & Horn Button Removal: See *'Ross Cam & Single Lever" in Steering Section*

Steering Gear Removal: See *"Ross Cam & Single Lever" in Steering Section*

BRAKES

Wagner Lockheed Hydraulic. Self-centering (with Bendix type shoes) Parking brake applies rear wheel service brakes

See *"Wagn r Lockh ed S lf-C ntering" in Brake S ction*

Drum Diam t r - 11" (Front), 10" (Rear)

Wh l Cylind r Diam t r - 1 1/16" (Front), 7 8" (Rear)

Braking P w r - 62% (Front), 38% (Rear)

►*PRIMARY BRAKE SHOE LINING LENGTH PRODUCTION CHANGE:* Primary shoe lining length has been changed to· 8 5/32" (Front), and 7¼" (Rear).

►*FRONT WHEEL SECONDARY LINING NOTE* Front wheel secondary lining is 7/32" thick (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeak This lining is applied to the full length of the shoe and is marked "secondary" and "top" and should be installed as marked

Lining Width & Length

	Front Wheels	Rear Wheels
Primary Shoes ①	2¼" x 12"	2" x 10 29/32"
Secondary Shoes	2¼" x 12"	2" x 10 29/32"

①- Early cars For later cars See *"Production Chang "*

Thickness - 3/16" (all except front wheel secondary) 7/32" (front wheel secondary)

Clearance—Lock shoes against drum with adjusting screw, then back off adjusting screw 8 notches, or more notches as required to free drum.

Standard Master Cylinder: On frame left side rail at base of brake pedal.

Checking Fluid—Access hole in front floor pan at left corner of drivers seat Fluid should be maintained 1/2" below top of filler opening.

Removal—Remove from beneath car. Disconnect clutch pedal pullback spring from master cylinder support strap Remove brake pedal pullback spring by unhooking it first from its frame bracket and then from spring clip attached to master cylinder-to-pedal rod. Disconnect fluid line or lines at rear of master cylinder (*NOTE* - One line with Hill-holder). Remove the brake pedal clevis pin and disconnect brake pedal-to-master cylinder rod at brake pedal. Remove mounting nut bolts and washers, swing support strap down out of position, remove master cylinder.

Power Brakes· Hydrovac Power Unit. Used with standard master cylinder.

See *"Hydrovac Power Unit" in Brake Section.*

►*POWER BRAKE NOISE CORRECTION:* See *"Hydr vac Power Unit" in Brake Section*

Checking Fluid—Same as for Manual Brakes (same master cylinder used)

Removal of Power Unit—Disconnect manifold vacuum supply hose at the power unit and disconnect stop light switch wires Disconnect hydraulic lines from power unit (lines leading to master cylinder and to wheel cylinders). Remove power unit-to-bracket mounting bolts and remove unit from car.

MISC. MECHANICAL

Windshield Wipers: Auto-Lite or Bosch. Electric type See *"Windshield Wipers" in Miscellaneous Section*

Air Conditioning: See *"Studebaker Air Conditioning" in Miscellaneous Section*

Power Window Regulators: Electrical with individual reversible motors in each window Control switches at each door with a master control switch located on left front door S *"Pow r Window R gulators" in Misc llan ous Section*

Flywheel to Crankshaft Bolts	36-40
Engine Mounting(at frame crossmember)	38-42

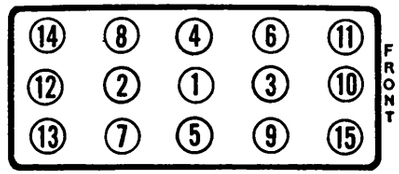
6 CYL. ENGINES

	Ft. Lbs.
Cylinder Head Bolts	30-35
Spark Plugs	30
Con Rod Cap Bolts	40-45
Main Bearing Cap Bolts	85-95
Camshaft Thrust Plate Bolts	12-15
Camshaft Sprocket Nut	35-40
Chain Cover Screws	12 15
Flywheel Mounting Bolts	35-40
Intake & Exhaust Manifolds	30-35
Vibration Dampener Bolt	100 130

CAUTION - Torque figures are for clean and dry threads

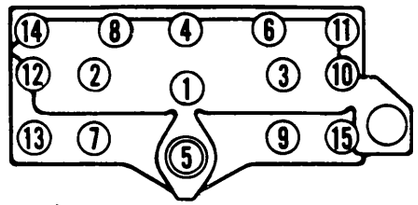
CYLINDER HEAD & MANIFOLD
ALL MODELS

►*"F" HEAD CYLINDER HEAD BOLT CAUTION* One head bolt is located under carburetor in intake manifold.



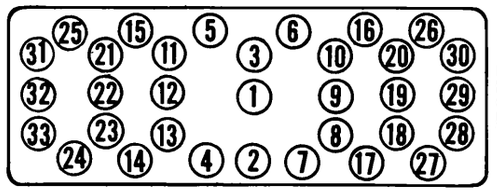
CYLINDER HEAD. Installation—Use a torque indicating wrench to tighten cylinder head stud nuts and capscrews; tighten in correct sequence as shown Recheck with engine water at 150°F

Tightening Torque—See Tightening (Torque Wrench) Specifications.



CRANKSHAFT & MAIN BEARINGS
4 CYL. ENGINES

CRANKSHAFT SERVICING: Bearing Replacement – Engine must be removed from car for bearing replacement (bearings "doweled" in case and crankshaft must be taken out to remove and install bearings). Make certain that oil holes in bearings line up with oil holes in crankcase, and that bearings fit snugly on dowel pins in crankcase and bearing caps.



Rear Bearing Oil Seal (Neoprene Type—*NOTE Upper and lower halves of seal can be replaced without removing crankshaft from engine.* Seal is neoprene with a steel back Upper half of seal can be removed by using a suitable piece of strap steel (hack saw blade with teeth ground off) Rotate upper half of seal around shaft with steel strap until opposite end protrudes far enough to grasp end and remove To install, coat both parts of seal with grease and install upper half by rotating it around crankshaft until it is in position with ends even at the engine block Coat both ends of lower seal with Permatex before installing to insure good seal with upper half

4 CYL. "L" HEAD ENGINES

4 CYL. "F-HEAD" ENGINE

6 CYL. 6226 "L" HEAD ENGINE

Rear Bearing Cap Seal—Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case When installing bearing cap, coat upper face lightly with sealing compound, insert new packing strips after cap is in place. Packing strips should protrude ¼" to provide proper compression when oil pan installed. CAUTION—Do not cut off this protruding portion of the packing.

6 CYL. ENGINES

OIL PAN TO FILLER BLOCK GASKET INSTALLATION: Install Neoprene Rubber gasket in each filler block (use Gasket Cement in grooves) with each end extending an equal amount (1/16") above faces of filler blocks ends Allow cement to dry

FRONT & REAR FILLER BLOCKS: Lower filler blocks (front and rear) are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace pan gasket) Rear filler blocks (additional **upper filler block guard** in crankcase) are grooved for cork oil seals which bear on polished surface of crankshaft directly behind oil slinger Filler blocks can be removed and replaced without disturbing crankshaft as follows

Front Filler Block (Lower) Servicing: Remove by taking out mounting capscrews and timing gear cover capscrews which enter the filler block When installing filler block, first install oil pan side gaskets (No 200266), install filler block (use Perma-tex), install new end gasket on block.

Rear Filler Block (Lower) Servicing: Same as for the lower front block (above) except for crankshaft oil seal (square cork gasket or graphite impregnated seal) Remove and discard old gasket or seal Install new seal (no 204654) in same manner as described below for Rear Filler Block (Upper) Guard Install lower filler block after upper filler block guard has been installed

Rear Filler Block (Upper) Guard Servicing: Guard is seated in groove in crankcase and can be "rotated" out without disturbing crankshaft after lower filler block removed Remove and discard old gasket or seal, clean out seal groove Install new graphite impregnated seal (no 204654), flatten seal slightly and use mandrel or rod to seat seal in groove by rolling from ends toward the center (ends must extend slightly above flat surface of guard). **Do not use shellac or sealing compound in groove.**

►*CAUTION*—Oil seal in both Upper Filler Block Guard and Rear Filler Block must be centered with crankshaft If necessary, seal can be built up using 1/32" thick gasket material, 3/16" wide, as shims shellacked to groove in block or guard behind seal

ENGINE FRONT COVER
4 CYL. ENGINES

FRONT COVER OIL SEAL: Cover has double metal baffle and spring-loaded leather seal which contacts polished surface of crankshaft pulley hub When installing seal, make certain that seal lip is inward or toward rear of engine.

6 CYL. ENGINES

FRONT COVER OIL SEAL: Drive out old seal using Oil Seal Driver KF-44 Place cover with opening flange on flat surface Coat outer edge of new seal with sealing compound place seal in opening with seal lip toward rear and drive seal in place

CAMSHAFT & BEARINGS
4 CYL. ENGINES

CAMSHAFT SERVICING: Rem val—Drain radiator and cylinder block, remove radiator and grille, cylinder head, manifold, valves, and valve springs Remove oil pump, fuel pump, oil pan, crankshaft pulley (use puller), fan and governor drive belts, and fan assembly Remove nuts on front engine support rubber insulators (Jeep only). Remove timing gear cover, remove camshaft gear and thrust plate, block up all valve lifters (can be tied up with string to manifold studs) On Jeep only, place jack under crankcase (use block of wood on jack to avoid damage to oil pan), raise front end of engine to provide clearance for camshaft. Remove camshaft through front of engine

Camshaft Front Bearing - Consists of steel backed babbitt lined bushing, staked in place to prevent rotation or endwise movement with oil hole in bushing lined up with oil hole in crankcase

Camshaft Thrust Plate - Thrust plate assembled behind camshaft gear with a spacer to control endplay Add shim behind spacer to increase clearance dress down spacer to reduce clearance Beveled edge of spacer must be to rear.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6 CYL. ENGINES

CAMSHAFT SERVICING: Removal - Drain cooling system, remove radiator, vibration dampener timing chain cover timing gear and chain Remove fuel pump cylinder head oil pan and oil pump Remove valve cover valves and spring Hold lifters up (use spring type clothes pins) while carefully removing camshaft

VALVE SYSTEM

VALVE TAPPET ADJUSTMENT

6 CYL. ENGINES

TAPPET CLEARANCE ADJUSTMENT PROCEDURE: Car manufacturer recommends valves be adjusted in order listed (see table below) Remove right front wheel and access cover in fender splash shield for access to valve compartment Remove spark plugs so that engine can be turned over by moving fan or fan belt By setting valves in fully raised position (left hand column), **valves in right hand column** will be on "low" side of cam **in position for tappet adjustment**

Fully Raise Valve	Then ADJUST Valve:
Nos 1 and 3	Nos 10 and 12
Nos. 8 and 9	Nos. 4 and 5
Nos 2 and 6	Nos. 7 and 11
Nos 10 and 12	Nos. 1 and 3
Nos 4 and 5	Nos 8 and 9
Nos 7 and 11	Nos. 2 and 6

ROCKER ARMS

4 CYL. "F" HEAD ENGINES

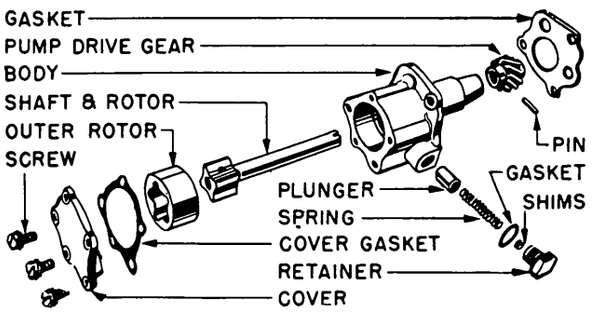
ROCKER ARM ASSEMBLY REMOVAL: Lock rocker arms, shaft, brackets and springs together as a unit by removing cover studs in front and rear rocker arm shaft brackets and installing 5/16'-24 thread set screws in the front and rear brackets in same manner set screws are installed in center brackets. Remove nuts on bracket studs and lift entire assembly off studs as a unit.

Installation: Check push rods, straighten or replace any that are bent. Place push rods in holes in head and block, being sure that they are properly seated in intake valve tappets. Place rocker arm assembly on its studs, seat intake valve adjusting screws in tops of push rods before installing nuts on bracket studs. Torque nuts to 30-36 ft. lbs. Remove extra set screws from front and rear rocker arm shaft brackets, install cover studs in front and rear brackets with short end of stud down.

OILING SYSTEM

OIL PUMP

4 CYL. ENGINE OIL PUMP



OIL PUMP REMOVAL & OVERHAUL: (Removal)— Rotate engine until distributor rotor points to No 1 firing position and timing mark on flywheel or vibration dampener is directly under pointer (do not remove distributor, pump must be installed so gears mesh without moving rotor for correct engine timing) *CAUTION*—Crankshaft must not be rotated with oil pump removed) Remove pump mounting bolts and pull pump out as far as possible Place a short jack between front suspension support and front lower edge of block and push engine to right until pump is free (Note—It may be necessary to loosen engine support bolts for more movement) Check pump shaft for wear before disassembling pump by mounting it in a vise with a dial indicator bearing against shoulder on gear, at right angles to relief valve housing Move gear toward, then away from indicator and note total reading If this play exceeds 010', replace complete pump

Disassembly Remove cover screws cover and gasket and shake outer rotor from housing Remove relief valve retainer, gasket, shims, spring, and plunger If rotor is to be replaced file off one end of gear retaining pin pull gear off shaft and remove shaft and inner rotor from housing Clean all parts in solvent and check for wear pits and scoring

Inspection: Measure clearance between outer rotor and pump body Replace body if clearance exceeds 012" Check body to make certain inner surface is not rough or scored and that lower face is flat within 001" Rotors must be within 001" thickness of each other With gear installed on pump shaft, clearance between gear and pump body should be 003- 010"

Checking Rotor Clearance Position inner rotor with one lobe engaged between two lobes of outer rotor, then measure clearance of opposite inner rotor lobe and lobe of outer rotor This clearance should not exceed 010 To check end clearance place a small piece of 010 shim stock on inner rotor so that it does not overhang edge of rotor at any point Install cover and gasket and tighten screws If shaft can be turned by hand, end clearance is excessive Install new cover and repeat test If rotors still not tight, replace rotors

Reassembly: Install relief valve, spring, gasket and retainer If shims were removed, install them between spring and retainer If new rotors installed, slide gear on shaft after installing shaft and rotor in housing Position gear so there is not over 010' clearance between gear and pump housing and drill a 5/32' hole through pump shaft for retaining pin Install pin and peen ends Install cover and gasket and tighten screws

4 CYL. ENGINE OIL PUMP

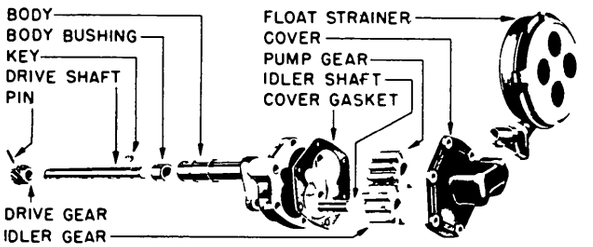
Installation (4 Cyl. Models): Check to see that timing marks on flywheel or vibration dampener are directly under pointer and distributor rotor is pointed toward No 1 firing position Insert pump in block with pump gear positioned so that it will engage camshaft gear and the distributor shaft drive key without moving distributor rotor Installation can be made only in one position without moving distributor rotor as slot in drive gear and key on distributor shaft is machined off-center

6 CYL. ENGINE OIL PUMP

OIL PUMP SERVICING Pump can be removed from engine (with oil pan off) by taking off retaining nut on stud on #3 main bearing cap and pulling pump straight down to disengage drive gear and distributor drive coupling Service pump as follows

Disassembly—Take out cotter pin and remove screen float assembly Remove cover and gasket Drive out pin holding upper drive gear on shaft (pin peened in place), drive out shaft from gear remove idler gear (remove idler shaft if required) Take off lower drive gear (press fit and keyed to shaft)

Oil Pump Clearances—Check as follows



1)—Pump Body Bushing if over 005" clearance between pump body and ends of lower drive gear teeth, replace bushing and ream to 500- 501"

2)—Pump Shaft shaft diameter 4990- 4985"

3)—Lower Drive Gear end of gear should be 001- 004" beyond gasket seat on pump body

4)—Upper Drive Gear 002- 004" clearance between underside of gear and upper end of pump body Controlled by pressing lower drive gear on shaft until this clearance obtained

NOTE—Cover plate should be replaced if worn from contact with gears, or if cracked

6226 ENGINE OIL PUMP

Oil Pump Bushing (in Cylinder Block)—Replace if worn or loose (can restrict oil gallery if loose) Replace by using drift inserted in distributor drive shaft bore from top of block Install new bushing from below (must be flush with bottom of block)

Reassembly—Press upper drive gear on shaft. Insert new pin and peen ends flush with gear Install shaft and gear in pump body Press lower drive gear on shaft (with key in place) until 002- 004" clearance obtained between upper drive gear and upper end of pump body Press idler gear shaft in body, install idler gear Install cover using new gasket and pin oil screen float assembly on cover Check shaft and gears—must rotate freely when turned by hand

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Oil Pump Installation—Set #1 piston at top dead center. Insert distributor main drive shaft from top of block. Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approx. parallel to side of block (slot pointing fore-and-aft), install lock washer, tighten mounting nut. Remove distributor shaft for cyl. head installation.

FRONT AXLE

STEERING LINKAGE (Checks & Adjustments) CJ-5 & FC-150: To correct shimmy, check all items listed as follows:

1) Remove both steering knuckles and inspect the upper and lower kingpin bearings (cups for brinnelling, pitting, or fretting) and replace if they show slightest imperfection.

2) Adjust kingpin bearing preload (add or remove shims), with axle shafts removed, to 12-16 pounds load (maximum preferred). *NOTE* - Hook scale in hole in arm for tie rod socket. Read scale after knuckle has been started.

3) Replace original Steering Knuckle Oil Seals with Kit Part No. 915-664 if seals show wear.

4) Steering bell crank and/or double tie rod socket should be replaced when slightest rocking action or looseness observed when turning wheels under normal load.

5) Adjust drag link to maximum safe tightening at both ends and adjust steering gear.

6) See "Steering Arm", "Leaning Correction", "Tie Rod & Spring Shackle" and "Shimmy Due To Loose Steering Arm" below.

VEHICLE LEANS TO LEFT (FC-150): Install Axle Shim Part No. 915858 with Spring Clip Front No. 808460 and Clip No. 808461, placing shim between spring and spring saddle on right front side of vehicle. Locate shim in saddle and torque to 50-55 ft. lbs.

SHIMMY DUE TO LOOSE STEERING ARM: Permanently correct condition by replacing two bolts in steering arm with two additional dowel studs and taper face nuts. Ream holes in steering arm to 60° taper for proper seating of taper face nuts.

TIE BAR INSTALLATION (FC-150): Installing Tie Bar will stabilize frame and reduce possibility of shimmy developing. Secure 29½" length of 2" x ½" hot or cold rolled #11 steel channel and proceed as follows:

1) Remove radiator guard screen and place Tie Bar up against front spring hanger brackets.

2) Set front wheels in straight ahead position, hold Tie Bar level and provide 3/8" clearance between Tie Bar and steering connecting rod.

3) Arc weld Tie Bar to hanger brackets at outside and inside rear edges of both brackets.

SILENT BLOC BUSHING TYPE SPRING SHACKLE: Silent-bloc bushing type shackle replaces U-type. Service Kit Part No. 916646 (2 silent bloc bushings and new type shackle) will replace one shackle only. When replacing threaded shackle, ream out frame bracket to .875" and press silent bloc bushing into bracket and spring eye. *NOTE* - Lockwasher included for spacer at the spring.

TRANSMISSION NOTES

TROUBLE SHOOTING AND ADJUSTING: For correcting "Hard Shifting", "Shifting into Two Gears" or "Slipping out of Gear", proceed as follows:

L6-226 (4x2) & DJ-3A Models - 1) Disconnect transmission shift rods from remote control levers and check for binding of remote control shaft on steering column and correct as necessary.

2) Check operation of remote control levers and clutches and reconnect shift levers.

3) Disconnect rods from levers at transmission, insert ¼" pin through remote control levers and bracket on steering gear housing Place transmission in neutral, adjust rods so clevis pin will enter clevis and lever freely.

4) If lever sticks in first gear or is hard to shift from first to second gear, shorten low and reverse shift rod one turn at a time (3 turns usually required) until improvement is obtained.

FC-150 Models - 1) Disconnect control rods from shift lever at cab and check free operation of shift lever. Correct as necessary.

2) Adjust shift rods with transmission in neutral.

3) Check clutch pedal adjustment.

All Models (with Two Wh l Driv) - When minimum clearance (.001-.007") between end of interlock sleeve and transmission shift levers (with longest sleeve Part No. 641310), cannot be obtained, remove original interlock pin from shift lever poppet spring and replace it with a Transfer Case Intermediate Gear Needle Bearing Roller Part No. 809294 which has been ground down to a length of .780". Assemble transmission so shift action can be checked. If pin is too long causing a bind, reduce length of pin from .780" until smooth ball and detent engagement is obtained.

FC-150 TRANSFER CASE OPERATING LEVER VIBRATION: To correct vibration noise caused by operating lever vibrating against, or transmitting vibration to body panel, proceed as follows:

1) Install sound deadening material between the two transfer case lever shaft brackets and body panel. Use Dust Cover material Part No. A-622 or a piece of rubber 3" square, 1/16" thick.

2) File body opening to obtain clearance for transfer lever when in "2WD High" and working lever to right and left.

3) Install Grommet Part No. 670543 on lever at body opening as dust seal and possible vibration dampener.

FC-150 TRANSFER CASE REMOTE CONTROL LINKAGE ADJUSTMENT: Linkage pins must be in end holes in both shift rods. To adjust position of remote control rod nuts proceed as follows:

1) Loosen jam nuts at transfer case and remove connecting link pin.

2) Place gear levers in Neutral position (both front rear) and insert connecting link pin without changing position of controls. *NOTE* - When control lever is in extreme rear position, linkage should be in 2-wheel drive (HIGH GEAR) or as far **forward** as rods permit linkage to go. When lever in 4-wheel drive (LOW GEAR) linkage should be as far **backward** as shift rods will permit.

MODEL IDENTIFICATION

Model	Series Symbol
F4-134 4x2 & 4x4 Jeep Utility	54

STARTER

Auto-Lite. Used as follows

Model	Starter	Armature
4 Cyl (All)	MCH-6203 or 6207	MCH-2088
6 Cyl	MCH-6210	MCH-2088

Drive - Bendix "Folo-Thru" type
Rotation - Counterclockwise at commutator end
Brush Spring Tension - 42-53 ozs

Performance Data

Torque	RPM	Volts	Amperes
0	4300	5 0	65
6 0	Lock	2 0	335

Starting Switch: Auto-Lite SST-4012 (MCH 6203), Key starting (Magnetic switch controlled by turning key past "Ignition On" position) Auto-Lite SW-4015A (MCH-6207), Foot operated

GENERATOR

Auto-Lite GGW-4801D (4 Cyl.), GGW-4801EN (6 Cyl.).
Armature - Auto-Lite GGW-2006F (All Cars)

Performance Data

Amperes	Volts	Cold	RPM	Hot
0	6.4	870-970		950-1050
40.0	8.0	1800-2000		2150-2350
45.0	8.0	1925-2125		2350-2550

Brush Spring Tension—35-53 ozs.
Field Current—1.4-1.5 amperes at 5.0 volts.
Rotation—Counter-clockwise at commutator end.
Belt Adjustment: ½-5/8" deflection with thumb pressure midway between generator and pump pulleys.

REGULATOR

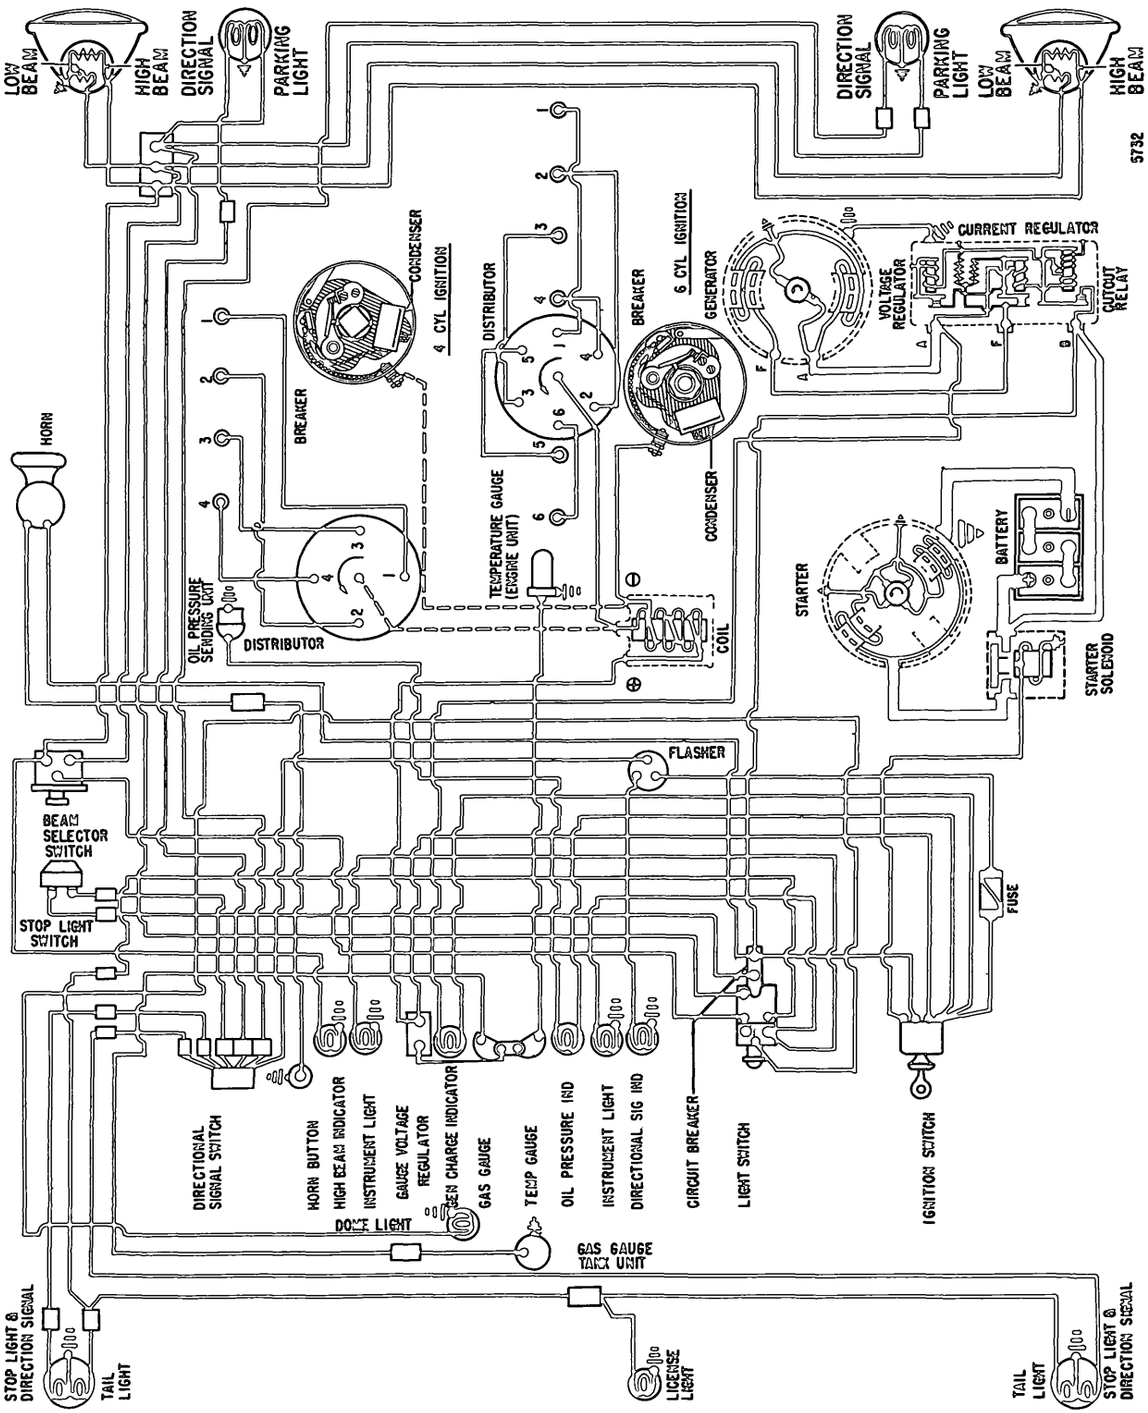
Auto-Lite VBE-6105A. Voltage & Current type with "Temperature Compensated" Current Regulator.

Cutout Relay

Cuts In—6.3-6.8 Volts (set to 6.4-6 6 volts).
Cuts Out—4.1-4.8 Volts (4.6 amps. discharge).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70°F *after 15 minutes operation charging at ½ maximum rate.*
Air Gap—.048-.052" with contacts just touching.
Checking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*



Current Regulator

▷*SETTING CAUTION: "Temperature Compensated" type Set to following specifications at 70°F.*

	Test A—Operating Amperes	Test B
VBE-6105A	52	45 (43-47)

Test A—After 15 minutes operation with current at ½ maximum rate.
Test B—After 15 minutes additional operation with current regulator operating.
Air Gap—.048-.052" with contacts just touching.
Checking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section*

Directional Signal: *See Electrical Section.*

Lighting Switch Removal: Loosen set screw on side of control knob and remove knob. Remove retaining nut and push switch through panel.

Stop Light Switch Location: On brake master cylinder.

CIRCUIT BREAKER: 30 ampere. Thermal type on light switch.

FUSES: Directional Indicator - SFE-14 ampere in flasher lead.
Radio - SFE-9A ampere in lead to radio.
Heater - SFE-10 (FC-150,170), SFE-14 (Others).
Overdrive - SFE-20 at overdrive relay.

ENGINE

►*THREE DIFFERENT ENGINES USED: See "Model Identification" for application.*

4 CYL. "F" HEAD

Model	Bore	Stroke	Displacem nt
F4-134 (All)	3.125"	4.375"	134.2 cu. ins.

Model	Compr. Ratio	Rated HP	Developed HP
F4-134 4x2	7.4-1①	15.63	75 at 4000 RPM
F4-134Others	6.9-1②	15.63	72 at 4000 RPM

① - 7.8-1 Optl. ② - 7.4-1 Optl.

Compression & Vacuum Reading–See *"TUNE-UP" above.*

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" main & connecting rod journals Undersize.
"B" .010" cylinder bore and pistons Oversize.
"AB" both above conditions exist.

CYLINDER HEAD & GASKET INSTALLATION: *See Willys Special Data.*

TIGHTENING TORQUES: *See Willys Special Data.*

PISTONS

Aluminum alloy, cam ground, T slot, Tin or Brass plated.

►*PISTON OVERSIZE NOTE:* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.
Weight–13.5 ozs.
Removal–Pistons & Rods removed from above.

Fitting New Pistons: Place .003" x 1/2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove ribbon feeler should be 5 to 10 lbs.

Replacement Pistons: Std. and .010", .020", .030" and .040" Oversize.

Installing Pistons: "T" slot toward valve (left side) of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON PINS

Locked in rod with clamp screw.
Diameter– .8118-.8120". **Length**–2-25/32".
Clearanc in Piston–.0002-.0004". Thumb push fit at 70° F.

Replacement Pins: No oversizes available.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	3/32"	.007-.017"	.002-.004"
Compr #2	3/32"	.007-.017"	.0015-.0035"
Oil	3/16"	.007-.017"	.001-.0025"

Replacement Rings: (For rebored cylinders)—Furnished .010", .020", .030" and .040" Oversize.

Service Type Rings—(For Cylinders not Rebored)—Furnished Std. (.000-.009"), .010" (.010-.019"), .020" (.020-.029"), .030" (.030-.039"), .040" (.040-.049") Oversize.

Installing Rings: Install compression rings with mark "Top" (on side) toward top. Rings have tapered face and must be installed correctly. Top ring inner bevel edge must be up.

CONNECTING RODS

Length (Center to Center) - 9.1845-9.1905. **Weight** - 32 ozs.

Crankpin Journal Diameter - 1.9375".

►*JOURNAL DIAMETER UNDERSIZE NOTE.* The letter "A" or "AB" following the engine number indicates that main and connecting rod journals are .010" Undersize.

Bearings—Steel backed babbitt.

Clearance - .0001-.0025"

Side Play - .004-.010"

Replacement Bearings: Std and .001", .002", .010", .012", .020", Undersize

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (#1, 3), and toward rear (#2, 4). Oil spray hole in lower rod bearing toward right of engine (away from camshaft) on all rods.

CRANKSHAFT

Journal Diameter—2.3341-2.3331". All main bearings.

►*JOURNAL DIAMETER UNDERSIZE NOTE.* The letter "A" or "AB" following engine number indicates that main and connecting rod journals are .010" Undersize.

Bearings—Steel backed babbitt.

Clearance—.0003-.0029".

Replacement Bearings: Std and .001", .002", .010", .012", .020", .030" Undersize

Crankshaft Servicing: *See "Crankshaft & Main Bearings" in Willys Special Data.*

End Thrust: Taken at #1 main bearing. Shims between crankshaft thrust washer and shoulder on the crank.

Endplay—.004-.006".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters - (1) 2.1860-2.1855", (2) 2.1225-2.1215", (3) 2.0600-2.0590", (4) 1.6230-1.6225".

Journal Diameters—(1) 2.188" (2) 2-1/4", (3) 2-3/16", (4) 1-3/4".

Bearings—#1 steel backed babbitt. #2, 3 & 4 cast iron.

Clearance—.001-.0025".

End Thrust: Taken by thrust plate assembled behind gear. To reduce clearance, add shim behind spacer. To increase clearance, reduce thickness of spacer.

End Play—.004-.007".

Camshaft Servicing: *See "Camshaft & Bearings" in Willys Special Data.*

Timing Gears: Crankshaft gear, steel. Camshaft gear, fibre with steel hub.

Camshaft Setting: Mesh marked tooth of camshaft with marked space (between teeth).

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Willys Special Data.*

VALVES

Tappet Clearance: Intake .018", Exhaust .016" Cold.

Valve	Head Diameter	Stem Diameter	Length
Intake	2"	.3733-.3738"	4.781"
Exhaust	1-15/32"	.371-.372"	5.909"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.260"	.0007-.0022"
Exhaust	45°	.351"	.0025-.0045"

►*EXHAUST VALVE NOTE* Thompson Valve Rotators used.

Valve Seat Width—3/64".

Valve Springs: Install with closed coil upward toward block (Exhaust), down towards head (Intake).

Free Length—1 31/32' (Intake), 2½" (Exhaust)

Valve Spring Specifications

Valve	Intake	Exhaust
Closed	73 lbs at 1 21/32"	53 lbs at 2 7/64"
Open	153 lbs at 1 13/32"	20 lbs at 1 3/4"

Valve Guides Use Tool W-177 to remove and install guides. Drive Exhaust guide down into valve compartment to remove. Drive new Exhaust guide to 1" below surface of cylinder block and new Intake guide flush with bottom of valve guide bore in cylinder head.

Rocker Arm Assembly Removal. *See "Valve System" in Willys Special Data.*

Valve Lifters Mushroom type operating in reamed holes in block. Serviced by installing oversize lifters. Lifters furnished .004" Oversize.

Diameter—.6240-.6245". **Clearance**—.0005-.002".

►*NOTE:* Camshaft must be removed for lifter removal.

VALVE TIMING

See "Camshaft Setting" under "CAMSHAFT" above.

Intake Valves—Open 9° BTDC. Close 50° ALDC.

Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

Valve Timing Check—Set Intake valve clearance at .026". Rotate engine clockwise until No. 1 cylinder is ready for intake stroke. Intake opens 9° BTDC. Note the distance between TDC and the 5° mark and estimate 9° from this distance. With the crankshaft in this position timing is correct if lifter is just tight against valve stem.

ENGINE

4 CYL. "L" HEAD

Model	Bore	Stroke	Displacement
L4-134	3.125"	4.375"	134.2 cu. ins.
Model	**Compr. Ratio**	**Rated HP**	**Developed HP**
L4-134	6.48-1	15.63	60 at 4000 RPM

►*OTHER ENGINE DATA See "4 Cyl. "F" Head" above and note the following differences*

►*ENGINE NUMBER NOTE Letters stamped after engine number denote the following*

"A" - .010" undersize main & connecting rod bearings.
"B" - .010" oversize cylinder bore.
"AB" - Both above conditions exist.
"C" - .002" undersize piston pin.
"D" - .010" undersize main bearing journals only.
"E" - .010" undersize connecting rod bearing journals only

VALVES: Tappet Clearance - .016" Cold (Intake & Exhaust).

Valve	Head Diam.	Stem Diam.	Length
Intake	1 17/32"	.373"	5 51/64"
Exhaust	1 15/32"	.3715"	5 51/64"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	3 51"	.0007-.0022"
Exhaust	45°	3 51"	.0025-.0045"

Valve Seat Width - 3/64".

Valve Springs: Free Length - 2½"

Valve Spring Specifications

Valve	Intake	Exhaust
Closed	53 lbs. at 2 7/64"	53 lbs. at 2 7/64"
Open	120 lbs. at 1 3/4"	120 lbs. at 1 3/4"

Valve Guides: Use W-177 to remove and install guides. Drive guides into valve compartment to remove. Drive new exhaust guide to 1" below surface of cylinder block and new intake guide 1 5/16" below surface of cylinder block.

Valve Timing Check: Set No. 1 cylinder intake valve tappet clearance to .020" for check. After check made, reset No. 1 cylinder intake valve tappet clearance to a running clearance of .016".

ENGINE

6 CYL. "L" HEAD

Model	Bore	Stroke	Displacement
L6-226	3.3125"	4.375"	226.2 cu. ins.
Model	**Compr. Ratio**	**Rated HP**	**Developed HP**
L6-226	6.86-1③	26.33	105 at 3600 RPM

③ - 7.3-1 Optl.

Compression & Vacuum Reading—*See TUNE-UP above.*

►*ENGINE NUMBER NOTE.* Letters following engine number denote the following

"A" .010" Undersize main and connecting rod journals.
"B" .010" Oversize cylinder bore and pistons.
"AB" Both above conditions exist.

CYLINDER HEAD & GASKET INSTALLATION: *See "Cylinder Head & Manifolds" in Willys Special Data*

TIGHTENING TORQUES: *See "Tightening Specifications" in Willys Special Data*

►*FILLER BLOCK-OIL PAN OIL SEAL PRODUCTION CHANGE (To Prevent Oil Leakage Between Filler Block & Oil Pan)* Neoprene oil seal, Part No. 910220, was placed in early production and is available for installation on earlier models. Replaces earlier type cork seal. To install new seal, coat inner surfaces of filler block grooves with gasket cement. Install gaskets in grooves evenly centered so each end extends 1/16" above faces of filler block ends. Do not trim off ends. Install filler blocks, dust gaskets with graphite and install oil pan.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

PISTONS

Aluminum alloy, steel band, T-slot Cam Ground. Tin Plated.

►*PISTON OVERSIZE NOTE* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.

Weight–15.312 ozs. Less rings and pin.

Removal–Pistons and rods removed from above.

Fitting New Pistons Place .0015" x 2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove feeler should be 5 to 10 lbs.

Piston Replacement–Std., .010", .020", .025 .030", 040", 050", and 060" Oversize

Installing Pistons Slot in skirt toward left or away from camshaft.

PISTON PINS

Floating type with lock ring at each end.

Diameter - 8591-.8593". **Length** - 2 779"

Clearance in Piston - 0002" Selective fit. Push fit at 160°F.

Clearance in Rod - 0002-.0006". Press fit.

Replacement Pins Std., .003" and .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (Upper)	.0930- 0935"	.008-.016"	.002-.004"
Compr. (Lower)	.0930- 0935"	.008-.016"	.003-.007"
Oil (Top ring)	1545- 1550"	.008-.016"	.006-.010"
Oil (Bottom ring	1545-.1550"	.008-.016"	.0025-.004"

Replacement Rings. Ring sets and single rings furnished in following sizes for oversize ranges indicated Std. (Std.-.009"), .020" (.010-.029"), .030" (.030-.039"), .040" (.040-.049"), .060" (.050-.069").

Installing Rings Side marked "Top" (compression rings) upward. Chrome plated ring must be installed in top (#1) ring groove.

CONNECTING RODS

Length–6.998"- 7.002" (Center to center).

Crankpin Journal Diameter–2.0619- 2.0627".

►*JOURNAL DIAMETER UNDERSIZE NOTE* The letter "A" or "AB" following engine number indicates that the main and connecting rod journals are .010" Undersize.

Bearings–Steel Backed Babbitt.

Clearance - .0018" maximum. **Sideplay** - .006- 011".

Replacement Bearings Std. and .001", .002", .010" and .012" Undersize.

Installing Rods Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. *NOTE*–Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 forward), (#2, 4, 6 toward rear).

CRANKSHAFT

Journal Diameter–2.3744-2.3752".

►*JOURNAL DIAMETER UNDERSIZE NOTE* The letter "A" or "AB" following the engine number indicates that the main and connecting rod journals are .010" Undersize.

Bearings–Steel Backed Babbitt.

Clearance - 0007- 0020"

Replacement Bearings Std. and .001", .002", 010" and .012" Undersize.

End Thrust Taken by #4 rear main bearing which is flanged type.

End Play– 002-.006".

Rear Bearing Oil Seal Installation *See "Crankshaft and Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters–(1) 1.8725-1.8735". (2) 1.8095-1.8105". (3) 1.7472-1.7485". (4) 1.2475-1.2485".

Bearings–Steel Backed Babbitt.

Clearance–.001-.003".

End Thrust Taken by thrust plate on front of engine (between front bearing journal and hub of sprocket)

End Play–.003-.007".

Camshaft Servicing: *See "Camshaft & Bearings" in Willys Special Data*

Timing Chain Non-adjustable type. Width 1". Pitch .500". Length 23" or 46 links.

►*TIMING CHAIN CAUTION Morse and Link Belt chains used. Chains and sprocket interchangeable only in COMPLETE SETS*

Camshaft Setting Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Willys Special Data*

VALVES

Tappet Clearance: Intake and Exhaust .014" Cold.

►*TAPPET CLEARANCE ADJUSTMENT PROCEDURE: See "Valve System" in Willys Special Data*

Valve	Head Diam.	Stem Diam.	Length
Intake	1 520"	3402-.3410"	5.187"
Exhaust	1.328"	.3382- 3390"	5 205 '

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°	284"	001- 003"
Exhaust	45°	284"	0032- 0050"

Valve Seat Width- 5/64-3/32" (intake), 3/32-7/64" (exhaust).

NOTE–Rotators used on Exhaust valves.

Valve Guides: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides to inside diameter of 3432-3422".

Replacement Guides–Std., .0005" (marked "A"), .0055" (marked "L") to insure .0005-.003" press fit.

Guide Installation–Place guide (tapered end of guide toward top) in position in bore and drive in to correct position of 1-7/32" below top face of cylinder block.

Valve Springs: Intake & Exhaust valve spring interchangeable

Free Length–1-31/32".

Valve Spring Specifications

Valve	Lbs. Press.	Length
Closed	51	1.672'
Open	118	1.312

Valve Lifters: Mushroom type with self locking adjusting screws.

Diameter–.6855-.6860".

Clearance–Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.

Replacement Lifters–Furnished in Std. and the following oversizes marked as indicated "B" is .001", "D" is .002", and "K" is .005" O.S.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above

►*VALVE TIMING NOTE:* Specifications are with tappet clearance as follows Intake 018", Exhaust 020"

Intake Valves - Open 2° BTDC Close 42° ALDC

Exhaust Valves - Open 42° BLDC Close 8° ATDC

OILING SYSTEM

Crankcase Capacity: (4 Cyl) 4 qts, (6 Cyl) 5 qts (refill)

Normal Oil Pressure: 35 lbs at 2000 RPM (4 Cyl), 1700 RPM (6 Cyl)

Pressure Regulator - In pump housing (4 Cyl), right side of cylinder block below valve chamber to rear of engine (6 Cyl)

Oil Pressure Indicator: Red telltale light in Instrument Cluster operated by Oil Pressure Switch Light comes on when Ignition Switch turned on and goes out when oil pressure reaches 6 lbs

Oil Pump: Rotor type on left side of engine (4 Cyl), gear type attached to rear intermediate main bearing (6 Cyl)

Pump Overhaul - *See "Oiling System" in Willys Special Data*

Oil Filter: Located on bracket attached to cylinder head (4 Cyl) On bracket on left side of cylinder head (6 Cyl)

Crankcase Ventilation: (4 Cyl) See Crankcase Ventilator above (Others) Filter in oil filler cap and outlet tube from crankcase ventilator baffle on valve side cover

COOLING

Water Capacity: (FC-150) 10 qts (FC-170) 11 qts (Other 4 Cyl) 11 qts (Other 6 Cyl) 12 qts Add 1 qt for heater

Pressure Valve: (FC-150 170) 9 lbs (Other 4 & 6 Cyl) 7 lbs Radiator filler cap

Thermostat: Harrison In water outlet elbow in cylinder head Opens at 163-168°F

Water Pump: Centrifugal packless ball bearing type *See "Willys" in Water Pump Section*

►*FC-150 FAN PULLEY NOTE.* Install fan pulleys on both water pump and fan shaft assemblies with offset to front of engine to eliminate interference with generator pulley Adjust fan belt to ¼-½" deflection with light thumb pressure by pulling shaft housing to right side of frame

Temperature Gauge: King-Seeley "CV" (Constant Voltage) type FC-170 has Voltage Regulation contained within Gauge Other models have separate Voltage Regulator

See "Temperature Gauges" in Miscellaneous Section

CLUTCH

Auburn 8501-39, Rockford 8½ RM, Borg & Beck 9A7 & 10A7. Single plate types Used as follows

4 Cyl. (All) - Auburn 8501-39 or Rockford 8½ RM 8½"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6 Cyl. Utility (4x2) - Borg & Beck 9A7, Assy No 951
6 Cyl. Utility (4x4) & Trucks (4WD) - Borg & Beck 10A7, Assy No 360982
See Clutch Section for complete data
Clutch Disc - (4 Cyl) B & B No 382298, (6 Cyl 4x2) B & B No 381929, (6 Cyl 4x4 & 4WD) B & B No 381806
Pedal Adjustment: 4 Cyl. (Exc. Trks. & Sta. Wgns.). 1½" pedal freeplay To adjust freeplay, loosen yoke locknut on cable between throwout lever and cross shaft lever and turn cable
4 Cyl. (Trks. & Sta. Wgns. exc. FC-150) - 1½" pedal freeplay To adjust, loosen locknut on adjusting rod (between clutch control lever and clutch control tube lever) and turn adjusting nut to increase or decrease rod length
6-226 Models (Exc. 4x2 and FC-170) - 1" pedal freeplay To adjust, loosen locknuts on pedal adjusting rod, turn nuts forward to increase or backward to decrease freeplay
6-226 (4x2) - 5/8-3/4" pedal freeplay Adjustment same as other 6-226 models
FC-150 & FC-170 - ½" pedal freeplay To adjust loosen locknut on cable between clutch pedal and cross shaft lever and adjust length of cable

► *FC-150 CLUTCH PEDAL MODIFICATION:* Late model FC-150 clutch pedals have approximately ¼" stock at extreme upper end which contacts pedal stop On pedals with ½" stock at this point grind off ¼" of stock to give pedal longer stroke to insure adequate clutch plate separation Reset cable length to obtain correct pedal freeplay *NOTE* - To remove lever, loosen left headlight and move forward Separate heater blower wire if necessary Remove lever assembly from bracket and cable from lever

SYNCHRO-MESH TRANSMISSION

4 WHEEL DRIVE

Warner. Three speed type Constant mesh synchro-mesh, helical gears (second and high), sliding spur gear (low and reverse) Used as follows

Model	Warner No.
Jeep	T90C
F4-134	T90C
6-226	T90J
FC-150 (3-speed)	T90A
FC-170 (3-speed)	T90J

NOTE - 4-speed Optional on FC-150 & FC-170

See "Warner Transmission" in Transmission Section

► *TRANSFER CASE SHIFT LINKAGE CAUTION (FC-150).* Attach linkage lever to outer hole (two in shift rod nearest transmission), to eliminate hard transfer case shifting For correct linkage adjustment, *See "Transfer Case" in Transmission Section*

► *TRANSFER CASE OPERATING LEVER VIBRATION ON ACCELERATION OR DECELERATION CORRECTION:* When light hand pressure (either forward or backward) minimizes vibration, insulate transfer case lever shaft brackets from body panel *See "Transmission Notes" in Willys Special Data*

► *TRANSFER CASE OUTFUT SHAFT OIL LEAKAGE CORRECTION.* Install additional seal Part No 811687 on both ends of output shaft in addition to standard seal, seal guard, and seal retainer New seal goes between seal retainer and seal guard

► *FOUR SPEED TRANSMISSION LUBRICATION CAUTION.* Since there is no passage between 4-speed transmission and transfer case it is necessary to check fluid level at both transmission and transfer case fill points Fluid capacity is 4-Speed Transmission - 6¾ pints Transfer Case - 3½ pints

Transfer Case: Spicer Model 18. Two speed auxiliary transmission and front wheel drive unit mounted on rear of transmission case. Separate control levers provided for Low-High range (right hand lever), and front wheel drive engagement (left hand lever).

See Transmission Section for complete data.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: (4 Whl. Drive) Transmission and transfer case are removed as an assembly. Disconnect front and rear propeller shafts at universal joints *(NOTE*–If equipped with Power Take-off drive, remove front end of power take-off propeller shaft assembly). Disconnect speedometer cable at transfer case, brake cable, and clutch release cable at cross shaft bell crank (Jeep), Place support jacks under engine and transmission, remove transfer case rubber snubber bolt nut (on right side) and rear mounting bolt nuts at cross member under transmission case. Remove floor board inspection plate. Drain radiator and loosen upper radiator hose. Remove transfer case shift lever pivot pin screw, remove pin and shift levers *(NOTE*–If Power Take-off used, remove power take-off shift lever plate screws and lift lever out). Remove bolts holding center cross-member at frame side rails and remove cross-member *(CAUTION* -With cross-member removed, engine and transmission weight will rest on support jacks). Remove bolts holding transmission on bell housing, force transmission to right until ball stud end can be disengaged from end of clutch control cross shaft. Lower support jacks under engine and transmission and slide transmission and transfer case assembly to rear until clutch shaft clears bell housing, remove assembly from beneath car.

2 WHEEL DRIVE

Warner. Three speed type Constant mesh synchro-mesh, helical gear (second & high) sliding spur gear (low & reverse) Used as follows

Model	Warner Type
Jeep Dispatcher	T90
F4-134	T96
6-226	T86

See "Warner Transmissions" in Transmission Section

► *HARD SHIFTING, SHIFTING INTO TWO GEARS OR JUMPING OUT OF GEAR CORRECTIONS* For trouble shooting above difficulties on 2-wheel drive models *See "Transmission Notes" in Willys Special Data*

Transmission Control: Remote control type with gear-shift lever on steering column. *See "Transmission Controls" in Transmission Section.*

Removal: (2 Whl. Drive) Remove floor boards, take off bell housing inspection cover, disconnect clutch throw-out bearing retracting spring. Disconnect transmission control rods and speedometer cable at transmission case. Disconnect propeller shaft at universal joints and remove shaft. Support engine with jack placed under bell housing, remove rear engine support bolts from cross-member under transmission case, raise rear end of engine so transmission clears cross-member *(CAUTION* –Use care that fan blades do not damage radiator). Remove transmission bell housing bolts, pull transmission straight back to clear clutch shaft, remove from car.

OVERDRIVE

Warner R10. *See "Warner R10" in Transmission Section.*

Overdrive Control: *See "Warner R10 & R11 Overdrive Controls" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (2 Wheel Drive above) after disconnecting control cable and wiring.

UNIVERSALS

2 WHEEL DRIVE

Spicer. Cross type. One at each end of propeller shaft.

4 WHEEL DRIVE

Drive Shaft Joints - Spicer. Cross type. One used at front and rear of both front and rear propeller shafts.
Front Axle Shaft Joints - Rzppa. Constant velocity type. One joint used at outer end of each shaft (within steering knuckle housing).
Power Take-off Shaft Joints - Detroit Ball-and-Trunnion type. Two used (one at each end of shaft - no splined joint used).

FRONT AXLE

4 WHEEL DRIVE

Spicer Model 44(FC-170), Model 25(All Others). Full floating Hypoid gear type Differential assembly (ring and pinion gear assembly) is serviced in same manner as Spicer Rear Axles
See "Spicer" in Rear Axle Section
Ratio - (F-134, FC-150) 5 38-1, 6-226 (4x4) 4 27-1, (4WD & FC-170) 4 88-1 *NOTE* - FC-170 Optional Ratios - 4 27-1, 5 38-1

Removal: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange cap screws and remove flange with puller, *(CAUTION*–do not lose shim pack under drive flange). Bend lip of bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly.(*(CAUTION*–use care not to damage oil seal). Disconnect brake tube, take out mounting screws on

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

►*INSTALLATION CAUTION:* Adjust front wheel bearings and bleed brakes after installation completed.

Wheel Bearing Adjustment: Tighten inner adjusting nut until wheel binds (turn wheel while adjusting), then back nut off 1/6 turn, install lockwasher, locknut, and make certain nut locked by turning lockwasher ear up.

Axle Shaft End Play—No adjustment. Shims (.060") between driving flange and wheel hub establish correct endplay.

REAR AXLE

Spicer. Hypoid Semi-floating with Hotchkiss drive For Model application see below.

Model	Spicer No.
DJ-3A	25
F4-134 & 6-226 (4x4), FC-170	53
All Other Models	44

See "Spicer Hypoid Semi-floating" in Rear Axle Section

►*"POWER-LOK" DIFFERENTIAL.* Optl equipment Can be installed on vehicles not so equipped (Axle shafts must be replaced if they do not have involute splines) *See "Spicer Power-Lock Differential" in Rear Axle Section.*

►*POWER-LOK DIFFERENTIAL CAUTION DO NOT use the engine to spin a rear wheel with one wheel raised off the ground Always remove rear wheels when balancing them*

►*AXLE SHAFT GREASE RETAINER PRODUCTION CHANGE* Use only new axle shaft grease retainer Part No 914802 to correct grease leaks at axle shaft grease retainer

►*RING GEAR BOLT LOCKING STRAP NOTE.* Replace drive gear screws and install locking straps when overhauling early production ring gear assemblies Late type have locking straps

Rear Axle Assembly Removal: Support rear end of car securely, remove rear wheels, disconnect rear shock absorbers, rear brake line (at frame connection on right side), rear brake cables, and propeller shaft at rear universal joint. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring "U" bolts, remove pivot bolt at front end of springs, lower springs. Remove axle assembly from beneath car.

Wheel Bearing Adjustment: End Play .003-.007". Adjust by adding or removing shims between backing plate and axle housing flange at each wheel. See "Axle Shaft Removal" above.

SHOCK ABSORBERS

Monroe or Gabriel. Direct acting type.

FRONT SUSPENSION

2 WHEEL DRIVE

Conventional I-Beam with Reverse-Elliot ends and semi-elliptical springs
Kingpin Inclination - 7°30'
Caster - 3° **Camber** - 1°
Toe-In - 047- 094"
Toe-Out on Turns -Outer wheel 20°, Inner wheel should be 21°45'

4 WHEEL DRIVE

Special front wheel drive unit with semi-elliptical springs Steering knuckle mounted on taper roller bearings carried on two stub shafts
End Play - 001- 003"
Kingpin Inclination - 7½°
Caster - 3° **Camber** - 1½°
Toe-In - 047- 094"
Toe-Out on Turns -Outer wheel 20° Inner wheel should be 20° (Exc Jeep), Jeep 19½°

ROCHESTER "RAMJET" FUEL INJECTION

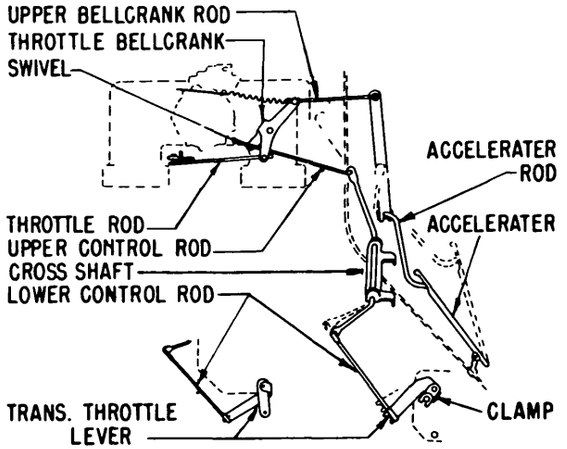
Ch vr l t C rv tte & Pontiac Bonneville (1957)

DESCRIPTION: This fuel injection system is the "continuous flow" type in which fuel is sprayed through calibrated nozzles adjacent to each intake port. At this point it is combined with air (in proper ratio) from intake manifold. An "air meter" containing a throttle valve and a venturi controls the amount of air admitted to the intake manifold and provides the necessary vacuum for fuel control under various operating conditions. A "fuel meter" containing a fuel reservoir, high pressure pump, and fuel controls, governs the amount of fuel required according to load and speed. Auxiliary controls for fuel cut-off during deceleration and for engine starting are also contained in the fuel meter.

Fuel Supply & R gulation: Fuel is supplied to reservoir in fuel meter by a conventional type fuel pump, and fuel level is maintained in reservoir by a float system similar to that used in conventional carburetors. The high pressure pump is externally driven by a cable from ignition distributor, and feeds fuel under high pressure to the fuel control valve. Incoming fuel passes through a filter screen and passes upward through center of fuel control valve where it lifts a ball check and passes through a series of small holes into main metering chamber. At this point the fuel passes through small holes into fuel distributor tubes or it flows upward and out the spill ports, depending on engine requirements. The position of the spill plunger determines how much fuel is spilled back to the reservoir or diverted to fuel nozzles. The spill plunger position is determined by fuel pressure from below balanced against the force of the control lever from above. For low fuel flow, the spill plunger is in its raised position so that all spill ports are uncovered allowing a **minimum** fuel flow to nozzles. For high fuel flow, the plunger is in its lowest position which shuts off all spill and raises pressure in metering chamber, allowing a **maximum** fuel flow to nozzles. For starting, the fuel valve is mechanically forced off its seat so that fuel can by-pass the ball check and flow directly to nozzles. With valve off its seat, a fuel by-pass passage is uncovered which admits fuel from fuel inlet at supply pump pressure to help supply sufficient fuel for engine at cranking speed.

R CHESTER "RAMJET" FUEL INJECTION INSTALLATION N ENGINE

Fuel Control Linkage: The correct metering of fuel for a given air flow is accomplished by the main control diaphragm and linkage as follows: A fuel control diaphragm operating on venturi vacuum and linked to the fuel control linkage moves upward with increased vacuum and acts on the linkage to force the spill plunger downward. As the plunger is forced down, the amount of spill is reduced and the fuel flow to nozzles is increased (the spill plunger will come to rest at a point where fuel pressure and lever force are in balance). The system is calibrated so that for a given air flow, venturi vacuum will move diaphragm and linkage so the right amount of spill is allowed for proper fuel pressure and flow to nozzles.



Mixture Control: For starting, warmup, and power, mixture control is accomplished by changing the pivot point of the fuel control lever which in turn changes the effect of the main control diaphragm on the spill plunger. A ratio lever located between main control diaphragm link and spill plunger can be rotated by the enrichment diaphragm to change the pivot point. With ratio lever moved to extreme left side (no vacuum in enrichment diaphragm), the main control diaphragm will depress spill plunger and allow maximum fuel to be delivered to nozzles. As vacuum in the venturi increases, the ratio lever moves to right side allowing spill plunger to rise and uncover spill ports resulting in less fuel to nozzles. For normal driving, the ratio lever is maintained in its extreme right position.

Nozzle Operation: Fuel is fed from fuel meter through fuel distributors to eight nozzles which are a factory matched set. Fuel is metered by the nozzle orifice and is sprayed across an air duct through a larger hole directly into intake manifold just outside the intake valve. An air duct in the nozzle allows fuel to be discharged to atmospheric pressure which allows better fuel control. Fuel is delivered continuously so that a full charge is ready whenever intake valve is open.

Air Flow & Control Syste: Air flow is controlled by the accelerator which opens and closes a throttle valve located in the air meter assembly which is attached to intake manifold. A cone shaped diffuser fits in place in main bore of air meter, forming a venturi at the point where air enters air meter. Air flow at the venturi creates a vacuum that is used to control the main control diaphragm and the fuel meter so that a proper amount of fuel can be fed in correct ratio to the air which is flowing.

OPERATION: The fuel injection system operates under various engine conditions as follows:

Idle Air Flow: During idle operation, the throttle valve is completely closed against bore of air meter and air is introduced to intake manifold through a by-pass system. Air taken into the by-pass system above the throttle valve is directed through a passage to a point below the throttle valve. An idle air screw at this point regulates the amount of air allowed through the by-pass system and controls engine idle speed. In addition to idle air taken in through the air meter, a portion of air for idle is also taken in through each of the eight fuel nozzles air ducts.

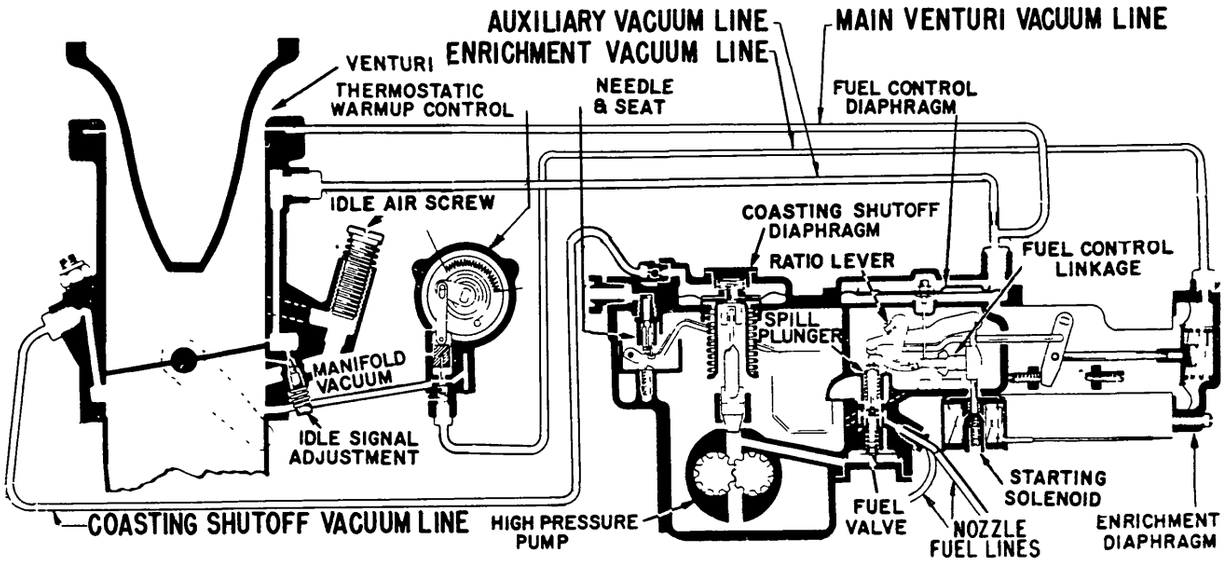
TURBOGLIDE POWERGLIDE
CHEVROLET TRANSMISSION THROTTLE LINKAGE WITH FUEL INJECTION

Idle Fuel Control: Since the venturi vacuum is light at idle speed and a higher vacuum is required to provide a richer mixture, the venturi vacuum is strengthened by the addition of a regulated amount of manifold vacuum. Vacuum is supplied to this system at idle needle valve hole and can be controlled by the idle needle. This auxiliary vacuum is transmitted to a "T" at the main control diaphragm where it passes a restriction and combines with main venturi vacuum to operate the main control diaphragm. As the throttle valve is opened, vacuum is introduced to the system through the off-idle port and, at this point, the vacuum is controlled by the restriction in the tube. As the throttle valve continues to open, auxiliary vacuum decreases and the main venturi vacuum operates the diaphragm.

Acceleration: The extra charge of fuel required for acceleration is obtained as follows: As the throttle valve is opened for acceleration, the air flow and the main venturi vacuum increase immediately. Because of the throttle valve opening, vacuum on the auxiliary vacuum system decreases but the decrease is delayed by the restriction in the vacuum line; so, for a short period, a very high vacuum is maintained at the control diaphragm, resulting in an extra charge of fuel for acceleration.

Power: For power operation, the ratio lever in the fuel control linkage is moved to its rich position by means of a vacuum diaphragm which is connected to manifold vacuum. When manifold vacuum is high and lean mixtures can be used, the diaphragm is held in a lean position. When power is required and engine vacuum drops, a calibrated spring moves the diaphragm to the rich position and holds it there until manifold vacuum rises.

CONTINUED ON NEXT PAGE



ROCHESTER "RAMJET" FUEL INJECTION (Cont.)

Stops are provided on the fuel meter casting to determine proper rich and lean mixtures. *CAUTION - These stops must not be moved in the field as doing so would require a complete recalibration of the system.*

Coasting Shut-Off: In order to cut off the flow of fuel during deceleration, a diaphragm controlled coasting shut-off valve is included in the fuel meter, which operates as follows: A heavy calibrated spring holds down a large check valve in the high pressure pump outlet so that under normal driving conditions high pressure fuel is fed to the metering system. The heavy spring is connected to a diaphragm and whenever the very high vacuum (due to deceleration) is applied to the diaphragm, it overcomes the spring and lifts the check valve causing the high pressure pump to discharge directly into fuel reservoir and no pressure is applied to metering system. To prevent operation of the coasting shut-off valve except during prolonged deceleration, a fitting containing a check ball and a restricted opening is installed in the coasting shut-off vacuum line at the diaphragm end. When a high vacuum is applied to this fitting, the check ball is pulled off its seat, and vacuum is applied to the diaphragm through the restricted opening. This has the effect of slowing down diaphragm reaction so that fuel is shut-off only during continuous deceleration. When throttle valve is opened and vacuum drops, the ball falls off its seat and relieves vacuum on the diaphragm.

Starting: Because of the low fuel pressure from the gear pump during engine cranking, a starting solenoid is included in the fuel meter which mechanically forces the fuel valve off its seat so that fuel can flow directly from reservoir inlet to nozzles as follows: The starting solenoid which is energized by the starting circuit forces the spill plunger downward, through linkage, until it forces the fuel valve off its seat. This action uncovers a special by-pass fuel line which delivers fuel at supply pump pressure to the metering chamber where it is combined with gear pump pressure to supply sufficient fuel for starting. As soon as engine starts and ignition switch is returned to "run" position, solenoid current is cut off causing the fuel valve to return to normal position, shutting off the fuel by-pass.

Cold Enrichment: To provide a richer mixture during engine warmup, manifold vacuum is cut-off from the enrichment diaphragm causing it to retain the ratio lever in the rich position, as follows: A thermostatically controlled check valve in the manifold vacuum line is pulled upward by manifold vacuum, cutting off vacuum to the enrichment diaphragm and exerting a pull on the enrichment piston. Opposing the vacuum pull on this piston is the tension of a thermostatic coil which will hold the piston up and leave check ball in a closed position until coil is heated and relaxes. A heating element in the thermostatic coil is energized by generator whenever engine is running. When coil has been heated sufficiently to relax its tension, vacuum pulls piston all the way down and piston stem unseats the check ball so that vacuum is applied to enrichment diaphragm, causing it to move the ratio lever to lean position.

ROCHESTER "RAMJET" FUEL INJECTION SYSTEM (SCHEMATIC)

Unloading: To allow cranking without use of the fuel by-pass, a solenoid cut-off switch is attached to air meter next to the throttle lever. Whenever the throttle valve is opened three quarters or wider, a cam on throttle lever operates a micro-switch to break the circuit to fuel by-pass solenoid, allowing a flooded engine to be "unloaded" and restarted.

ADJUSTMENT

► *ADJUSTMENT NOTE: Make all adjustments in the order indicated below.*

CHEVROLET (CORVETTE ENGINE)

Idle Speed & Mixture: For an initial adjustment, turn both the idle air adjustment screw (located below and to rear of fuel enrichment housing- this screw faces left side of car), and the idle fuel adjustment screw (located below and to rear of fuel enrichment housing- this screw faces rear of car and is closer to side of engine than idle air adjustment screw), two full turns open from a seated position. With engine at normal operating temperature and running, adjust air adjusting screw to obtain best possible idle speed. Adjust idle fuel adjusting screw to smooth out the idle speed. Readjust idle air adjusting screw and fuel adjusting screw until best idle is obtained at approximately 500 RPM (700 RPM with racing camshaft).

Throttle Linkage (Synchro-mesh Trans.): With accelerator pedal pressed to floor and throttle bellcrank rotated so throttle valves are in wide open position, adjust upper bellcrank rod for free entry into bellcrank lever.

Throttle Linkag (Pow rglid & Turboglide): On Powerglide models, disconnect lower control rod from transmission throttle lever on side of transmission and loosen throttle lever clamp. Insert Gauge J-5906 (adjusted to 3 5/8") between transmission left hand side cover lower front bolt and hole in transmission throttle lever. With gauge in place, hold clamp counter-clockwise in full detent position and tighten clamp. Install lower control rod. On Powerglide & Turboglide models, disconnect upper control rod from throttle bellcrank and place bellcrank lever in wide open throttle position. Pull upper control rod forward until it is stopped by transmission internal stop. Adjust swivel on end of upper control rod for free entry in bellcrank lever, then install rod in lever. Check adjustment to make sure transmission is on its internal stop and that bellcrank lever reaches wide open throttle position. Depress accelerator so pedal rod is within 3/8" of floor pan with carpet removed. Disconnect upper bellcrank rod from bellcrank and rotate bellcrank lever so throttle valves are in wide open position. Adjust swivel on upper bellcrank rod for free entry into bellcrank lever, then connect rod to lever. Check to make sure throttle reaches wide open position when accelerator depressed fully.

PONTIAC BONNEVILLE

► *PONTIAC NOTE:* The fuel injection system used on Pontiac is basically the same as that used on Chevrolet models, however, the complete system is fully enclosed in a sheet metal shroud and air is introduced through a conventional type air cleaner.

Idle Speed & Mixture: Remove idle adjustment cover (in center of shroud), and air adjustment plug (on left hand end of shroud) from upper shroud. Connect a tachometer and vacuum gauge to engine. Insert a screwdriver through hole in shroud and adjust the air screw to obtain a correct idle speed of 480-500 RPM (with transmission selector lever in "Dr" (Drive) range). Set idle mixture

CONTINUED ON NEXT PAGE

ROCHESTER "RAMJET" FUEL INJECTION (Cont.)

screw (through opening in top of shroud) to best idle, highest vacuum and RPM. *(NOTE* - Turn screw in to lean mixture, out to richen mixture). Recheck idle RPM. If any slight stalling tendency shows up on road test, use a slightly richer (1/8 turn) mixture adjustment.

Thr ttl Linkag : Disconnect rod "A" (see illustration) at throttle lever on air meter. Install linkage adjustment pin J-2544 at point indicated in illustration. Adjust length of rod "A" so that with linkage pin installed the air meter throttle plate will be in full closed position. Connect rod "A" to throttle lever and remove pin J-2544.

TROUBLE SHOOTING & DIAGNOSIS: Check to make sure that all adjustments have been properly made before diagnosing fuel injection trouble.

Failur T Start: Check to make sure that depressing the throttle on a cold engine will allow the fast idle cam to index, and that throttle remains closed until engine has started. Check starting solenoid on fuel meter to make certain it operates when starter is engaged. Make sure fuel is flowing from nozzles. If fuel flows from nozzles, and car won't start, check for large air leaks, such as loose nozzle blocks. If no fuel flows from nozzles, check gas tank and supply pump. Check the gear pump drive cable. There is also the possibility that foreign material under the coasting shut-off valve will prevent pump from delivering fuel.

Starts & Dies: Check for vacuum leaks, especially in lines to main control diaphragm. If this trouble occurs on cold starts, check the thermostat cover for proper location. Check thermostat housing for leaks and make sure the check ball in the sleeve is free to move. Check the spill plunger for sticking by moving it manually (push on solenoid plunger). Check for a leak in main control diaphragm, either at seal between cover and casting or in the diaphragm (diaphragm leakage may be checked by applying a 2.5" vacuum on control line). Check fuel supply pump for capacity and pressure. Be sure the by-pass solenoid is returning to "run" position.

Hesitation or Flat Spot: Check for leaks in control lines and fittings. Check the venturi signal system in the Air Meter for cleanliness and make sure the auxiliary signal passages are clear. Check main control diaphragm for leaks. Make sure there is a restriction in the 'tee" on the auxiliary signal side. Check for sticking spill plunger. Apply an 18" vacuum to enrichment diaphragm to check leakage. Check enrichment linkage for proper cut-in and mixture ratio limits (Enrichment lever should leave power stop at 4" of vacuum and reach the economy stop at 8" of vacuum. Check to be sure enrichment diaphragm is receiving manifold vacuum; if not, look for trouble in the thermostat housing, such as a broken heat element or a sticky piston.

Surge: Check the enrichment diaphragm and spill plunger (see above). Disconnect coasting shut-off diaphragm line and plug it to prevent a vacuum leak into the air meter; if this cures the surge, check adjustment of the coasting shut-off and check springs for distortion.

Rough Idle: Check for correct idle speed and mixture adjustments. Look for plugged nozzle (to do this, short out the spark plugs, one by one). Check for any vacuum leaks in control lines and nozzle blocks. Be sure enrichment lever is on the economy stop when engine is warm.

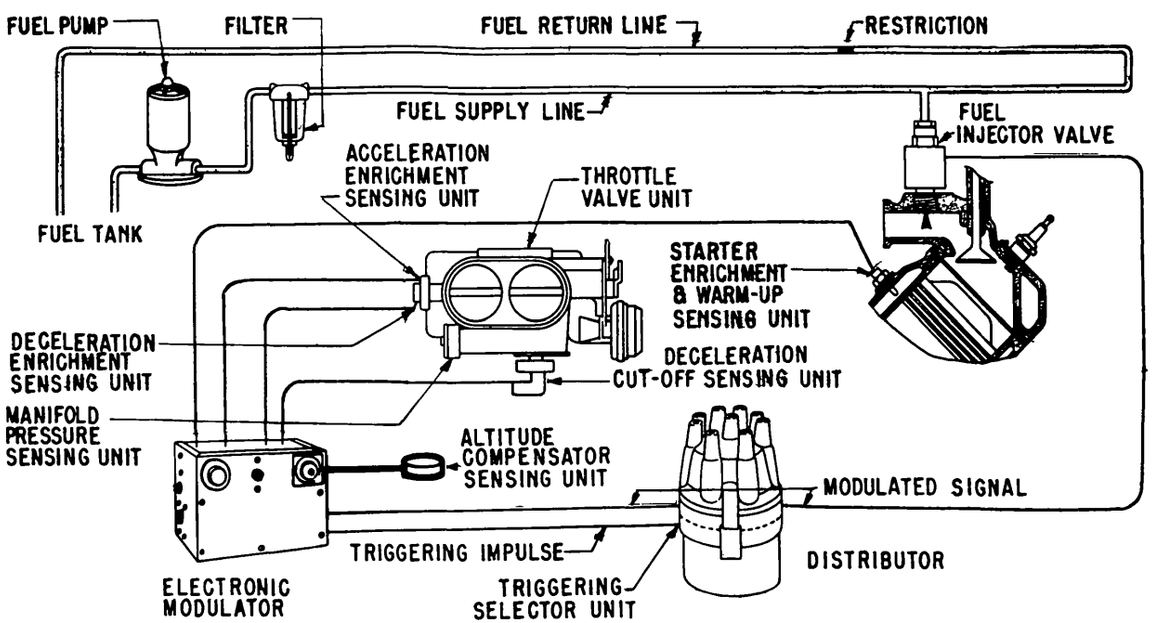
Cold Driveaway: Check for proper adjustment of cold enrichment cover and the fast idle rod. Check thermostat control piston to make sure it is not sticking and that the enrichment lever rests on the power stop during warm-up. *(See "Starts & Dies" above).* Check for vacuum leaks throughout system.

Fuel Economy: Be sure the enrichment lever rests on economy stop during normal operation. *(See "Hesitation & Flat Spot" above).* Check to see that mixture stop screws are locked in place so they cannot move and vary the mixture. *CAUTION - These stops are pres t.*

BENDIX ELECTROJECTOR FUEL INJECTION

Rambl r R b l (1957) - Optl.

► *NOTE:* Actual installation may differ in detail from units described below.



DESCRIPTION: The Bendix "Electrojector" fuel injection system is electrically controlled and actuated by the "Triggering Selector Unit" located in the engine ignition distributor and by the "Electronic Modulator Unit" enclosed in a separate container attached to the engine. The fuel supply to engine cylinders is a "common rail" type using an electric fuel pump to circulate fuel under approximately 20 lbs. pressure to a solenoid injector valve located in the intake valve port of each of the engine's cylinders. Fuel injector valves are electronically timed by the "Triggering Selector Unit" and the amount of fuel delivered to each injector valve is controlled by the "Electronic Modulator Unit" in relation to engine requirements. Controls are employed to make the system responsive to engine speed, air pressure, temperature, and manifold vacuum.

OPERATION: General operation of the fuel injection system and controls are as follows:

Thr ttle B dy: This unit, in addition to containing the throttle valves also contains the Manifold Pressure Sensor and the Idle Enrichment Unit.

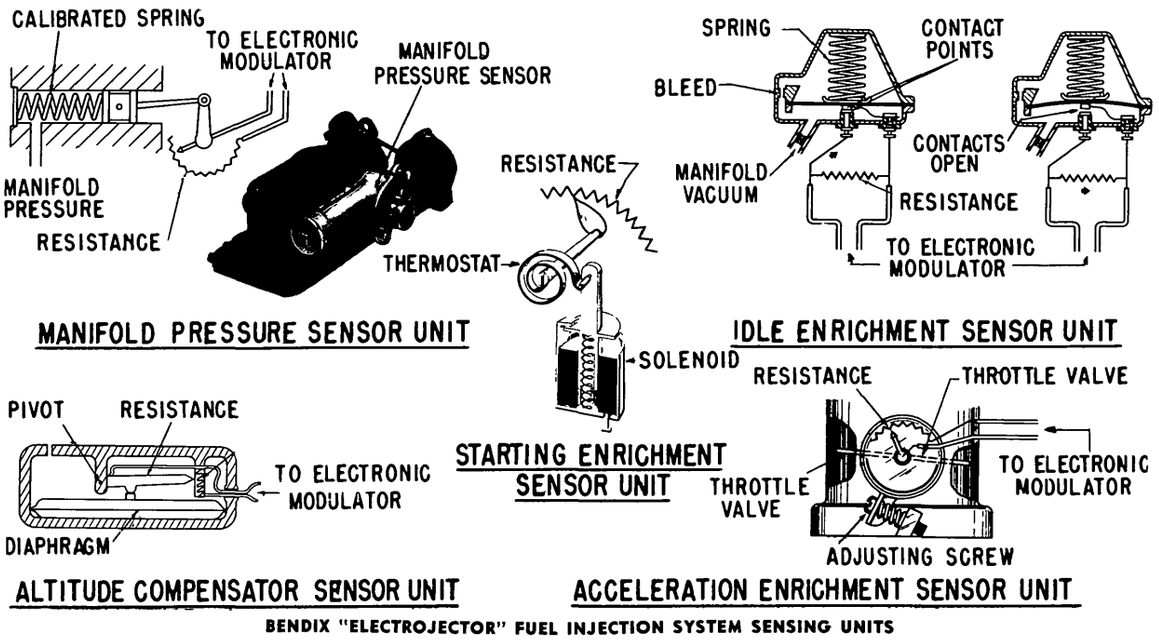
Fu l Supply: An electric, non-metering fuel pump delivers fuel at approximately 20 lbs. pressure through a fuel filter into the "common rail" fuel supply line which

CONTINUED ON NEXT PAGE

BENDIX "ELECTR JECT R" FUEL INJECTION SYSTEM (SCHEMATIC)

BENDIX ELECTROJECTOR FUEL INJECTION (Cont.)

connects to all of the fuel injector valves. A fuel return line to the gas tank allows a continuous circulation of fuel in the system continually purging the fuel supply of air and fuel vapors.



Fuel Injector Valve: This unit is a high speed solenoid operated injector valve and nozzle screwed into the cylinder head so that discharged fuel is directed at the head of the intake valve when the valve is off its seat.

Triggering Selector Unit: Engine speed and injection timing are "sensed" in this unit which consists of a set of breaker points and a distributing commutator having a commutator segment for each of the solenoid injection valves. This assembly is inserted between distributor main body and cap and is actuated by the same cam operating the regular engine ignition points. Each time the fuel injector breaker points make contact, a triggering impulse is transmitted to the modulator where the signal is modified to control the length of time the fuel injector valve is to remain open (depending on engine fuel requirements). The modified signal is then returned to the selector portion of the assembly where it is distributed to the correct injector valve.

Electronic Modulator: The modulator is an electrical unit employing transistors to transform signals received from the triggering selector unit into an electrical pulse of a given standard width. Simultaneously, signals indicating engine operating conditions are also received by the modulator from sensing units located on various parts of the engine. By integrating these external sensing signals into the standard pulse width circuit of the control system, the standard pulse width is modified to reflect engine conditions. This modified electrical pulse is then transmitted to selector portion of the triggering selector unit which in turn distributes the pulse to the correct fuel injector.

External Sensing Units: In all external sensing units, added resistance is introduced into the fundemental circuit to modulate the pulse width of the electrical impulse that is transmitted to the solenoid injector valves. As the sensing circuits resistances increase, the pulse widths increase and the length of time the injector valves are held off their seats likewise increase, resulting in additional fuel flow. Operation of the various sensing units are as follows:

Manifold Pressure Sensor - This unit is mounted on the throttle body and transmits a signal to the modulator

BENDIX "ELECTROJECTOR" FUEL INJECTION SYSTEM SENSING UNITS

control, indicating the relative density of the air charge entering the engine.

Acceleration Enrichment - In order to supply the added amount of fuel required for smooth engine operation when the engine is accelerated, an acceleration enrichment unit controlled by manifold vacuum, is used. This unit, connected to the intake manifold contains a diaphragm and spring assembly, contact points and a resistance circuit. In operation, a rapid decrease in manifold vacuum will cause the points to separate and introduce an additional resistance in the control system thus increasing the operating pulse width of the electrical signal for the length of time necessary to equalize the pressure in the chamber on both sides of the diaphragm. A bleed hole connecting both sides of the diaphragm allows a time interval for the points to close and eliminate the resistance. The added pulse width, during the time the points are open, will increase the fuel flow from each injector as the injectors will be energized for a longer period of time.

Idle Enrichment - This is controlled by a rheostat connected to the throttle shaft to interject a variable resistance in the control circuit when the throttle valve is in an idle position. The idle adjustment is obtained by adjusting this resistance instead of the conventional idle mixture adjusting needle.

Starting Enrichment - Starting and warm-up enrichment is controlled by a thermostatic coil spring which is connected on one end to a solenoid unit, and on the other end to a variable resistance rheostat. During engine cranking the solenoid is energized causing maximum resistance thereby increasing fuel flow during the cranking period. During the warm-up period (solenoid not energized) the thermostatic coil spring maintains a resistance which decreases as engine temperature rises. Enrichment is decreased accordingly. A conventional fast idle cam on the throttle shaft which is linked to the thermostat provides the necessary fast idle speed during the warm-up period.

Altitude Compensator - This sensing unit is connected to the modulator box and consists of a small aneroid connected to a variable resistance unit that transmits its signal to the modulator. As altitude is increased the aneroid expands causing the resistance to be decreased and thereby decreasing the fuel flow.

Fuel Cut-off During Deceleration: As the piston in the manifold pressure sensing device reaches the extreme position during deceleration, fuel is automatically cut off.

CADILLAC (CARTER & ROCHESTER) CARBURETORS

CARTER 4-BARREL WCFB

1957 Eldorado Engine (Two Carbs.)	Carter No.
Without Air Cond. (Early)..(Front)	2582S, (Rear) 2583S
Without Air Cond. (Late)...(Front)	2690S, (Rear) 2691S

Without Air Cond.	2479S
With Air Cond.	2480S
Service Replacement Carb.	④ 2479S

ROCHESTER 4-BARREL 4GC ③

1957 Series (Exc. Eldorado Eng.)	Rochester No.
Without Air Cond. (Early)	7010100
Without Air Cond. (Late)	7012000
With Air Cond. (Early)	7010101
With Air Cond. (Late)	7012001
Service Replacement Carb. (Early)	7015701
Service Replacement Carb. (Late)	7015757

① - Replaces Carburetor Nos. 2583S & 2584S. When using this carburetor to replace 2584S (Front carburetor on cars with air conditioning), it will also be necessary to use Unitized Package 202-111U.

② - Replaces Carburetor Nos. 2691S & 2692S. When using this carburetor to replace 2690S (Front carburetor on cars with air conditioning), it will also be necessary to use Unitized Package 202-111U.

③ - Both Carter and Rochester Carburetors used on cars with single carburetor after Engine No. 101833.

④ - When used on air conditioned cars, Unitized Package 202-114U must also be used.

▷CHANGES, CAUTIONS, CORRECTIONS

▷*1957 ROCHESTER FLOAT ADJUSTMENT PROCEDURE CHANGE: See "Adjustments (Rochester)" below.*

▷*1957 ROCHESTER FLOAT DROP SPECIFICATION CHANGE:* Adjust float drop on both primary and secondary floats to 1 13/16"±1/32". This supersedes previous setting of 1 7/8".

▷*1957 ROCHESTER CARBURETOR FLOODING CORRECTION:* Perform the following operations as outlined.

1) Install the new type filter element, Part No. 854467 (dyed red for identification), and replace the rubber center gasket with the later type gasket, Part No. 854475 which has a cotton reinforcement. The later type gasket is identified by its square shape. On cars without air conditioning rotate the complete filter downward 30° below horizontal to allow dirt to settle in the glass bowl.

2) On early cars with carburetor Nos. 7010100 & 7010101 and on later cars with carburetor Nos. 7012000 & 7012001 not having the letter "A" stamped on brass identification tag, install a new float needle valve and seat assembly, Part No. 7012144. This later valve is made of a harder material and the seat width contacting the needle has been reduced from .010" to .005".

3) On cars before Eng. No. 075598 enlarge the 3/32" holes in the primary and secondary sides of the float bowl that feed fuel into the balance channel between the bowls, to 3/16". The bowl casting should be removed for this operation. Carburetors having this change made in production are identified by the letter "C" stamped on the identification tag.

4) Adjust floats, using the new procedures. *See "Adjustments" below.*

▷*1957 ROCHESTER STALLING OR HARD STARTING WHEN HOT CORRECTION:* Adjust idle speed and mixture using a vacuum gauge and a tachometer to obtain peak vacuum and RPM at the same time, and adjust the mixture screws midway between "Rich" and "Lean" limits. Make sure that throttle return check is correctly adjusted. To avoid flooding the manifold, the accelerpedal should be held only part way down and it should not be pumped. A new vented throttle body-to-bowl gasket, Part No. 7011979 has been released for service replacement (installed in production in carburetors having the letter "C" stamped on identification tag) to reduce the cranking time when engine is hot. The new gasket permits external vapor venting of the throttle bores while parked.

▷*1957 ROCHESTER STALLING OR HARD STARTING WHEN COLD CORRECTION:* Install a new choke piston, Part No. 7010522 which has a deeper slot than the earlier type piston. Carburetors having the later type piston are identified by the letter "D", or later, stamped on the identification tag. In cases of cold stalling at closed throttle, check the intermediate choke rod adjustment *(see "Intermediate Choke Rod Adjustment" below).* In cases of hard starting, or in cold stalling when throttle is opened, set the choke thermostat two notches rich and reset the fast idle speed to 1500 RPM on high step of fast idle cam. *(NOTE* - This is the summer adjustment, which should be changed back to index setting and the conventional 1700 RPM adjustment for cold weather). In cases of hard starting, especially when car has been parked for several days, remove sight plugs and check fuel level. If fuel level is up, readjust choke as indicated above. If level is down, check bowl casting for leaks. If level is down only slightly, remove bowl cover and check slot in side of pump well for the specified depth of 3/8". If slot is too shallow, remove bowl and file slot to correct depth.

▷*1957 ROCHESTER ENGINE "CUT-OUT" ON TURNS CORRECTION:* This condition can be corrected by drilling two additional vent holes in top of air horn as follows: Remove air horn from carburetor and drill a .125" hole in each of the "blind die-cast holes" that are identical to the existing diagonally opposite vent holes now in top of air horn. Carburetors having this change are identified by the letter "E" or later stamped on the identification tag.

DESCRIPTION: Carter - Four-barrel downdraft type similar in design to 1956 models. The throttle body has been changed to lower the carburetor height, and velocity type secondary auxiliary throttle valves have been incorporated in the bowl assembly. Primary & Secondary floats are of different types and the secondary float setting has been changed.

Rochester - Four-barrel downdraft type. Design changes have been made as follows: New type "spring balanced" float assemblies. New velocity type secondary auxiliary throttle valves. The automatic choke has been moved from the air horn to float bowl (Intermediate Choke Rod Adjustment required). Secondary throttle actuating rod has been moved from choke housing side to throttle lever side. The idle air adjusting screw has been moved to rear of throttle body.

ADJUSTMENTS (On Engine): *See "Off Engine" Adjustments for Carter & Rochester Carburetors below.*

Initial Idle Speed & Mixture Adjustment: Back each screw out from a fully seated position as indicated in table below.

Initial Idle Setting

Carburetor	Idle Speed	Idle Mixture
Carter WCFB	3 turns	3/4-1 3/4 turns
Carter AFB	3 turns	3/4-2 1/4 turns
Rochester	2-3 turns	2 turns

Idle Speed & Mixture Adjustments (Single & Dual Carburetors): With engine at normal operating temperature, transmission in "N" (Neutral), choke fully off and carburetor on "slow" idle, loosen throttle lever jam nuts at carburetor trunnion. Place transmission selector lever in either "D" (Drive) range. Adjust engine idle to correct speed (see table below), using the idle air bypass screw (idle speed adjusting screw) on throttle body. Turn one idle mixture screw until highest engine RPM is reached and highest vacuum is obtained at the same time, then repeat this operation with the other screw (on the same carburetor if two carburetors are used). On cars with two carburetors, adjust idle mixture screws on the other carburetor in the same manner. Repeat the above procedure until turning mixture screws will not increase engine RPM, and the smoothest idle is obtained with the highest vacuum.

Idle Speed ①

Model	Air Conditioned	Standard
Single Carburetor	500 RPM ②	450 RPM
Dual Carburetors	500-520 RPM ③	500-520 RPM

① - Transmission selector lever in either "D" range.

② - With Air Conditioner turned OFF.

③ - With Air Conditioner turned ON.

Fast Idle (Single & Dual Carburetors): With engine at normal operating temperature, transmission in "N" (Neutral), choke valve fully open and engine speed properly adjusted (see above), proceed as follows: On Rochester Carburetors, hold throttle lever closed so fast idle adjusting screw is on highest step of fast idle cam. On Carter Carburetors, hold choke rod down by pressing on end of cam trip lever. Open primary throttle valves slightly and rotate fast idle cam to its stop against spring tension, so that screw is on high step of cam. Adjust fast idle screw to obtain an engine speed of 1700 RPM (Single Carbs.), 2000 RPM (Dual Carbs.).

Throttle Check Adjustment (Single & Dual Carbs.): With engine at normal operating temperature, set parking brake and apply foot brake. Place transmission in "D" (Drive) position *(NOTE - Allow engine to idle and make certain that throttle check plunger is not in contact with screw in throttle relay lever).* Open the throttle wide momentarily to allow engine manifold vacuum to drop off and throttle check plunger to come out. Let

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (Cont.)

throttle snap shut. If engine races, clearance is too small. If engine stalls, clearance is too great. Adjust screw on relay lever so that engine will not quite stall during the above procedure. *CAUTION - Do not perform th above operation too frequently as transmission may b come overheated.*

Idl Speed-up Control (Air Conditioned Cars): With engine warm and air conditioner compressor "ON", and with transmission selector lever in "N" (Neutral) position hold speed-up control stem with a wrench and adjust the hex head screw to maintain an idle speed of 900 RPM.

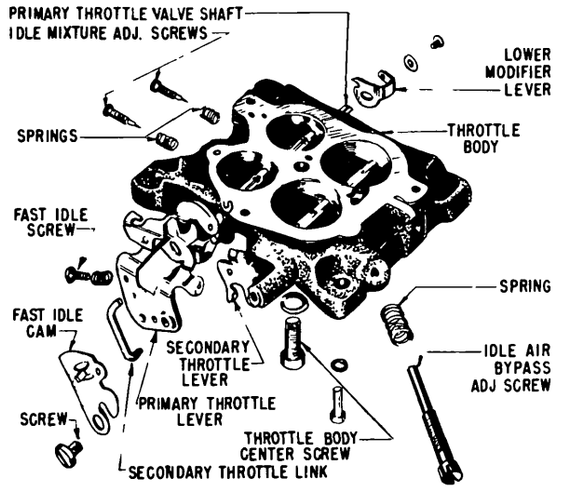
CADILLAC (Single Carburetor) (Rochester)

ADJUSTMENTS (Off Engine): *See "On Engine Adjustm nts" above. NOTE* - The following adjustments must be made in the sequence given, however, they may be classified into the following separate groups: (1) Float Level and Float Drop. (2) Accelerator Pump and Atmospheric Idle Vent *(NOTE - When group No. 2 is performed separately, the Fast Idle Adjustment must also be made).* (3) Choke, Fast Idle, Choke Rod, Unloader, Secondary Throttle Opening, Secondary Throttle Lockout, Intermediate Choke Rod. *NOTE - When one adjustment of a group is made, the rest in the group must also be performed.*

►*FLOAT ADJUSTMENT PROCEDURE CHANGE NOTE:* Previous adjustment procedures have been superseded by the following:

Fl at Level: With bowl cover assembly removed from carburetor and inverted (with cover gasket in place), place Gauge J-6628 so it is centered in bore of cover and positioned over highest point of floats. Bend float arms at rear of float assembly until floats just clear top portion of gauge between the gauge legs. Dimension from bottom of each float to gasket should be 1 3/8".

Fl at Side Play: *(NOTE - This new adjustment replaces th final steps of the previous level adjustment).* Align the gasket with bowl cover by dropping two attaching screws through mating holes of gasket and bowl cover. Sight down on top of floats and position floats as required to center them sideways in the gasket cutouts. Sides of floats must be parallel to adjacent edges of gasket. *(NOTE* - Position floats by grasping float across diagonally opposite corners so as not to distort the sides. Be careful not to change float volume by denting or crushing). Recheck float positioning with bowl cover tilted 90° to either side, or with floats moved to left and right extreme positions. By removing power piston, each float assembly can be held at mid point of float arms to check the side play without bending the arms. If any portion of float overhangs gasket cutout, reposition float as required. If necessary, replace float assembly, hinge pin, or bowl cover to reduce sideplay of float assembly.



Fl at Tip: After float level and float sideplay have been adjusted and with bowl cover inverted, raise the gasket and sight across flat surface of casting. The lower edge of each float at the tip should be flush with this surface within 1/16". To adjust, carefully bend each float arm as required. Recheck float level after adjustment is made.

Fl at Dr p: *NOTE - Float drop must be adjusted accurately because of the new type spring balanced floats.* With air horn upright and floats hanging freely, distance from air horn gasket to lower edge at float tip should be 1 13/16". Adjust by bending float tang.

►*ACCELERATOR PUMP ADJUSTMENT PRODUCTION CHANGE: The pump adjustment setting has been changed from 15/16" to 29/32".*

Accelerator Pump: With fast idle screw backed out and with throttle valve held fully closed, distance from bowl cover surface to bottom of pump plunger rod should be 29/32".

Atmospheric Idle Vent: With primary throttle valves closed against a .063" wire gauge (BT-79) bend idle vent tang with Tool BT-69 so that tang just touches face of valve.

CADILLAC (ROCHESTER) CARBURETOR THROTTLE BODY

Automatic Choke: Centered (At Index). Adjust choke modifier as indicated below.

Choke Modifier: Loosen thermostat lever retaining screw, Rotate metal pointer counter-clockwise from free position until thermostat spring starts to close choke valve. Continue counter-clockwise until metal pointer lines up with index position on choke cover.

Fast Idle Adjustment ("Off" Engine): *(CAUTION - Make final adjustment "On Engine" as detailed above).* Hold choke valve tightly closed and hold throttle in closed position so that fast idle screw rests on high step of fast idle cam. Turn fast idle screw in until throttle valve opening or clearance between edge of valve and air horn is .020" (Gauge BT-67).

Choke Rod Adjustment: *(NOTE - This rod connects choke valve shaft to fast idle cam).* Position fast idle cam and primary throttle so that fast idle screw contacts second step of fast idle cam, and rests against shoulder of the highest step. Hold choke valve closed with choke trip lever in contact with choke counterweight lever. Hold linkage in this position and check choke valve opening or clearance between upper edge of choke valve and dividing wall in air horn using Gauge BT-102 (.040"). Adjust by bending choke rod.

Choke Unloader: Move throttle to wide open position and hold trip lever down in contact with choke counterweight. Check choke valve opening or clearance between upper edge of choke valve and dividing wall in air horn using Gauge BT-102 (.125"). Adjust by bending tang on fast idle cam using Tool BT-69.

Secondary Throttle Opening: With carburetor inverted, move choke valve to wide open position. Move throttle lever to wide open position and check opening of secondary throttle valves which should reach wide open position at same time as primary valves. If adjustment required, remove fast idle cam and connecting link. Check wide open stops on primary and secondary throttle shafts, and bend tangs with heavy pliers as required to obtain wide open positions. Tangs should contact stops at same instant.

Secondary Throttle Lockout: With choke valve partially closed and throttle valves fully closed, check clearance between upper edge of lockout lever tang and edge of slot in fast idle cam using a feeler gauge. Clearance should be .015". Adjust by bending tang horizontally using Tool BT-18.

Secondary Throttle Contour Cl arance: With choke valve wide open, open throttle valves so tang on secondary lockout lever rides over top of fast idle cam. Measure clearance between tang and fast idle cam edge using feeler gauge. Clearance should be .015". Adjust by bending tang up or down using Tool BT-19.

Intermediate Choke Rod: *(NOTE - This rod conn cts choke valve shaft to lever on automatic choke control).* Remove automatic choke cover and baffle plate. With choke valve held fully closed, bend intermediate throttle rod as necessary so choke piston is flush to 1/32" out of choke piston sleeve.

CADILLAC (Singl Carbur t rs) (Carter AFB)

ADJUSTMENTS (Off Engine): *S "On Engin Adjustments" above. NOTE* - The following adjustments must be made in the exact sequence given.

Float Alignment: Adjust float so it is parallel to outer edge of bowl cover casting by bending float lever. *NOTE* - Bend float lever by appiying pressure to end of float with finger while supporting float lever with thumb. After aligning float, remove as much clearance as possible between arm of float lever and lugs on bowl cover. Arms of float lever should be as parallel to inner surface of lugs as possible. Be sure that floats operate freely without excessive play on hinge pin.

Float Level: With bowl cover inverted, bowl cover and gasket in place, and needle seated, there should be 5/16" clearance between top of float at outer end and bowl cover gasket. Check and adjust float level, using Gauge J-818-9. Adjust by bending float arm. Recheck float alignment after adjusting level.

Float Drop: Hold bowl cover in upright position and measure distance from the top outer end of each float to bowl cover gasket. The distance should be 3/4". To adjust, bend stop tabs on float brackets.

Accel rat r Pump: Back out fast idle screw so throttle

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (Cont.)

valves are fully closed, making sure that choke is wide open. Distance from top of bowl cover to top of plunger shaft should be 15/32". Adjust by carefully bending throttle connector rod at lower angle using Tool J-1137.

Choke Piston Lever: Remove three choke coil housing screws and remove choke coil housing assembly. Remove gasket and baffle plate. Open choke valve and insert .026" wire gauge, Tool KMO-658 between bottom of slot in piston and top of slot in choke housing. Close choke against this gauge and check clearance between top of choke valve and web of bowl cover casting. This dimension should be 5/64". Check this clearance using a 5/64" drill. Adjust by bending choke connector rod using Tool J-1137.

Choke Modifier: Place choke coil housing on index and remove lower end of connecting rod. Loosen clamp screw and rotate metal pointer until it is in line with raised pointer on coil housing. Align scribed line on lever so it is in a horizontal position and tighten clamp screw. Seat throttle valves (hold choke wide open). Reposition pointer so it is in line with raised pointer on housing. Bend connector rod at upper angle so that lower end of rod will slide freely into hole in modifier lever on primary throttle shaft.

Choke Shaft Lever: With choke valve fully closed and choke lever and arm in contact, adjust choke connector rod to align index on fast dile cam with fast idle screw.

Fast Idle: *(CAUTION - Make final adjustment "On Engine" as detailed above).* With center of fast idle screw aligned with index mark on fast idle cam, adjust screw to obtain .018" clearance between edge of throttle valve and carburetor bore adjacent to throttle lever. Check clearance with Gauge KMO-657. *NOTE* - Tang on fast idle cam and stop on body must have a clearance of .005" minimum. Use a standard feeler gauge to check.

Unloader: Rotate primary throttle to full open position and insert a 9/32" drill between upper edge of choke valve and inner wall of bowl cover assembly. Choke valve should give a slight drag on gauge under finger pressure. To adjust, bend unloader lip on throttle lever using Tool J-1137.

Secondary Throttle Lever: Fully open primary and secondary throttle valves. Stop lugs on primary and secondary throttle levers should contact boss on flange. Adjust by bending secondary operating rod. Close primary and secondary throttle valves. Clearance between positive closing shoes on primary and secondary throttle levers should be .017-.022" (Tool J-1388). Adjust by bending shoe on primary throttle lever.

Secondary Throttle Lockout: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should engage freely in notch of lockout dog. Adjust by bending tang on secondary throttle lever. With lockout dog held tight against stop on flange casting and secondary throttle valves partially open, there should be .020" clearance between tang on secondary throttle lever and lockout arm. Check this clearance using Tool J-1388. Adjust by bending arm at slot on lockout dog. *NOTE* - Fast idle cam may be removed to ease gauging and adjusting.

CADILLAC (Dual Carburetors) (Carter WCFB)

ADJUSTMENTS (Off Engine): *See "On Engine Adjustments" above. NOTE* - The following adjustments must be made in the sequence given, however, they may be classified into the following separate groups: (1) Float Level & Float Drop. (2) Accelerator Pump, Metering Rod, Atmospheric Idle Vent. (3) Choke Modifier, Choke Rod, Unloader, Secondary Throttle Opening, Secondary Throttle Lockout, Fast Idle. *NOTE - When one adjustment of a group is made, the rest in the group must also be performed.*

Float Level: *NOTE - Primary and Secondary Float Settings are different. VERTICAL & HORIZONTAL adjustments must be made on both floats.* With bowl cover assembly removed from carburetor, remove cover gasket and place correct gauge (see table below) directly under center of floats with notched portion of gauge fitted over edge of cover. Lateral Adjustment - Sides of float should just clear vertical uprights of gauge. Adjust by bending float arm as required. Vertical Adjustment - Floats should just clear horizontal portion of gauge (see table for vertical distance between tops of floats and machined surface of cover). Adjust by bending float arms up or down.

Carter Float Level

Float	Checking Gauge	Vertical Distance
Primary	① T109-232	1/8"
Secondary	② T109-223	1/4"

① - Cadillac No. J-5457. ② - Cadillac No. J-5228.

Float Drop: Hold bowl cover assembly upright so that floats hang down freely. Use scale to measure distance from machined lower surface of bowl cover (gasket removed) to top of floats at center. Distance should be 5/8" (Primary Floats), 3/4" (Secondary Floats). Adjust by bending tab on float bracket.

Accelerator Pump: Install pump connector link in inner hole (short stroke) of pump arm, with end extending toward countershaft. Seat throttle valve in carburetor bore. Remove dust cover and gasket and hold a straightedge across top of dust cover boss at pump arm. The flat on pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at lower angle.

Metering Rod: *Make this adjustment after "Accelerator Pump Adjustment".* Seat throttle valves in bore of carburetor and loosen metering rod arm clamp screw. With metering rods in place, press down on vacumeter link until metering rods bottom in carburetor body casting. Hold rods in downward position, throttle valves seated, and revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and tighten clamp screw.

Atmospheric Idle Vent: With throttle valve seated in bores, clearance between lower edge of vapor vent valve and dust cover should be 1/16" (Gauge T109-197). To adjust, remove dust cover, bend vapor vent arm up or down.

Automatic Choke: Centered (At Index). Adjust choke modifier as indicated below.

Choke Modifier: Set cover assembly as indicated above. Loosen clamp screw and remove lower end of connector rod. Rotate metal pointer until it is in line with raised pointer on housing. Align scribed line on lever so it is straight up and down. Hold in place and tighten clamp screw. Seat throttle valve (hold choke valves wide open) and with pointer in line with raised pointer on coil housing, lower end of rod must slide freely into hole in throttle arm. To adjust, bend rod at upper angle. Reconnect rod.

Choke Rod: Loosen choke lever clamp screw on choke shaft. Lip of fast idle cam should lightly contact boss of flange casting. Take up all slack in linkage by exerting pressure with a screwdriver on choke lever clamp screw. Hold choke valve tightly closed and tighten clamp screw.

Unloader: Move throttle lever to wide open position. Check choke valve opening or clearance between upper edge of valve and inner wall of air horn using Gauge T109-39 (13/64"). Adjust by bending unloader lip on throttle lever shaft using Tool T109-41.

Secondary Throttle Opening: With carburetor inverted, move choke valve to fully open position. Rotate primary throttle to fully open position. Check opening of secondary valves. They should be fully open at the same time as primary valves. If adjustment required, remove secondary throttle actuating link and check wide open stops on primary and secondary throttle shafts. Bend tangs with pliers as necessary to obtain wide open position. Install secondary throttle link, bending it as necessary so that link fits into proper holes correctly.

Secondary Throttle Lockout: With choke valve tightly closed, tighten fast idle adjusting screw until there is .010" (Gauge T109-200) opening between primary throttle valves and bore of carburetor on side opposite idle ports. Lock pawl should now be in unlocked position, if not, adjust by bending tang on lock pawl using Tool T109-105. Hold primary throttle valves half way open. Open choke valve fully, then open primary throttle valves all the way. Tang on secondary throttle arm should engage notch on lockout lever preventing secondary throttle shaft movement. Keep choke valve in wide open position. Close primary throttle valves so that lock pawl is unlocked, then open primary throttle valves all the way. Lockout lever should fall free allowing secondary throttle valve to be open before primary throttle valves are fully open. To adjust, bend tang on secondary throttle lever for clearance.

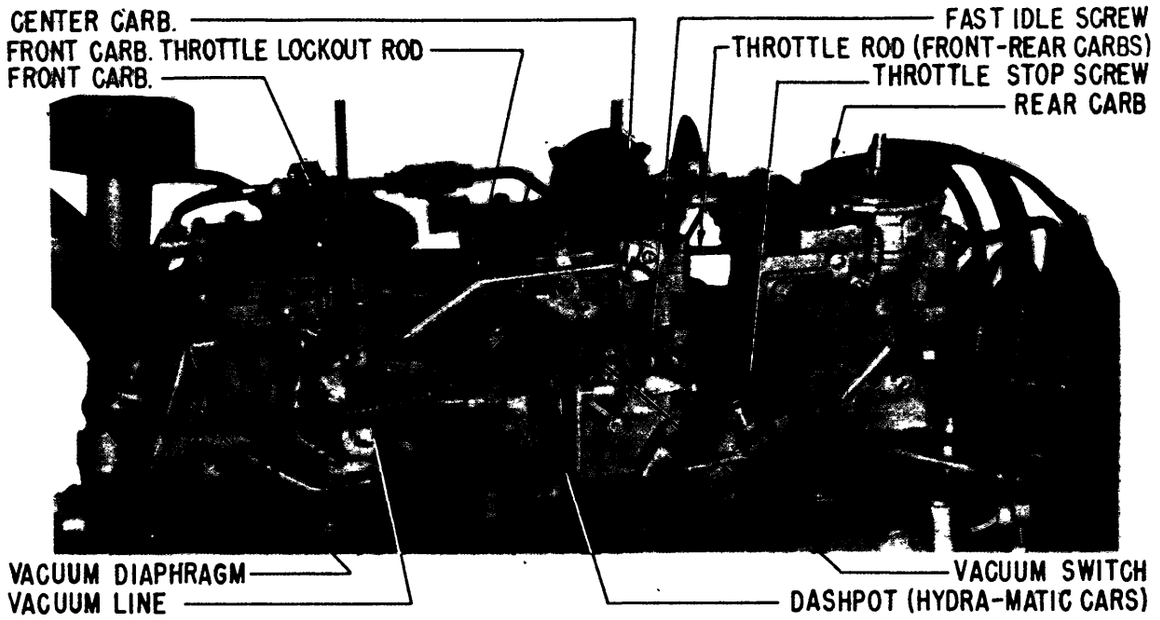
Fast Idle: *(CAUTION - Make final adjustment "On Engine" as detailed above).* With fast idle adjusting screw on high step of fast idle cam, clearance between primary throttle valves and side of bore opposite idle ports should be .008".

OVERHAUL: *See "Carter WCFB 4-Barrel", "Carter AFB 4-Barrel" and "Rochester 4GC 4-Barrel" Carburetors.*

OLDSMOBILE TRIPLE 2-BARREL COMPOUND CARBURETORS

OLDSMOBILE (J-2 Engine)	Rochester No.
Front	7010960
Center	7010959
Rear	7010958

DESCRIPTION: Three Rochester 2GC Carburetors are used, with the center carburetor having all the conventional systems (Float, Idle, Part Throttle, Power, Pump, and Choke). The front and rear carburetors contain only Float, Pump, and Main Metering Systems. Throttle valves and accelerator pump on the front carburetor are operated by a vacuum diaphragm which is controlled by a vacuum switch mounted on the center carburetor. Vacuum is supplied to this switch by the vacuum booster side of the fuel pump. Throttle shafts on front and rear carburetors are connected by a common rod and are controlled by the vacuum diaphragm so that both carburetor throttle valves will open simultaneously.



OPERATION: During idle and part throttle operation, the center carburetor feeds fuel while the front and rear carburetors remain idle. On normal acceleration the center carburetor feeds air and fuel until the throttle valves are opened approximately 60° at which time the vacuum switch located on the center carburetor is operated by a tang on center carburetor accelerator pump lever. With the switch actuated, vacuum is applied to the diaphragm on front carburetor, which opens front and rear carburetor throttle valves simultaneously. On deceleration the vacuum switch closes, shutting off all vacuum applied to the diaphragm. Air is then bled from inside front carburetor air horn by another line through the vacuum switch to vacuum diaphragm unit, allowing diaphragm to return to its normal position under spring tension and closing throttle valves on front and rear carburetors. Front and rear carburetors are locked out when choke is on by a lockout lever on front carburetor.

ADJUSTMENT: Some adjustments must be made with carburetor on the engine; other adjustments may be made with carburetor on the engine or on the bench.

► *ADJUSTMENT NOTE: The following adjustments may be made with carburetor either on or off the car.*

Float Level (All Carburetors): 1 9/32" (Center Carb.), 1 5/16" (Front & Rear Carbs.), with bowl cover inverted and Gauge J-5917 placed so it rests against pump side of power piston shaft with outer leg in line with center of float. Bend float arm so float just touches bottom of gauge, using Tool BT-69.

► *TOOL J-5917 NOTE:* To use Tool J-5917 for adjusting float level on center carburetor, scribe a line 1 9/32" from end of both legs of gauge.

OLDSMOBILE "TRIPLE CARBURETORS"

Float Drop (All Carburetors): With air horn held upright, distance from air horn gasket to bottom of float should be 1 29/32". To adjust, bend tang on float.

Choke Setting: 1 notch lean.

Pump Rod (All Carburetors): Back off idle speed adjustment screw and fast idle speed screw until throttle valves are completely closed. Hold throttle valve closed and check distance from top of air horn to top of pump rod with Gauge J-5917. This distance should be 15/16". Bend lower section of pump rod with Tool BT-18

Vacuum Switch (Center Carburetor): *(CAUTION* - Before making adjustments, open throttle valves wide open and close them to position switch post properly for adjustment). Hold throttle valves completely closed and check clearance from tang on pump lever to the actuating post on vacuum switch with a 1/32" (.031") drill. Loosen two retaining screws and move switch assembly up or down to obtain proper clearance.

Choke Rod (Center Carburetor): Turn fast idle screw in until it just touches second step of fast idle cam. Hold fast idle cam so the highest step is against the fast idle screw and check clearance between choke valve and side of air horn, using small end of Gauge J-5918 (.040"). *(NOTE* - Make sure choke trip lever is in contact with choke counterweight). Bend counterweight tang as necessary with Tool BT-69,

► *ADJUSTMENT NOTE: The following adjustments must be made on the car.*

Choke Lockout (Front Carb): Hold choke valve completely open and check distance between lockout lever and throttle lever. This distance should be .030", measured with a feeler gauge. Adjust by bending lockout rod with Tool BT-18.

Choke Lockout Lever Contour Adjustment (Front Carb.): Hold throttle valve on **front carburetor,** completely closed, then with choke valve on **center carburetor** in the closed position and choke lockout lever rod connected, bend lockout tang on **front carburetor** throttle lever to obtain a .015" clearance between lockout lever and tang on throttle lever.

Throttle Rod (Front-to-Rear Carburetors): With throttle valves on front and rear carburetors completely closed and front of throttle rod attached to lever on front carburetor, rear end of rod must be in middle of slotted hole in throttle lever on rear carburetor. Use Tool BT-18 to bend throttle rod as necessary for this adjustment.

Unloader: With throttle valves held wide open, choke valve should be open just enough to admit large end of Gauge BT-110 (.140") between upper edge of choke valve and inner air horn wall. To adjust, bend tang on throttle lever with Tool BT-69.

CONTINUED ON NEXT PAGE

OLDSMOBILE CARBURETORS (C nt.)

Idle Sp ed (C nt r Carburetor): 460 RPM (All models). On Hydra-Matic Drive cars, selector lever must be in "DR" position. *NOTE - On air conditioned cars, place controls in "Maximum Cooling" position.* The above supersedes previous idle setting specifications.

Idl S tting (Center Carburetor): With idle speed stabilized, adjust each idle air screw using Tool BT-1000, until smoothest possible idle is obtained Readjust engine idle speed

Fast Idle (Cent r Carburetor)· With engine at normal operating temperature and transmission selector lever in "N" position, rotate fast idle cam so fast idle screw is resting on high step of cam Adjust fast idle screw to obtain an engine speed of 1500-1600 RPM

Throttle Return Check (Center Carburetor)· After fast idle adjustment is made, shut off the engine Rotate fast idle so screw is on high step of fastidle cam Measure clearance between contact screw and contact on throttle lever This clearance should be 050" Adjust contact screw (using two wrenches) to obtain correct adjustment *NOTE* - When fast idle adjustment is changed, readjust throttle return check

REMOVAL & INSTALLATION: Front and rear carburetors can be removed and replaced individually Because of clearances, the rear carburetor must be removed whenever the center carburetor is removed

OVERHAUL: *See "Rochester 2G & 2GC" Carburetors.*

►*NOTE: Overhaul procedure is the same for all carburetors except that the front and rear carburetors have only the pump, float, and metering systems*

PONTIAC TRIPLE CARBURETORS

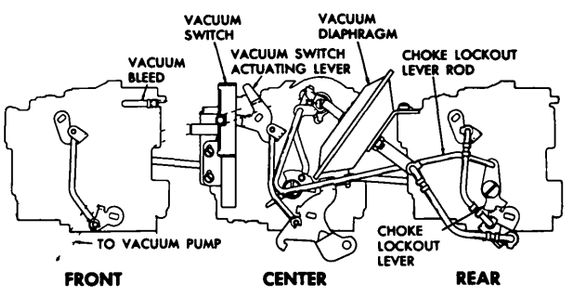
PONTIAC (Tripl Carb.)	Rochester No.
Front	7011351
Center (Synchro-mesh)	7011500
Center (Hydra-Matic)	7011350
Rear	7011352

DESCRIPTION: Three Rochester 2GC Carburetors are used, with the center carburetor having all the conventional systems (Float, Idle, Part Throttle, Power, Pump and Choke) The front and rear carburetors contain only Float, Pump, and Main Metering systems Throttle valves on the rear carburetor are controlled by a vacuum switch mounted on the center carburetor Throttle valve shafts on front and rear carburetors are connected by a common rod so that throttle valves and accelerating pumps will operate simultaneously

OPERATION: During idle and part throttle operation, the center carburetor feeds fuel while the front and rear carburetors remain idle On normal acceleration, the center carburetor feeds air and fuel until the throttle valves are opened approximately 60°, at which time the vacuum switch located on the center carburetor is operated by a tang on center carburetor accelerating pump lever With the switch actuated, vacuum is applied to the diaphragm on rear carburetor which opens front and rear carburetor throttle valves simultaneously On deceleration, the vacuum switch closes shutting off all vacuum applied to the diaphragm Air is then bled from inside front carburetor air horn by another line through the vacuum switch to vacuum diaphragm unit, allowing diaphragm to return to its normal position under spring tension and close throttle valves on front and rear carburetors Front and rear carburetors are locked out when choke is on by means of a lockout lever on the rear carburetor and a rod connecting this lever to choke shaft on center carburetor

ADJUSTMENTS· *Make all adjustments in the order given below and on each carburetor (except as noted)*

Float Level With air horn inverted and gasket in place, the distance from top of float (not float seam) to gasket surface should be (center carburetor) 1 15/64" (Gauge J-6877), (front & rear carburetors) 1 5/16" (Gauge J-5917) To adjust, bend float arm



Float Drop· With air horn upright and floats hanging freely, the distance from gasket surface to bottom of the float should be 1 29/32" (all carburetors) To adjust, bend float tang

Pump Rod· With idle stop screw backed off and throttle valve completely closed, check the distance from top of air horn casting to top of pump rod This distance should be (center carb.) 57/64" (Gauge J-6877), (front and rear carbs) 15/16" (Gauge J-5917) To adjust, bend pump rod at lower angle

Vacuum Switch (Center Carb.)· With throttle valves tightly closed, loosen the two screws holding switch to bracket and move lip on switch upward to the end of its travel Position switch on bracket to obtain 1/32" clearance between bottom of lip and top surface of lower finger on pump lever Tighten screws securely

Automatic Choke (Center Carb.): Centered (at index)

Choke Rod (Center Carb.)· Place idle screw on second step of fast idle cam and against shoulder of high step Make sure choke trip lever is in contact with choke counterweight lever Bend counterweight tang so there is a clearance of 061" (Gauge J-6876) between upper edge of choke valve and wall of air horn To adjust, bend counterweight tang

PONTIAC "TRIPLE CARBURETORS"

Unloader (Center Carb.)· With throttle valve wide open, Gauge J-6876 (163") should fit freely between choke valve and air horn wall To adjust, bend unloader tang on throttle lever

Choke Lockout (Rear Carb.) With carburetor installed on engine and lockout linkage installed, hold choke valve (center carb) in the wide open position With rear carburetor throttle valves held slightly open (it may be necessary to remove throttle return springs to open throttle valves), there should be .030" clearance between lockout lever and throttle lever tang on rear carburetor. To adjust, bend lockout rod at sharp bend.

Choke Lockout Lever Contour (Rear Carburetor)· With choke valve on center carburetor closed and choke lockout lever connected, bend lockout tang on rear carburetor throttle lever to obtain 015" clearance between tang and contour portion of lockout lever

Throttle Actuating Rod: Disconnect one end of rod connecting throttle levers on front and rear carburetors With throttle valves closed on front and rear carburetors, the rod should center in the slot in throttle lever Bend rod as necessary to obtain the correct fit

►*THROTTLE RETURN SPRING INSTALLATION NOTE:* Throttle return springs on front and rear carburetors should be installed with open end of spring loop **facing float bowl.**

Idle Mixture & Speed (Center Carburetor)· Adjust with engine at normal operating temperature

Idle Speed - 430-450 RPM with selector lever in "N", (Hydra-Matic Drive Cars), 630-670 RPM (Synchro-mesh Cars)

Idle Mixture - Adjust for smoothest possible idle at specified speed Recheck idle speed after making mixture adjustment

OVERHAUL: *See "Rochest r 2G & 2GC" Carburetors.*

►*NOTE· Overhaul procedures are the same for all carburetors except for the differences in systems on front and rear carburetors*

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 CHRYSLER C-300 STUMBLE OR STALLING CORRECTION:* Poor idle, stumble or hesitation on acceleration, stalling on stops or sudden turns conditions can be improved by making the following service corrections. Remove both carburetors from engine and disassemble each carburetor into three major sections (air horn, main body and throttle body). Remove floats and fuel inlet valves from air horn. Proceed as follows: **Vent Passage Rework** - Using a No. 42 drill (.0935"), drill holes through wall of air horn and vent passage boss into vent passage at each end of the two vent tubes (these are the vented tubes extending across and above primary and secondary bores in air horn). Holes into vent passages should be located 11/16" (primary side), 13/16" (secondary side) below top of air horn wall and aligned with centerline of vent tube at a point where vent tube is closest to inner side of air horn wall. Cut away choke housing-to-air horn gasket on rear carburetor for access to vent passage boss behind choke housing.

Idle Tube Well Enlargement - Remove main nozzle plug rivets or primary side of carburetor and remove the two primary idle tubes. Enlarge idle tube wells for their full length (into main nozzle passage), using a No. 4 drill (.209"). Idle tube wells are approximately 8° from vertical and care must be taken to prevent damaging the idle tube seat located just below threads in carburetor main body.

Main Body Pilot Bosses - File projecting pilot bosses on primary side of under side of main body to a height of 1/32". Clean carburetors thoroughly, making sure that all passages are clean and free of metal chips. Reassemble carburetors and note the following changes that must be made.

Secondary Metering Jet Change (Front Carburetor)-Install secondary metering jets, Carter No. 120-193 in **front carburetor only.** Use original jets in rear carburetor.

Metering Rod Change (Front & Rear Carburetors) - Install metering rods, Carter No. 75-1160 in **both front and rear carburetors.**

Float Setting Change - Adjust float level to 1/4" (primary floats), 5/16" (secondary floats).

Carburetor Installation - Install carburetors on engine using a new 1/8" thick flange gasket.

Idle Speed & Idle Setting Procedure Change - Close off completely the idle by-pass screws of both carburetors by turning them in until fully seated. *(NOTE - Leave these screws in the closed position and adjust idle speed with the idle speed screws on the throttle lever).* With engine at normal operating temperature, connect tachometer to engine and adjust front carburetor idle speed screw to obtain 650-700 RPM. Adjust rear carburetor idle mixture screws for best performance, then adjust front carburetor idle mixture screws for best performance. Reset front carburetor idle speed screw to obtain 650-700 RPM.

►*1957 DESOTO, DODGE & PLYMOUTH (CARS WITH TWO 4-BARREL CARBURETORS) IDLE ADJUSTMENT CHANGE NOTE:* The "idle by-pass" screw formerly used for idle adjustment is no longer used and must be screwed in against its seat. *See individual car model pages for idle setting procedure.*

►*1957 CHRYSLER, DESOTO, DODGE & PLYMOUTH TWO 4-BARREL CARBURETOR PRODUCTION CHANGE:* Carburetor Nos. 2534S, 2535S, 2631S, 2632S, 2633S, 2634S, 2635S, 2636S, had a lead ball driven into hole in face of flange to seal over head of screw holding flange onto body. This lead ball must be removed before flange is separated from carburetor body. On later production carburetors, the lead ball has been replaced with a copper washer (Carter No. 136-199), which should be used instead of the lead ball when servicing these carburetors.

►*1957 DESOTO ADVENTURER REAR CARBURETOR THROTTLE LEVER LOSSENESS CORRECTION:* This condition is caused by excessive side strain on throttle lever due to improper adjustment and alignment of the inter-connecting linkage rod. To correct, remove carburetor and place it on a vise so end of throttle shaft (away from lever) is firmly supported. Peen end of shaft, tapping lightly, to tighten lever. Adjust interconnecting link for freeness and alignment.

►*1957 DODGE D-500 STUMBLE & LEANNESS CORRECTION:* On early cars with WCFB 2532S carburetor, install metering rod, Carter No. 75-1251 to replace 75-1327. On later cars with WCFB 2622S carburetor, install metering rod, Carter No. 75-1251 to replace 75-1373.

►*1957 LINCOLN & MERCURY ENGINE STUMBLE OR CUTTING OUT ON TURNS: This condition may b* caused by a poor seal between carburetor body and air horn. Inspect gasketed surfaces and remove any small nicks or burrs with a stone. Make sure that top surface of inner wall of bowl is in good contact with gasket. Before installing air horn, check lateral and vertical float adjustments and float drop.

►*1957 HUDSON, NASH, RAMBLER ROUGH ENGINE IDLE CORRECTION: If idle adjustments do not corr ct* rough idle condition, check for an air leak at front left hand corner of carburetor (with carburetor on engine) by squirting gasoline between throttle body flange and main body at this location. If an air leak exists, a drop in engine RPM will be noted. To correct, remove carburetor from engine, and with carburetor inverted (choke coil housing on left hand side) remove the upper right hand main body-to-throttle flange screw and coat threads with Permatex or other sealing compound. Replace carburetor and recheck for air leakage.

►*1957 HUDSON & NASH VAPOR LOCK OR LOW PRESSURE CORRECTION (Early Cars):* If either of these conditions exist on cars prior to Serial No. V-18114 (Nash), Y-11786 (Hudson), check the carburetor-to-fuel tank return elbow. This elbow must have a .034-.036" (No. 65 drill) restriction. If hole is larger or not drilled through, replace elbow with Part No. 3152259.

►*1956-57 LINCOLN & CONTINENTAL HARD STARTING, STALLING & BACKFIRING CORRECTION (When Caused by Defective Automatic Choke Control Heat Tube):* A new tube, Part No. ECU-9890-B having a larger center section and a larger runout radius at each end replaces the tube formerly used. When replacing intake manifold, make sure later heat tube is installed.

DESCRIPTION: 4-Barrel downdraft types of the same general design used on previous models, with the following special features.

Automatic Secondary Throttle Control (Chrysler 2589S, 2590S; DeSoto 2588S; Lincoln, Continental & Mercury 2404S, SA): Consists of a diaphram type vacuum control unit which opens and closes the secondary throttle valves in accordance with air velocity through primary venturi (vacuum passages connected at primary venturi). A mechanical override linkage ensures that secondary valves will always be closed with primary valves.

Auxiliary Throttle Valves (Chrysler 2555S, 2505S, SA, 2655S, 2626S, 2627S; Chrysler 2534S, 2535S; DeSoto

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

2532S, 2635S, 2636S; Dodge 2532S, 2622S, SA, 2633S, 2634S, 2534S, 2535S, 2698S; Hudson & Nash 2593S; Plymouth 2530S, SA, 2631S, 2632S): Velocity type valves located directly over secondary valves (action is controlled by counterweight on shaft and valves are not operated by throttle linkage). On some carburetors, these valves are locked out when choke is operating and this lockout must be adjusted (see Adjustments).

Spring L aded Primary Throttle Linkage (Chrysler 2589S, 2590S; DeSoto 2588S; Lincoln, Continental & Mercury 2404S, SA): Consists of a torsion spring on the throttle shaft between flex dog and throttle spring arm with a stop pin located on the throttle shaft dog.

"Cross-Ov r" Typ Automatic Choke (DeSoto & Dodge 2532S, 2622S, SA, 2698S; Plymouth 2530S, SA): On these models, the Thermostatic Coil Assembly is mounted in a well in the manifold and is linked to choke shaft lever by a rod (a plain cover is used on the choke housing on air horn and a lever is mounted in end of choke shaft where it extends through cover). This type automatic choke is adjusted differently.

ADJUSTMENTS: *Make all adjustments in sequence as listed below.*

►*1957 IDLE SETTING & CARBURETOR SYNCHRONIZATION NOTE (CARS WITH TWO 4-BARREL CARBURETORS): See individual car model pages for idle setting and carburetor synchronization procedures. On Chrysler C-300 models with modified carburetors, see "1957 Chrysler C-300 Stumble or Stalling Correction"*

Idl Setting (Exc pt Cars with Two 4-Barrel Carburetors): With engine at normal operating temperature, automatic choke not operating (choke valve wide open), fast idle inoperative (fast idle screw on low step of fast idle cam), proceed as follows: *(NOTE* - If initial adjustment required to allow engine to be started and warmed up, set both idle mixture adjusting screws as indicated in table below). Adjust idle speed adjusting screw for correct engine idle speed (see table below), then adjust each idle mixture adjusting screw (one screw for each primary barrel - two screws only) until engine idles smoothly and RPM is ⁴ maximum. Readjust idle speed.

Idl Mixture Setting

Car & Carb.	Idle Screw Opening
Chevrolet 2505S, SA, 2555S	3/4-1 3/4 turns
Chevrolet 2626S, 2627S	1/4-1 1/4 turns
Chevrolet 2655S	1/2-1 1/2 turns

① - With transmission selector lever in "D" (Drive).
② - 800-850 RPM cars with "SR" Racing camshaft.
③ - With transmission selector lever in "N" (Neutral).
④ - 475 RPM with air conditioner turned on.
⑤ - 650-750 RPM on C-300 models with reworked carburetors. *See "1957 Chrysler C-300 Stumble or Stalling Correction" above.*

Throttle Return Check (Dashpot) Adjustment: Used with automatic transmission. *See "Throttle Linkage Adjustment" under CARBURETOR on each car model page.*

ACCELERATING PUMP

Accelerating Pump Stroke: *CAUTION—This is a linkage adjustment and not a seasonal change recommendation.* Remove dust cover, make certain that pump connector link installed in **outer** (long stroke) hole of pump arm. Back off throttle stopscrew so that primary throttle valves are fully seated. Hold a straightedge across top of dust cover boss at pump arm. The flat on the top of the pump arm should be parallel with straightedge. Adjust by bending pump connector link at lower angle on all carburetors except 2404S, SA which should be bent at the upper angle. Use Tool T109-213 to bend connector link.

►*STUDEBAKER NOTE:* On carburetors with dashpot, after completing pump rod adjustment (above), make certain that clearance between lower edge of countershaft arm and dashpot bracket is .015" minimum. Correct by bending pump connector rod slightly.

METERING RODS

Metering Rods (Primary Side): *No gauge required for this adjustment and no metering rods used on secondary side.* With dust cover removed and primary throttle valves fully seated (as for Pump Stroke Adjustment above), loosen setscrew in metering rod arm on pump countershaft just enough so that arm has slight bind on shaft, lift arm slightly. Depress metering rod link until metering rods just bottom in bowl casting, position metering rod arm so that it contacts link, tighten arm setscrew. Then adjust Atmospheric Idle Vent (following)

FLOAT LEVEL SETTING

Fl at S tting: *CAUTION—Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL and FLOAT DROP must b ch ck d for ach assembly.* Remove bowl cover and float assembly from carburetor for these checks:

Float Level—*Primary and Secondary Float Assemblies set to different heights (Except on Pontiac, Oldsmobile and Studebaker).* Check and adjust as follows: Remove bowl cover gasket (take out float hinge pins, remove float assemblies with intake needles attached, remove gasket, re-install floats). Invert bowl cover. install correct gauge for each float assembly (see table below) on bowl cover under center of floats with notched ends of gauge fitted tightly against sides of bowl cover casting. Both floats should just clear horizontal section of gauge (adjust by bending float arms as required) and each float should barely touch vertical uprights on gauge (bend float arms sideways for this clearance). This sideways adjustment is extremely important to prevent floats hanging up on sides of bowl casing.

Float Level Setting
Primary Floats

Car & Carb.	Height	Gauge No.
Chevrolet 2505S, SA, 2555S	1/8"	T109-232
Chevrolet 2626S, 2627S, 2655S,	1/8"	T109-232
Chrysler 2534S, 2535S	1/8"	T109-232
Chrysler 2589S, 2590S	5/32"	T109-236
DeSoto 2532S	7/32"	T109-283
DeSoto 2588S	5/32"	T109-236
Dodge 2532S, 2622S, SA, 2698S	7/32"	T109-283
Dodge 2534S, 2535S	1/8"	T109-232
Hudson & Nash 2593S, SA	1/8"	T109-232
Lincoln & Continental 2404S, SA	1/16"	T109-293
Mercury 2404S, SA	1/16"	T109-293
Plymouth 2530S, SA	7/32"	T109-283
Plymouth 2631S, 2632S	3/16"	T109-222
Rambler 2593S,SA	1/8"	T109-232
Studebaker 2214SB, 2219SB	3/16"	T109-222

Secondary Floats

Car & Carb.	Height	Gauge No.
Chevrolet 2505S, SA 2555S	1/4"	T109-223
Chevrolet 2626S, 2627S, 2655S	1/4"	T109-223
Chrysler 2534S, 2535S	3/16"	T109-222
Chrysler 2589S, 2590S	9/32"	T109-284
DeSoto 2532S, 2588S	9/32"	T109-284
Dodge 2532S, 2622S, SA, 2698S	9/32"	T109-284
Dodge 2534S, 2535S	3/16"	T109-222
Hudson & Nash 2593S, SA	3/16"	T109-222
Lincoln & Continental 2404S, SA	3/16"	T109-222
Mercury 2404S, SA	3/16"	T109-222
Plymouth 2530S, SA	9/32"	T109-284
Plymouth 2631S, 2632S	5/16"	T109-107
Rambler 2593S,SA	3/16"	T109-222
Studebaker 2214SB, 2219SB	3/16"	T109-222

Float Drop—*Primary and Secondary Float Drop is different (except Oldsmobile, Pontiac, Studebaker). Check and adjust as follows:* Hold bowl cover assembly upright so that floats hang down freely. Use scale to measure distance from machined lower surface of bowl cover (gasket removed) to top of floats at center. If distance not correct (see table below), adjust by bending stop tabs on float bracket.

CONTINUED ON NEXT PAGE

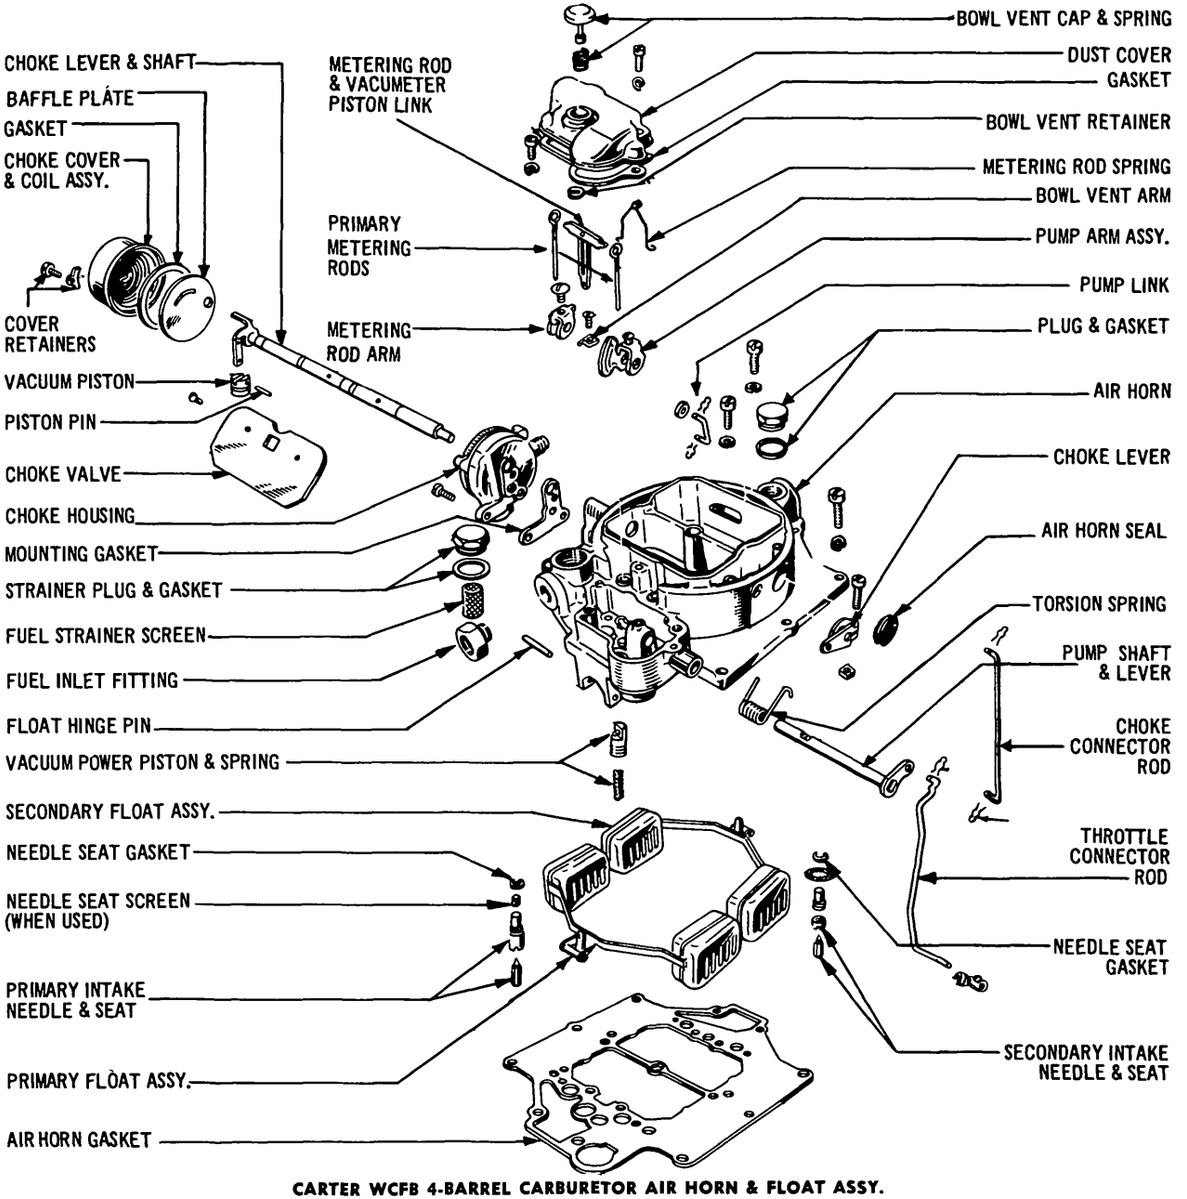
CARTER WCFB 4-BARREL CARBURETORS (Con..)

Float Drop Setting

Car & Carb.	Primary	Secondary
Chevrolet 2505S, 2555S	5/8"	3/4"
Chevrolet 2626S, 2627S, 2655S	5/8"	3/4"
Chrysler 2589S, 2590S	21/32"	25/32"
DeSoto 2532S	23/32"	25/32"
DeSoto 2588S	21/32"	25/32"
Dodge 2532S, 2622S, SA, 2698S	23/32"	25/32"
Hudson & Nash 2593S	5/8"	11/16"
Lincoln & Continental 2404S, SA	9/16"	11/16"
Mercury 2404S, SA	9/16"	11/16"
Plymouth 2530S, SA	23/32"	25/32"
Rambler 2593S,SA	5/8"	11/16"
Studebaker 2214SB, 2219SB	11/16"	11/16"

BOWL VAPOR VENT

Bowl Vapor Vent (Atmospheric Idle Vent) Adjustment: *This vapor vent not used on all carburetors.* **Checking & Adjustment**—With dust cover and gasket installed. Back out throttle lever stopscrew so that primary throttle valves fully closed. Check clearance between lower edge of vapor vent valve and dust cover using Gauge T109-197. Clearance should be 1/16". Adjust by removing dust cover and bending vapor vent arm.



AUTOMATIC CHOKE

Automatic Choke Setting: See table below for settings. Adjust by loosening choke cover screws and rotating cover and coil assembly. Then adjust connector rod.

Car & Carb.	Automatic Choke Setting	Choke Setting
Chevrolet 2505S, SA, 2555S		Index
Chevrolet 2627S, 2655S		Index
Chrysler 2535S, 2589S, 2590S		1 Point Rich
DeSoto 2532S		Index
DeSoto 2588S		1 Point Rich
Dodge 2532S, 2622S, SA, 2698S		Index
Dodge 2535S		1 Point Rich
Hudson & Nash 2593S, SA		Index
Lincoln & Continental 2404S, SA		1 Point Rich
Mercury 2404S, SA		1 Point Rich
Plymouth 2530S, SA		Index
Rambler 2593S,SA		Index
Studebaker 2214SB, 2219SB		1 Point Rich

"Cross-Over" Type Choke Setting (DeSoto 2532S; Dodge 2532S, 2622S, SA, 2698S; Plymouth 2530S) - "Cross-Over" type choke is mounted in well in manifold casting. To adjust, with unit off engine, loosen mounting post locknut and turn mounting post with screwdriver until index mark on disc is centered on scale. When choke is installed on engine, lift cover disc and open and close choke valve manually to make sure connector rod clears sides of hole in housing cover. If rod does not clear, replace unit (bending the rod will affect choke calibration).

Choke Rod: *This adjustment is preliminary to checking and adjusting Fast Idle, Unloader, and Secondary Throttle Lock-out.* Loosen choke lever clampscrew, insert wire gauge of correct thickness (see table below) between tang on fast idle cam and boss on throttle body casting (hold gauge in place by pressure on choke lever) and take up all slack in linkage. Hold choke valve tightly closed and tighten clampscrew.

CARTER WCFB 4-BARREL CARBURETOR AIR HORN & FLOAT ASSY.

CARTER WCFB 4-BARREL CARBURETORS (Con..)

FAST IDLE

Fast Idl : *This adjustment can be made with carburetor "Off Engine" (on the bench) or "On Engine" (with engine operating).*

Fast Idl Adjustm nt "Off Engine"–Hold choke valve tightly closed so that fast idle cam rotated to point where high step of cam is under fast idle screw. Turn fast idle screw in or out until primary throttle valve opening is correct (see table below). Measure this opening between edge of valve and carburetor wall on side opposite idle ports.

Fast Idle Setting "Off Engine"

Car & Carb.	Checking Gauge Size & No.
Chevrolet 2505S, SA, 2555S, 2655S	015" T109-44
Chevrolet 2626S	018" T109-44
Chrysler 2535S	018" T109-44
Chrysler 2589S, 2590S	012" T109-200
DeSoto 2532S	010" T109-200

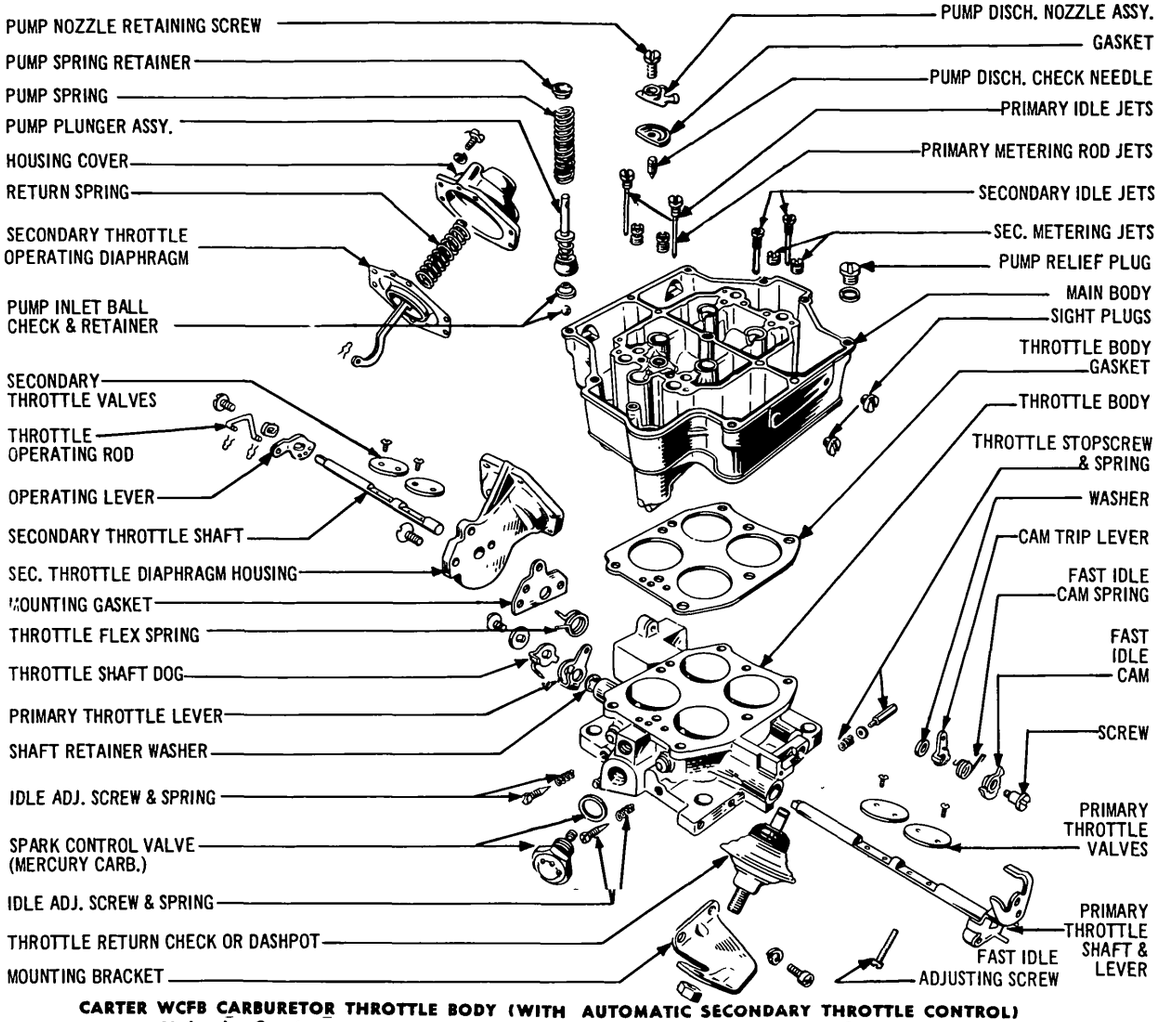
Lincoln & Continental 2404S, SA	030" T109-20
Mercury 2404S, SA	030" T109-20
Plymouth 2530S, SA	010" T109-200
Rambler 2593S,SA	.023" T109-189
Studebaker 2214SB, 2219SB	024" T109-189



Fast Idl Adjustment "On Engine"–Engine and Transmission must be at operating temperature, shift lever in neutral, and air cleaner in place. (Buick–Disconnect fast idle connector rod from trip lever so that cam may be held in "cold" position while engine running with choke valve fully open). On models listed below, rotate fast idle cam so fast idle screw rests on high step of cam. Adjust fast idle screw to obtain fast idle speed as indicated in table below.

Car M del	Fast Idle Speed Engine RPM
Chevrolet 2505S, SA, 2627S, 2655S	1800
Chevrolet 2555S	1600
Chrysler 2535S, 2590S	1450-1500

Dodge 2532S, 2622S, SA, 2698S	1350-1400
Dodge 2535S	1450-1500
Hudson & Nash	1600-1800
Lincoln & Continental	① 800
Mercury	① 800
Plymouth 2530S, SA	1350-1400
Rambler	1600-1800

① - With throttle stop screw on lowest step of fast idle cam.

UNLOADER

Unl ad r: *After Choke Rod adjusted (above),* rotate primary throttle valves to wide open position and hold valves in this position. Check choke valve opening by inserting correct Unloader Gauge (see table below) between edge of choke valve and air horn wall. With correct setting, choke valve should have slight drag on gauge. Adjust by using bending tool T109-41 to bend unloader tang on throttle lever as required.

CARTER WCFB CARBURETOR THROTTLE BODY (WITH AUTOMATIC SECONDARY THROTTLE CONTROL)

Unloader Setting

Car & Carb.	Checking Gauge Size & No.

AUXILIARY THROTTLE VALVES

Auxiliary Throttle Valves (Chevr let 2505S, SA, 2555S, 2626S, 2627S, 2655S; Chrysler 2534S, 2535S; DeSoto 2532S, 2635S, 2636S; Dodge 2532S, 2622S, SA, 2698S, 2534S, 2535S, 2633S, 2634S; Hudson & Nash 2593S; Plymouth 2530S, SA, 2631S, 2632S): Velocity type valve located directly above secondary throttle valves. On carburetor models 2530S, SA; 2532S, 2534S, 2535S, 2622S, SA, 2633S, 2634S, 2635S, 2636S, 2698S, the auxiliary valves are locked out when choke is operating and lockout adjustment is required. Lockout adjustment is not required on the other models.

Auxiliary Throttle Valve Adjustment (Plymouth 2530S, SA) - Disconnect secondary throttle operating rod. Adjust stop lug on secondary throttle lever using bending tool T109-214 until clearance between lower edge of auxiliary throttle valve and bore is 27/64" (Gauge T109-242) with stop lug against stop on lever.

Auxiliary Throttle Lockout Adjustm nt (Chrysler 2534S

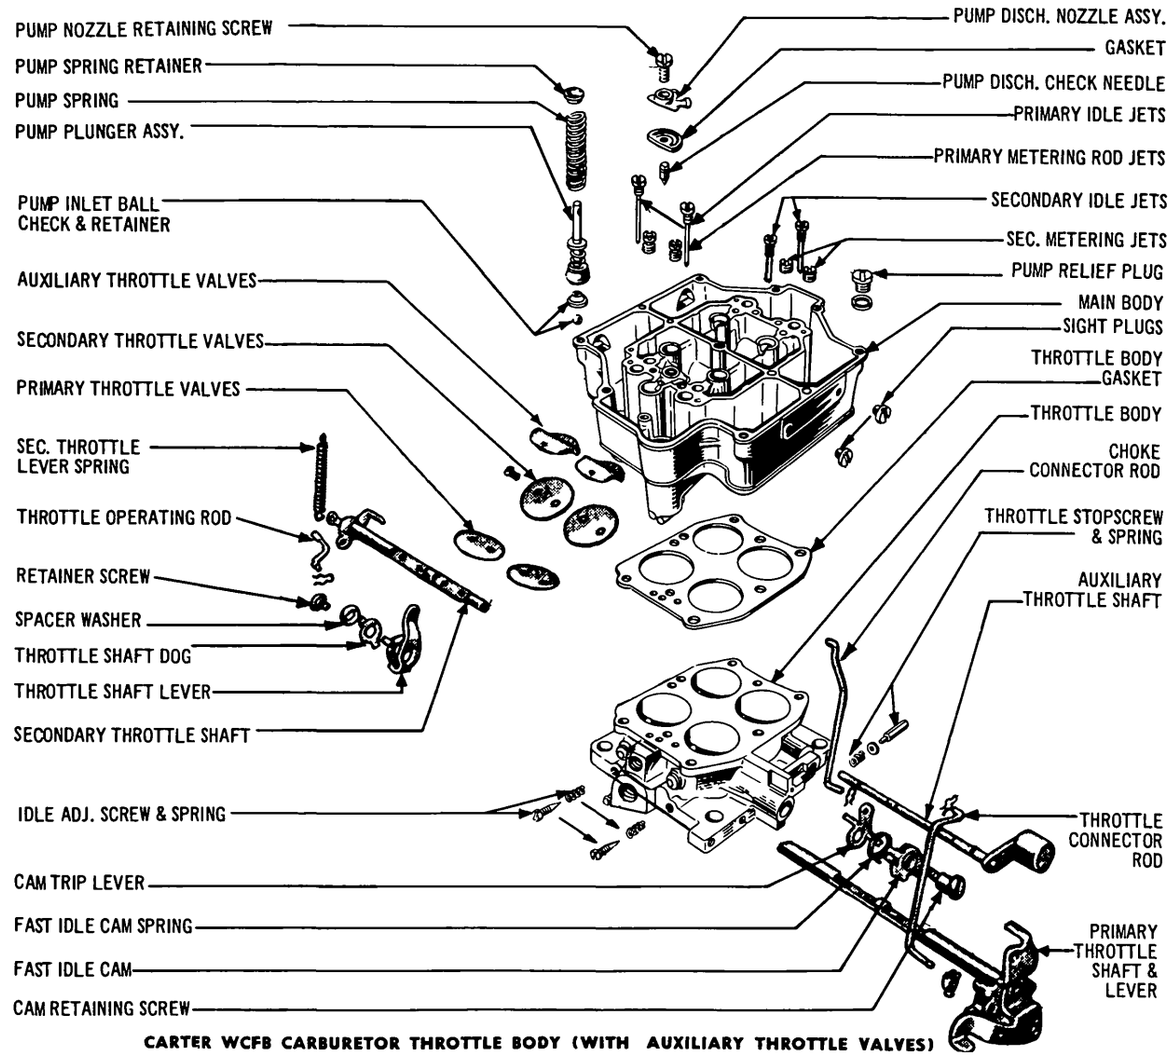
CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

2535S; DeSoto 2532S, 2635S, 2636S; Dodge 2532S, 2534S, 2535S, 2622S, SA, 2698S; Plymouth 2530S, SA, 2631S, 2632S) - After fast idle adjusted, proceed as follows: (1) With choke valve closed, make certain that edge of hook on lockout arm contacts auxiliary throttle lever with maximum contact on locking step on lever. (2) Open choke valve and make certain that auxiliary valves are unlocked a few degrees before choke reaches wide open position. Adjust by bending the lockout arm.

SECONDARY THROTTLE LINKAGE

►*CAUTION: Adjustment procedure and settings differ due to different linkage designs. Secondary lock-out is not used on all carburetors with Auxiliary Throttle Lock-out (above)*



Secondary Throttle Operating Lever Adjustment (Chevrolet 2626S, 2627S, 2505S, SA, 2555S, 2655S; Hudson & Nash 2593S): Block choke valve wide open and back out throttle lever stop screw so primary valves are seated in bores. With primary valves open 3/16" (Chevrolet), Gauge T109-28; 11/64" (Hudson & Nash), Gauge T109-166, secondary valves should just start to open. To adjust, bend throttle operating rod. *(NOTE* - Secondary valves will be a few degrees from wide open when primary valves are wide open). With primary and secondary valves tightly closed, there should be .017-.022" (Chevrolet), Gauge T109-29; .008-.013" (Hudson & Nash), Gauge T109-200 between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary throttle lever.

Chrysler 2534S, 2535S; DeSoto 2635S, 2636S; Dodge 2534S, 2535S; Plymouth 2631S, 2632S) - Primary and secondary valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle using Tool T109-213. With primary and secondary valves in tightly closed position, there should be .020" clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary throttle lever, using Tool T109-29.

DeSoto 2532S; Dodge 2532S, 2622S, SA, 2698S; Plymouth 2530S, SA - Stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust, bend secondary throttle operating rod at angle, using Tool T109-213.

Lincoln, Continental & Mercury 2404S, SA - Block choke valve wide open and back out throttle lever stop screw so that primary valves seat in bores. When primary and secondary throttle valves are seated there should be a minimum clearance of .010" between lug on secondary operating lever and stop on primary throttle shaft dog. To adjust, bend lug on secondary operating lever with Tool T109-214. *NOTE - Secondary valves s at at top edge only.*

Spring Loaded Primary Throttle Linkage Adjustment Chrysler 2589S, 2590S; DeSoto 2588S): With primary throttle valves wide open, adjust secondary operating rod (using Tool T109-213), so there is .054-.064" clearance (Gauge T109-193) between upper edge of secondary throttle valve (next to idle port) and bore of carburetor. Place 1/4" gauge (Tool T109-31) between upper edge of primary throttle valve and bore of carburetor (next to idle port) and adjust long tang on primary throttle shaft dog (using Tool T109-214) so that inner arm of spring just contacts inner lug of secondary operating lever and secondary throttle valves just start to open. With primary and secondary throttle valves tightly closed, there should be .005" clearance (Gauge T109-237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog. To adjust, bend outer lip on secondary operating lever, using Tool T109-214 *(NOTE - Make sure that secondary operating lev r operat s fre ly and does not bind in any position).* With primary and secondary valves tightly closed, there should be .040" clearance (Gauge T109-193) between short tang on primary throttle shaft dog and outer arm of spring. Adjust by bending short tang on primary throttle shaft dog using Tool T109-214.

CARTER WCFB CARBURETOR THROTTLE BODY (WITH AUXILIARY THROTTLE VALVES)

Lincoln, Continental & Mercury 2404S, SA - Place a .030" gauge (Tool T109-29) *(NOTE - This supersed s previous setting of .076")* between wide open stop tang on primary throttle lever and stop on flange. Adjust upper lug of throttle shaft so that upper arm of spring lightly contacts tang of throttle operating lever. Hold primary and secondary throttle valves in wide open position. Adjust lower lug of throttle shaft dog so lower arm of spring lightly contacts center web of throttle operating lever. Use bending Tool T109-214 to adjust lugs on throttle shaft dog.

Secondary Throttle Lockout Adjustment (Chevr let 2505S, SA, 2555S, 2626S, 2627S, 2655S; Chrysl r 2589S, 2590S; D Sot 2588S; Hudson & Nash 2593S): After fast idle and secondary throttle lever adjustment completed,

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

crack primary throttle valves, manually close choke valve, then close throttle valves. Tang on secondary throttle lever should freely engage in notch of lockout dog. Adjust by bending tang on secondary throttle lever.

Automatic Secondary Throttle Control (Chrysler 2589S, 2590S; DeSoto 2588S; Lincoln, Continental & Mercury 2404S, SA): This unit requires no adjustment. Bend operating rod as necessary to insure secondary valves closing simultaneously with primary valves. See that linkage is free and that there are no vacuum leaks between carburetor body and unit.

OVERHAUL: *CAUTION–When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Bowl and Throttle Body) which can be overhauled separately.

Air Horn & Bowl Cover–Remove fuel inlet fitting, gasket, and strainer assembly. Disconnect and remove choke connector rod, accelerating pump rod, secondary throttle return spring. Remove dust cover and gasket. Remove metering rods by rotating rods off pins on vacumeter link and lifting rods out carefully. Remove pump connector link by removing pin spring, sliding upper end of link out of pump lever, and rotating link around lever. Remove vent arm (when used) by taking out vent arm screw. Loosen (do not remove) screw holding pump operating lever on pump countershaft and screw in metering rod arm, slide pump countershaft and lever assembly out, remove pump arm and metering rod arm. Take out all air horn attaching screws (inner screws will be lifted out after air horn removed), make certain that screw located within pump countershaft housing is removed, lift air horn assembly straight up (*CAUTION*–use care not to damage floats). Disassemble remaining parts from air horn as follows: Invert air horn on bench, take out float hinge pins, remove floats with intake needles and clips attached, remove needle seats and gaskets (*CAUTION*–Keep each float assembly, intake needle, and needle seat together, DO NOT mix primary and secondary side parts). Remove vacuum piston by rotating it 90° in either direction and lifting it out. Remove accelerator pump plunger assembly. Remove and discard bowl cover gasket. If automatic choke to be disassembled, proceed as follows: Remove choke lever from choke shaft, remove choke valve (file burrs from staked ends of attaching screws before removing the screws), take out attaching screws and remove thermostatic coil housing, gasket, and baffle plate. (*NOTE* – On cars with "cross-over" type choke, remove screws holding dust plate to choke piston housing and slide plate off shaft). On all carburetors, rotate choke shaft counterclockwise to disengage vacuum piston from cylinder, then withdraw choke shaft and piston assembly. Disconnect piston from link by pushing piston pin out with a piece of wire. Take out attaching screws and remove choke housing and gasket (vacuum passage rubber gasket can be removed from inner side of choke housing by rotating gasket with the blunt end of a thin wire).

Carburetor Bowl–Invert bowl to remove pump spring and vacuum piston spring. Take out housing screw and remove pump jet housing, gasket, and pump discharge check needle (needle will drop out if bowl inverted). Remove primary and secondary metering jets (*CAUTION*–keep these jets separate). Remove pump relief valve plug and gasket. Remove pump intake ball retainer from bottom of pump cylinder, invert bowl to remove intake check ball. Remove all primary and secondary low speed jets. (*NOTE* – Low speed jets used on both primary and secondary sides of Chrysler, DeSoto, Dodge & Plymouth Carburetors). Loosen bowl to throttle body attaching screws, remove throttle body from bowl, remove screws. Discard gasket.

Throttle Body – Remove two idle adjusting screws and springs (used on primary side only). Remove four idle port rivet plugs. Remove idle stop screw and spring, and fast idle adjusting screw. On carburetors with vacuum diaphragm assembly remove hairpin clips holding throttle operating link to primary and secondary operating levers. Slide link out and away from levers (don't lose washers). Disengage throttle flex spring from tang on throttle flex dog and slide flex dog off primary shaft. Remove operating lever and flex spring. Disconnect vacuum diaphragm plunger from secondary operating lever by removing hairpin clip. Remove operating lever retaining screw and washer, the slide lever off secondary throttle shaft. Remove screws attaching vacuum diaphragm to throttle body and remove diaphragm and gasket. On all carburetors, take out fast idle mounting screw, remove all fast idle parts (fast idle cam, spring, trip lever, and lockout cam and pawl). Remove primary-to-secondary throttle connector rod, remove secondary throttle lever by loosening clamp screw and sliding lever off shaft, remove primary throttle lever screw from end of shaft, remove all lever parts from shaft. *It is recommended that throttle body not be disassembled further*, however, if it is necessary to remove throttle valves and shaft, proceed as follows: (*NOTE – Mark all throttle valves so they can be reinstalled in the proper position with the correct side of valve upward*). File burrs from staked ends of all throttle valve screws and remove screws and valves from shaft. Remove secondary throttle shaft. Remove primary throttle shaft by using a rawhide hammer to tap shaft through retaining washer. Remove auxiliary throttle valves and shaft when so equipped.

Cleaning & Inspection: Wash all parts in carburetor cleaning solvent except pump plunger assembly, thermostatic coil and housing assembly, and choke housing gasket (clean these parts in clean gasoline). Clean and blow out all passages with compressed air. Remove all gum and carbon deposits. Make certain all calibrated restrictions are clean but DO NOT use drills to clean out these passages. Inspect floats for dents and leaks. Check choke and throttle shafts for excessive wear, inspect pump plunger leather and replace plunger if cracked or creased. See that choke piston operates freely in cylinder (if carbon or dirt present in slots, remove welch plug in bottom of housing to clean slots, install NEW welch plug and make certain that it is air-tight).

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure (above), pay particular attention to the following points.

Valve Installation – Use new screws when installing valves. Install throttle valves as follows: Before tightening screws, shift valves to provide closest possible fit in barrel in closed position (short end of auxiliary valves should have a good bearing on stop bosses). tighten screws securely and stake ends lightly (*CAUTION* – Support shaft on steel block while staking screws). Install retaining washer on end of primary shaft with prongs outward, press washer in on shaft, just far enough to obtain snug fit without endplay in shaft.

1956 CHEVROLET CORVETTE (TWO CARTER) CARBURETORS

CARTER CARBURETORS

CHEVROLET CORVETTE	Carburetor No.
1956	(Front) WCFB 2419S
	(Rear) WCFB 2362S

►*IMPORTANT NOTE: The PARTS CHANGES and new ADJUSTMENT PROCEDURE listed below are recommended for improved idling and low speed operation on cars equipped with Corvette Engine with Two Carburetors. This data supersedes that given in the 1956 Annual Data (Pgs. 244 & 251).*

►CHANGES, CAUTIONS, CORRECTIONS

►*RECOMMENDED CHANGES FOR IMPROVED IDLING & LOW SPEED OPERATION:* Make the following changes in the above carburetors and adjust carburetors in accordance with revised Idling Adjustment procedure below

1) Carburetor Parts Changes - Install following new low speed jets and metering rods in BOTH carburetors On REAR carburetor only, install an idle speed screw in the tapped boss on the carburetor (Screw No 101-376, Spring No 61-291, Washer No 136-174) This screw is used to adjust engine idle speed

Carburetor Parts Changes

	Original Part No.	New Part No.
Low Speed Jets	11-294S	11-263S
Metering Rods (Std)	75-1255	75-1356

2) Carburetor Installation & Flange Gasket Modification - Install each carburetor with TWO gaskets (1A-114 or 1A-113) which have been modified by cutting out entire center section as follows: Cut along centerline between two primary barrel bores and two secondary barrel bores, cut along line ¼" out and parallel to centerline between each primary bore and adjacent secondary bore

►*IDLE ADJUSTMENT PROCEDURE:* Engine must be at normal operating temperature (choke valve wide open, fast idle inoperative) Open and close throttle valves several times to make certain throttle valves seat properly *(see Throttle Linkage below).* Connect tachometer and vacuum gauge On Powerglide models, set brakes and place selector lever in Drive "DR" position Then adjust both carburetors as follows

1) - *On both front and rear carburetors, turn Idle Air Adjusting Screw IN until it is just seated and LEAVE SCREW IN THIS POSITION SO THAT NO AIR IS ADMITTED THROUGH THIS PASSAGE. These screws are NOT used for carburetor adjustment.*

2) - Adjust idle speed screw on REAR carburetor (this screw installed as part of carburetor parts change - see Recommended Changes above) for correct hot or slow idle speed of 600 RPM (Standard Camshaft - Engines with "GR" or "GS" engine number suffix), 800-850 RPM (Special Camshaft - Engines with "GT" or "GU" engine number suffix) *NOTE* - Throttle valves in FRONT carburetor remain seated at idle speed

3) - Adjust both idle mixture screws on each carburetor (rear carburetor first, front carburetor second) for highest vacuum reading and engine RPM with best engine idle "feel".

4) - Reset engine idle speed (2 above).

5) - Repeat idle mixture screw adjustment (3 above).

6) - Check and reset engine idle speed (2 above)

►*THROTTLE LINKAGE ADJUSTMENT:* Remove carpet adjacent to accelerator pedal. Remove air cleaners and throttle pull back springs on carburetors. With REAR carburetor throttle valves wide open, accelerator pedal should be 3/8" from toeboard. Adjust by changing length of accelerator linkage rod at rear carburetor (remove clip and turn trunnion nut on rod). Holding rear carburetor throttle valves wide open, check FRONT carburetor for throttle valves being wide open and against throttle stop. Adjust by turning nut on front carburetor control shaft. *NOTE* - With correct linkage adjustment, front carburetor throttle valves begin to open with rear carburetor at half-throttle.

►*OTHER CARBURETOR DATA: S "Chevrolet Corvette (Two Carter Carburetors)" in 1956 Annual Data.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK CHOKE VALVE STICKING CORRECTION (Causing Hard Starting):* This condition is caused by air cleaner interference with choke linkage which allows the choke to be held open. Correct by installing a new carburetor-to-air cleaner gasket, Part No. 1458911.

►*1957 BUICK CARBURETOR CHANGES FOR IMPROVED PERFORMANCE:* Make the following changes on carburetors bearing date codes before "B-7". On carburetors with date code "B-7" and later or with date codes having a suffix letter "X", the changes have been made in production. On carburetors having an "X" stamped or scribed adjacent to left front mounting bolt hole, indicates that the changes were made in service. Date codes are stamped on the rear portion of the throttle body flange (brass identification tags are no longer stamped with the date codes).

1) Accelerating Pump Plunger Spring Replacement (To liminate a lean flat spot on light acceleration) - Install pump plunger and spring assembly, Carter No. 64-209S.

2) Secondary Throttle Operating Lever (To eliminate a lean or sag spot) - This condition may be experienced when engine is at normal operating temperature on one-half to seven-eights throttle acceleration. Correct by installing Secondary Throttle Operating Lever, Carter No. 53A-419, noting the following: When installing lever, secondary throttle return spring should be wound one complete turn clockwise. Make sure that the pick-up lever on primary throttle shaft contacts the loose lever at both points at the same time. If not, bend pick-up lever to obtain proper engagement. Also make sure that primary and secondary throttle valves come to wide open position at the same time. Bend throttle connecting link as necessary.

3) Aut matic Ch k Vacuum Pist n (To liminat a l ading c nditi n n arly warm-up) - Install Automatic Choke Piston, Carter No. 160-125.

►*1957 BUICK ENGINE ROUGHNESS & INCORRECT IGNITION TIMING CORRECTION:* On cars having carburetors bearing code dates K-6, L-6, M-6 & A-7 (Stamped on rear portion of throttle body flange), this condition may be caused by distributor vacuum advance operating during engine idle. To check, operate engine at 485 RPM and disconnect vacu m spark line at throttle body. Attach a vacuum gauge to fitting on carburetor and if gauge indicates 5" or more of vacuum, the one throttle valve (primary) which operates vacuum advance unit must be replaced using Throttle Valve, Carter No. 2-208. If for any reason, production throttle valves on the above identified carburetors need replacement, and the vacuum advance operation has been satisfactory, the standard throttle valve, Carter No. 2-186 should be used.

►*1957 CHRYSLER CARBURETOR FLOODING CORRECTION:* This condition is caused by dirt or foreign matter lodging between fuel inlet needle and seat and can be corrected by installing a new fuel inlet needle and seat assembly, Carter No. 25-343S which has a longer standpipe than previous assemblies. When installing this new assembly, thoroughly clean carburetor and fuel filter. *NOTE* - If Carter No. 25-343S is not available, Carter No. 25-279S can be used by cutting off the standpipe section so the overall length is 1 1/16". Remove all burrs and clean thoroughly before installing.

►*1957 FORD & MERCURY SURGE AT 50-60 MPH (DUE TO LEANNESS) CORRFCTION:* Install the following new parts: Primary Venturi Assembly (choke side), Carter No. 58-179S. Primary Venturi Assembly (pump side), Carter No. 58-180S. Vacuum Piston Spring, Carter No. 61-259. Step-Up (Metering) Rod, Carter No. 16-28.

►*1957 FORD & MERCURY SECONDARY JET CHANGE (To correct rich mixture at high altitudes):* When installing 2-step lean step-up rods for high altitude operation (10,000-15,000 ft.), install secondary metering jet, Carter No. 120-186, which supersedes Carter No. 120-176.

►*1957 FORD & MERCURY CHOKE SETTING CHANGE:* Initial choke setting has been changed from 2 points rich to 1 point rich from index.

►*1957 FORD HARD (HOT) STARTING CORRECTION:* Install a new "resinoid" spacer, Part No. B7A-9603-D between carburetor and intake manifold to replace the former aluminum spacer. Heat transfer between manifold and carburetor will be reduced with the later type spacer.

DESCRIPTION: This new carburetor is a four barrel downdraft type having the float bowl (main body assembly) cast integrally with the throttle body. The primary section contains a low speed (idle) system, high speed system, choke, accelerating pump, dashpot, and vacuum operated metering rods. The secondary section contains only a high speed system. Two separate float bowls are used, each of which supply fuel to both the primary and secondary sections.

Fuel System: A single fuel inlet and passages in air horn casting direct fuel to right and left hand float bowls. Floats operate independently of each other and the float bowls are vented to the air cleaner with a connecting passage between the bowls to maintain a uniform air pressure on the fuel.

Idling & Low Spe d (Primary Sid)—Fuel for idling and early part throttle operation is metered through the low speed circuit on primary side only (secondary throttle valves remain closed). With primary throttle valves closed or at idle position, fuel enters the idle wells through the main metering jets and is metered in the low speed jets. As the fuel passes the economizer, air enters the by-pass and air bleeds and the mixture is discharged at the idle discharge ports and the idle mixture adjustment screw ports in both primary throats.

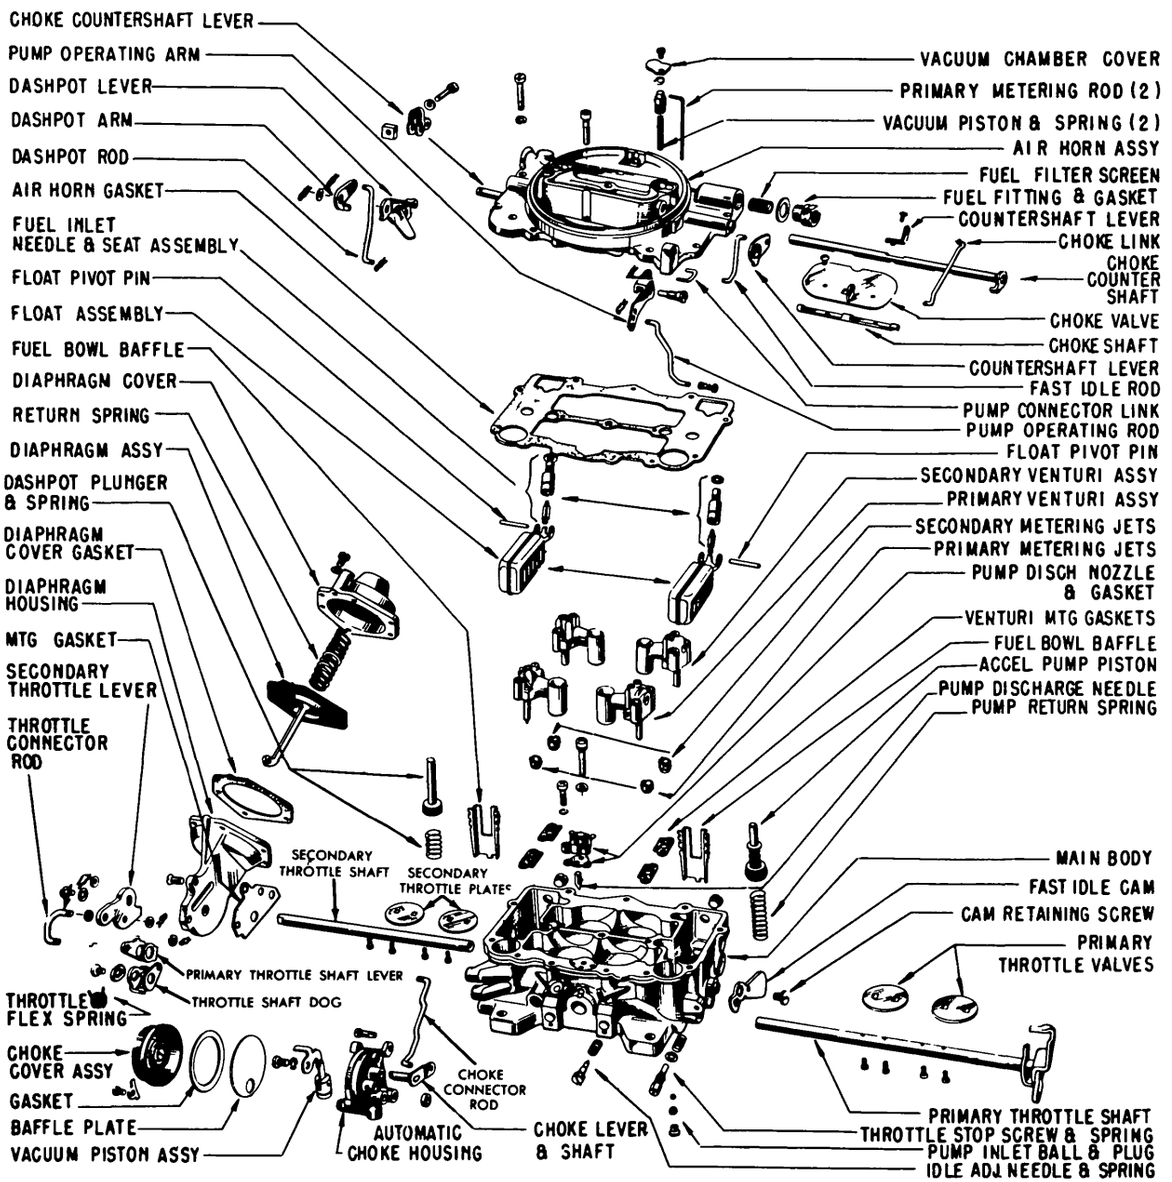
High Speed (Primary Side)—As primary throttle valves are opened, manifold vacuum at idle ports drops, diminishing fuel-air flow through idle system. At this point, venturi vacuum is increased causing fuel to flow from the high speed nozzles, with the amount of fuel delivered being governed by throttle valve opening and the position of the main metering rods in main metering jets. The position of the main metering rods (one for each primary barrel) is controlled by manifold vacuum applied to the vacuum piston. The metering rods do not require adjustment. As the vacuum existing in primary venturi draws fuel from primary main metering jet and main well up to the high speed nozzle, the fuel passes through the main well tube and is mixed with air which enters the vent tube through the primary venturi high speed air bleed. The air-fuel mixture is then discharged from high speed nozzle into carburetor venturi. The high speed air bleed also acts as an anti-percolator vent when engine is hot.

High Speed (Secondary Side)—Fuel for the high speed circuit of the secondary side is metered through secondary metering jets, and with secondary system supplementary at high speeds only, metering rods are not used. When secondary throttle valves are opened, fuel is drawn from secondary metering jets and wells, through the secondary venturi main well, where it is mixed with air from secondary venturi air bleed and discharged out of the secondary high speed nozzles.

Accelerating Pump (Primary Sid): Pump is conventional type with pump plunger linked to primary throttle valve lever. When the throttle is opened, the pump plunger moves downward and forces fuel out through pump discharge ports. Intake and discharge ball checks are provided in the pump circuit to prevent air being drawn into the system or fuel being forced back into the bowl. During high speed operation, a vacuum exists at pump discharge ports. To prevent fuel from being drawn into pump through pump circuit and out the ports, the pump jets are vented by a cavity between pump jet restrictions and discharge ports. This allows air instead of fuel to be drawn through the pump discharge ports.

Automatic Choke (Primary Sid): Conventional type Carter Climatic Control with thermostatic coil.

Automatic Secondary Throttle C ntr l (F rd & M rcury): Consists of a diaphragm type vacuum control unit which opens and closes the secondary throttle valve in accordance with air velocity through primary venturi (vacuum passage at primary venturi is connected with a vacuum passage in secondary venturi). When secondary throttle valves are closed, the primary venturi vacuum is bled off through the secondary vacuum ports. When accelerator is fully depressed, the second-



CONTINUED ON NEXT PAGE

CARTER AFB 4-BARREL CARBURETORS (C nt.)

ary throttle valves, through linkage are forced a few degrees off the closed position, and close the secondary vacuum ports, causing the vacuum to be applied directly to diaphragm control unit, opening the secondary throttle valves fully. A mechanical overriding linkage insures that secondary valves will always close with the primary throttle valves.

Auxiliary Throttle Valve (Buick & P ntiac): Velocity valves located directly over secondary valves (action is controlled by counterweights on shaft and valves are not operated by throttle linkage).

Spring Loaded Primary Throttle Linkage (Ford & Mercury): Consists of a torsion spring on the throttle shaft between the flex dog and throttle spring arm with a stop pin located on the throttle shaft dog. Special throttle linkage adjustment required (see "Adjustment" below).

CARTER AFB 4-BARREL CARBURETOR (FORD & MERCURY)
(BUICK, CHRYSLER & PONTIAC SIMILAR—SECONDARY VACUUM UNIT NOT USED)

ADJUSTMENTS: *Make all adjustments as indicated below.*

Idle Setting: *Adjust only with engine at normal operating temperature with automatic choke not operating (choke valve wide open, fast idle inoperative so that engin idles at hot or slow idle speed).* If initial adjustment required to allow engine to be started and warmed up, set both idle adjusting screws as indicated in table below (use tachometer), then adjust each idle mixture adjusting screw (one screw for each primary barrel—two screws only) until engine idles smoothly and RPM is at maximum.

Idle Mixture Setting

Car & Carb.	Idle Screw Op ning
Buick 2507S	¾-1¾ turns
Chrysler 2448S, 2686S	¼-1¾ turns
Ford 2441S, SA	½-1½ turns
Mercury 2441S, SA	½-1½ turns
Pontiac 2506S	1-2 turns

Idle Speed Setting

Car	Synchro-mesh	Auto. Trans.
Buick		① 485 RPM
Chrysler		② 500 RPM
Ford	475-500 RPM	② 425-500 RPM
Mercury	475-500 RPM	② 425-500 RPM
Pontiac	③ 450-470 RPM	②③ 430-450 RPM

① - With transmission selector lever in "N" (Neutral)
② - With transmission selector lever in "D" (Drive)
③ - 500-520 RPM with Air Conditioner unit turned "OFF"

Accelerating Pump: Back off idle speed screw until throttle valves seat in bores of carburetor (make sure choke is wide open so fast idle cam does not hold throttle valves open). Place pump operating rod in center hole (Ford & Mercury), and measure the distance from top of air horn to top of plunger shaft (Ford & Mercury), from top of bowl cover to top of plunger shaft (Buick, Chrysler & Pontiac) This measurement should be as indicated below Adjust by bending throttle connector rod at lower angle

Accelerating Pump Setting

Car & Carb.	Setting
Buick 2507S	33/64"
Chrysler 2448S, 2686S	7 16"
Ford 2441S, SA	① 15/32"
Mercury 2441S SA	① 15 32"
Pontiac 2506S	15/32"

① - This supersedes previous setting of 27/64"

Metering Rods: *No adjustment required. Metering rods are not used on secondary side.*

Float Setting: Align float by sighting down side of float to determine if side of float is parallel to outer edge of horn casting. To adjust, bend float lever by applying pressure to end of float shell with fingers while supporting float lever with the thumb *(CAUTION–Apply only enough pressur to bend float l ver).* After aligning float, remove as much clearance as possible between arms of float lever and support lugs on air horn by bending both arms of the lever. Arms should

CONTINUED ON NEXT PAGE

CARTER AFB 4-BARREL CARBURETORS (C nt.)

be parallel to inner surfaces of support lugs and float must operate freely without excess clearance on hinge pin.

Float Level–*Both floats are set to the same height.* With air horn inverted, bowl cover gasket in place and needle seated, measure the distance between top of float at outer end and air horn gasket with the proper gauge (see table below). Adjust by bending float arm.

Float Level Setting

Car & Carb.	Height	Gauge No.
Buick 2507S	7/32"	T109-106
Chrysler 2448S, 2686S	5/16"	T109-107
Ford 2441S, SA	5/32"	T109-154
Mercury 2441S, SA	5/32"	T109-154
Pontiac 2506S	© 17/64"	T109-238

© -Plus or minus 1 64"

Float Drop (All Models)–23/32" with bowl cover held in upright position and measured from outer end of float to bowl cover gasket. Adjust by bending stop tabs on float bracket.

Automatic Choke: See table below for settings. Adjust by loosening choke cover screws and rotating cover and coil assembly. Then adjust Choke Piston Lever and Choke Shaft Lever.

Automatic Choke Setting

Car & Carb.	Choke Setting
Buick 2507S	Centered (At Index)
Chrysler 2448S, 2686S	One Point Rich
Ford 2441S, SA	© One Point Rich
Mercury 2441S, SA	© One Point Rich
Pontiac 2506S	Centered (At Index)

© - Supersedes previous setting of 2 Points Rich

Ch ke Piston Lever Adjustment: Buick & Pontiac 045" (Gauge T109-158), Chrysler 040" (Gauge T109-193), Ford & Mercury 086" (Gauge T109-215) clearance between choke lever and stop in piston housing with choke held closed To adjust, bend choke connector rod (Buick, Chrysler & Pontiac), remove slack from linkage by setting choke countershaft lever (Ford & Mercury)

Ch ke Shaft Lever Adjustment (Exc. Chrysler): 010" (Gauge T109-200) clearance between lug on outer choke shaft lever (Buick & Pontiac), outer countershaft lever and stop on inner lever with choke valve tightly closed and fast idle cam against stop on casting (Ford & Mercury) To adjust bend fast idle connector rod (Buick & Pontiac), bend lug on outer countershaft lever (Ford & Mercury)

► *FORD, MERCURY & FONTIAC OPTIONAL CHOKE SHAFT LEVER ADJUSTMENT (LATER CARBURETORS).* With slight clearance between lug on fast idle cam and stop on flange casting, and with inner countershaft lever contacting lug on outer countershaft lever, align index mark on cam with adjusting screw To adjust, bend fast idle connector rod

Chok Shaft Lev r Adjustm nt (Chrysler): With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever, align center of fast idle screw with index mark on cam To adjust, bend fast idle connector rod

Fast Idl : This adjustment can be made with carburetor either on or off the car.

Fast Idle Adjustment - Off Engine (Exc. Chrysler) - With choke valve tightly closed and fast idle adjusting screw on high step of fast idle cam, insert a feeler gauge (see table below) between lower edge of primary throttle valve and throttle bore on side opposite idle ports Turn fast idle screw as necessary to obtain correct adjustment

Fast Idle Adjustment - Off Engine (Chrysler) - With choke valve tightly closed clearance between lower edge of throttle valve and bore of carburetor should be 012" (Gauge T109-200) with center of fast idle adjusting screw aligned with index mark on fast idle cam

Fast Idle Setting (Off Engine)

Car & Carb.	Checking Gauge Size & No.
Buick 2507S	.026" T109-189
Ford 2441S, SA	.020" T109-29
Mercury 2441S, SA	.020" T109-29
Pontiac 2506S	.030" J-1388

Fast Idle Adjustment - On Engine (All Models) - With engine at normal operating temperature, transmission in neutral, and air cleaner in place on carburetor, rotate fast idle cam so fast idle screw is on high step of cam (Except Chrysler) so fast idle screw is aligned with index on cam (Chrysler) Adjust fast idle screw to obtain an engine speed as indicated below

Fast Idle Setting (On Engine)

Car & Carb.	Engine RPM
Buick 2507S	1500 RPM
Chrysler 2448S	1450-1500 RPM
Chrysler 2686S	1300-1350 RPM
Ford 2441S, SA	1800-2000 RPM
Mercury 2441S, SA	1800-2000 RPM
Pontiac 2506S	1900 RPM

Unloader: After Choke Rod adjusted (see above), rotate primary throttle valves to wide open position. Use gauge indicated (see table below) to check clearance between upper edge of choke valve and wall of air horn. To adjust, bend unloader lip on primary throttle shaft lever with tool T109-214.

Unloader Setting

Car & Carb.	Checking Gauge Size & No.
Buick 2507S	3 16" T109-28
Chrysler 2448S, 2686S	1 4" T109-31
Ford 2441S, SA	067" T109-234
Mercury 2441S, SA	067" T109-234
Pontiac 2506S	1 8" T109-36

Dashpot (Ford & Mercury): With primary throttle valves in wide open position there should be a distance of 7/16" between top surface of bowl cover and bottom of dashpot arm lever. To adjust, bend dashpot inner arm tang with Tool T109-22.

Auxiliary Throttle Valves (Buick & Pontiac): Velocity type valves. No adjustment required.

S c ndary Throttle L ver Adjustment (Chrysler): Block choke valve wide open With 19 64" clearance between lower edge of primary valve and bore opposite the idle ports, secondary valves should just start to open To adjust, bend operating rod *(NOTE - At wid open throttle primary and secondary valves will reach full vertical position)* With primary and secondary throttle valves in tightly closed position there should be 017-022" (Gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary throttle lever

Secondary Throttle Lever Adjustment (Buick & Pontiac): Fully open primary and secondary throttle valves. Stop lugs on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust, bend secondary throttle operating rod at angle. *(NOTE–Secondary throttle valves will be a few degrees from vertical at wide open throttle).* With primary and secondary throttle valves in tightly closed position, the clearance between positive closing shoes on primary throttle levers should be 017-022" (Gauge T109-29) To adjust bend shoe on primary lever (Buick), secondary lever (Pontiac).

Secondary Throttle Lockout Adjustm nt (Buick, Chrysler & Pontiac): Crack throttle valves and manually open and close choke valve Tang on secondary throttle lever should freely engage in notch in lockout dog To adjust, bend tang on secondary throttle lever

Spring Loaded Primary Throttle Linkage (Sec ndary Throttle Operation): (Ford & Mercury)–With primary throttle valves in wide open position there should be a clearance of .015" (Gauge T109-44) between edge of secondary throttle valves and bore of carburetor adjacent to primary throttle valves. To adjust, bend rear tang (closest to diaphragm housing) on primary throttle shaft dog *(NOTE–To decrease clearance, bend tang toward end of spring).* With primary and secondary throttle valves in tightly closed position, there should be a clearance of .067" (Gauge T109-234) between primary throttle shaft flex spring and front (closest to choke housing) tang of primary throttle shaft.Dog. To adjust, bend tang with Tool T109-214.

Automatic Secondary Throttle Control (Ford & Mercury): This unit requires no adjustment. See that linkage is free and that there are no vacuum leaks between carburetor body and unit.

Buick Vacuum Starter Switch Timing Ch ck (On Car): Back off throttle stop screw and rotate fast idle cam to slow idle position, then fully close throttle valve *(CAUTION* - Make sure that dashpot does not prevent full closing of throttle) Measure distance from diaphragm flange of dashpot to near edge of dashpot arm on throttle lever. With ignition turned on, slowly open throttle while holding scale in position against flange of dashpot When cranking motor is energized note distance from flange of dashpot to near edge of dashpot arm. Subtract the two measurements If switch is properly timed, the difference should be 3 8-11 16" Adjust by changing timing shims located below contact spring in terminal cap

OVERHAUL: *CAUTION - When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled*

CONTINUED ON NEXT PAGE

CARTER AFB 4-BARREL CARBURETORS (C nt.)

Disass mbly: This carburetor consists of two main subassemblies (Air Horn & Main Body) which can be overhauled separately Remove air horn from main body as follows On all carburetors except Ford & Mercury, disconnect choke connector rod at choke shaft lever, then disconnect throttle connector rod at pump arm On Ford & Mercury remove air cleaner anchor screw then remove dashpot arm operating lever and choke countershaft lever On all cars disconnect fast idle connector rod at choke lever (choke countershaft lever on Ford & Mercury) On Ford & Mercury disconnect accelerating pump operating rod at pump arm On all cars remove air horn to main body attaching screws and lockwashers and remove air horn from main body by carefully lifting air horn assembly straight up

Air Horn - Remove fuel inlet strainer nut gasket and screen Remove power piston cover plate attaching screws and remove cover plate Remove both metering rods (step-up rods) If necessary rods may be separated from pistons Remove the two power piston springs On all cars except Ford & Mercury remove pump arm and link On Ford & Mercury remove pump plunger assembly Remove hinge pin float and float needle assemblies and mark for proper identification so they can be reassembled in the same location On all cars except Ford & Mercury remove screw and remove inner and outer choke shaft levers and washer Remove choke valve screws and remove choke valve and choke shaft On Ford & Mercury remove choke valve connector link, then slide choke valve countershaft out of air horn assembly Remove choke valve then remove choke valve shaft by sliding it out of air horn Remove and discard air horn gasket

Main Body - On Cadillac remove choke modifier rod at operating lever then loosen clamp screw on choke coil lever and remove lever On all cars remove three screws attaching coil housing to main body and remove coil housing and thermostatic coil Remove housing gasket and baffle plate To disassemble choke remove choke lever attaching screws and retaining washer then remove choke piston lever and link assembly by rotating piston in bore On Buick remove starter switch terminal cap return spring guide block assembly plunger and ball On all cars remove pump discharge nozzle assembly and gasket then remove primary and secondary venturi assemblies *(CAUTION - Venturi assemblies must be marked for reassembly in the same location)* Remove two primary and two secondary metering jets and mark them for reassembly in the same location On Buick Cadillac & Pontiac remove the auxiliary throttle valve assembly On all cars remove the pump return spring idle mixture screws and springs On Buick if starter switch strainer is not visibly damaged or clogged it need not be removed On all cars remove the pump return spring idle mixture screws and springs On Cadillac remove the large idle air adjustment screw and spring On all cars invert carburetor body and remove pump discharge check needle With body inverted remove pump intake screw plug, check ball seat and check ball Remove fast idle cam attaching screw and cam, then on all cars except Ford & Mercury remove spacer and lockout lever throttle operating rod throttle shaft washer secondary throttle lever and spring On Ford & Mercury remove throttle connecting rod, disconnect secondary operating diaphragm lever, then remove secondary throttle operating lever Remove secondary diaphragm housing cover return spring and diaphragm then remove diaphragm housing and gasket from main body On Cadillac, remove choke modifier operating lever On other cars remove throttle shaft arm throttle shaft dog and inner throttle shaft arm and flex spring from end of primary throttle shaft on choke side *NOTE - It is recommended that throttle body not be disassembled further, however, if necessary to remove throttle valves and shafts, proceed as follows* Mark all throttle valves so they can be reinstalled in the proper position with correct side of valve upward File burrs from staked ends of all throttle valve screws and remove screws and valves from shafts Remove secondary throttle shaft Remove primary throttle shaft using a rawhide hammer to tap shaft through retaining washer

Cleaning & Inspection: Clean all metal parts in carburetor cleaner and dry with compressed air *(CAUTION - Do not wash accelerator pump plunger assembly or thermostatic coil and cover assembly in cleaning solvent)* Clean and blow out all passages with air Remove any gum deposits in carburetor Clean carbon out of bowl assembly heat passages Make sure that all calibrated restrictions such as idle ports air bleeds and vents are clean but do not pass drills or wires through these passages Check all shafts and their bearing bores for wear Check each piston in its cylinder Check for worn or damaged jets and worn holes in ends of various levers Check accelerator pump plunger leather and replace as an assembly if leather is creased or cracked Examine float needles and seats and if needle is grooved replace needle and seat assembly Check idle mixture adjusting screws for burrs ridges or grooves and replace screws if necessary Check floats for dents or leaks and check hinge pin bores for burrs or wear and check pins for straightness Clean fuel inlet screen Check fast idle cam for excessive wear on steps and replace if necessary On Buick Cadillac & Pontiac check auxiliary throttle valve assembly to make sure it is free to swing and that weights do not rub on casting On all cars carefully check body assembly and valve assembly for wear at throttle valves and bores and between shafts and their bores On Ford & Mercury check secondary throttle diaphragm housing for cracks and check dashpot plunger leather for damage or wear Make sure the intake check and discharge restriction is free of lint gum or other foreign matter

Reassembly: Use all new gaskets Install parts in reverse order of disassembly procedure(above) and note the following

Valve Installation - Use new screws when installing valves Install valve shafts, then install valves in their respective bores with "C" in circle toward manifold side of carburetor Install new screws but do not tighten Make sure the idle speed adjusting screw is backed out then hold valves in place with fingers pressing on high side of valve Tap valves lightly with a screwdriver to seat them in the bores and while holding in this position tighten the screws securely Stake screws in place by squeezing with pliers

THROTTLE VALVE SETTING

Carb. No.	① Idle Port Opening	Vacuum P rt
2441S SA	187- 193"	② 040- 050"
2448S 2686S	142- 148"	② 026- 034"
2479S 2480S	082- 088"	③ 002- 003"
2506S	147- 153"	② 025- 035"
2507S	156- 162"	④⑤

① - Primary side (none on secondary) Above top edge of fully closed throttle valve

② - Top of port above top edge of fully closed throttle valve

③ - Bottom of port above lower edge of fully closed throttle valve

④ - Bottom of port above top edge of fully closed throttle valve

⑤ 000 010" (Early with valve No 2-186) 008- 016" (Late with Valve No 2-211)

Buick Vacuum Starter Switch Installation - Install starter switch ball plunger (with groove up) guide block assembly return spring terminal cap and screws in main body

Ford & Mercury Secondary Throttle Operating Diaphragm Installation - Install secondary throttle diaphragm housing with a new gasket and stake the screws into indentations with a prick punch Install secondary operating lever and attached operating rod secondary throttle shaft washer and screw Install secondary diaphragm and gasket in diaphragm housing Temporarily attach diaphragm rod to secondary throttle lever pin Install diaphragm return spring and housing cap with vacuum passage in cap indexing with vacuum passage in housing Install six screws and lockwashers *NOTE* - Diaphragm must be positioned so it is not under tension as the attaching screws are being tightened finger tight Disengage diaphragm rod and securely tighten the six screws Reinstall diaphragm rod and retain with spring retainer

① - Choke side. ② - Pump side. ③ - Supersedes 16-14.

④ - 1 size lean 16-21; 2 sizes lean 16-22. Step-up rod 120-186 used with secondary jet 16-22.

⑤ - Supersedes 58-215S.

⑥ - Supersedes 58-216S.

⑦ - 1 size lean 16-39; 2 sizes lean 16-40

⑧ - Supersedes 58-170S which superseded 58-128S on 2441S with Air Horn 6-1304S which supersedes 6-1224S.

⑨ - Supersedes 58-179S which superseded 58-129S on 2441S with Air Horn 6-1304S which supersedes 6-1224S.

⑩ - Nozzle installed permanently. **Do not remove.**

⑪ - 1 size lean 16-46; 2 sizes lean 16-48U (Unitized Pkg. consisting of 2 step-up rods 16-47 and 2 metering jets 120-185).

1957 CARTER DUAL CARBURETORS

CARTER DUAL "WCD"

RAMBLER — **Carter Carburetor No.**

1957 Six (Powerpack) ..... WCD 2350S

1957 Six (Flash-O-Matic Powerpack) ..... WCD 2586S

►CHANGES, CAUTIONS, CORRECTIONS

► *CARBURETOR INSPECTION & INSTALLATION CAUTIONS (TO CORRECT FLASH-O-MATIC TRANSMISSION 1-2 SLIPPAGE OR 2-3 FILE-UP IN D1 RANGE):* Vacuum for transmission Solenoid & Vacuum Control is supplied from carburetor passage which terminates in two ports in carburetor as follows: 1) Vacuum port at throttle edge, 2) In carburetor mounting flange at choke vacuum supply passage. In correcting above transmission complaints, inspect carburetor and observe cautions as follows:

1) Carburetor Vacuum Ports - Check port at throttle edge for correct size (.0465") and make certain passages are not restricted. With throttle valves tightly closed, top edge of this port should be flush with bottom edge of valve.

2) Carburetor Mounting Flange & Gasket - Inspect mating surfaces of carburetor flange and manifold for unevenness, burrs, or chipped areas. These surfaces can be cleaned up by using crocus cloth on a surface plate. Inspect gasket for swelling at the vacuum port and channel area

DESCRIPTION: Dual downdraft carburetors with automatic choke. Same design as used on previous models except as noted below.

Carter 2586S Flash-O-Matic Carburetor Note - This carburetor has additional Vacuum Port at throttle edge for transmission control. With throttle valve tightly closed, top of port should be flush with butt edge of throttle valve.

ADJUSTMENT: *Set these carburetors to the following specifications:*

IDLING ADJUSTMENT

► *CAUTION - Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative.*

Idle Mixture Screw Setting

Car	Idle Screw Opening
Rambler	½-1½ turns

Idle Speed Setting

Car	Synchro-mesh	①Auto. Trans.
Rambler	550 RPM	② 475 RPM

① - With Selector Lever in Neutral.

② - 500 RPM with Air Conditioning turned on.

ACCELERATING PUMP

Pump Stroke Check - Back off idler screw to fully close throttle valves and have choke valve wide open. Place straight edge across dust cover boss at pump arm. Bend throttle rod at upper angle (Tool T109-213) until pump arm is parallel with straight edge.

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

METERING ROD ADJUSTMENT

►*CAUTION—Adjust metering rods AFTER Pump Stroke adjustment has been completed.*

Metering Rod Check— Check and adjust rods as follows: Back off throttle lever stopscrew so that throttle valves tightly closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover), press down on vacumeter link until both metering rods just bottom in carburetor casting, rotate metering rod arm until finger on arm contacts lip on vacumeter link, tighten clampscrew *(CAUTION*—do not disturb arm position).

FLOAT LEVEL SETTING

►*RAMBLER "SPLIT" FLOAT NOTE.* Float assembly consists of two floats (right & left hand) and auxiliary lever Floats are adjusted in same manner as on other carburetors and should be set for uniform height (float level or vertical adjustment)

Float Level Setting—With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket, install correct gauge on cover directly under floats with notched portions of gauge fitting over edge of cover casting. Sides of floats should just barely touch vertical legs of gauge (lateral adjustment). Adjust by bending arms of floats Both floats should just clear horizontal portion of gauge (vertical adjustment).

►***FLOAT SETTING CAUTION—Floats must be adjusted laterally (parallel to gauge uprights) as well as vertically (Float Level figure in table below).***

Float Level Setting

Car	Float Level	Checking Gauge
Rambler	5/32"	T109-196

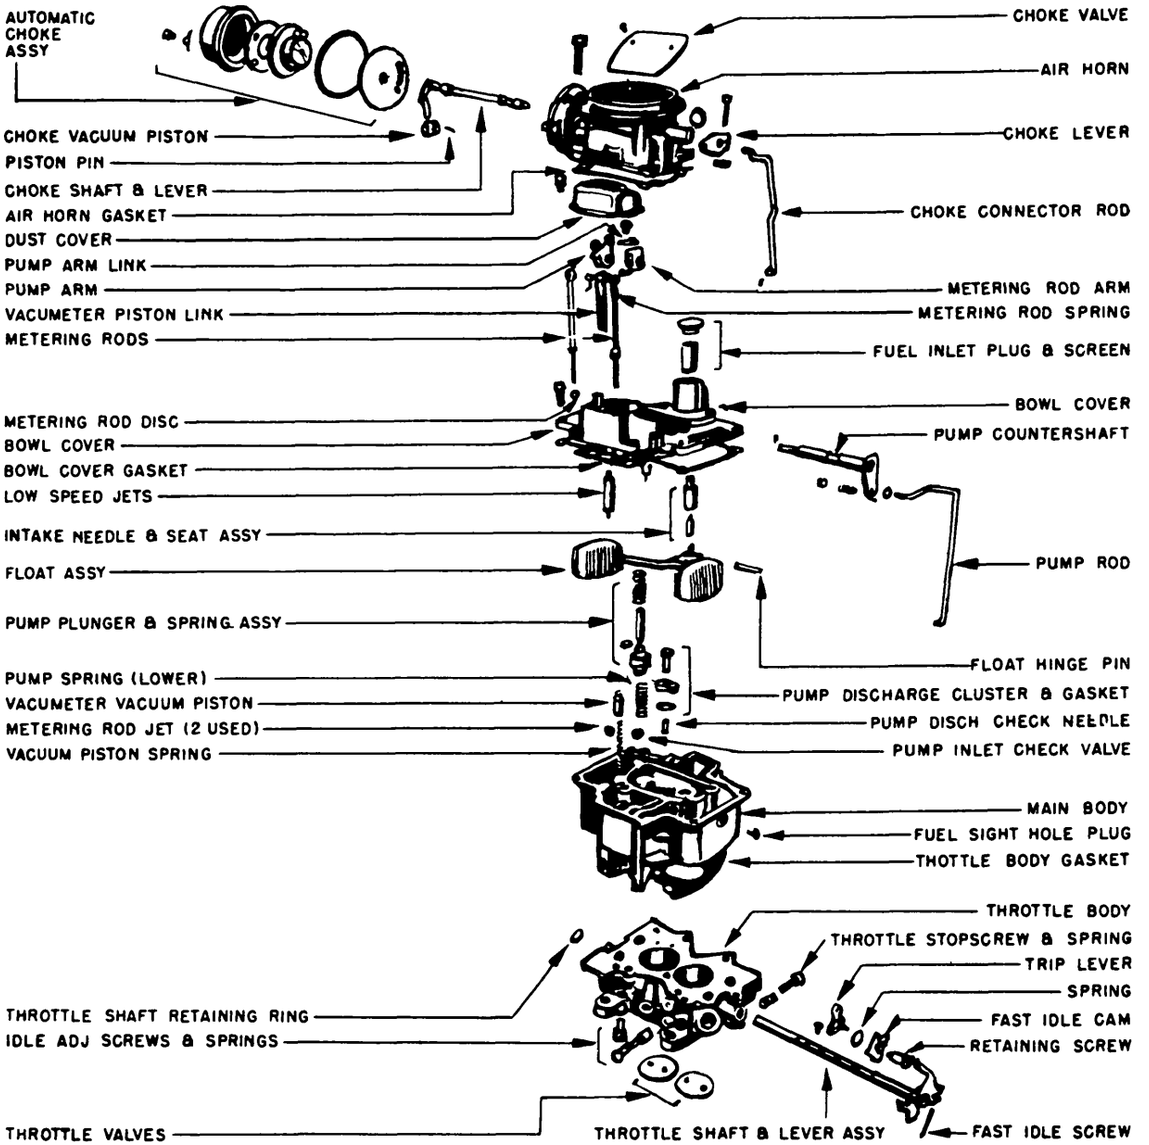
CLIMATIC CONTROL (CHOKE) SETTING

Car	Choke Setting
Rambler	Centered (At Index)

FAST IDLE SETTING

CAUTION—TWO settings (1) and (2) required as explained below.

(1) Fast Idle Cam Clearance—Loosen choke valve lever clampscrew on choke shaft, insert gauge of correct thickness (See Checking Gauge (1) in table below) between lip of fast idle cam and boss on flange casting, hold choke valve tightly closed, remove all slack from linkage by pressing choke valve lever toward closed position, tighten choke valve lever clampscrew.



(2) Fast Idle Screw Setting—Hold choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite idle ports is correct (see Checking Gauge (2) in table below

Fast Idle Setting

Car Mod l	S tting & Checking Gauge (1)	(2)
Rambler	010" T109-200	020" T109-29

UNLOADER SETTING

►*CAUTION—Fast Idle Cam Clearance (Fast Idle Setting (1) above) must be adjusted befor Unloader Setting is adjusted*

CARTER "WCD" DUAL CARBURETOR

Unloader Setting—Check choke valve opening with throttle valve held wide open. Adjust by bending unloader lip on throttle shaft lever using bending tool T109-41.

Unloader Setting

Car	Choke Opening	Checking Gauge
Rambler	3/16"	T109-28

THROTTLE VALVE SETTING

Car	Idl P rt	Vacuum Spark P rt
Rambler	① 074- 080"	① 033- 043"

① - Top of port above top edge of valve

Carter 2586S Note - This carburetor has additional Transmission Control vacuum port Top edge of this port should be flush with bottom edge of valve

OVERHAUL: *See "Carter WCD" in Carburetion Secti n f 1955 Final Data or later Manual editions.*

SERVICE PARTS

Gask t Set - Carter No 285 (All Models)
R pair Pkg. (With Std. M t ring R d) - Carter No 1836 (All Models)

CARTER DUAL "WGD"

BUICK	Carter Carburetor No.
1957 Series 40 (Synchro-mesh)	WGD 2529S
1957 Series 40 (Dynaflow)	WGD 2536S
RAMBLER	
1957 V8 Series 5720	WGD 2352S, SA

►CHANGES, CAUTIONS, CORRECTIONS

►*BUICK PERFORMANCE IMPROVEMENTS (Synchro-mesh Cars with Carter 2529S Carburetor):* Parts listed below are used in later carburetors and can be installed in earlier carburetors to improve performance and correct complaints as indicated:

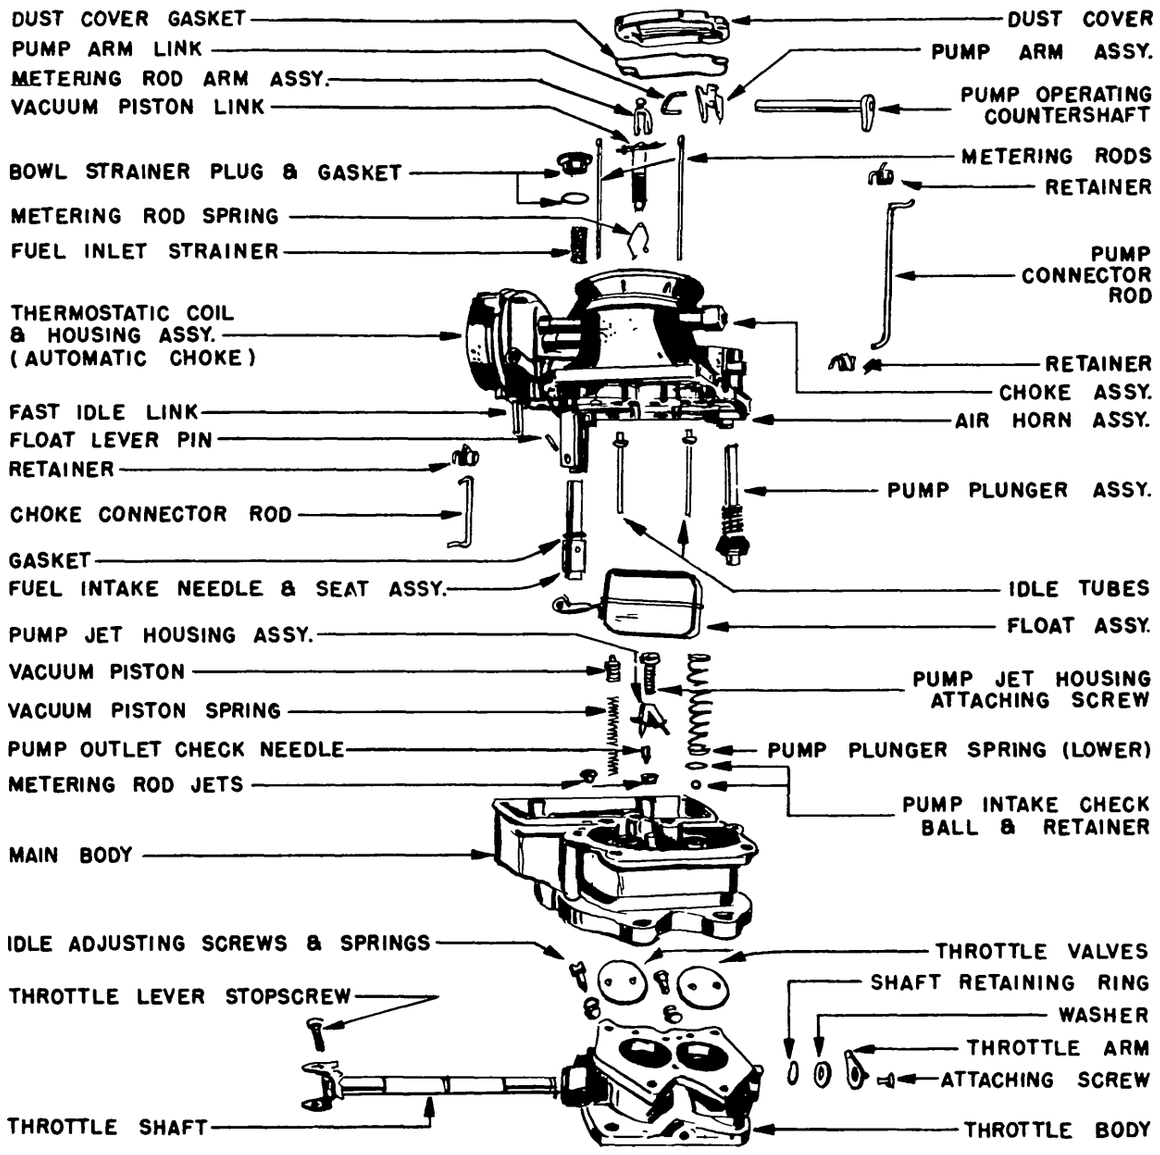
1) Lean Part Throttle Condition at 30-40 MPH - Install parts furnished in Unitized Kit, Carter No. 75-1383U (Buick No. 1180737) as listed below. This pump spring is included in new Pump Plunger, Rod, Spring, & Retainer Assy., Carter No. 64-208S (Buick No. 1180623). This Pump Plunger Assembly will be included in revised Repair Pkgs. and supersedes previous type assembly No. 64-200S.

Carter Unitized Pkg. No. 75-1383U

Part	New No.	Superseded No.
Metering Rods	75-1371	② 75-1348
Pump Plunger Spring ①	61-601	

① - Part of Pump Plunger Assy. No. 64-208S.
② - This rod now 1 Size Lean.

2) Loading During Warm-up Condition - Replace original Vacuum Piston in automatic choke housing with new type, Carter No. 160-122 (Buick No. 1179336), and change Automatic Choke Setting to 1 Point Lean (was 1 Point Rich). Also set Fast Idle Speed (on engine) to 1800 RPM (was 1500 RPM) as directed below. *NOTE* - Previous type Choke Vacuum Piston, Carter No. 160-157, is continued on 2536S carburetors.



DESCRIPTION: Dual (double barrel) downdraft carburetors of same design used on previous Buick and Nash models. Buick carburetor has different Fast Idle Mechanism than that used on Rambler and each type is adjusted differently as detailed below.

ADJUSTMENTS: *Make all adjustments exactly as follows:*
Idle Setting: Adjust only with engine at normal operating temperature. With engine idling at correct hot or slow idle speed, adjust each idle mixture adjusting screw as follows: Turn screw in until engine begins to run unevenly due to lean mixture, then turn screw out until engine rolls due to rich mixture, finally turn screw in just enough for smoothest engine operation. Recheck idle speed.

Idl Mixtur Setting

Car	Idle Screw Setting
Buick ①	½-1½ turns
Rambler	½-1½ turns

① - Initial setting (for Warm-up) ¾ turn open.

CARTER TYPE WGD CARBURETORS

Idle Speed Setting

Car	Synchro-mesh	③ Auto. Trans.
Buick ②	485 RPM	485 RPM
Rambler	550 RPM	⑩ 475 RPM

② - Initial setting (for Warm-up) 1 turn in from point where screw contacts stop with throttle valves fully closed.
③ - With selector lever in Neutral.
⑩ - 500 RPM on Air Conditioned Cars with air conditioning turned ON.

Dashpot Adjustment (Buick): Used on Dynaflow Cars. *See Throttle Linkage Adjustment under CARBURETOR on car model page for Dashpot Adjustment.*

Accelerating Pump: Check pump stroke as follows: Remove dust cover over pump countershaft. On Buick, make certain that pump link connected in outer (long stroke) hole of pump arm. Back off throttle stopscrew so that throttle valves fully closed. Place straightedge

CONTINUED ON NEXT PAGE

CARTER DUAL "WGD" (Continued)

across dust cover boss in line with pump arm Top surface of pump arm should be parallel to straightedge Adjust by bending pump rod at offset using bending tool T109-213

Metering Rods: *CAUTION - Metering rods should be adjusted after Pump Stroke Adjustment completed No gauge required* Remove dust cover, back off throttle stopscrew so that throttle valves fully closed Loosen clampscrew on metering rod arm on pump countershaft, press down on vacuum piston link until metering rods just bottom in carburetor casting Hold link and rods in this position, revolve metering rod arm until tongue on arm just contacts lip on vacuum piston link, tighten clampscrew

Float Level: Remove bowl cover and float assembly and invert assembly so that float hangs freely with needle valve closed Measure distance from face of bowl cover to top of float at center using gauge listed below Adjust by bending float arm Make certain that float operates freely and that hinge pin clearance is not excessive

Float Level

Car	Checking Gauge	Float Level
Buick	⑤ T109-238	17/64"
Rambler	T109-106	7/32"

⑤ Buick No J-818-6

Fast Idle (Buick): Fast idle cam is pivoted on carburetor main body directly above throttle lever and is linked to choke valve lever by a rod TWO separate adjustments required as follows

Choke Lever Clearance - Open throttle to clear fast idle cam and close choke valve fully Rotate fast idle cam against stop on casting With valve and cam held in these positions, measure clearance between lug on outer choke shaft lever and stop on inner choke shaft lever This clearance should be 020" (Carter Gauge T109-29, Buick Gauge J-1388) Adjust by bending lug on outer choke shaft lever using needle-nosed pliers or Buick Tool J-4552

► *ADJUSTMENT NOTE (LATER CARBURETORS)* These carburetors have index mark on fast idle cam and above adjustment can be made as follows With slight clearance between tang on fast idle cam and stop on flange casting and inner choke shaft lever contacting lug on outer choke shaft lever, index mark (line) on fast idle cam should be aligned with fast idle adjusting screw Adjust by bending lug on outer choke shaft lever

Throttle Valve Clearance - To adjust with carburetor off engine, rotate fast idle cam so that highest step of cam is under fast idle screw (right hand screw facing throttle lever side of carburetor), turn screw in until throttle opening is 028" (all models) Measure by inserting No 70 drill between lower edge of throttle valve and carburetor wall *NOTE* - This setting supersedes previous specifications of 018" and 025" To adjust with carburetor on engine, idle engine (engine must be at normal operating temperature with choke valve open), rotate fast idle cam until highest step is under fast idle screw, turn fast idle adjusting screw in until engine speed is 1800 RPM (Synchro-mesh Cars) 1500 RPM (Dynaflow Cars) *NOTE* - This setting supersedes previous specification of 1500 RPM on Synchro-mesh Cars *See "Changes & Corrections" above*

Fast Idle (Rambler): Fast idle mechanism is built in automatic choke housing For access to adjustments, remove thermostatic coil housing, gasket, and baffle plate To adjust with carburetor off engine crack throttle and close choke valve (to allow fast idle cam to assume fast idle position), close throttle valve Throttle valve opening should be 023" Measure by inserting Gauge T109-189 between edge of throttle valve and carburetor wall on side opposite idle ports Adjust by bending choke connector rod at lower angle With carburetor on engine, fast idle speed should be 1700-1800 RPM with engine at normal operating temperature *Adjust Unloader before reassembling automatic choke*

Unloader (Buick): Consists of an arm on the throttle lever which engages the fast idle cam and rotates the cam to open the choke valve when throttle moved to wide open position To check, hold choke valve closed lightly fully open throttle valve which will open choke valve slightly Measure choke valve opening or clearance between upper edge of valve and air horn wall. Use drill rod or Carter gauge as follows Carburetor 2529S - 9/64" (Carter Gauge T109-34), Carburetor 2536S - 3/16" drill (Carter Gauge T109-166 - 11/64") Adjust by bending unloader arm on throttle lever

Unloader (Rambler): To check setting, hold throttle valves in wide open position, close choke valve as far as possible without forcing, measure choke valve opening or clearance between upper edge of choke valve and air horn wall This clearance should be 3/16" (Gauge T109-28). Adjust by bending unloader arm on choke shaft using bending tool T109-213

Automatic Choke: *See "Changes & Corrections" above for Performance Improvements including choke setting change on Buick 2529S Carburetor*

Automatic Choke Setting

Car & Carb.	Choke Setting
Buick 2529S	1 Point Lean
Buick 2536S	Centered (At Index)
Rambler 2352S, SA	Centered (At Index)

Car Starter (Buick): Switch timing can be checked with carburetor on engine on Dynaflow Cars only On all cars, switch can be timed with carburetor off engine as detailed below

Switch Timing (Off Engine) - Connect battery and test lamp across switch terminals so that lamp will light when switch contact is made. See that choke valve is wide open and fast idle cam in hot or slow idle position Close throttle valve against ¼" drill rod inserted between lower edge of valve and carburetor wall at center. Lamp should light indicating that switch contacts are closed. Repeat test with 7/64" drill rod. Lamp should not light. If switch does not operate within above limits, adjust by adding or removing square timing shims located under contact spring. Shims furnished in thicknesses of 006" and 018".

Switch Timing (On Engine - Dynaflow Cars) - Place transmission selector lever in Park and apply parking brake. Back off throttle stopscrew so that throttle valves tightly closed (fast idle cam must be in hot or slow idle position). Place scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever Turn ignition on, open throttle slowly and, at point where starter is energized, again measure distance to nearest edge of dashpot lever The difference between the two measurements should be 5/8-15/16" If switch timing not correct, adjust as for off engine timing (above).

► *NOTE.* After checking switch timing, reset engine idle speed to 485 RPM

OVERHAUL: *See "Carter WGD Carburetors" in 1955 Annual Data or later Manual edition*

SERVICE PARTS: Gasket Set - Carter No. 289 (Rambler), No. 305 (Buick)

Repair Pkg. (With Std. Metering Rods) - Carter No 1867 (Buick 2529S), No. 1868 (Buick 2536S), No 1843 (Rambler 2352S,SA).

CARTER "WE"

STUDEBAKER	Carter Carburetor No.
1957 Champion 57G	WE 2417S
1957 Silver Hawk 6	WE 2417S

DESCRIPTION: Single barrel downdraft type with automatic choke and fast idle. Similar to design used on previous Champion models

ADJUSTMENT: *Set these carburetors to the following specifications.*

IDLING ADJUSTMENT

Idle Screw Setting - ½-1½ turns open. Turn screw out for richer mixture. Adjust only with air cleaner in place and with engine at normal operating temperature (choke valve open, fast idle inoperative).

Idle Speed – 550 RPM (With selector lever in "N" or "P" position on "Flightomatic" Transmission" cars).

ACCELERATING PUMP SETTING

Pump Stroke Setting - Check pump travel after carburetor has been reassembled. Back off throttle stopscrew so that throttle valve tightly closed, remove dust cover. Install Pump Gauge T109-117S on bowl cover with lip of gauge extending over plunger shaft and gauge held vertically, turn nut on gauge until lip contacts top of plunger shaft note gauge reading. Open throttle wide and again note gauge reading Difference in two readings should be 14/64". Adjust by bending throttle connector rod at lower angle using T109-213 bending tool.

METERING ROD SETTING

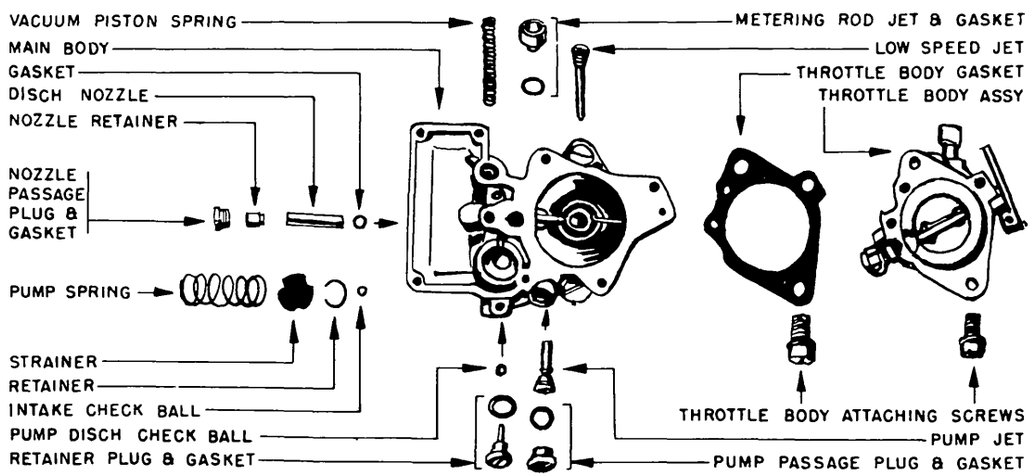
Checking & Adjustment - Remove metering rod and install Metering Rod Gauge No. T109-102 (2.468') in place of the rod making certain that gauge seated in metering rod jet. With throttle stopscrew backed off so that throttle valve tightly closed, press down lightly on metering rod arm so that upper lip of arm contacts pin in pump arm. At this point, clearance between metering rod pin and shoulder of notch in gauge should be less than .005"and gauge should not contact pin Adjust by bending upper lip of metering rod arm using bending tool T109-105. *Then check and adjust lower (economy) lip as follows* - Remove gauge,press down on metering rod arm until upper lip contacts pump arm pin. Clearance between pin and upper surface of lower lip should be 3/16" (Float Level Gauge T109-28 can be used). Adjust by bending the lower lip.

ANTI-PERCOLATOR SETTING

Checking & Adjustment - Crack throttle valve open .030" by placing **large** end of Gauge T109-29 between edge of valve and carburetor wall on side opposite idle port. Clearance between rocker arm lip and pump arm should be .025" (Gauge T109-189 can be used to check this clearance). Adjust by bending rocker arm using bending tool T109-105.

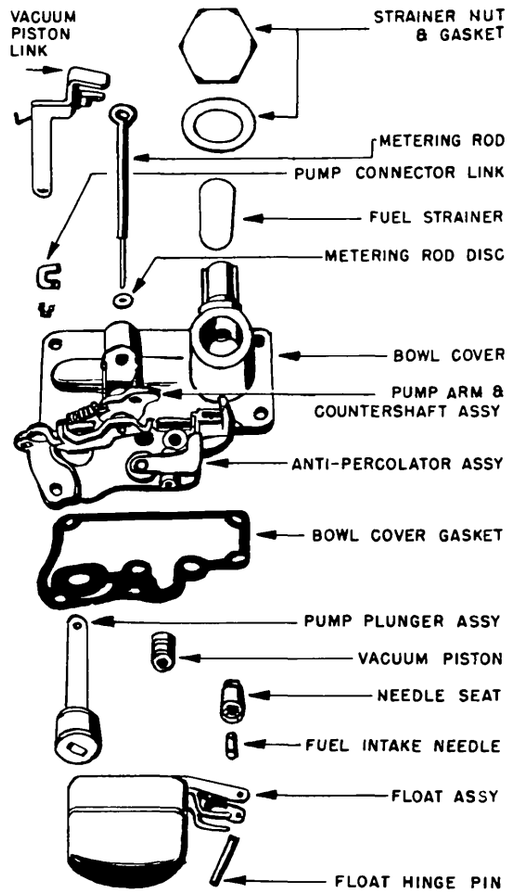
FLOAT LEVEL

Checking & Adjustment - Remove and invert bowl cover assembly so that float in closed position. Measure distance from top of projection on bowl cover to top edge of soldered seam on float using gauge T109-80 (3/8"). Adjust by bending lip on float lever which contacts intake needle.



THROTTLE VALVE SETTING

Idle Port Opening - Top of lower idle port should be .112-.116" above upper edge of throttle valve.



Vacuum Spark Port - Top of port should be .060-.070" above upper edge of throttle valve.

FAST IDLE SETTING

Checking & Adjustment - With thermostatic coil housing, gasket, and baffle plate removed, crack throttle valve to allow choke valve to close, close choke valve, move throttle valve toward closed position as far as possible. Check remaining throttle valve opening which should be .046" (.045" end of gauge T109-158 may be used). If opening not correct, adjust by bending choke connector rod at lower angle using bending tool T109 213. Then adjust Unloader.

"WE" MAIN BODY & THROTTLE BODY ASSEMBLY

"WE" BOWL COVER ASSEMBLY

UNLOADER SETTING

Checking & Adjustment - After fast idle adjustment completed, open throttle valve fully, close choke valve as far as possible without forcing. Check remaining choke valve opening using gauge T109-28 (3/16"). If opening not correct, bend arm on choke trip lever (within choke housing) using bending tool T109-214.

AUTOMATIC CHOKE SETTING

Setting (All Carburetors) 1 Point Lean

Adjustment - Loosen retainer screws around rim of cover, rotate cover and thermostatic coil assembly clockwise (for leaner setting) or counter-clockwise (for richer setting).

OVERHAUL· *See "Carter WE" carburetors in 1955 Annual Data or later Manual edition.*

SERVICE PARTS

Gasket Sets - Carter No. 235.

Repair Pkg. (With Std. Metering Rod) - Carter No 1837

CARTER YF

WILLYS	Carter Carburetor No.
1957 Jeeps CJ-3B, CJ-5, CJ-6	YF 938SA
1957 Jeep Dispatcher DJ-3A	YF 2392S
1957 Utility Wgns. & Truck (4 Cyl.)	YF 951S
1957 Utility Wgns. & Truck (6 Cyl.)	YF 2467S
1957 Forward Control FC-150 (4 Cyl.)	YF 938SA
1957 Forward Control FC-170 (6 Cyl.)	YF 2467S

DESCRIPTION: Single barrel downdraft type of same design as used on previous models.

ADJUSTMENT: *Set following specifications:*

Idle Setting: Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. See table for screw settings. Turn screw out for richer mixture. See Car Model pages for complete tune-up data.

	Idl Setting	
Car & Carb.	Idl Screw Opening	Idle Speed
Willys 938SA, 951S	3/4-1 3/4 turns	600 RPM
Willys 2392S	1/2-2 turns	600 RPM
Willys 2467S	1-2 1/2 turns	550 RPM

Float Setting: Invert air horn and float cover assembly allowing float to hang freely, and measure from top of float at free end to bowl cover (gasket removed). Adjust by bending lip which contacts intake needle - do not bend float arm.

► *CAUTION: On models with spring-loaded intake needle, do not compress this spring when checking float level (will result in false reading and incorrect float setting).*

	Float Setting	
Car & Carb.	Checking Gauge	Float Setting
Willys 951S,938SA	T109-107	5/16"
Willys 2392S,2467S	T109-126	9/32"

Accelerating Pump: Diaphragm type pump with ball check discharge valve (except 2467S), discharge needle (2467S). On 2467S only, check pump adjustment whenever carburetor disassembled or pump linkage disturbed **before** checking and adjusting Metering Rod.

Pump Adjustment (2467S). With idle speed screw backed off so that throttle valves fully seated, press down on on upper end of diaphragm shaft until it is bottomed in diaphragm housing (Tool T109-212 may be used to hold diaphragm shaft down in this position). In this position, metering rod arm should contact pump lifter link at outer end nearest the springs. Adjust by bending pump connector link at lower angle using bending tool T109-213. *CAUTION - Bending link at any other point may cause binding of pump lifter link.*

Metering Rod Adjustment: *No gauge required.* Air horn and bowl cover must be removed for access to metering rod. Back off throttle lever stopscrew so that throttle valve completely closed. Press down on upper end of diaphragm stem until diaphragm bottoms in vacuum chamber (tool T109-212 can be used to hold diaphragm down). Metering rod arm must contact lifter link flat surface between springs and at supporting lug under metering rod pin spring (see note below for first carburetors without this lug) and the metering rod should contact the bottom of the metering rod well at the same instant. Adjust by bending lip of metering rod arm to which metering rod is attached up or down.

Fast Idle: To check fast idle, hold choke valve in wide open position and check to see that lip on fast idle arm is in contact with boss on carburetor body casting. To adjust, bend fast idle arm rod at lower offset.

CARTER "YF" DOWNDRAFT CARBURETOR

	Throttle Valve Setting

Willys, 951S,938SA,2392S	.168-.172"	.035-.045"
Willys, 2467S	.143-.147"	.019-.029"

① - Top edge of port above top edge of throttle valve.

OVERHAUL: *See "Carter YF Carburetor" in 1956 Annual Data.*

SERVICE PARTS: Gasket Set - Carter No. 200 (2392S), No. 206A (938SA, 951S), No. 241A (2467S). **Repair Pkg. (With Std. Mtring Rod)** - Carter No. 1546B (2392S), No. 1559C (951S), No. 1764 (938SA), No. 1849 (2467S).

CARTER "AS" DOWNDRAFT

RAMBLER SIX — Carter Carburetor No.

1957 Synchro-mesh & Overdrive (Early) ..... AS 2580S
1957 Synchro-mesh & Overdrive (Later) ..... AS 2665S
1957 Automatic Transmission (Early) ..... AS 2564S
1957 Automatic Transmission (Later) ..... AS 2664S

▷CHANGES & CORRECTIONS

▷ *CARBURETOR INSPECTION & INSTALLATION CAUTIONS (TO CORRECT FLASH-O-MATIC TRANSMISSION 1-2 SLIPPAGE OR 2-3 FILE-UP IN D1 RANGE):* Vacuum for transmission Solenoid & Vacuum Control is supplied from carburetor passage which terminates in two ports in carburetor as follows: 1) Vacuum port at throttle edge, 2) In carburetor mounting flange at choke vacuum supply passage. In correcting above transmission complaints, inspect carburetor and observe mounting cautions as follows:

1) Carburetor Vacuum Ports - Check port at throttle edge for correct size (.0465") and make certain this passage not restricted. With throttle valve tightly closed, top of this port should be flush with bottom edge of throttle valve.

2) Carburetor Mounting Flange & Gasket - Inspect mating surfaces of carburetor flange and manifold for unevenness, burrs, or chipped areas. These surfaces can be cleaned up using crocus cloth on a surface plate. Inspect gasket for swelling at the vacuum port and channel area. See installation below.

3) Carburetor Installation - Use new type corbestos gasket, Rambler No. 3153999. *NOTE* - If this gasket not available, No. 3108576 ro 3143932 can be used. Gasket No. 3108576 has four 3/16" holes but these holes will not affect operation.

▷ *ENGINE SURGE AT STEADY THROTTLE (Early Cars with Carter 2580S Carburetor):* On cars with carburetors code-dated "J-6" or earlier, this condition can be corrected by installing new Metering Rod, Carter No. 75-1366S, to replace original rod No. 75-1332S. This new metering rod used in production on later 2580S & 2564S carburetors. *NOTE* - Metering rod setting is important and should be checked and adjusted.

▷ *ACCELERATOR LINKAGE BIND (FLASH-O-MATIC CARS):* If carburetor throttle does not return to idle position, check for bind between accelerator linkage vertical rod and manifold vacuum line at left rear corner of cylinder head. Correct by moving vacuum line downward to provide minimum clearance of ½" between vacuum line and rod. *NOTE* - This binding occurs with transmission in reverse, or during heavy acceleration and high engine torque.

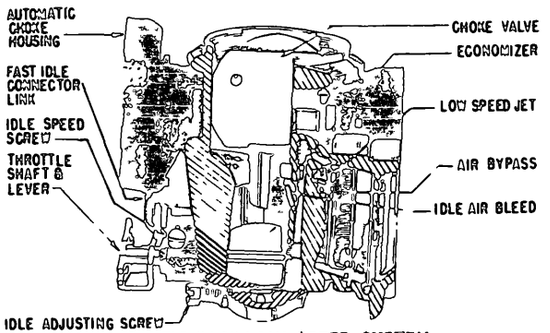
▷ *REPLACEMENT CARBURETOR NOTE:* Only carburetors with transmission vacuum control port (AS 2564S or 2664S) are furnished for service. When used on Synchro-mesh or Overdrive Cars, this vacuum port will not be used. Production carburetors used with Synchro-mesh or Overdrive (AS 2580S or 2665S) do not have this vacuum port.

DESCRIPTION: Single barrel downdraft type of same design used on previous Rambler Six cars beginning 1956. See Replacement Carburetor Note above.

ADJUSTMENTS: Set these carburetors to the following specifications:

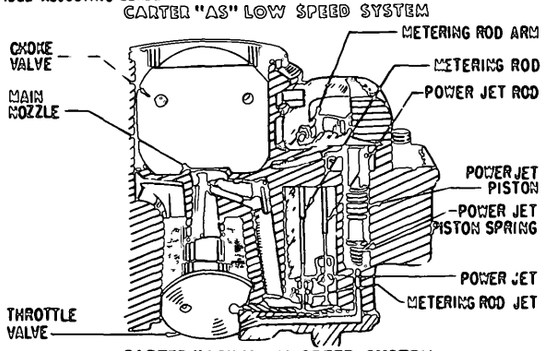
Idling Adjustment: Warm up engine thoroughly, so that choke valve is wide open and fast idle inoperative. See table for idle screw setting. Turn screw out for richer mixture. See car model pages for complete tune-up data.

Idle Mixture Setting



Car & Carb.	Idle Screw Setting
Rambler All Models	¼-1¼ turns

Idle Speed Setting

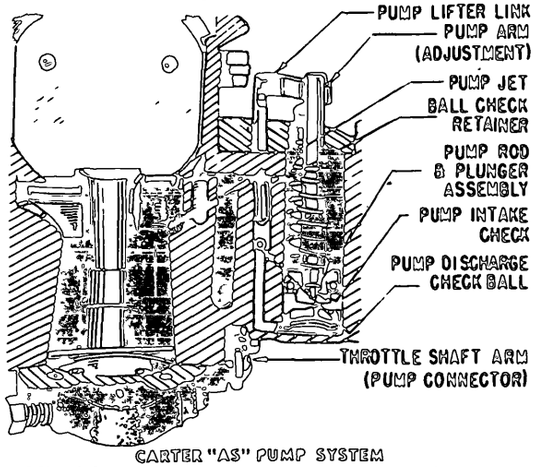


Car & Carb.	S-M & O.D.	Auto. Trans.
Rambler All Models	550 RPM	① 475 RPM

① ~500 RPM in Neutral with air conditioning turned on.

Float Level: *CAUTION - Floats are "split" type and must be checked exactly as follows:* Remove bowl cover, gasket, and float pin retainer. Check each float separately while holding lip of float arm against seated needle (*CAUTION* - Float pin must be at bottom of guide slots). Place gauge squarely on top edge of bowl at free end of float. Ridge on top of float should just contact step on gauge. Adjust by bending lip on float arm. Make certain that floats clear sides of bowl. Adjust by bending float arms as necessary. Install float pin retainer, invert carburetor so that both floats rest against seated needle. Clearance between overlapping tangs on float levers should be .010-.015". Adjust by bending long tang on left hand float. Recheck float level.

CARTER "AS" LOW SPEED SYSTEM



CARTER "AS" HIGH SPEED SYSTEM

Float Setting

Car & Carb.	Checking Gauge	Float Setting
Rambler All Models	T109-282	1/4"

Pump Adjustment: Top of pump arm that engages slot in pump shaft must be parallel to top surface of bowl cover with throttle in wide open position. Adjust by bending pump arm up or down as necessary.

Metering Rod Adjustment: With throttle wide open, metering rod should just bottom in carburetor casting. To adjust bend metering rod arm. When metering rod is properly adjusted, some movement can be noted around eye of metering rod retainer clip when throttle is moved slightly from wide open position. If rod is too low, it will tend to push metering rod retainer clip up. If rod is too high, it will be possible to push rod down.

CARTER "AS" PUMP SYSTEM

Fast Idle Adjustment: Remove thermostat coil housing, gasket and baffle plate. Crack throttle valve and hold choke valve closed to rotate fast idle cam to fast idle position. Close throttle. Measure clearance between throttle valve and bore of carburetor (side opposite idle port) using gauge listed in table below. Adjust by bending choke connector rod at lower angle using bending tool T109-213.

Fast Idle Speed - With correct fast idle adjustment, fast idle speed should be 1600-1800 RPM (Hot).

Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening
Rambler All Models	T109-29	① .030"

① - Supersedes original setting of .043" (T109-158).

Unloader Adjustment: Hold throttle valve wide open and close choke valve without forcing it. Measure clearance between upper edge of choke valve and inner wall of carburetor air horn. See table below. To adjust, bend choke shaft unloader arm.

Unloader Setting

Car & Carb.	Checking Gauge	Choke Opening
Rambler 2564S, 80S	T109-34	9/64"
Rambler 2664S, 65S	T109-28	3/16"

Throttle Valve Setting: *NOTE* - Carburetors 2564S & 2664S have additional Transmission Control Vacuum Port (top of port should be Flush with bottom of throttle valve). Other carburetors do not have this port.

Throttle Valve Setting

Car & Carb.	Idle Port	Vacuum Spark Port
Rambler All Models	① .058-.062"	① .040-.050"

① - Top of port above top edge of valve.

Automatic Choke Setting: 2 Points Rich (All Models).

(63)- Supersedes 75-1388S.

(64)- Kit consists of 1 Power Jet Rod 16-16, and 1 Metering Rod Assembly 75-1309S.

1957 CARTER BB UPDRAFT CARBURETORS

CARTER BB UPDRAFT

CHEVROLET FORWARD CONTROL — **Carter Model**

1957 Series 34, 35, 3700 ..... 871SC

►**ACCESS TO CARBURETOR (for Adjustment or Removal):** **Forward Control Models**—Remove toe pan attaching screws, disconnect wires at stop light switch, disconnect accelerator pedal rod from throttle control rod, remove toe pan.

DESCRIPTION: Plain tube, updraft type of same design as used on previous Chevrolet models

ADJUSTMENT & SERVICING: *See complete "Carter (BB) Updraft Type" carburetor in Carburetor Section of Manual and set this carburetor to the following specifications:*

IDLING ADJUSTMENT

Idle Screw Setting—½-1½ turns open (turn screw out for richer mixture).

Idle Speed—450-500 RPM (Std. Trans.), 400-450 RPM (Auto. Trans. in Neutral).

FLOAT LEVEL SETTING

Float Level—0-1/32" (Carter Gauge T109-49 or Chevrolet J-818-13A) from top of float to top edge of bowl with needle valve seated.

CAUTION—Use 1/32" side of gauge (other side used for 1/16" settings).

Intake Needle & Seat Assembly—Carter No. 25-44S

ACCELERATING PUMP

Pump Seasonal Setting—Short Stroke—Summer, Long Stroke—Winter.

Pump Stroke—9/16" (Short Stroke) with connecting screw in holes in throttle lever and pump link nearest throttle shaft, 1" (Long Stroke) with screw in holes farthest from shaft.

THROTTLE VALVE SETTING

Idle Port—.005-.009" from top of lower idle port to lower edge of throttle valve.

Vacuum Spark Port—.000-.004" top of port below lower edge of throttle valve.

NOTE—Above specifications apply with throttle valve tightly closed.

SERVICE PARTS

Gasket Set - Carter No. 202.

CARTER BBR1 CARBURETORS

STUDEBAKER — **Carter Carburetor No.**
1957 Champion Scotsman — BBR1 2724S

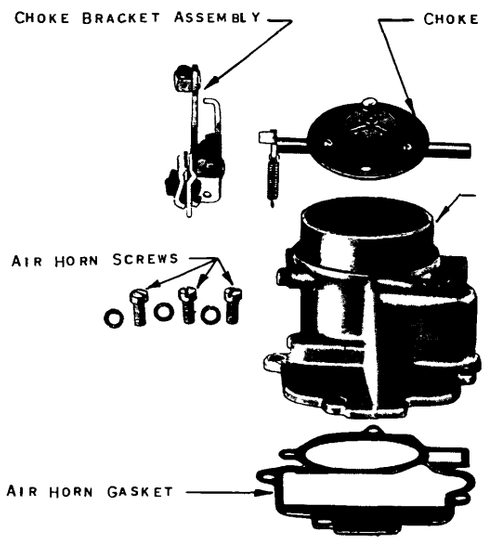
DESCRIPTION: Single barrel downdraft carburetor with manual choke control. Same design as other Carter (B&B) Downdraft carburetors with vacuum controlled step-up jet or power orifice.

ADJUSTMENTS: *Set carburetor to the following specifications*

Idl Setting: Adjust only with engine at normal operating temperature (choke valve wide open).
Idle Mixture - ½-1½ turns open. Turn screw out for richer mixture.

Idle Speed - 550-600 RPM With engine at normal operating temperature (with choke valve wide open so that fast idle inoperative)

Accelerating Pump: Check pump stroke setting after carburetor overhaul, adjust pump for seasonal requirements as indicated.



Seasonal Setting - Three holes provided in throttle lever for pump lifter link engagement as follows

Center Hole - Normal operation (medium stroke). **Outer Hole** - Cold weather operation (long stroke). **Inner Hole** - Hot weather operation (short stroke).

Pump Stroke Setting - To check stroke, remove air horn assembly, make certain pump link connected in center hole of throttle lever (medium stroke), back off throttle stopscrew so that throttle valve fully closed. Place pump travel gauge, T109-117S, on upper edge of body casting at pump cylinder, turn gauge until projecting finger contacts top of pump plunger shaft, note gauge reading. Open throttle wide with pump plunger pressed to bottom of pump cylinder, take a second gauge reading. Difference between two gauge readings is pump stroke and should be "32" (32/64"). To adjust stroke, bend horizontal portion of pump lifter link.

Float Level: 5/64" from top edge of float bowl to top of float with needle valve seated. To check float level, remove air horn assembly. If gauge T109-50 used, place gauge squarely to top edge of bowl parallel to float, hold float arm lip firmly against closed needle valve. Top of float should just touch gauging lugs on gauge. If scale used, measure from top edge of bowl to top of float on each side of center seam. This measurement should be 5/64" ± 1/64". To adjust float level, bend lip on float arm.

St p-up (P wer) Valv : No adjustment provided. Vacuum piston should operate freely and clearance between step-up rod and top of piston plate should be .010" minimum with piston pushed all the way down *(CAUTION* - This clearance necessary to permit spring to fully close step-up jet). Adjust clearance by bending plate slightly.

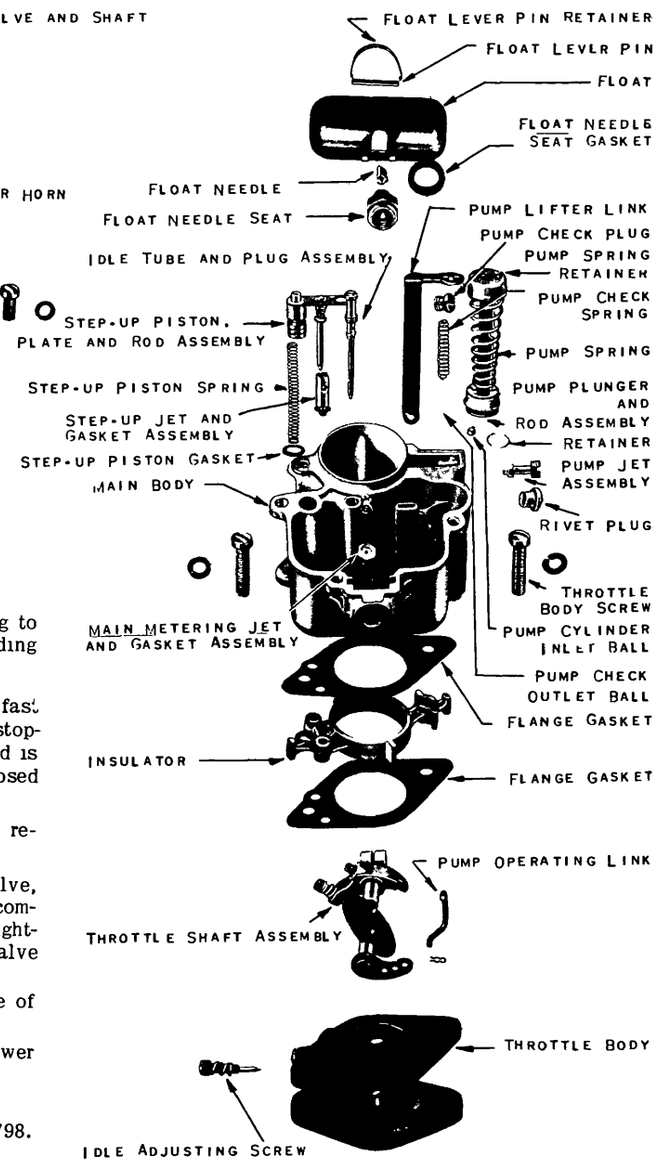
CARTER BBR1 CARBURETOR

Fast Idle: No adjustment required Consists of a fast idle cam serving as a stop for the throttle lever stopscrew Fast idle cam is linked to choke valve and is rotated to fast idle position when choke valve is closed for cold starting

Choke: Manual type Choke valve has poppet type relief valve

Throttle Valve Setting: When installing throttle valve, insert attaching screws loosely, then close valve completely and tap it lightly to centralize it in bore, tighten attaching screws securely. Check throttle valve position.

Idle Port - Top of port .133-.137" above top edge of valve.



Vacuum Spark Port - Top of port .007-.013" below lower edge of valve.

SERVICE PARTS. Gasket Set - Carter No. 192.
Repair Pkg. (with Std. Metering Jet) - Carter No. 1798.

BBR1 JET SPECIFICATIONS

Part	Size	Part No.
Main Metering Jet (Std.) ①	②	159-59S
Main Vent Tube Air Bleed Assy.	.0135"	145-72
Step-up Jet Power Orifice	037"	149-43S
Idle Orifice Tube	.0276"	123-31S

① - 1 size lean 159-61S, 2 sizes lean 159-66S, 3 sizes lean 159-82S.
② - Flow 268-272 c.c.

OVERHAUL: *See "Carter (B&B) Downdraft" Carburetor in Carburetion Section of Manual and note the following:*

Main Vent Tube Replacem nt - Remove rivet plug at lower end of vent tube passage below float bowl (use Tool T109-143), remove main vent tube through this opening, install new main vent tube using Tool T109-195 *(CAUTION* - Tube must seat tightly in body), install new rivet plug to close passage.

CARTER "BBS"

PLYMOUTH	Carter Carburetor No.
1957 6 Cyl P-30 (Std)	BBS 2567S
1957 6 Cyl P-30 (Overdrive)	BBS 2568S
1957 6 Cyl P-30 (Auto Trans)	BBS 2569S
1957 Replacement Carburetor	BBS 2604S
1957 6 Cyl P-30 Taxicab	BBS 2410S
1957 6 Cyl P-30 City Service	BBS 2403S

►*PLYMOUTH REPLACEMENT CARBURETOR NOTE* When installing 2604S carburetor as replacement, additional parts required as follows **Overdrive Cars** - Use Unitized Pkg No 192-33U (Kickdown Switch Assy), **P w rFlit Cars** - Use Unitized Pkg No 202-80U (Dashpot, Bracket and Locknut)

DESCRIPTION: Single barrel downdraft type of same design used on previous models with integral Automatic Choke (fast idle mechanism located within choke housing)

City S rvic Carbur t r 2403S - This model has hemispherical throttle restrictors mounted on throttle valve (retained by special screws and nuts which replace regular mounting screws).

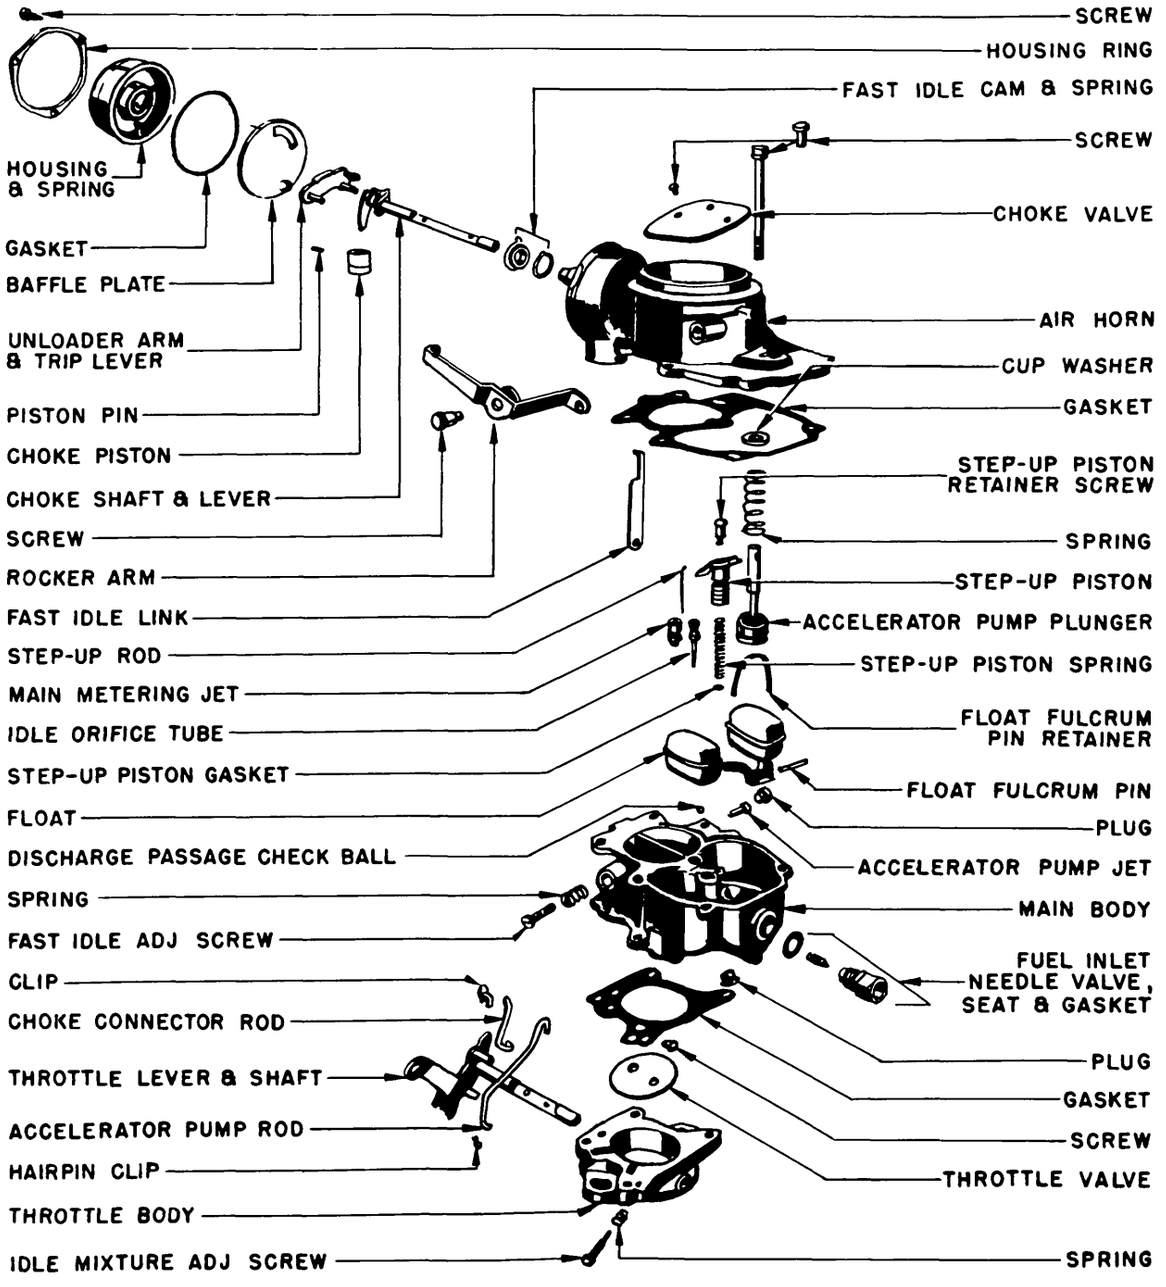
ADJUSTMENTS: *Make all adjustments exactly as listed below*

Idle Adjustment: Make preliminary setting of idle adjusting screw by turning screw in until it is lightly seated and then turn screw out exactly 1 turn Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative Set engine idle speed to correct figure then adjust idle mixture as follows

Idl Mixtur - With engine warmed up and idling at correct idling speed turn mixture adjusting screw in or out until highest engine speed and smoothest running is secured Recheck idle speed

Idl Mixture Setting

Car & Carb	Idle Screw Setting
Plymouth 2567S 68S 69S 2604S	½-1¾ turns
Plymouth 2403S	½-1¾ turns
Plymouth 2410S	1-2 turns



Idle Sp d - 450-500 RPM *NOTE* - On Auto Trans Cars Neutral selector button must be pressed in

Acc l rating Pump: Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as listed below

Pump Strok Adjustm nt - Back off throttle stopscrew so that throttle valve fully closed. Make certain that connector rod engaged in center hole of throttle lever. Use scale to measure distance from top surface of bowl cover to top of pump plunger shaft This distance should be 54-64" (All models) If height not correct, adjust by bending connector rod at lower angle using bending tool T109-213

Pump Seasonal S tting - Std setting is with pump connector rod engaged in center hole of throttle lever Outer hole in throttle lever will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).

Float L v l: To check float level remove air horn and bowl cover assembly and gasket. Place gauge (see table below) squarely on top edge of bowl at center of floats Remove float pin retainer, hold float arm lip firmly against seated needle valve with float pin at bottom of the guide slots Ridge or crown on each float should just touch step on gauge Adjust by bending float lip *(NOTE* - If one float lower than the other first equalize floats by bending float arm, then adjust both floats by bending the lip) Reinstall float pin retainer

CARTER "BBS" SINGLE CARBURET R

CONTINUED ON NEXT PAGE

CARTER "BBS" (C nt.)

Float Level Setting

Car & Carb	Checking Gauge	Float Level
Plymouth 2567S,68S 69S	T109-239 ①	9/32"
Plymouth 2604S	T109-239 ①	9/32"
Plymouth 2403S,10S	T109-239 ①	7/32"

① - Same gauge used for both 9/32" and 7/32" settings

Fast Idle: Remove choke thermostatic coil housing assembly, gasket, and baffle plate (necessary for access to fast idle mechanism) *NOTE - Adjust Unloader before reassembling choke.*

Fast Idle Setting - Back out throttle stopscrew so that throttle valve fully closed Open throttle partially, close choke valve, then close throttle valve (this will allow fast idle cam to revolve to fast idle position) Measure throttle valve opening or clearance between edge of valve and carburetor wall on side opposite idle ports using gauge listed in table below Adjust by bending choke connector rod at lower angle using bending tool T109-213

Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening
Plymouth (All)	T109-44	016- 020"

Unl ader: After completing fast idle adjustment (above) hold throttle valve in wide open position, close choke valve as far as possible without forcing Measure choke valve opening or clearance between upper edge of valve and air horn wall using gauge listed in table below Adjust by bending arm on choke trip lever which actuates choke lever using bending tool T109-214 Reassemble and adjust automatic choke (below)

Unloader Setting

Car & Carb.	Checking Gauge	Choke Opening
Plymouth (All)	T109-34	9/64"

Aut matic Choke: *CAUTION* - When disconnecting hot air tube at choke housing fitting (for removal or adjustment of choke), hold fitting on housing with open end wrench while loosening tube nut to prevent distorting or breaking housing To adjust choke, with heat tube disconnected, loosen three screws in retainer ring, rotate choke housing until index mark (line) on housing is aligned with longer center line of scale on air horn This is correct Centered setting for all models

Kickdown Switch (Overdrive Cars): With throttle valve wide open, clearance between kickdown lever and switch stem guide should be 1/64-3/64" Adjust by loosening switch mounting nuts and changing position of switch in bracket

Sl w-closing Throttle Dashpot (Auto. Trans. Cars): With throttle valve tightly closed, it should be possible to move dashpot plunger shaft inward 3/32" Adjust by loosening locknut and screwing dashpot in or out of mounting bracket

Throttl Valv S tting: When installing valve, it should be positioned as indicated "Idle Port Opening" is port opening above upper edge of tightly closed valve, "Vacuum Spark Port" is height of top of port above tightly closed valve

Throttle Valve Setting

Car & Carb.	Idle Port Opening	Vacuum Spark Port
Plymouth (All)	140- 144"	044 050"

OVERHAUL: *CAUTION* - Carburetor main castings (air horn, main body, and throttle body) are assembled with long screws (inserted through air horn and threaded in throttle body) so that all three assemblies will be loose when screws removed Use care not to damage throttle body when removing air horn or main body

Disassembly: Disconnect and remove choke connector rod and accelerating pump rod Take out long screws in air horn flange, lift air horn and bowl cover assembly straight up and off main body, discard gasket Remove pump plunger by pressing it up and sliding it off pump arm Take out step-up piston retaining screw, remove piston and step-up rod, remove spring and gasket from cylinder Invert main body to drop out pump discharge check ball from pump passage *(NOTE* - inlet check ball is located under retainer in bottom of pump cylinder) Remove main metering jet and gasket, and idle orifice tube Remove pump jet by first removing plug on side of main body and then removing jet through this hole Do not remove main vent tube unless replacement required (special tools required see Reassembly for removal and installation data) Remove idle mixture screw and spring from throttle body discard throttle body gasket Do not remove throttle valve or shaft unless wear or damage requires parts replacement (see Reassembly for installation data)

Automatic Choke Disassembly - Take out screws in choke housing retainer, remove retainer, housing assembly, gasket, and baffle plate Slide out unloader arm and trip lever Remove staked portion of choke valve screws, remove screws, lift valve out Rotate choke shaft until vacuum piston is clear of cylinder, withdraw shaft and piston assembly, slide fast idle cam and spring off shaft Choke thermostatic coil and heat retainer plate can be removed from housing by rapping assembly hard against palm of hand *(CAUTION* - Do not attempt to remove coil from heat retainer plate)

Cleaning & Inspection· Clean all parts in cleaning solvent and dry with air Blow out all passages with air Do not use wire or drills to clean jets Clean main vent tube by removing plug at end of vent passage, soak in solvent, and blow out with air applied at high speed air bleed hole at top of nozzle bar Clean all parts of choke mechanism thoroughly, make certain that slots in cylinder and air passages are clean Clean heat tube, remove heat tube shield at manifold and clean shield and tube in manifold Inspect tube for dents (obstructing hot air flow) and leaks *(NOTE* -Heavy black carbon deposits on choke parts may indicate exhaust leaks in heat tube) Check all parts for wear or damage and replace as required

Reassembly: Use all new gaskets Reassemble carburetor by reversing disassembly procedure and note the following

Throttle Valve Installation - *NOTE* - If throttle valve shaft or throttle body worn, it is recommended that new throttle body assembly be used Install throttle valve in same relative position as old valve, install new screws loosely, then close throttle and centralize valve by tapping lightly, tighten screws securely and stake by squeezing with pliers Check throttle valve position (see specifications above)

Choke Valve Installation - With fast idle cam and spring assembled on choke shaft, slide shaft and piston assembly into air horn, rotate shaft to enter vacuum piston in cylinder Install choke valve, install new screws loosely, close valve and tap lightly to centralize valve in bore, then tighten screws securely and stake by squeezing with pliers Check for free operation by closing valve with air horn upright Choke should open of own weight

Automatic Choke Assembly - Install unloader arm and trip lever in air horn See that retaining spring in heat retainer plate clears notch in plate, align notch with lug in housing and seat plate in housing Install baffle plate and gasket on air horn, then install choke housing (index mark downward), retainer ring, and retainer screws, tighten screws loosely Rotate housing counterclockwise until index mark on housing aligned with longer center line of scale on air horn, tighten retainer screws

Accelerating Pump Assembly - If old pump plunger being reinstalled, flare plunger leather by rolling it back and then reshaping it between thumb and forefinger *(NOTE* - Plunger leather must be soft and pliable) Install plunger in cylinder Install discharge check ball in discharge passage Check pump operation as follows Pour clean gasoline in carburetor bowl (½" deep), operate pump plunger several times to fill cylinder and remove air from discharge passage Use small brass rod to hold discharge ball down on its seat, press pump plunger down No fuel should be emitted at either discharge or intake passages If fuel discharge noted, remove check balls and inspect for damage clean passages thoroughly Reseat ball by using small brass rod to tap ball lightly to form new ball seat *(CAUTION* - install new check ball after using ball in reseating operation)

Step-up Piston and Rod Assembly - Make certain that step-up rod is free on piston plate (must return freely to vertical position when released) and that piston is free in cylinder See that step-up rod enters metering jet when assembly installed in carburetor

Carburetor Adjustment Make all adjustments listed under ADJUSTMENTS above

DESCRIPTION: These "Cross-over" type automatic choke controls are separate units mounted in a well in the intake manifold (at the exhaust "cross-over" passage) and linked to the choke valve lever by a connector rod. *See illustration.*

OPERATION: Cross-over type automatic choke operates in the same manner as other thermostatic coil types. The vacuum piston is located in the carburetor air horn and is linked directly to the choke valve shaft (not part of automatic choke assembly).

ADJUSTMENT & CHECKING: No adjustment is required and choke must be removed from manifold well to check the setting. Operation can be checked as follows: **Operation Check** - With choke mounted on engine and connected to carburetor, lift cover disc and open and close choke valve manually to make certain connector rod does not bind on sides of hole in housing cover. If connector rod does not clear the hole, replace assembly *(CAUTION - Bending rod will change calibration).* Move rod up and down to check for free movement of the coil

"CROSS-OVER" TYPE CHOKE ASSY.

housing on the pivot. If internal bind noted, replace assembly.

Setting Check - With choke assembly removed from manifold well, index mark on disc should be midway between "L" and "R" marks of scale on housing (Std. setting - see individual car model pages for specific settings). To adjust setting, loosen mounting post locknut and turn mounting post with a screwdriver to align index mark on disc with correct mark on scale. Hold post from turning while tightening locknut.

CLEANING & INSPECTION: Entire housing and rod assembly can be cleaned with carburetor parts cleaner without disassembly. After cleaning, rinse in solvent and blow out inside of housing with compressed air. Check to make certain that housing revolves freely on mounting post without binding. If necessary, unit can be disassembled for thorough cleaning and should be reassembled as follows:

REASSEMBLY (After Disassembly for Cleaning): *NOTE - Two types of choke assembly have been used: 1) One Piece Open Housing, 2) Two Piece Closed Housing. See illustration. Assemble each type as follows:*

One Piece Open Housing: Insert thermostatic coil in housing with hook on coil pointing toward web on edge of housing approximately 120° below straight upper edge of housing. Insert mounting post through housing and coil with index mark toward hook on coil, secure mounting post with washer and pin spring. Install cover disc on connector rod and install rod through housing cover into housing toward split end of mounting post, secure rod with washer and pin spring (spring eye outward). Assemble housing cover to mounting post with lockwasher and nut, rotate mounting post counterclockwise until hook on coil picks up connector rod, tighten nut. Check for positive spring action by pushing connector rod down through housing cover. Adjust choke setting (see Adjustment above).

Two Piece Closed Housing: Place coil mounting post in one of the coil housing halves, install thermostatic coil on mounting post with hook facing clockwise. Assemble other half of housing with holes in both halves aligned, secure with washer and hairpin. Install connector rod with hairpin end extending through hole in housing toward split end of mounting post, secure with washer and hairpin (hairpin eye outward). Install index disc on mounting post with flat on disc and post aligned, rotate disc and post counterclockwise until hook on coil engages connector rod. *(CAUTION* - Index mark on disc should be approximately 60° to right of connector rod with housing held so that rod points straight up - if mark not in correct position, turn disc over). Assemble housing cover on mounting post and install lockwasher and nut. Install cover disc on rod. Adjust choke setting (see Adjustment above).

CARTER BBD DUAL

►CHANGES & CORRECTIONS

►*CHRYSLER, DE SOTO, PLYMOUTH CARBURETOR JET CALIBRATION CHANGES FOR IMPROVED PERFORMANCE: See "Carter BBD Carburetor Jet Specification Table" for production changes and latest type jets used in these carburetors.*

►*DE SOTO FLAT SPOT OR HESITATION CORRECTION (2522S Carburetors):* If this trouble not corrected by complete tune-up procedure (including Ignition Timing, Manifold Heat Control operation check, and Carburetor adjustment including Float Level and Pump Stroke check), check pump valves and make changes in carburetor as detailed below. *NOTE* - These new parts installed in 2522SA carburetors in production.

Accelerating Pump Check Valves - Check for leakage by holding discharge check ball at bottom of pump discharge cluster hole while operating pump (Discharge Cluster removed). If leakage noted at discharge ball check, or at intake ball check, reseat balls. Use brass rod to tap ball down if new balls not available.

Venturi Cluster Screws (Main Idle Air Bleed) - Install new screws, No. 101-434 (supersedes 101-433).

Step-up Rods - Install new rods, No. 75-1145 (supersedes 75-1177).

►*PLYMOUTH HESITATION OR STUMBLE CORRECTION (301" ENGINE):* First check Ignition Timing and set to specified setting, check Manifold Heat Control Valve for free operation and correct positioning on shaft, check Carburetor Float Level and set to specified setting (see below). If above steps do not correct complaint, install new parts as listed below. *CAUTION* - These parts provide richer-than-standard mixture and should only be used in cases of extreme necessity.

Plymouth Parts Changes

Part & Usage	Part No.
Step-Up Rod (All Cars)	75-1217
Venturi Cluster Screw (Auto.Trans.)	101-433

►*PLYMOUTH CHOKE PISTON CHANGE FOR INCREASED ECONOMY DURING WARM-UP & SHORT TRIP OPERATION:* New Choke Piston & Link Assembly, Carter No. 160-165S, used in production on all "SB" and later carburetors. Supersedes previous type, No. 160-142S, on earlier carburetors.

►*PLYMOUTH REPLACEMENT CARBURETOR NOTE:* Carburetor No. 2512SC used as replacement for all models. When installing this carburetor on Overdrive Cars, use Unitized Pkg. No. 192-36U also.

►*PLYMOUTH 277" ENGINE CARBURETOR NOTE: Carter BBD 2409S and 2407S carburetors were used on a few 1957 Plymouth Plaza cars. For all data on these models, refer to Carter BBD Carburetors in 1956 Final Data.*

DESCRIPTION: Dual (double barrel) downdraft type of same design used on previous models except for new type Automatic Choke used on Plymouth models:

"Cross-over Type" Automatic Choke (Plymouth) - Automatic choke is separate unit mounted in well in intake manifold (in exhaust cross-over passage) and is linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder on the air horn and is linked directly to the choke valve. *See "Carter Cross-over Type Automatic Choke".*

ADJUSTMENTS: *Make all adjustments exactly as detailed below.*

Idle Adjustment: Make preliminary setting of both idle mixture screws by turning each screw in until it is lightly seated and then backing screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows:

Idle Mixture - With engine warmed up and idling at correct idling speed, turn both idle mixture adjusting screws in 1/8 turn for leaner mixture. If engine speed increases and engine runs smoother, lean mixture further by turning both screws in an additional 1/8 turn. If this results in improved performance, reset idle speed, then make a final adjustment of each mixture screw by turning screw in (leaner) or out (richer) for best performance position of the screw. If any step of above procedure causes engine speed to drop off or engine to run roughly, turn both screws out 1/8 turn for richer mixture and then make final adjustment of each screw. *NOTE* - Best idle performance will normally be found with adjusting screws ¾-1¼ turn open from inner seated position. Both screws should be set alike within 1/8 turn.

Idle Speed - 450-500 RPM. *NOTE* - On Auto. Trans. Cars, Neutral selector button must be pressed in.

Accelerating Pump: Three holes provided in throttle lever and two holes provided in pump arm for connector rod engagement to provide seasonal pump setting as listed below.

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that connector rod engaged in center hole of throttle lever and inner hole of pump arm. Use scale to measure the distance from top surface of bowl cover to top of pump plunger shaft. If height not correct (see table below), adjust by bending connector rod at lower angle.

Pump Stroke Setting

Car & Carb.	Pump Plunger Height
Chrysler 2527S	1 1/32"
DeSoto 2522S, SA	1 1/32"
Plymouth (All)	1 1/32"

Pump Seasonal Setting - Std. setting is with connector rod engaged in center hole of throttle lever and inner hole of pump arm (Medium Stroke). Outer hole in throttle lever will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).

Float Level: To check float level, remove air horn and bowl cover assembly, and gasket. Place gauge (see table below) squarely on top edge of bowl at center of floats. Hold float arm lip firmly against seated needle valve. Ridge or crown on each float should just touch step on gauge. Adjust by bending float lip (*NOTE* - If one float lower than the other, first equalize floats by bending float arm, then adjust both floats by bending lip).

Float Level Setting

Car & Carb.	Checking Gauge	Float Level
Chrysler 2527S	T109-282	1/4"
DeSoto 2522S, SA	T109-239	9/32"
Plymouth (All)	T109-239	9/32"

Fast Idle: *Two different settings required as follows:*

Fast Idle Cam Clearance - With choke valve tightly closed and lip on choke shaft inner lever contacting lug on outer lever, clearance between fast idle cam lever and stop on body should be .020" (Gauge T109-29) and index mark (line) on fast idle cam should be in line with fast idle screw. Adjust by bending lip on inner choke shaft lever using bending tool T109-22.

Fast Idle Throttle Valve Opening - Back out idle speed adjusting screw, close choke valve tightly. Fast idle screw should be in line with index mark on fast idle cam (highest step of cam). Turn fast idle screw in or out until correct throttle valve opening is secured (see table below). Check by inserting gauge between lower edge of throttle valve and carburetor wall on side opposite idle ports.

Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening
Chrysler 2527S	T109-44	.015"
DeSoto 2522, SA	T109-44	.016"
Plymouth (All)	T109-44	.014"

Unloader: To check, close choke valve lightly, open throttle valves to wide open position which will open choke valve slightly. Check choke valve opening or clearance by inserting gauge (see table below) between upper edge of valve and air horn wall. Adjust by bending unloader arm on throttle lever using bending tool T109-213.

Unloader Setting

Car & Carb.	Checking Gauge	Choke Opening
Chrysler 2527S	T109-28	3/16"
DeSoto 2522S, SA	T109-28	3/16"
Plymouth (All)	T109-28	3/16"

Automatic Choke: Different type choke mechanisms used as follows:

Chrysler & DeSoto - Integral type mounted on air horn with thermostatic coil linked directly to lever on choke valve shaft. Choke vacuum piston is mounted within choke housing. Fast idle cam is mounted on main body directly above throttle lever and is linked to choke valve lever on opposite side of air horn from automatic choke. To adjust choke setting, loosen three screws in retainer ring, rotate choke housing. *NOTE* - Standard (Centered) setting is secured with the index line on the choke housing aligned with the center longer line of the scale on the rim of the housing on the air horn.

Automatic Choke Setting

Car & Carb.	Choke Setting
Chrysler 2527S	1 Point Rich
DeSoto 2522S, SA	Centered (At Index)

CONTINUED ON NEXT PAGE

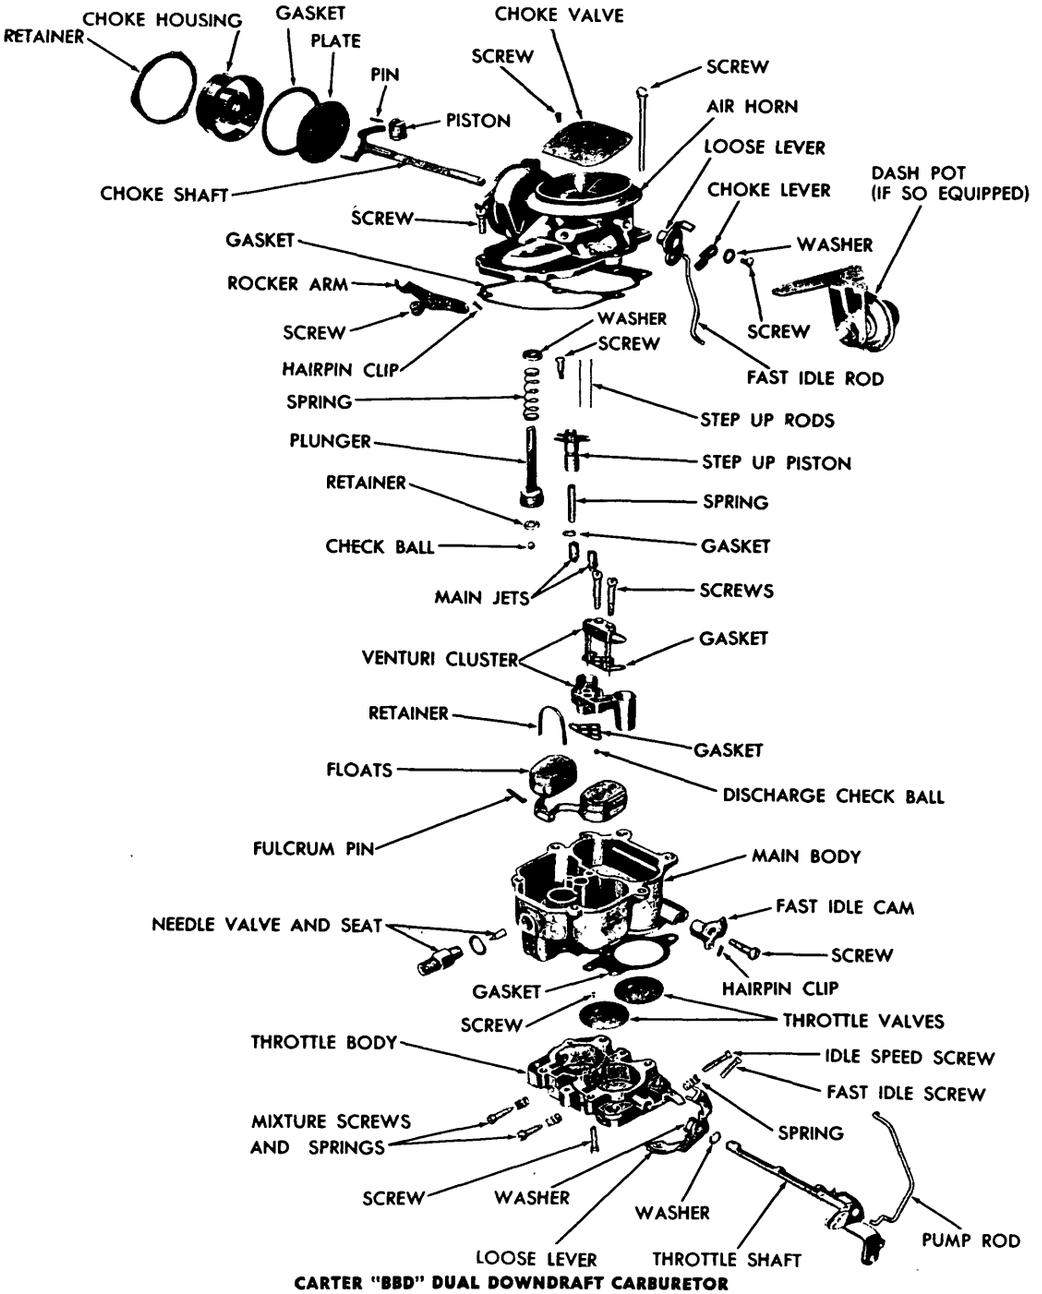
CARTER BBD DUAL (C nt.)

Plymouth - Automatic choke is separate "Cross-over" type mounted in well in intake manifold (at exhaust cross-over passage) and linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in the carburetor air horn and linked directly to the choke valve. This type choke ordinarily does not require adjustment. *See "Carter Cross-over Type Automatic Choke" for complete data.*

Overdrive Kickd wn Switch (Plymouth): With throttle valves wide open, clearance between kickdown lever and switch stem guide should be 1/64-3/64". Adjust by loosening switch mounting nuts and changing position of switch in bracket.

Thr ttl Valv Setting: When installing valves, they should be positioned as indicated. "Idle Port Opening" is the port opening above upper edge of tightly closed throttle valve. "Vacuum Spark Port" is height of top of port above upper edge of tightly closed throttle valve.

Thr ttle Valve Setting



Car & Carb.	Idl Port Opening	Vacuum Spark Port
Chrysler 2527S	.144-.148"	①
DeSoto 2522S, SA	.148-.152"	①
Plymouth (All)	.144-.148"	①

① - .035-.045" (Early Production - .030" x .110" port). .025-.035" (Later Production - .045" x .110" port).

OVERHAUL: With carburetor off engine, proceed as detailed below. *NOTE* - It is recommended that carburetor be mounted on stand, Tool C-3225, to protect throttle valves from damage while carburetor is on the bench.

Disassembly: Disconnect and remove fast idle and pump connector rods. Remove air horn and bowl cover as an assembly (with integral automatic choke), discard air horn gasket. Remove pump plunger and spring by pressing up on plunger and cocking it to one side to disengage plunger stem from pump arm. Remove fuel inlet needle valve seat, gasket, and needle valve. Take out float pin retainer, remove fulcrum pin and floats. Remove vacuum step-up piston retaining screw, lift out piston and step-up rods, remove piston spring from cylinder. Remove main metering jets and gaskets. Loosen venturi cluster screws, lift venturi cluster assembly straight up and remove, separate cover and cluster and discard gaskets (*CAUTION* - Do not attempt to remove idle orifice or main vent tubes from cluster - these parts not furnished separately). Invert carburetor to drop out pump discharge check ball from channel under cluster mounting. Remove idle mixture adjusting screws and springs. Invert carburetor, remove throttle body attaching screws, lift off throttle body, discard gasket. Do not remove throttle valves or shaft unless wear or damage requires installation of new parts (see Reassembly for installation data).

Automatic Ch ke Disass mbly (Chrysler & DeSoto) - Take out screws in choke housing retainer, remove retainer, heat tube cap and gasket, choke housing and thermostatic coil assembly, baffle plate, and gasket. Remove staked portion of choke valve screws (use file or other tool), remove screws, slide choke valve out. Remove screw in end of shaft retaining choke shaft lever (opposite end from automatic choke housing), slide lever, loose lever, and washer off end of shaft. Rotate choke shaft clockwise until vacuum piston clears cylinder in choke housing, withdraw shaft, lever, and piston assembly from air horn.

CARTER "BBD" DUAL DOWNDRAFT CARBURETOR

Cleaning & Inspection: Clean all parts in denatured alcohol, Metalclene, or equivalent cleaner. Clean and blow out all passages in carburetor castings, venturi

CONTINUED ON NEXT PAGE

CARTER BBD DUAL (C nt.)

cluster, and jets (*CAUTION* - Do not use wire or drills to clean jets). Choke thermostatic coil and heat retainer plate can be removed from housing for cleaning by rapping assembly hard against palm of hand (*CAUTION* - Do not attempt to remove coil from heat retainer plate). If heavy black carbon deposits noted on choke parts, check heat tube in exhaust manifold for leaks. Check all parts for wear or damage and replace as required.

Reassembly: Use all new gaskets. Reassemble carburetor by reversing disassembly procedure and note the following:

Throttle Valve Installation - *NOTE* - If throttle valve shaft or throttle body worn, it is recommended that new throttle body assembly (with shaft) be used. Install throttle valves with mark ("C" in circle) downward and on idle port side, install new screws loosely, close throttle valves tightly and centralize valves by tapping them lightly, tighten screws securely and stake screws by squeezing with pliers. Check throttle valve position (see specifications above).

Idle Mixture Screws - Replace screws if tapered portion grooved or ridged. Turn screws in by hand until lightly seated, then back each screw out 1 full turn for approximate idle setting.

Choke Valve Installation - Slide choke shaft and piston assembly into air horn, rotate shaft counterclockwise to enter vacuum piston in cylinder. Install choke valve shaft, install new screws loosely, close valve and tap lightly to centralize valve in bore, then tighten screws securely and stake by squeezing with pliers. Check for free operation by closing valve with air horn upright. Choke should open of own weight.

Automatic Choke Assembly (Integral Type) - See that retaining spring in heat retainer plate clears notch in plate, align notch with lug in housing and seat plate in housing, assemble heat tube cap and retaining ring on housing. Install baffle plate and gasket on air horn, then install choke housing assembly with index mark downward, rotate housing clockwise until index mark is centered on scale on air horn, install retainer screws and tighten. Install choke shaft loose lever and sleeve, choke shaft lever, washer, and screw on opposite end of choke shaft. *NOTE* - See Automatic Choke Setting (above) for correct choke setting on each carburetor model.

Accelerating Pump Assembly - If old pump plunger being reinstalled, flare plunger leather by rolling it back several times, install plunger in cylinder. Install discharge check ball in discharge passage. Check pump operation as follows: Pour clean gasoline in float bowl (½" deep). Operate pump plunger several times to fill cylinder and remove all air from discharge passage. Use small brass rod to hold discharge ball down on its seat, press pump plunger down. No fuel should be emitted at either the discharge or intake passages. If fuel discharge noted, remove check balls and inspect for damage, clean passages thoroughly. Reseat ball by using small brass rod on ball and tapping lightly to form new ball seat (*CAUTION* - install new check ball after using ball in reseating operation). When installing plunger, make certain plunger leather enters cylinder evenly.

Step up Piston & Rod Assembly - Make certain that step-up rods are free on piston plate (must return to vertical position when released), and that piston is free in cylinder. See that step-up rods enter metering jets when installing assembly in carburetor.

Carburetor Adjustment - Make all adjustments listed in Adjustment section above.

SERVICE PARTS: Gasket Sets - Carter No. 298 (Chrysler 2527S & DeSoto 2522S), No. 300 (Plymouth - All).

Repair Pkg (with Std. Metering Jets) - Carter No. 1858 (Chrysler 2527S), No. 1863 (DeSoto 2522S), No. 1860 (Plymouth - all).

1957 (Synchro-mesh)	B7C-9510-C
1957 (Fordomatic)	B7A-9510-D

►CHANGES & CORRECTIONS

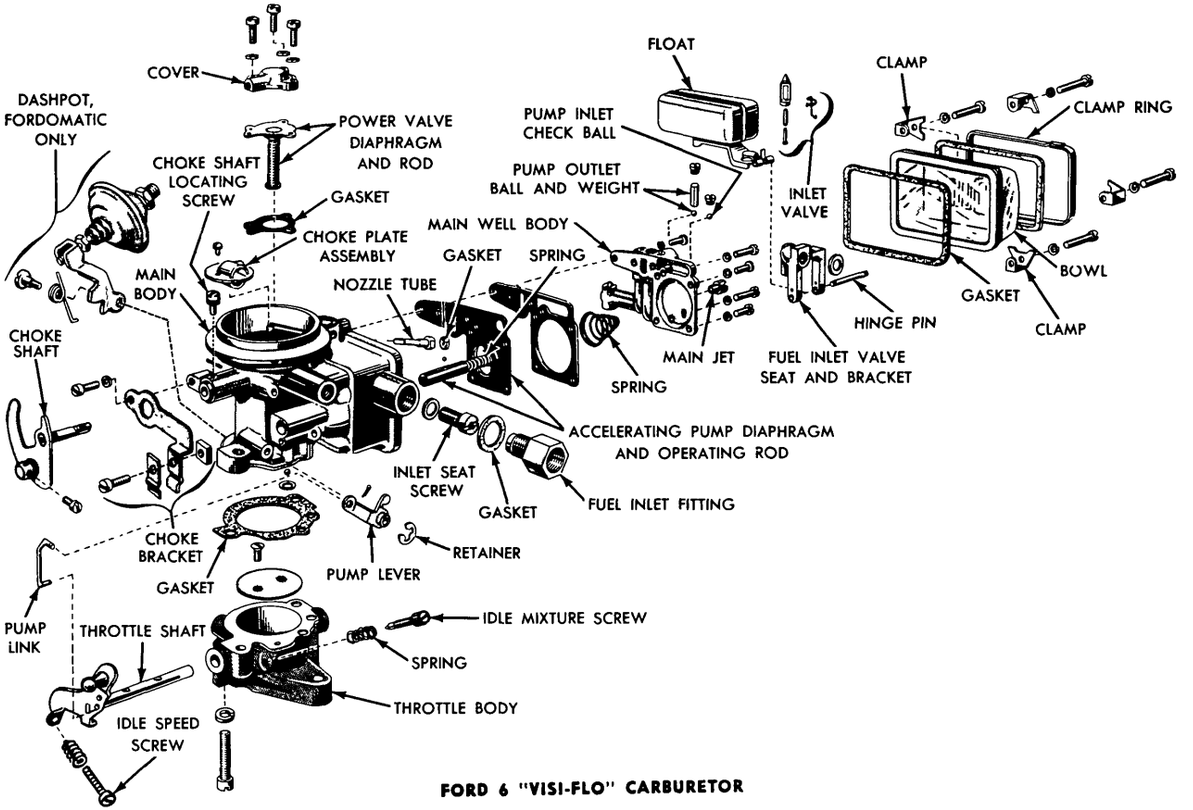
►*CARBURETOR MODIFICATION TO ELIMINATE ENGINE PING (Carburetor B7A-9510-N):* To correct pinging under load at low engine speeds, the following carburetor modifications should be made in addition to a Distributor advance modification. *See Ford 6 Cyl. Pass. Car & Truck car model pages for distributor modification data.*

1) Rework Distributor Vacuum Passages in Carburetor - With carburetor removed from engine, remove throttle body assembly *(see OVERHAUL below)*, remove wire retainer from lower end of distributor passage at mounting face of throttle body, remove nylon ball from passage *(CAUTION* - If ball sticks, dislodge ball by tapping throttle body on hand, DO NOT pound throttle body on bench which may mar mounting surface and prevent proper sealing when carburetor reinstalled). Drill out restriction at upper end of this vertical passage to .0585-.0605" using a No. 53 drill. Working through distributor vacuum line connection hole, drill out restriction at inner end of horizontal passage to .051-.053" using a No. 55 drill. *CAUTION* - Use extreme care to remove all drill chips from passages and mating surfaces of carburetor. Reassemble carburetor.

2) Main Metering Jet Change - Remove glass fuel bowl and install new Main Metering Jets as follows:

Main M tering Jet (New Sizes)

Altitude	Jet Size	Jet Part No.
0-5000 ft.	.069"	B7T-9533-A
5000-10000 ft.	.067"	B4C-9533-A
10000-15000 ft.	.065"	5GA-9533-A



DESCRIPTION: Visi-flo single barrel downdraft type. Design changed from type used on previous models and has the following new features:

Main Fuel System - Consists of a main nozzle tube discharging into a booster venturi formed integrally with the choke valve. Booster venturi rotates with the valve and is turned across the air flow when the choke valve is closed. As the choke valve is opened, air flow is directed through the venturi to apply suction on the main nozzle. Choke valve is attached to stub end of choke shaft (one side only) and pivots on the main nozzle tube on the other side.

Pump Discharge Nozzle - Nozzle is "pressed-in" type (same as 1956) and cannot be removed. If nozzle is loose, replace main body assembly.

ADJUSTMENTS: Make all adjustments exactly as follows:

Idling Adjustment: If initial adjustment required to warm up engine, turn idle mixture screw in until lightly seated,

FORD 6 "VISI-FLO" CARBURETOR

then back screw out exactly 1 turn. Operate ending at fast idle until normal operating temperature reached (20 minutes for cold engine), then adjust as follows:

Idle Mixture - With engine at normal operating temperature (choke valve wide open, fast idle inoperative), adjust idle speed (see below), turn idle mixture adjusting screw in until engine runs rough from lean mixture, then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough so that engine idles smoothly. This will provide a slightly rich mixture which is desired. Recheck idle speed.

Idle Speed - With engine at normal operating temperature so that throttle stopscrew resting on lowest point of fast idle cam (choke lever), adjust stopscrew for correct idle speed of 475-500 RPM in neutral *(NOTE* - On Fordomatic cars, place selector lever in Neutral "N" and set hand brake to hold car).

►*FORDOMATIC IDLE SPEED:* After setting idle speed at 475-500 RPM in Neutral, place selector lever in Drive "D" position and recheck idle speed. Speed should be 425-450 RPM in Drive. Readjust throttle stopscrew as necessary to secure this 425-450 RPM in Drive setting.

Antistall Dashpot (Fordomatic): After idle speed adjusted, check dashpot setting by depressing dashpot plunger fully with throttle valve closed. Clearance between end of dashpot plunger and adjusting screw on operating lever should be .045-.064". Adjust by loosening locknut and turning adjusting screw.

Accelerating Pump: Seasonal adjustment provided by two holes in throttle lever for pump link engagement:

Inner Hole - Normal or hot weather (short stroke).

Outer Hole - Cold weather operation (long stroke).

Float Level: *NOTE* - Fuel level setting can be checked and adjusted with carburetor on engine, float level setting is a bench check when overhauling carburetor.

Fuel Level - 11/16" below power valve mounting surface. To check fuel level, remove power valve diaphragm cover and valve assembly (adjacent to bowl), install gauge, Tool T52L-9550-AGE in this opening. Fuel in bowl should just touch "Low" gauge pin and should not touch "High" gauge pin. If adjustment required, remove float bowl and install dummy bowl (with open top) using three of the regular retaining screws. Adjust by bending float arm and recheck fuel level before installing regular bowl.

Float Level - With carburetor off engine and float bowl removed, invert carburetor, install special cardboard gauge (furnished in Repair Pkg.) on edge of bowl at free end of float. Lowest point on float should clear gauging leg. Adjust by bending float arm tab.

Power Valve: No adjustment provided. Power valve opens when manifold vacuum decreases to 9½-10".

CONTINUED ON NEXT PAGE

FORD 6 "VISI-FLO" (C nt.)

Fast Idle: No adjustment required. Consists of a cam shaped section of the choke lever which serves as the stop for the throttle stopscrew.

OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Disconnect and remove pump link. Take out two throttle body screws, lift off throttle body assembly, discard gasket. Remove fuel inlet fitting and gasket, remove dashpot assembly (if used). Take out float bowl retainer screws, remove retainer and clamps, retainer gasket, float bowl, and bowl gasket. Remove fuel inlet seat screw and gasket (in inlet passage), remove complete inlet valve and float assembly from within the main body, remove inlet seat gasket. Disassemble float by removing float shaft to free float, then remove wire clip, spring, and plunger from fuel inlet needle. Take out power valve diaphragm screws and lockwashers, lift the power valve diaphragm assembly out, separate the cover from diaphragm and stem assembly. Take out five main well screws and lockwashers, lift off main well assembly. Remove pump return spring from pump piston disc, remove spacer gasket, pull pump diaphragm out of main body. Remove pump operating lever retainer and slide lever off stud. Remove choke bracket screw and choke valve screw, slide choke shaft and lever assembly out, remove choke bracket. Slide main discharge nozzle out of opposite side of body, remove choke valve and booster venturi assembly. Invert main body, take out distributor passage ball retainer, remove ball from passage. Remove main metering jet, pump inlet and outlet check ball retainers from main well body, invert body to remove check balls *(CAUTION* - Balls are not same size, inlet ball is larger). Press pump rod sleeve toward diaphragm until sleeve retainer ball drops out, remove sleeve and spring. Remove idle mixture adjusting screw and spring, remove dashpot lever (if used). *NOTE* - If necessary to remove throttle valve, mark valve to insure correct reinstallation.

Cleaning & Inspection: Soak all castings and metal parts (except dashpot) in cleaning solution or denatured alcohol. Blow out all passages and jets with air. Inspect all parts for wear or damage.

Reassembly: Use all new gaskets. Install parts in reverse order of disassembly (above) and note the following important points:

Choke Valve Assembly - Install choke bracket on main body, insert choke valve and booster venturi assembly in main body with poppet valve stem down, slide choke shaft and lever assembly in to engage valve, install choke valve screw loosely. Install main nozzle to engage opposite side of choke valve. Close choke valve and check for it being centered by holding main body up to a light (little or no light should show around edges of valve), tighten choke valve screw and check choke valve for free operation without binding. Install choke shaft locating screw and lockwasher.

Pump Assembly - Place pump operating lever on main body stud and install retainer on stud. Install spring on pump diaphragm rod, compress spring by pressing pump rod spring into rod, then drop retainer ball into hole in sleeve. Position pump assembly in main body *(CAUTION* - Make certain main nozzle gasket is in place on end of nozzle), place main well spacer gasket over pump assembly. Install main well assembly (following).

Main Well Assembly - Install pump inlet and outlet check balls *(CAUTION* - Inlet check ball is larger), seat balls by using brass drift to tap ball gently down on seat, install inlet ball retainer and outlet ball weight and retainer. Seat large end of pump return spring in disc on pump diaphragm, insert main well attaching screws and lockwashers in body *(CAUTION* - Two longer screws are used in top and bottom center holes), then install main well body as follows: Apply pressure against protruding end of pump rod sleeve to fully compress pump return spring and at the same time press the main well body into position *(NOTE* - This will prevent spring pressure from disturbing alignment of pump diaphragm, spacer gasket, and main body). Tighten all five main well body screws before releasing pressure.

Float & Inlet Needle Valve Assembly - Assemble inlet valve parts and float on inlet valve seat *(CAUTION* - Needle must be clipped to float lever tab). Install gasket on inlet seat screw, insert screw in inlet fitting boss in main body, install seat gasket on end of screw protruding into fuel bowl. Set float assembly in position at end of screw, place float gauge under float hinge bracket and across lower corners or bowl mounting face to prevent assembly from tilting, tighten inlet seat screw securely before removing gauge. Adjust Float Level using cardboard gauge furnished in repair kit *(see Float Level under ADJUSTMENTS).*

Fuel Bowl Installation - Install new gasket in bowl recess of main body, assemble new gasket and retainer on bowl, position bowl on main body. Assemble clamps, screws, and lockwashers. Tighten two center screws first, and then the two end screws, alternately and evenly, to approximately 8-10 in. lbs. torque. *CAUTION* - Do not overtighten these screws which may crack the bowl.

Carburetor Adjustments - *Make all adjustments listed under ADJUSTMENT above.*

SERVICE PARTS: **Gasket Sets** - Ford No. B6A-9502-A (B7C-9510-C).
Repair Kit - Ford No. B6A-9590-A (B7C-9510-C).

FORD TRUCK DUAL CARBURETOR

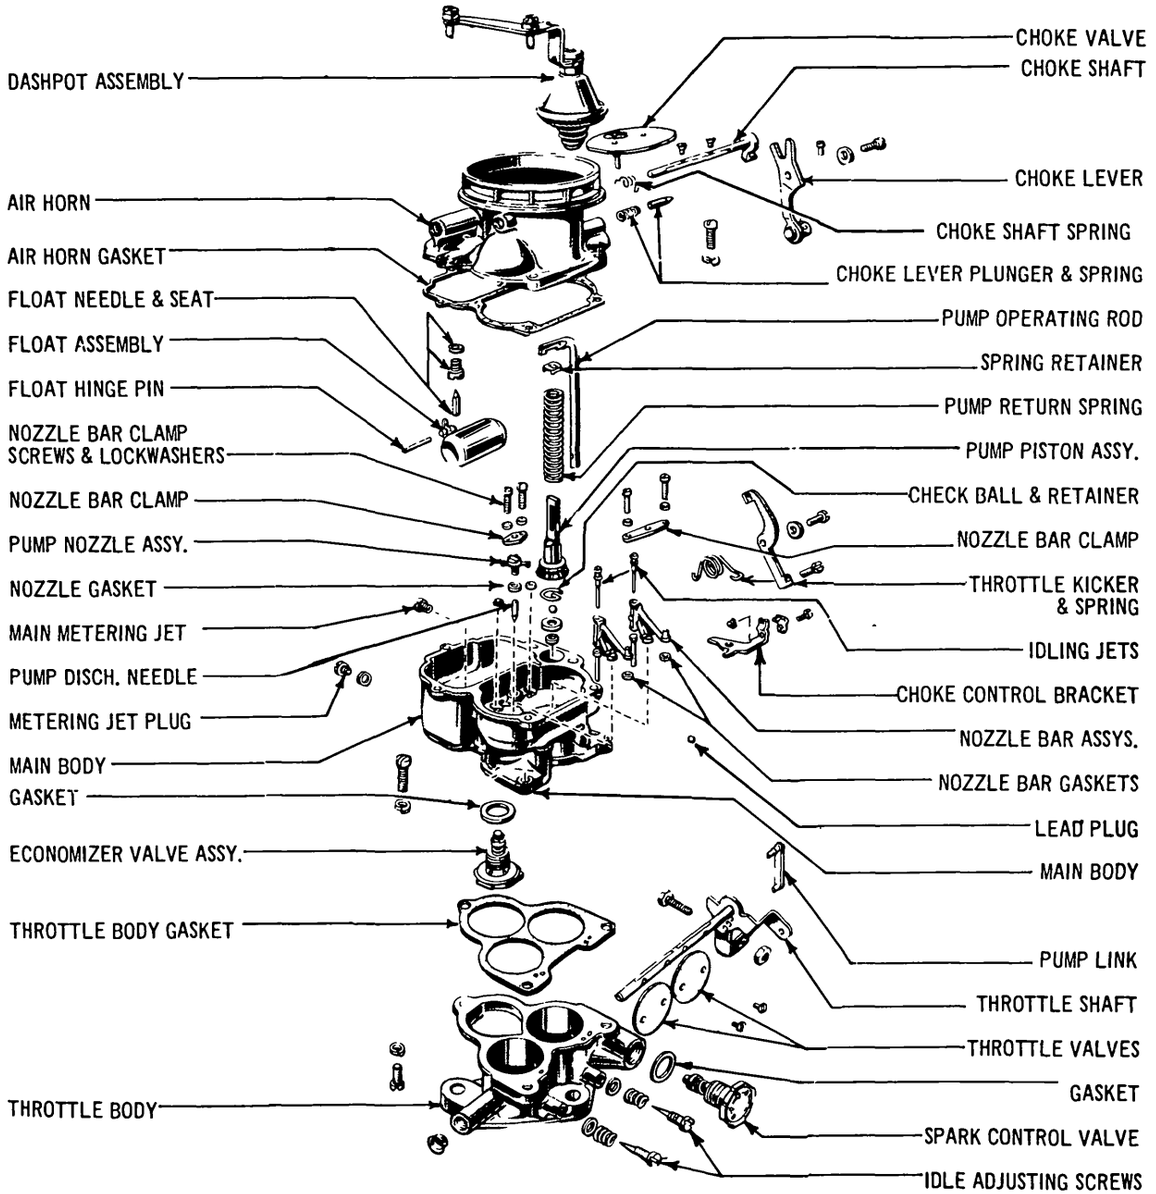
FORD V8 TRUCK	Carburetor No.
1957 V8 F-100, 250, 350 (S-M)	① B7C-9510-A
1957 V8 F-100, 250, 350 (A-T)	② B7C-9510-B

① - Stamped ECW-L7-1 on left side of main body.
② - Stamped ECW-M7-1 on left side of main body.
(S-M) - Synchro-mesh. (A-T) - Fordomatic.

DESCRIPTION: Dual (2-barrel) downdraft type with manual choke control. Design has been changed from type used on previous models as follows:

Main Nozzl s - Nozzle bars are new type with integral booster venturi (see illustration). Main nozzle consists of a horizontal passage in the nozzle bar discharging into the throat of the booster venturi. Idle system is similar to previous type with idle tube installed in leg of nozzle bar and extending down into the main well. The horizontal idle passage extends around the rim of the booster venturi with the idle air bleed opening in the upper surface of the nozzle bar adjacent to the idle tube.

ADJUSTMENTS: Make all adjustments exactly as follows:



Idling Adjustment: If initial adjustment required to warm up engine, turn each idle mixture screw in until lightly seated, then back screw out exactly 1 turn. Operate engine at fast idle until normal operating temperature reached (20 minutes for cold engine), then adjust as follows:

Idle Mixtur - With engine at normal operating temperature and choke valve wide open, adjust idle speed (see below), adjust both idle mixture screws alike by turning screws in until engine runs rough from lean mixture, then turn screws out until engine begins to roll from rich mixture, finally turn screws in just enough so that engine idles smoothly. This will provide a slightly rich mixture which is desired. Recheck idle speed.

Idle Spe d - With engine at normal operating temperature and choke valve wide open, adjust throttle stopscrew for correct idle speed of 475-500 RPM with transmission in neutral (*NOTE* - On Fordomatic models, place selector lever in Neutral "N" and set handbrake).

►*FORDOMATIC IDLE SPEED:* After setting idle speed at 475-500 RPM in Neutral, place selector lever in Drive "D" position and recheck idle speed. Speed should be 425-450 RPM in Drive. Readjust throttle stopscrew as necessary to secure this 425-450 RPM in Drive setting.

Antistall Dashp t (Fordomatic): After idle speed adjusted, check dashpot setting by depressing dashpot plunger fully with throttle valves closed. Clearance between end of dashpot plunger and adjusting screw should be .045-.064". Adjust by loosening locknut and turning adjusting screw.

HOLLEY (FORD TRUCK) DUAL CARBURETOR

Accelerating Pump: Seasonal adjustment provided by three holes in throttle lever for pump link engagement:
Inn r H le - Hot weather or high altitudes.
Cent r H le - Normal or average conditions.
Out r H l - Extreme cold weather.

Fl at Level: Fuel level can be checked without dismantling carburetor. Float level requires removal of air horn and bowl cover assembly.

Fuel Level - 11/16" below top edge of bowl. To check fuel level, install gauge, Tool T56L-9562-A, in one of

CONTINUED ON NEXT PAGE

FORD TRUCK DUAL CARBURETOR (Cont.)

the main jet plug holes on side of bowl. With engine idling, fuel level should be even with "LO" pins in gauge cap.

Float Level - 1.437-1.500" from lower face of bowl cover to bottom of float (at side of soldered seam) with needle valve closed. To check float level, invert air horn and float assembly, place Float Gauge, Tool T56L-9510-A, squarely on gasket face of bowl cover with gauging leg extending over float adjacent to soldered seam (*CAUTION* - Do not gauge top of seam). "GO" end of gauge should just clear float, "NO GO" end should not clear float. Adjust by bending tab on float arm which contacts intake needle. *NOTE* - Gauge both ends of float and adjust for equal height.

Power Valve (Economizer): No adjustment provided. Power valve opens when manifold vacuum decreases to 7-8".

Spark Control Valve: No adjustment required. Calibrating spring in valve is set to allow valve to operate with manifold vacuum of 5-6".

OVERHAUL: *Se "Ford V8 Dual Downdraft" Carburetor in 1955 Annual Data or later Manual edition and note the following:*

Main Nozzle (Nozzle Bar) Servicing - To remove nozzle bars, take out screws in both nozzle bar clamps, remove clamps. Lift out pump discharge nozzle and both nozzle bars. Remove idle tubes from nozzle bars. Clean nozzle bars by dipping inlet end in cleaning solution (*CAUTION* - Do not immerse booster venturi in solution), blow all passages out with compressed air. Use new gaskets when reinstalling nozzle bars in main body.

SERVICE PARTS: Gasket Sets - Ford No. B6A-9502-B.

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 FORD 2-BARREL & 4-BARREL CARBURETOR POWER VALVE (ECONOMIZER) BOTTOMING CORRECTION:* On carburetors that appear to have a leaking power valve, check to determine if power valve is bottoming before the gasket is sufficiently compressed. To check, remove power valve and gasket, then install power valve (finger tight) without gasket. Using the removed gasket as a gauge, try and insert gasket between valve and carburetor body. If gasket can be inserted, the power valve has insufficient thread length. To correct, install original gasket and one additional gasket, Part No. B5A-9909-A on power valve assembly. Install valve and check for proper sealing of the two gaskets.

►*1957 FORD 2-BARREL CARBURETOR (B7A-9510-L) MAIN JET PRODUCTION CHANGE:* Main jets have been increased in size as follows: No. 62 (0-5000 ft.); No. 60 (5000-10,000 ft.); No. 58 (10,000-15,000 ft.) replacing the former sizes of Nos. 53, 51, 49.

►*1957 FORD 2-BARREL & 4-BARREL CARBURETOR-TO-INTAKE MANIFOLD GASKET AND SPACER NOTE:* Proper gaskets and spacers must be used as follows: 2-Barrel (Two gaskets, Part No. B7A-9447-A, and one spacer, Part No. B7A-9603-C); 4-Barrel, except on 312" Engine (Two gaskets, Part No. B7A-9447-B, and one spacer, Part No. B7A-9603-B); 4-Barrel, 312" Engine (Two gaskets, Part No. B7A-9447-B and one spacer, Part No. B7A-9603-D).

►*1957 FORD 312" ENGINE HARD STARTING CORRECTION:* Replace the early aluminum carburetor-to-intake manifold spacer, Part No. B7A-9603-B, with the later "resinoid" spacer, Part No. B7A-9603-D. This later spacer, prevents excessive heat transfer between intake manifold and carburetor.

FORD 2-BARREL CARBURETOR BOWL COVER & MAIN BODY ASSEMBLY

►*1957 FORD 2-BARREL CARBURETOR WHISTLE CORRECTION:* This whistling noise is caused by the 90° corner located at bottom of throttle bore and can be corrected by using a file to remove the sharp edge at junction of throttle bores and intake manifold flanges. *Care must be taken so that not more than 1/16" of stock is removed. The removal of additional stock would cause a vacuum leak at this point.*

►*1957 FORD 2-BARREL CARBURETOR SURGE CORRECTION:* This surge may be encountered in the 40-50 MPH range and is caused by air leaking into booster venturi assembly through the plugs on top of the "tower-like" projections in carburetor throat. Eliminate this air leakage by replacing the defective booster assembly or by sealing the plugs with sealing compound, Part No. 8A-19554-B. *CAUTION - Do not cover any of the bleed holes on booster assembly.*

►*1957 FORD "HIGH ENGINE SPEED" CORRECTION (Cars with Ford 4-Barrel Carburetors):* This condition results from the secondary valves not closing completely due to rough edge at flat portion of valve diameter, or to a slight bend in the secondary throttle shaft. Correct by removing secondary throttle valves and shaft and polish the valves (where flat portion of diameter joins), and the throttle shaft at the three points where shaft contacts carburetor body. Remove any burrs on secondary throttle shaft bores. *CAUTION - Do not remove any more stock than is necessary or carburetor calibration will be affected.*

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

DESCRIPTION: **2-Barrel Carburetor** - New design downdraft type with automatic choke. The throttle body and main body (fuel bowl) are integral, and the air horn also serves as the main body cover. The automatic choke is mounted on the main body and is connected to choke valve shaft by linkage. A diaphragm type accelerating pump is also mounted on main body and connected to throttle valve shaft by linkage. A bowl vent is actuated by accelerating pump linkage.

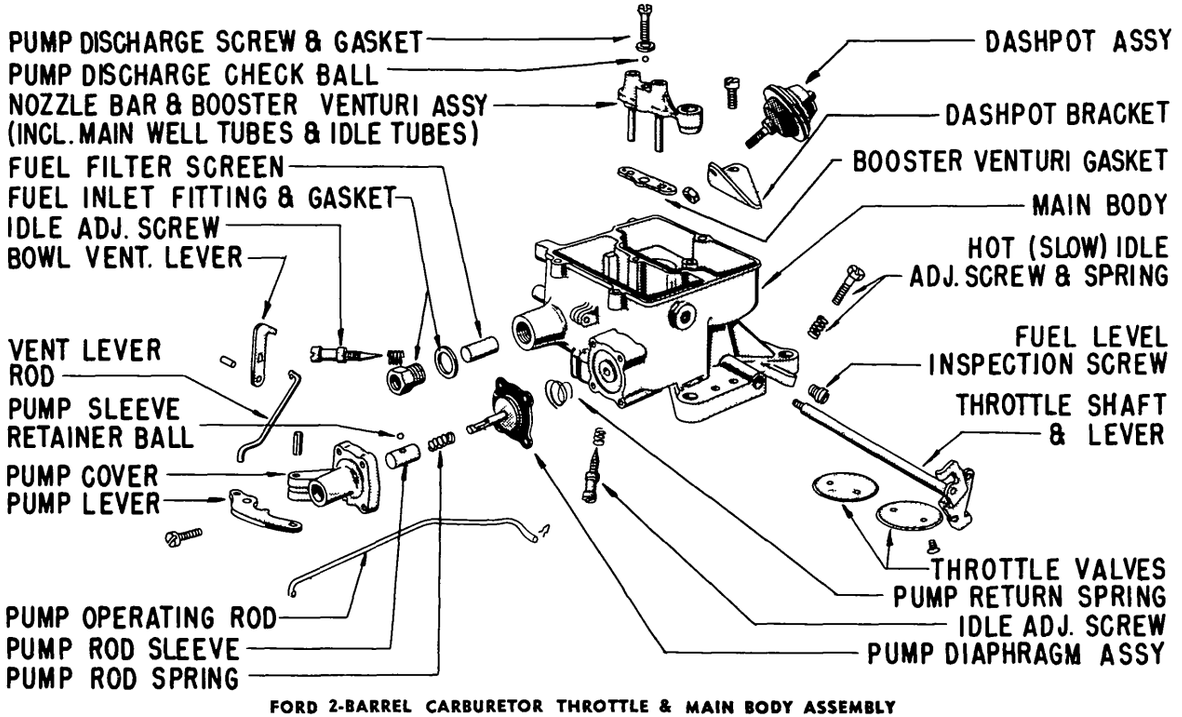
4-Barrel Carburetor - Downdraft type with automatic choke. This carburetor is similar in design to the 2-barrel carburetor (see above). The primary side consists of an idle fuel system, accelerating pump system, main fuel system, power system and choke system. The secondary side has only an idle system and a main fuel system. Secondary throttle valves are operated by a vacuum diaphragm and are connected through linkage to the primary throttle to insure positive closing.

ADJUSTMENTS: Adjustment procedures for both carburetors are the same (except as noted).

Idle Mixture Setting: Initial adjustment 1 turn open from inner seated position (to warm up engine). With engine at normal operating temperature (after running at fast idle speed for 20 minutes), turn both adjusting screws in until engine runs rough from lean mixture, then turn screws out until engine rolls from rich mixture, finally turn screws in just enough for smooth idling (slightly rich rather than lean setting desired). Recheck idle speed.

Idle Speed Setting (Hot Engine): *See Fast Idle for Cold Engine Idle Speed Setting.* Hot engine idle speed is controlled by throttle stopscrew on left side of carburetor (contacts lug on throttle lever). Adjust idle speed only with engine at normal operating temperature and choke valve wide open. Back off fast idle adjusting screw (on opposite side of carburetor) so that it does not contact fast idle cam. Turn stopscrew in or out for correct idle speed. Check by opening throttle by hand and allowing it to close normally.

Idl Speed (Synchro-mesh Cars) - 475-500 RPM.



Idle Speed (Fordomatic Cars) - 475-500 RPM with selector lever in Neutral. Set hand brake and check idle speed with selector in Drive (Dr) position. Readjust as necessary for idle speed of 425-450 RPM in Dr.

Anti-Stall Dashpot (Fordomatic Cars): After adjusting engine idle speed, hold throttle closed, press dashpot plunger in to end of stroke, check clearance between end of plunger and lug on throttle lever. Clearance should be .045-.064". Adjust by loosening dashpot adjusting nut and turning dashpot in or out.

Acc l rating Pump Stroke: Bend accelerator pump rod to obtain correct measurement between end of pump plunger and pump cover when throttle valves are closed Install pump lever rod in inner hole (Winter), outer hole (Summer)

Accelerating Pump Setting

Engin	Pump Setting Synchro-mesh	Ford matic
272" Engine	.3 '16-7/32"	3/ 16-7/32"
292" Engine	.3 '16-7 32"	7/32-1 4"
312" Engine		7/ 32-1 4"

FORD 2-BARREL CARBURETOR THROTTLE & MAIN BODY ASSEMBLY

►*ACCELERATING PUMP ADJUSTMENT NOTE.* After installing a new rod or bending the old rod, check operation by slowly moving throttle lever to fully opened position If accelerator link strikes pump cover casting, file a notch in link as necessary for clearance

Bowl Vent: With engine operating at correct idle speed, place a 100" feeler between idle adjusting screw and screw stop Bowl vent valve should just close To adjust bend operating rod on vent

Economizer (Power Valve): *NOTE - On 4-Barrel carburetors, the power valve is located on the primary side only.* Diaphragm type located under cover on bottom of fuel bowl surface on main body. Power valve opens when manifold vacuum falls to 9½-10" and by-passes fuel through the valve directly to main well. No adjustment provided. *CAUTION - Power valve forms vacuum chamber and must be tight.*

Float Level· To check float setting, remove air horn and bowl cover, hold float in upper position with needle valve closed. Use Checking Tool 9590-B (2-Barrel Carb.), 9590-9 (4-Barrel Carb), *(NOTE - These are cardboard gauges furnished with Repair Kit),* or scale to measure from top edge of bowl to top of float at free end This distance should be .325-.355" (2-Barrel Carb.), 540- 570" (4-Barrel Carb.), Adjust by bending tab on float arm which contacts inlet needle.

►*FLOAT GAUGE NOTE:* When using Gauge 9590-B or 9590-9, install gauge on bowl edge at wide section of bowl at free end of float. Float should just touch longer leg on gauge and should not touch shorter leg (turn gauge 180° to bring opposite leg into gauging position).

Fuel Level - With correct float setting, fuel level should be 1" ± 1/32" (2-Barrel Carb.), .970-1.03" (4-Barrel Carb.) below top edge of bowl *(NOTE - Fuel level is the same for secondary float on 4-Barrel Carb.)* A fuel level inspection hole (closed by plug) is provided on side of main body (separate plugs for primary & secondary floats on 4-Barrel Carbs)

Fast Idle: Consists of a stepped sliding cam linked to the automatic choke bellcrank and serving as a stop for the fast idle adjusting screw (on right side of carburetor at opposite end of throttle valve shaft from hot or slow idle speed throttle stopscrew). Adjust fast idle with engine at normal operating temperature after hot or slow idle speed adjustment has been completed. With throttle valves in closed position, turn fast idle adjusting screw in until it just contacts **low st** step on fast idle cam. This setting will provide correct fast idle speed (when screw will contact higher steps on fast idle cam).

►*FAST IDLE SPEED NOTE* If above setting is considered too high for operating conditions, fast idle speed may be reduced by backing off fast idle screw not more than one turn from standard setting On Ford 4-Barrel carburetors clearance between fast idle adjusting screw and cam must not be less than 005" when choke is wide open

Aut matic Ch ke S tting: Centered. Mark on thermostatic coil cover should be in line with center (longest) mark on choke housing. Adjust by loosening three screws in retainer ring and rotating cover.

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (Con..)

► *AUTOMATIC CHOKE ADJUSTMENT NOTE:* For maximum fuel economy, the cover may be rotated in the **lean** direction, dependent on ambient temperatures in the local area. If hard, cold starting is experienced, the cover should be rotated in the **rich** direction.

OVERHAUL: Remove air cleaner anchor screw and lockwasher. On 2-barrel carburetors, invert the carburetor and remove throttle body-to-main body screws and lockwashers. Lift off main body and remove throttle body gasket. On 4-barrel carburetors, disconnect choke rod at bellcrank assembly, then remove rod seal retainer from air horn and slide felt seal and two washers off rod. Remove air horn-to-main body screws, then remove air horn and gasket. Remove choke plate from choke shaft, then remove choke rod, and slide choke shaft from air horn.

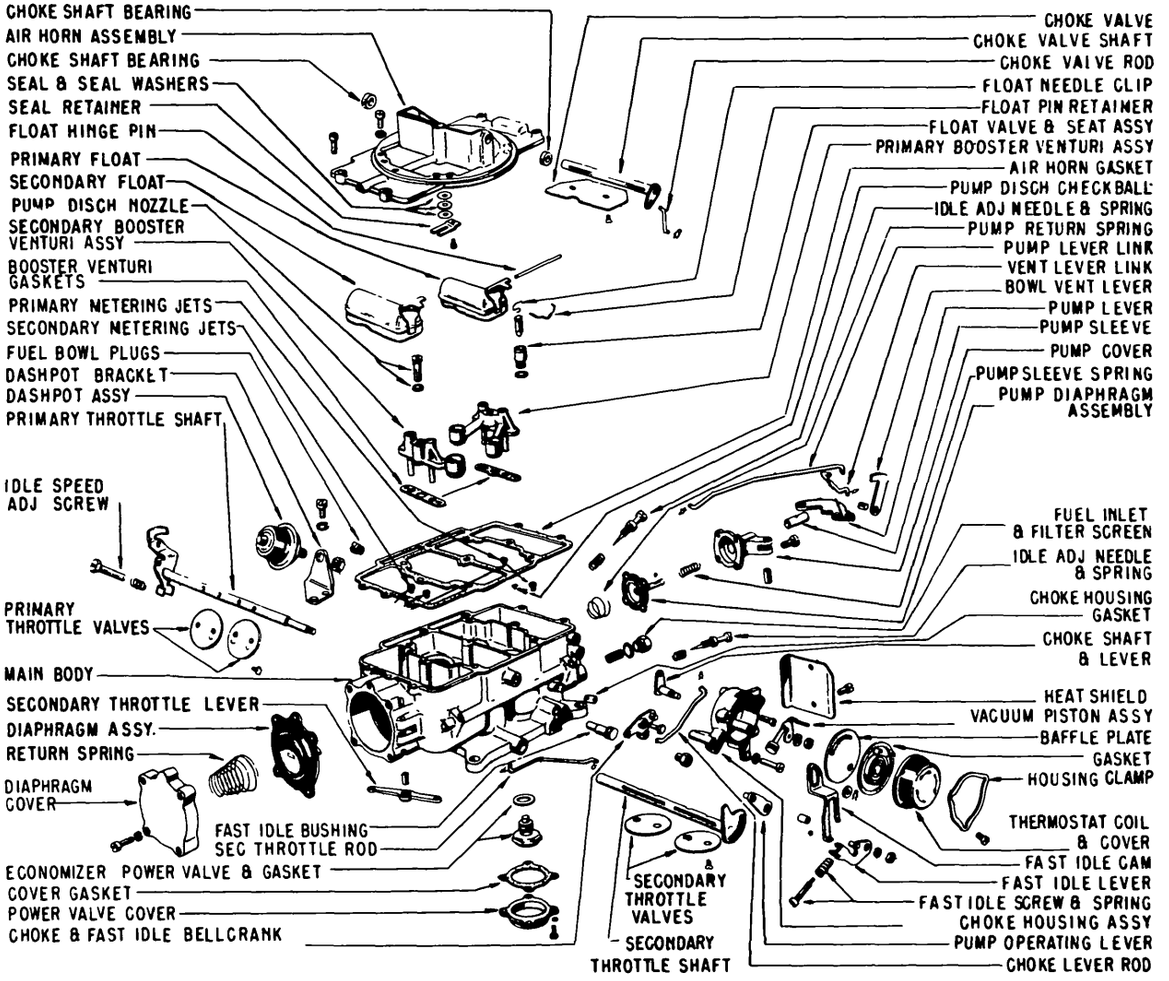
Disassembly (2-Barr l Carb.): 1) Remove fuel inlet fitting gasket and screen, then remove fuel bowl retaining screws. Fuel bowl, gasket, metering assembly, and metering assembly gasket will slide off main body. Separate metering assembly from fuel bowl and discard gaskets.

2) Remove vent valve, idle adjusting screws and gaskets, and the power valve and gasket from metering assembly. Remove external vent linkage retainer and spring, then remove vent and linkage from fuel bowl. Remove accelerating pump cover assembly from fuel bowl, then remove diaphragm and spring. Remove float retainer, then lift float out of bowl. Remove float spring and the "O" ring seal from fuel valve seat assembly, then remove baffle plate. Remove fuel valve seat and let the valve, spring, and pin fall out.

3) Remove choke rod pin from choke housing shaft and lever assembly. Remove thermostat housing and gasket from main body, then remove vacuum passage gasket. Remove nut, lockwasher, and spacer from choke housing shaft, then remove shaft and fast idle assembly. Remove choke piston and lever assembly. Remove choke rod pin from choke shaft lever. Remove choke rod, washers, and seal from main body. Remove choke valve from shaft, then slide shaft and lever out of choke housing.

4) Remove pump discharge nozzle screw, then lift pump discharge nozzle and gasket out of main body. Invert main body and let the pump discharge weight and ball fall out into the hand.

5) Remove dashpot assembly, then remove pump operating lever retainer and remove pump operating lever. Remove fast idle pick-up lever and fast idle cam lever and spring. If it is necessary to remove throttle valves, lightly scribe both valves along throttle shaft and mark each valve and its corresponding bore with a number or letter for proper replacement. Remove throttle valve screws and remove valves. Slide throttle shaft out of throttle body.



Disass mbly (4-Barr l Carb.): 1) Remove fuel inlet fitting, gasket and screen. With needle nose pliers, disconnect float shaft retainer, and remove the main jets. Invert main body and remove power valve cover and gasket, then remove valve and valve gasket. Remove idle adjusting needles and springs and remove distributor vacuum line fitting.

2) Remove accelerating pump discharge screw and gasket, then remove booster venturi assembly and gasket. Invert main body and let accelerating pump discharge ball fall into the hand. Remove accelerating pump operating rod and bowl vent rod. Remove accelerating pump cover, diaphragm assembly, and spring. Press pump rod sleeve toward diaphragm until sleeve retainer ball drops out. Remove sleeve and spring. Remove dashpot assembly and bracket.

3) Remove choke thermostat shield. Disconnect choke lever rod from choke housing lever, then remove thermostat housing retaining screws and clamp, thermostat housing, gasket, and the choke housing plate. Remove three choke housing-to-main body screws and lockwashers, then remove choke housing and gasket. Remove choke shaft and lever assembly retaining nut and spacer, then remove choke shaft and lever assembly, choke piston, lever and link assembly.

4) Remove nut and lockwasher securing fast idle adjusting lever assembly to throttle shaft, then remove lever assembly. Disconnect fast idle cam assembly at bellcrank, then remove fast idle cam. Remove bushing, primary throttle closing lever, and the inner bushing. Remove choke rod from bellcrank.

5) If it is necessary to remove throttle valves, lightly scribe both plates along the throttle shaft and mark each valve and its corresponding bore with a number or letter for proper installation. Remove throttle valve screws, then slide throttle shaft out of main body.

FORD 4-BARREL CARBURETOR

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (Cont.)

6) On the secondary side, disconnect float shaft retainer, then remove float and shaft, and the fuel inlet needle and clip. Remove fuel inlet needle seat and float retainer, and remove the secondary jets. Remove secondary diaphragm operating rod, diaphragm cover, return spring, and diaphragm assembly. Remove secondary booster venturi assembly retaining screw and lockwasher, then remove booster assembly and gasket. 7) If it is necessary to remove throttle valve, proceed as for primary valve (above).

Cleaning & Inspection (All Carbs.): Wash all parts, except those noted below in clean solvent. *(CAUTION - Do not use solvent on accelerating pump diaphragm, power valve, secondary operating diaphragm, and dashpot).* Blow out passages in casting with air. Inspect all parts for wear or damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idel tubes for wear or clogged passages. *(CAUTION - Clean with air, do not use drills to clean out calibrated openings).* Replace all worn or damaged parts.

Reassembly (2 & 4-Barrel Carbs): Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Throttle Valve Installation - Refer to the line scribed on throttle valve at disassembly, and install valves in their proper location with the screws snug, but not tight. Little or no light should show between throttle valves and throttle bores. Tap valves lightly to seat them, then tighten the screws.

Float Installation (4-Barrel Carb.) - Retainer grooves on float shaft are not equally spaced. To install, slide shaft in float lever so that the groove closest to end of shaft is toward outside of carburetor, then install float retainer.

Acc l rating Pump Ball Ch ck - Seat ball with a brass drift and a light hammer. Make sure the ball is free, then proceed with reassembly.

Air Horn - On 4-barrel carburetors, be sure to install a new fibre washer with the screw that enters the secondary vacuum passage.

Carburetor Adjustments - Make all the adjustments indicated. *See "Adjustments" abov .*

SERVICE PARTS: Gasket Kits - Ford No. B7A-9502-E (B7A-9510-A, E, L, Q, W); Ford No. B7A-9502-F (B7A-9510-B, X).

►CHANGES, CAUTIONS, CORRECTIONS

►*HESITATION & STUMBLE CORRECTION (2- & 4-Barrel Carbs):* This condition may be caused by a binding fuel bowl vent linkage Check the following points for mis-alignment: Accelerator pump to throttle shaft lever bind at the center shaft, and lever contact alignment. Binding at accelerator pump lever on pin in pump cover assembly Binding at float bowl vent selector where it enters float bowl casting Bowl vent hanging on top of float bowl casting recess.

►*AUTOMATIC CHOKE STICKING CORRECTION (2- & 4-Barrel Carbs):* This may be caused by interference between carburetor main body and end of thermostatic choke lever rod. Correct by bending the choke lever assembly (bellcrank) away from main body

►*ACCELERATOR PUMP-TO-THROTTLE LEVER INTERFERENCE (2- & 4-Barrel Carbs):* If interference is at the dashpot mounting bracket, correct by bending the dashpot bracket upwards. Do not bend more than is necessary to provide clearance Check and adjust alignment between end of dashpot and contact point on throttle lever by bending bracket outward slightly

►*STUMBLE (ON ACCELERATION) CORRECTION (2- & 4-Barrel Carbs):* This condition may be caused by a blocked passage in accelerating pump circuit due to misalignment between fuel bowl and metering block which will press the accelerating pump circuit ferrule into metering block and close the circuit Remove and reposition ferrule as follows: Slip the end of a small piece of wire into ferrule, then using a pair of side cutters or similar tool, work ferrule from metering block *(NOTE* - The wire is used only to prevent ferrule from collapsing) Reposition ferrule, remove wire, and then assemble the fuel bowl to metering block, making sure that all parts are aligned

►*1957 HOLLEY 4-BARREL CARBURETOR SECONDARY FLOAT SETTING NOTE* Some of these carburetors have a boss in the floor of the secondary float bowl which interferes with use of float gauge (Tool 9510-10 Ford, 9550-K-2 Mercury) *(NOTE - These are the gauges supplied with carburetor kit)* Existing instructions indicate the two positioning arms of gauge must touch side of bowl However on bowls with boss in floor the top positioning arm should be tipped away from side of bowl so locating step will seat firmly on bottom of bowl and not ride on boss Firm pressure on gauge will position gauge for correct float setting

►*1957 HOLLEY CARBURETOR FLOAT BOWL PRODUCTION CHANGE & FLOAT SETTING CAUTION* Float bowls and baffle plates have been revised during production as follows to prevent leakage and flooding (1) First design includes primary and secondary bowls with no retaining ribs and a baffle plate with a retaining hole through which the fuel inlet valve passes An "O" ring is used between valve and baffle (2) Second design has one baffle retaining rib and a baffle of same design as used in first type (3) Third design bowls have two retaining ribs and a baffle plate which is slotted at the bottom to clear fuel inlet valve assembly *CAUTION* - When baffle is installed, gently vibrate bowl and determine if baffle has a tendency to tilt toward float If so carefully bend upper portion of baffle until this tendency is eliminated If an "O" ring is used make sure that a good seating condition is established using a new "O" ring Handle baffle carefully at all times as it is easily distorted Do not bend more than indicated above

►*4-BARREL CARBURETOR THROTTLE BODY-TO-MAIN BODY GASKET INSTALLATION CAUTION* This gasket must be installed so ALL holes in gasket align with mating holes in throttle body Because the gasket can be installed in either an inverted or rotated position each gasket installation should be carefully checked before assembling carburetor

►*1957 FORD TRUCK 4-BARREL CARBURETOR "DE-POPPER VALVE" NOTE* The depopper device has been made inoperative on all 4-barrel carburetors by plugging the air inlet passage located between secondary venturi next to air cleaner stud hole boss to maintain proper idle characteristics If the depopper device is needed and a higher idle RPM can be maintained the plug can be removed

►*1957 FORD TRUCK 4-BARREL CARBURETOR CHOKE VALVE STICKING CORRECTION (B7T-9510-C)* The choke valves sticking in the closed position may be caused by sideways movement of the fast idle cam and shaft assembly To correct this condition, bend end of choke rod lever which contacts the fast idle pickup arm approximately 10° outboard of its original position

DESCRIPTION: **2-Barrel Carburetor** - New design dual downdraft type with automatic choke consisting of a main body, throttle body, and a side mounted (on main body) fuel bowl and metering block assembly. The automatic choke is mounted on main body and is connected to choke valve shaft by a connecting rod. The accelerating pump is mounted in bottom of fuel bowl and is connected to throttle shaft by a bellcrank arm and lever A power valve located in main body is controlled by vacuum and actuated by a power valve spring.

4-Barrel Carburetor - New design downdraft type with automatic choke. This carburetor is similar to the 2-Barrel (above). On the primary side there is an idle system, main fuel system, accelerating pump system, power system and choke system The secondary side has an idle system, main fuel system and a power system Throttle valves on secondary side are operated by a vacuum diaphragm

ADJUSTMENTS: Adjustment procedure and settings are the same for 2-Barrel & 4-Barrel carburetors (except float level, fuel setting & economizer setting).

Idle Speed (Hot Engine) Setting: *See "Fast Idle" (below) for Cold Engine Idle Speed Setting* Adjust engine idle speed by rotating throttle stopscrew on left side of carburetor, with engine at normal operating temperature and choke valve wide open. Back off fast idle screw (Except trucks with 4-Barrel carbs) which is on opposite side, so that it does not contact fast idle cam

CONTINUED ON NEXT PAGE

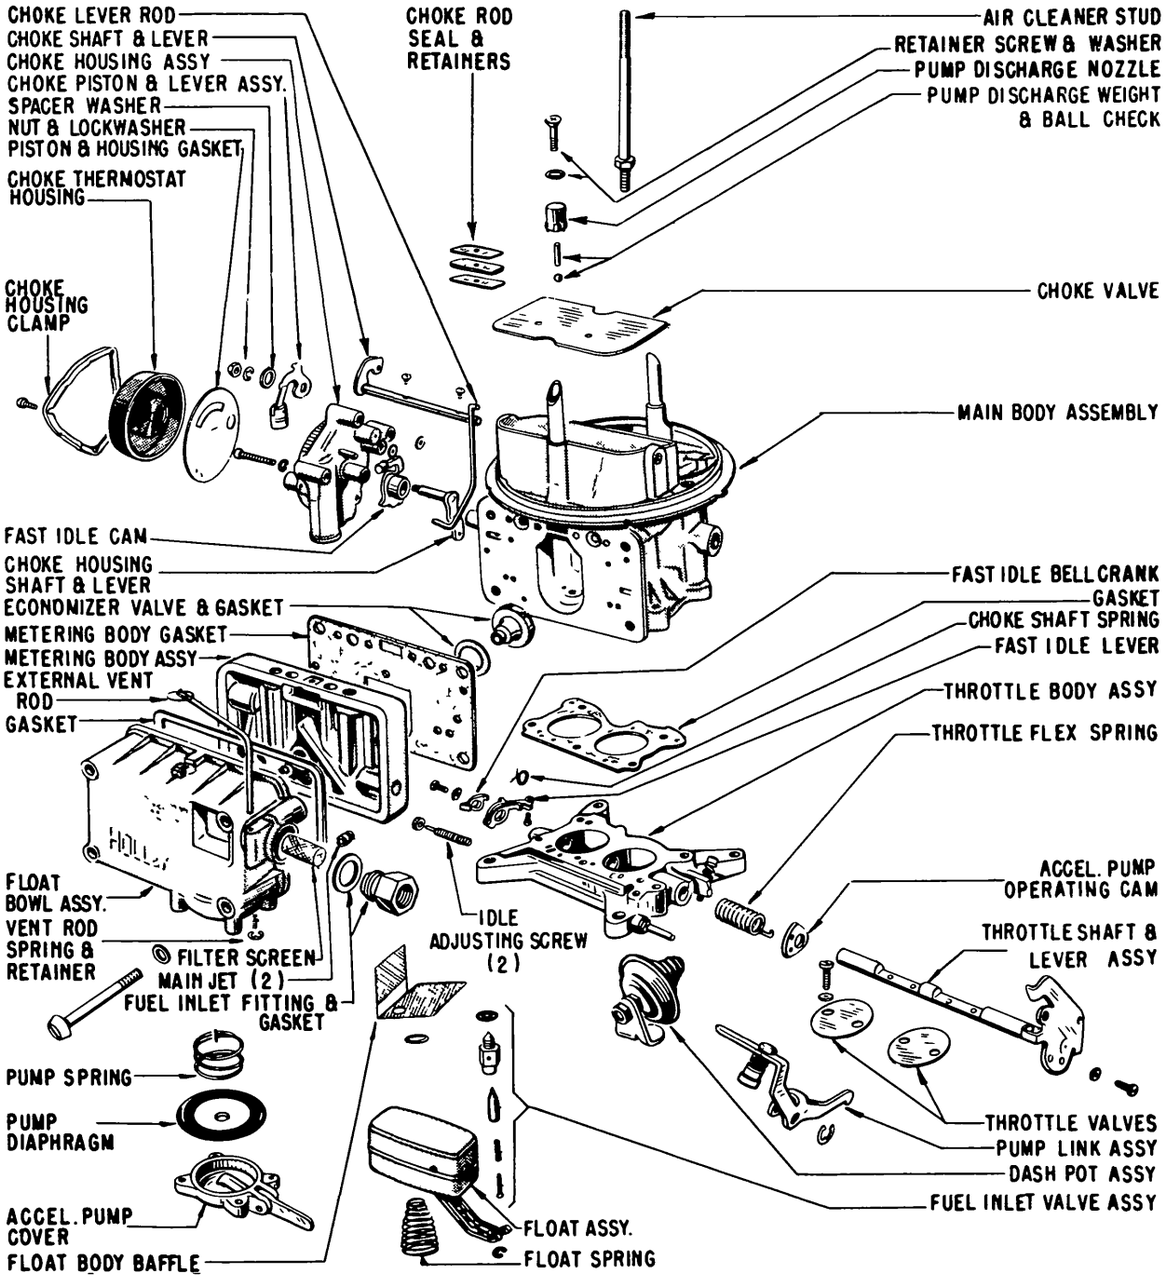
HOLLEY 2 & 4-BARREL CARBURETORS (C ntinu d)

Idl Speed (Cars & Trucks, Synchro-mesh Trans.) - 475-500 RPM.

Idl Speed (Cars & Trucks, Automatic Trans.) - 425-450 RPM with transmission selector lever in "D" (Drive) position.

Idl Mixture Setting: *(NOTE - Idle mixture screws are on Primary side, Pass. Cars; Secondary side, Trucks).* Initial adjustment is 1 turn open (Ford Pass. Cars), 1-1½ turns open (Ford Trucks), 1¼ turns open (Mercury) from a lightly seated position. With engine at normal operating temperature, make final adjustment as follows: Turn both idle mixture screws in until engine runs rough, then turn screws out until engine "rolls" (from rich mixture). Finally turn screws in just enough for smooth idling (slightly rich rather than lean setting desired). Reset engine idle speed.

Anti-Stall Dashpot (Fordomatic & Mercomatic): With engine at proper idle speed, hold dashpot plunger into the limit of its travel, then loosen dashpot locknut. Rotate dashpot to obtain .045-.064" clearance (Ford), 1 16" clearance (Mercury) between end of dashpot plunger and throttle operating lever. *(NOTE - Make sure throttle is closed so hot idle screw is against the stop).* Tighten dashpot and recheck clearance.



Acc lerating Pump Adjustment (Lever Screw): Hold throttle valves wide open and depress pump arm fully. Distance between pump lever adjusting screw head and pump arm should be .015". *(NOTE - One-half turn of screw changes the adjustment .015").*

S asonal Setting - Align top hole in cam with top hole in throttle lever for long stroke (cold weather). Align bottom hole in cam and bottom hole in throttle lever for short stroke (warm weather).

Ec nomizer (Power Valve): Diaphragm type located in metering assembly. Adjustment not necessary. Power valve opens when manifold vacuum falls below 8-9" (2-Barrel Carb. & Primary side of 4-Barrel Carb.), 10-11" (Secondary side of 4-Barrel Carb.), and by-passes fuel through valve directly into main well.

Fu l Bowl Vent Setting (Pass. Cars): *(NOTE - Adjustment is made on Primary side of 4-Barrel Carb.).* With throttle valves fully closed, distance between top of fuel bowl and vent button should be 1/16". Bend end of horizontal arm on accelerating pump lever.

Fl at Level: *(NOTE - If float is to be checked with carburetor on engine, remove a lower bowl retaining bolt and drain fuel bowl).* Invert fuel bowl and check float setting with Gauge 9590-10 (furnished with carburetor repair kit). If gauge not available, adjust float to correct level (see table below), measured between floor of bowl and top of float at a point on float 11/16" from inside of bowl (end furthest from float needle) and ½" in from gasket mounting surface. Adjust by bending tab on float arm.

HOLLEY 2-BARREL CARBURETOR

Carb.	Fl at L v l S tting	ↄ tting
2-Barrel (Pass. Car)		3/4"
2-Barrel (Truck)		11/16"
4-Barrel (Primary)		13/16"
4-Barrel (Secondary)		3/4"

►*4-BARREL SECONDARY FLOAT SETTING NOTE: S e "1957 H ll y 4-Barrel Carburetor S condary Float S t-ting N t " abov*

Fu l L v l - With correct float setting, fuel level should

CONTINUED ON NEXT PAGE

HOLLEY 2 & 4-BARREL CARBURETORS (Continued)

then remove diaphragm and spring. Remove float retainer, then lift float and spring out of fuel bowl. Remove "O" ring seal from fuel valve seat assembly and remove the baffle plate. Remove fuel valve seat and let valve, spring, and pin fall out into the hand.

2) Remove secondary fuel bowl retaining screws, then remove fuel bowl from main body. Separate main metering assembly from fuel bowl, then remove the gasket. Remove vent valve. On Trucks, remove the idle mixture adjusting needles, then remove the jets, power valve and gasket from metering assembly. Remove float retainer, then lift float and spring out of fuel bowl. Remove "O" ring seal (if so equipped) from fuel valve seat assembly, then remove baffle plate. Remove fuel valve seat assembly and let the valve, spring, and pin fall out into the hand.

3) Remove choke rod retainer from choke housing lever assembly. Remove thermostat housing and gasket, then remove choke housing and gasket from main body. Remove choke housing shaft nut, lockwasher and spacer, then remove choke housing lever and shaft assembly and fast idle cam assembly. Remove choke piston and lever assembly. Remove choke rod retainer from choke lever. Remove choke rod, washers and seal from main body, then remove choke valve from shaft and slide shaft out of choke housing.

4) Remove secondary diaphragm housing and gasket from main body. *(NOTE* - Housing must be removed before cover can be removed). Remove diaphragm housing cover, then remove spring and diaphragm from housing.

5) Remove pump discharge nozzle screw, then lift pump discharge nozzle and gasket out of main body. Invert main body and let pump check weight and ball fall into the hand.

6) Remove dashpot assembly (if so equipped), then remove pump operating lever retainer and pump operating lever. Remove secondary throttle connecting rod and washer. Remove secondary diaphragm lever assembly. Remove fast idle pickup lever and fast idle cam lever and spring. If it is necessary to remove throttle valves, lightly scribe valves along throttle shaft and mark each valve and its corresponding bore with a number or letter for proper installation, then remove throttle plates. On the secondary side, remove the two throttle connecting rod retainers and washer. Slide throttle shafts out of throttle body. On primary throttle shaft, remove the throttle connecting rod and return spring.

Cleaning & Inspection (All Carbs.): Wash all parts, except those noted below in clean solvent. *(CAUTION - Do not use solvent on accelerating pump diaphragm, power valve, secondary operating diaphragm, and dashpot).* Blow out passages in casting with air. Inspect all parts for wear or damage, with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idle tubes for wear or clogged passages. *(CAUTION - Clean with air, do not use drills to clean calibrated openings).* Replace all worn or damaged parts.

Reassembly (2 & 4-Barrel Carbs.): Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points.

Throttle Valve Installation - Refer to line scribed on throttle valve at disassembly, and install valves in their proper location with the screws snug, but not tight. Little or no light should show between throttle valves and throttle bores. Tap valves lightly to seat them, then tighten the screws.

Accelerating Pump Ball Check - Seat ball with a brass drift and a light hammer. Make sure ball is free, then proceed with reassembly.

Seconadary Diaphragm Housing (4-Barr l Carbs.) - Install secondary diaphragm housing before installing the choke housing.

Carburetor Adjustments - Make all adjustments indicated. *See "Adjustments" abov .*

SERVICE PARTS: Gasket Kits - Ford No. B7A-9502-B (B7A-9510-F,G,K,R,S,T); Ford No. B7A-9502-C (B7A 9510-H,U).

Repair Kits - Ford No. B7A-9590-B (B7A-9510-F,R,AA); No. B7A-9590-C (B7A-9510-G,K,S,T,AB); Ford No. B7A-9590-F (B7A-9510-H,U).

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK FLOAT DROP SETTING CHANGE:* The float drop setting specification has been changed from 1 7/8" ± 1/32" to 1 13/16" ± 1/32".

►*1957 BUICK VACUUM SWITCH STICKING NOTE:* If the vacuum switch sticking is found to be caused by the steel ball sticking in the "up" position and cleaning the unit does not correct the condition, the ball seat may be improperly staked. If this is the case, replace the throttle body.

►*1957 BUICK (WITH CARBURETOR No. 7010070) PRIMARY VENTURI CLUSTER CHANGE (To Correct an Acceleration Flat Spot When Car is Coasted Back From Speed Above 40 MPH and Then Again Accelerated at 30 MPH):* Install primary cluster kit, Part No. 7011329. Make sure that the brass identification tag included in the kit is installed on carburetor along with the original tag. *NOTE - Carburetors built after October 1956 will have this change made and can be identified by the letters "C", "D" or higher on the original identification tag.*

►*1957 BUICK STUMBLE AND FLAT SPOT CORRECTION (CARS WITH CARBURETOR No. 7010070): (NOTE - If carburetor identification tag is not "C" or "D" or later, install primary venturi kit, see "Primary Venturi Cluster Change" above, then proceed as follows):* Install a new pump shaft and lever, Part No. 7011462, which has three holes in end of lever for pump travel adjustment. Install the pump rod in the inner hole. Adjust pump setting to provide a distance of 1 3/32" between bottom of plunger and cover casting (with pump rod in inner hole of lever). Check and adjust float drop *(see "Float Drop Change" above).* Check position of vacuum piston which should be 1/32" to 1/16" above the flush position, *(see "Choke Piston Setting Change" below).* Check choke rod adjustment and adjust the ignition timing.

►*1957 BUICK CHOKE PISTON SETTING CHANGE:* With choke valve held fully closed, vacuum piston should be exposed 1/32" to 1/16" out of cylinder (NOTE—This setting supersedes previous "flush" setting. To adjust, bend intermediate rod (connecting link on choke to choke valve shaft).

►*1957 BUICK CARBURETOR (No. 7010070) MODIFICATION (To correct a lean flat spot condition in part throttle and power ranges):* Install Kit, Part No. 7011-481 as outlined in instructions contained in kit and note the following: If carburetor tag does not have the letter "C", "D" or later, make sure the primary venturi cluster has been changed *(see "Primary Venturi Cluster Change" above).* After installation of kit, adjust accelerating pump so that distance from top of air horn casting to bottom of pump plunger shaft is 1 1/64". Install pump rod in outer hole for warm weather and in inner hole for cold weather operation.

►*1957 BUICK CHOKE HOUSING INDEX POINT CHANGED (Moved From Bottom of Housing to Top:* Only the new housing, Part No. 7011276 and Cover, Part No. 7010778 will be available for service. If necessary to replace either of these parts on carburetors having identification tags with the letter "C" or earlier, both parts will have to be replaced. On later carburetors, either part may be replaced

►*1957 CHEVROLET CARBURETOR (No. 7009846) PUMP JET CHANGE (For improved fuel atomization):* A new pump jet cluster assembly, Part No. 7011576, having four (.024") pump jets instead of the customary two, can be used for replacement on this carburetor.

►*1957 CHEVROLET CARBURETOR (No. 7009846) PRIMARY MAIN METERING JET PRODUCTION CHANGE AND SERVICE REPLACEMENT NOTE :* Primary main metering jets, Part No. 7002645 (.045") used in early carburetors were changed to Part No. 7002647 (.047") in carburetors identified by an "A" on the identification tag. Later carburetors with "B" on the identification tag used main metering jets, Part No. 7002648 (.048").

►*1957 CHEVROLET TRUCK CARBURETOR (No. 7011161) PRIMARY MAIN METERING JET CHANGE:* Main metering jet, Part No. 7002647 (.047") replaced Part No. 7002648 (.048") on carburetors identified by "B" or later stamped on the identification tag.

►*1957 OLDSMOBILE CARBURETORS (Nos. 7009470 & 71) POWER VALVE & POWER PISTON PRODUCTION CHANGE:* Carburetor No. 7009470 with letter "E" and later, and carburetor No. 7009471 with letter "D" and later stamped on the identification tag have a new power valve assembly, Part No. 7009349, replacing Part No. 7010918; and a new power piston assembly, Part No. 7000204, replacing Part No. 7008612. Only the latest power valve and power piston should be used for service replacement.

►*1957 OLDSMOBILE HARD (HOT) STARTING NOTE: After partial warm-up or partial cooling the car will run below idle speed for a few seconds then either speed up and throw clouds of black smoke or else stall out entirely.* This condition is caused by the choke being set two or three notches rich. (Because of the choke modifier it is not possible to tell visually whether choke setting is correct). Adjust choke as specified under "Adjustments" below.

►*1957 OLDSMOBILE CARBURETOR UNLOADER SETTING CHANGE:* Adjust the unloader to obtain .115"± .015" clearance (Gauge BT-90) between upper edge of choke valve and dividing wall in air horn. *See "Adjustments" below.* This supersedes previous setting of .090" ± .015".

►*1957 OLDSMOBILE IDLE MIXTURE & IDLE SPEED SETTING CAUTION:* These adjustments must be made with the air cleaner in place on the carburetor.

►*1957 PONTIAC CARBURETOR MODIFICATION TO PREVENT A FLOODING CONDITION: The following modifications are recommended to eliminate a flooding and stalling condition:*

Fuel Filter Element - Install the later type fuel filter element Part No. 854467.

Float Needle & Seat Assembly - Install Package No. 7012295 which includes needles, seats and gaskets for both the primary and secondary side of carburetor. The needle seat is a new type having a narrower seating area. Do not seat needles by tapping or lapping into place as this would damage the narrow seating area.

Drilling Fuel Balance Ports - With air horn removed from carburetor, drill out the balance passage holes (located below gasket surface of main body in wall of float chambers on side adjacent to choke housing). Use a 3/16" drill, and drill out the existing balance passage holes. *(CAUTION* - These holes are drilled at an angle and care should be taken to make sure the drill does not contact other areas of the carburetor.

Cleaning & Inspection - Use air pressure and clean all passages in carburetor. Remove idle mixture screws and use a light or a tag wire to make sure passages are clean. Remove all gum and carbon deposits.

Float Level Adjustment - Adjust float level to 1 3/8" using gauge J-6628 *(see "Adjustments" below). (NOTE* - Adjust float tip so that lower edge of float tip is flush to 1/16" above gasket surface). Adjust float drop *(see "Adjustments" below).*

Idle Speed - Adjust idle speed to 500 RPM. *See "Adjustments" below for idle mixture and idle speed adjustment procedures.*

►*1957 PONTIAC SECONDARY THROTTLE VALVE SPRING ADJUSTMENT NOTE:* This is a new adjustment to insure positive closing of secondary throttle valves on idle, and must be made with carburetor on the car. *See "Adjustments" below.*

DESCRIPTION: Four-barrel downdraft type with automatic choke (4GC), without automatic choke (4G). Except for Chevrolet Pass. Car carburetors, design changes have been made as noted below.

Buick: The float bowl has been lowered with new type spring balanced, cutaway floats. Automatic choke housing has been moved from the float bowl to throttle body. Counterweighted auxiliary throttle valves have been replaced by a new type spring loaded, factory calibrated auxiliary throttle valve assembly which is now located in the float bowl. These new type valves are not adjustable, and should not be disassembled.

CONTINUED ON NEXT PAGE

ROCHESTER 4G & 4GC 4-BARREL CARBURETORS (Cont.)

Oldsmobile: Same design as previously used except that automatic choke housing has been moved from the air horn to the float bowl. A choke modifier is used on the automatic choke for improved cold driveaway.

Pontiac: The float bowl has been lowered with new type spring balanced, cutaway floats. Automatic choke housing has been moved from air horn to float bowl.

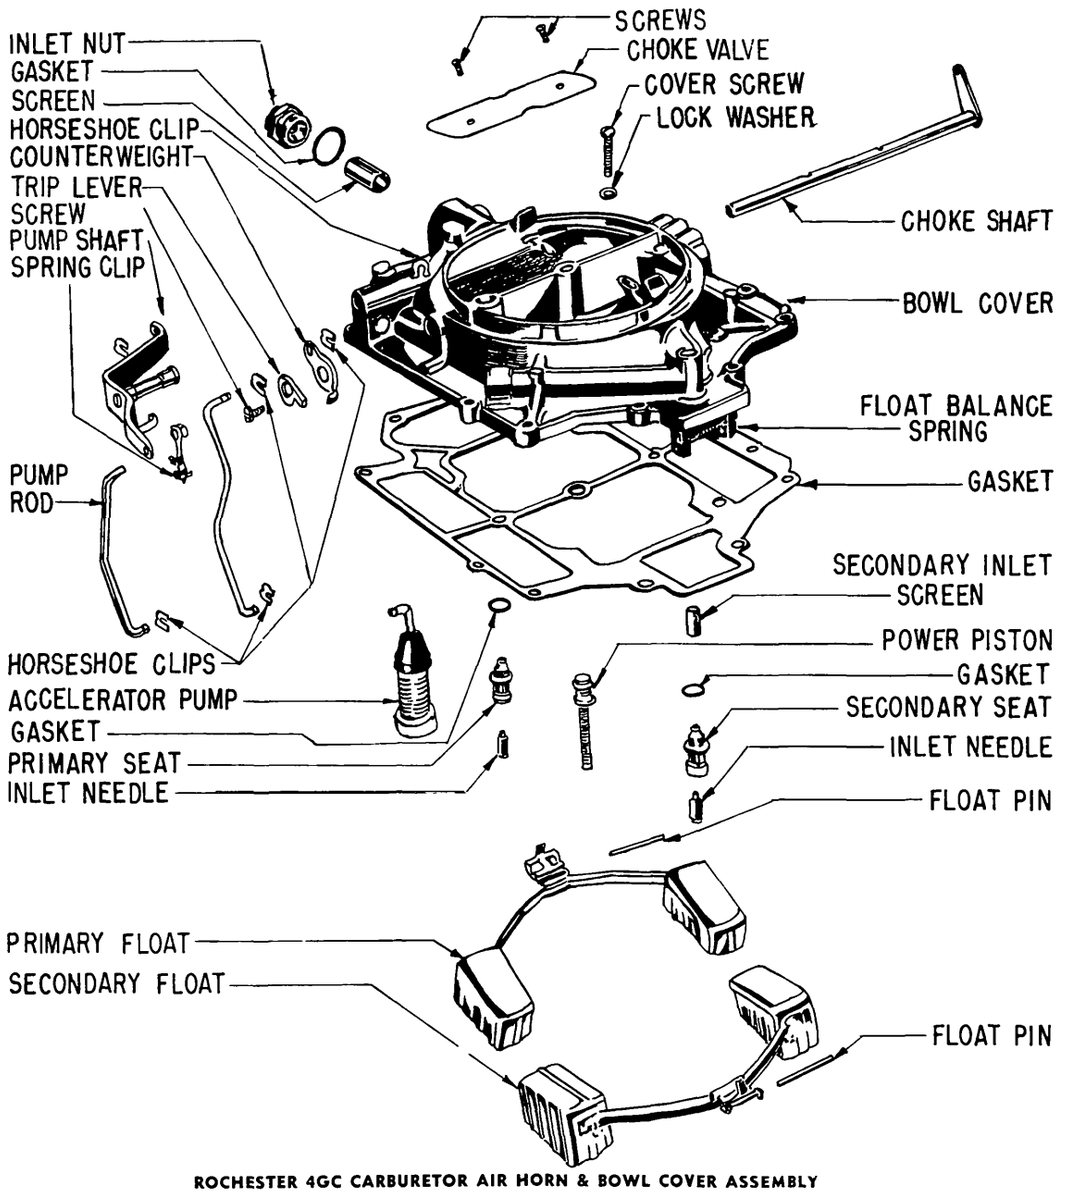
ADJUSTMENTS: *Make all adjustments in sequence given below (except for Idle Speed and Mixture adjustments).*

►*OLDSMOBILE IDLE SETTING NOTE: Air cleaner must be in position on carburetor when idle speed and idle mixture adjustments are made.*

Idle Setting: With engine at normal operating temperature, automatic choke not operating (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed), adjust engine to correct idle speed (see table below). Adjust each idle mixture adjusting screw (one screw for each primary carburetor barrel) until engine idles smoothly and RPM is at maximum (see Oldsmobile Note following). Recheck idle speed.

►*OLDSMOBILE NOTE: Manufacturer recommends that after setting idle speed (as above), each idle mixture screw should be turned out (rich) 1/4 turn which will provide desired idling performance. Idle speed and vacuum will drop off slightly after this adjustment.*

►*NOTE:* A change in idle speed adjustment affects throttle linkage adjustment on all cars except Oldsmobile. The split throttle design on Oldsmobile insures throttle linkage remaining as set when idle speed readjusted.



Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans:
Buick ①	485 RPM	② 485 RPM
Chev. Pass. ①	450 RPM	③ 425 RPM
Oldsmobile ①⑤	⑤ 460 RPM	③ ⑤ 460 RPM
Pontiac	⑩ 450-470 RPM	③⑩⑥ 430-450 RPM
Chev. Truck	450 RPM	③ 425 RPM

① - Air conditioner "ON" (if so equipped).
② - Transmission in "N" (Neutral).
③ - Transmission in "D" (Drive).
⑩ - 500-520 RPM, air conditioner "ON".
⑤ - Supersedes previous idle speed specifications.
⑥ - 500 RPM on cars with modified carburetors. *SEE Pontiac carburetor modification (to correct flooding) above.*

Fl at Setting: *Both Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL & FLOAT DROP (Float Tip, on cars with "Spring Balanced" floats), must be checked for each assembly.* Remove bowl cover and float assembly from carburetor but DO NOT remove bowl cover gasket for following checks:

Float L vel–*CAUTION–Do not remove bowl cover gasket.* Invert bowl cover, install correct float gauge (see table below) on cover and against curvature in air horn bore, or use scale to measure distance from gasket on cover to highest point on each float. If floats do not touch top portion of gauge legs, or if scale distance not correct, adjust by bending float arms at rear of float assembly *(CAUTION–All floats must be set alike).* Bend float arms horizontally until each float is centered between gauge legs, then check this setting by tilting bowl cover assembly 90° to each side to make sure that floats do not touch gauge legs under these conditions *(CAUTION–This adjustment is necessary to prevent floats touching sides of bowl and hanging up in service).*

ROCHESTER 4GC CARBURETOR AIR HORN & BOWL COVER ASSEMBLY

Float Level Setting
(Primary & Sec ndary Floats)

Car Model	Float H ight	Gaug N .
Buick	1 3/8"	BT-132
Chev. Pass.	1 5/8"	BT- 89
Oldsmobile	1 5/8"	BT- 89
Pontiac	1 3/8"±1/32"	BT-132
Chev. Truck	1 19/32"	BT-101

CONTINUED ON NEXT PAGE

ROCHESTER 4G & 4GC 4-BARREL CARBURETORS (C nt.)

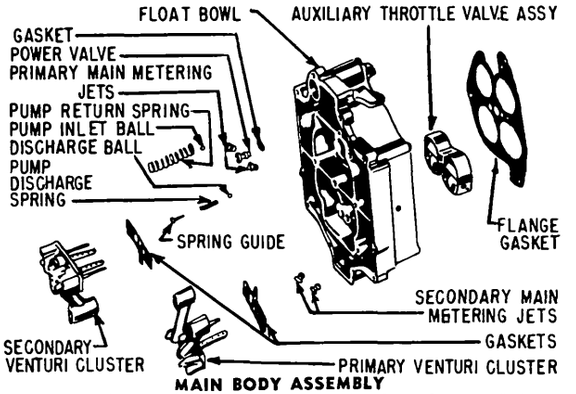
Fl at Tip Adjustment (Buick & Pontiac)–Move Gauge BT-132 to small ends of floats. With gauge held vertically, the upper edge of the float at the point where the radius ends should align between scribe marks.

Float Drop–With air horn upright and floats hanging free (bowl cover gasket in place), distance from air horn gasket to lower edge of float at tip should be as indicated in table below. To adjust, bend the float tang.

Float Drop Setting (Primary & S condary Floats)

Car Mod l	Float Drop
Buick	1-13/16"
Chevrolet Pass. Cars	2-1/4"
Chevrolet Trucks	2-1/4"
Oldsmobile	2-1/4"
Pontiac	1-13/16"

Accel rating Pump Strok : *CAUTION–This is a linkage adjustment and not a seasonal change recommendation.* Back off idle speed stop screw and fast idle screw so that primary throttle valves are fully seated and hold throttle lever in this position, use scale to measure height of pump rod plunger (from top surface of bowl cover to bottom edge of pump plunger rod). If height not correct (see table below), adjust by bending pump rod as required.



Pump Rod Setting

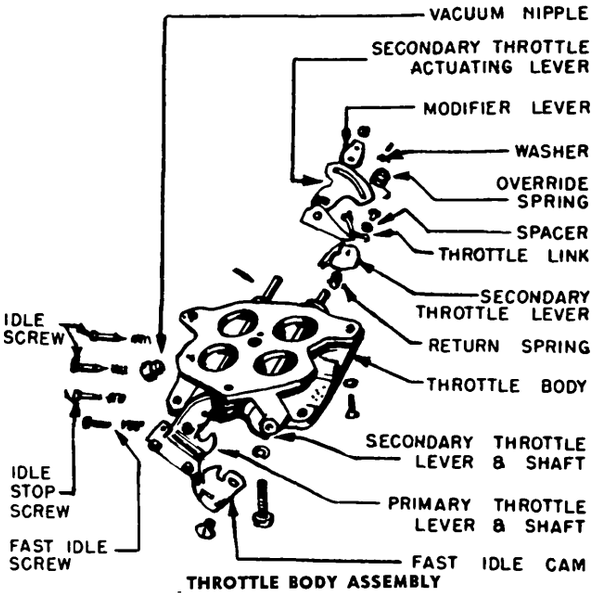
Car M del	Pump Rod Height
Buick ①	1-1/64"
Chevrolet Pass. Cars	1-1/16"
Chevrolet Trucks	1-1/16"
Oldsmobile	1-3/64"
Pontiac	15/16"

① –See *"1957 Buick Stumble and Flat Spot Correction" above.*

Atmospheric Idle V nt Adjustment: (Oldsmobile) - Adjust the pump rod (see above), then gradually open primary throttle valve to the point where idle vent valve just closes. Using a scale, measure distance from top of air horn to bottom of pump plunger shaft (same as checking pump rod dimension). With idle vent valve just closed, the distance from top of air horn to bottom of pump plunger shaft (right angle bend at top of pump shaft) should be 13/16". Adjust by bending idle vent tang with Tool BT-69.

Pontiac–With throttle valve closed against a 1/16" drill, the bent contact tang on pump lever should be positioned so that valve is just closed. Bend tang as necessary to obtain this adjustment.

MAIN BODY ASSEMBLY



Automatic Choke Setting: To adjust loosen heat suction tube connection on cover (except Oldsmobile) and loosen cover retainer screws. Rotate cover until index mark on cover is aligned with correct mark on housing (see table below). Tighten all cover retainer screws, tighten heat tube connection.

Automatic Choke Setting

Car Model	Choke Setting
Buick	Centered (At Index)
Chevrolet Pass. Cars	1 Notch Lean
Oldsmobile	Centered (At Index)
Pontiac	Centered (At Index)

Intermediate Choke Rod Adjustment (Buick, Oldsmobile, Pontiac): *NOTE–This rod connects lever on choke valve shaft to choke lever on automatic choke housing.* Hold choke valve completely closed and bend intermediate choke rod as necessary so that choke piston is 1/32" to 1/16" (Buick); flush to 1/32" (Other cars) out of end of choke piston sleeve.

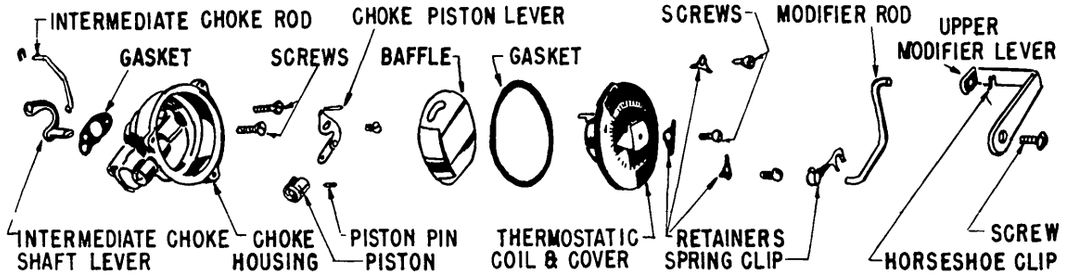
Choke Rod Adjustment (All Models Except Chevrolet Truck): *NOTE–This rod connects choke valve shaft to fast idle cam.* Rotate choke valve and fast idle cam untio fast idle screw (Buick & Oldsmobile), slow idle screw (Chevrolet & Pontiac), is in contact with SECOND step of fast idle cam, then close choke valve until screw is against side of highest step on cam making certain that choke trip lever is in contact with choke counterweight lever. Measure choke valve opening or clearance between top edge of valve and dividing wall in air horn (see table below for gauge and clearance specifications). Adjust by bending choke rod at center angle using Tool BT-18.

THROTTLE BODY ASSEMBLY

Choke Rod Setting

Car Model	Gauge & Choke Opening
Buick	BT-135 (.148")
Chevrolet Pass. Cars	BT-131 (.043")
Oldsmobile	BT-68 (.052")
Pontiac	BT-79 (.063")

Choke Modifier Adjustment: Oldsmobile - With fast and slow idle screws backed out and primary throttle valves tightly closed, loosen the choke modifier lock screw and rotate the index pointer counter-clockwise from free position until the thermostat spring begins to close choke valve. Continue counter-clockwise until pointer lines up with index position on thermostat cover.



Unloader Setting: After choke rod adjusted (above). Move throttle lever to wide open position and make sure that choke trip lever is in contact with choke counterweight. Measure choke valve clearance between upper edge of valve and dividing wall in air horn (see table below for gauge and clearance specification). Adjust by bending tang on fast idle cam (Tool BT-69).

Unloader Setting

Car Model	Gauge & Choke Opening
Buick	BT-135 (.128")
Chev. Pass. Car	BT-131 (.235")
Oldsmobile	① BT- 90 (.115")
Pontiac	BT- 90 (.115")

① - Supersedes previous setting of .092".

Secondary Throttle Valve Lock Spring (Pontiac): *(NOTE - This adjustment must be made with carburetor on the car).* Adjust idle speed and mixture (make sure secondary throttle valves are completely closed). Turn off engine and place idle speed screw on second step of

AUTOMATIC CHOKE ASSEMBLY (WITH MODIFIER)

CONTINUED ON NEXT PAGE

ROCHESTER 4G & 4GC 4-BARREL CARBURETORS (Cont.)

fast idle cam. Measure distance between secondary lock spring and secondary throttle operating lever. Clearance should be .028". Adjust by bending lock spring. *(CAUTION - This adjustment must be made accurately).*

Secondary Throttle Lock-out Setting: Close choke valve to point where secondary throttle lock-out tang is on lock-out step of fast idle cam (Buick); in fast idle cam slot (Other Models). Distance between cam and step should be .015". Bend tang as required.

Secondary Throttle Contour Setting: Buick-Fully open choke valve so fast idle cam falls to its lowest position, then open throttle so that secondary lock-out tang follows contour portion of fast idle cam. With choke valve held wide open, check clearance between lock-out tang and contour portion of cam. This measurement should be .030" (Gauge J-1388). Bend tang as necessary.

Other Models-Hold choke valve in wide open position so that secondary lock-out tang is positioned over fast idle cam, then measure clearance between tang and cam. This clearance should be .015" (Chevrolet), .010-.020" (Pontiac), .030" ± .010" (Oldsmobile). To adjust, bend tang straight up or down.

Fast Idle Setting: *NOTE-On Chevrolet & Pontiac, the fast idle adjustment will be correct after "slow idle speed" and choke rod adjustment made. On Buick & Oldsmobile, "Off Engine" fast idle adjustment must be checked "On Engine" to insure proper warm-up performance. Adjust fast idle after Choke Rod adjusted (above).*

"Off Engine" Adjustment (Buick & Oldsmobile)-With fast idle screw on "high" step of fast idle cam, clearance between edge of primary throttle valve and bore of carburetor on side opposite idle ports should be .024" (Gauge BT-90).

"On Engine" Adjustment (Buick & Oldsmobile)-With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on "high" step of cam. Adjust fast idle screw so that engine operates at 1500 RPM.

Throttle Return Check Adjustment (Oldsmobile): *(NOTE-Make sure that normal idle speed and fast idle speed adjustments are correct).* With engine at normal operating temperature and running, rotate the fast idle cam so fast idle adjusting screw is on "high" step of cam. Measure clearance between contact screw of throttle return check and contact on throttle lever. Clearance should be .020". If adjustment necessary, loosen contact screw locknut and adjust. Use two wrenches when adjusting to prevent damage to plunger and diaphragm.

OVERHAUL: *CAUTION-When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor assembled.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Carburetor Bowl, and Throttle Body) which can be overhauled separately as follows:

Buick Vacuum Starter Switch Timing Check (On Car): Back off throttle stop screw and rotate fast idle cam to slow idle position, then fully close throttle valve. *(CAUTION - Make sure dashpot does not prevent full closing of throttle).* Measure distance from diaphram flange of dashpot to near edge of dashpot arm on throttle lever. With ignition turned on, slowly open throttle while holding scale in position against flange of dashpot. When cranking motor is energized, note distance from flange of dashpot to near edge of dashpot arm. Subtract the two measurements. If switch is properly timed, the difference should be 1/2" - 3/4". Adjust by changing timing shims located below contact spring in terminal cap.

Air Horn & Bowl Cover - On Cadillac, (with air conditioning), remove idle speed-up control and bracket. On Chevrolet Pass. Cars, remove choke cover, gasket, and coil assembly from housing. On all cars (except Chevrolet), disconnect intermediate rod from choke shaft lever. On all cars, disconnect pump rod from pump lever. Remove choke trip lever, then disengage choke lever and collar assembly from choke shaft and disengage lower end of choke rod from fast idle cam. Remove choke lever, collar, and rod as an assembly. Remove choke valve, then on all cars (except Chevrolet), remove choke shaft. On Chevrolet Pass. Cars, rotate choke shaft counterclockwise to free choke piston from housing and remove piston and shaft assembly by sliding from bowl cover. Remove choke housing from bowl cover. On all cars, take out all air horn retaining screws *(CAUTION - One screw is located in counterbore in dividing wall just inside edge of air horn),* then carefully lift air horn straight up from main body to avoid damage to floats, pump plunger and vacuum piston. *(CAUTION - Break cover loose from bowl with finger pressure only. DO NOT PRY ON COVER).* Invert bowl cover and take out float hinge pins and remove floats and inlet needles, seats, and gaskets. *(NOTE - On carburetors with spring balanced floats, it is not necessary to remove the balance spring).* Keep each float assembly intake needle, and seat together. DO NOT mix primary and secondary parts. Remove power piston assembly by compressing spring and letting it snap repeatedly until hammering action of power piston drives staked retaining disc from air horn. *(NOTE - It may be necessary to remove burrs if heavy staking is encountered).* Remove horseshoe clip from top of accelerating pump plunger shaft and disengage plunger shaft from pump lever. Pull pump plunger, with rubber boot, downward and out of bowl cover. Remove pump lever and choke countershaft. Remove fuel inlet, gasket and strainer.

Carburetor Bowl - On Cadillac & Oldsmobile, remove modifier lever from choke cover. On all cars (except Chevrolet Pass. Car & Truck), remove thermostat cover and coil assembly. Remove choke piston lever screw and slide choke piston out of vacuum passage. Disconnect choke piston from link attached to shaft by tapping piston and letting it fall into the hand. Remove choke housing from bowl (or throttle body). Remove intermediate choke shaft lever from housing. On all cars, remove accelerator pump spring, then remove power valve and gasket. Remove primary and secondary venturi clusters. *(CAUTION - Break clusters loose with finger pressure only).* Remove and discard venturi cluster gaskets. On Oldsmobile, disconnect throttle return check vacuum line at throttle flange, then remove throttle return check from carburetor body. On all cars, remove metering jets from primary and secondary sides, keeping each jet separate in separate groups. Invert bowl casting and remove pump inlet and outlet check valve balls. If necessary, remove pump inlet screen and retainer from bottom of float bowl.

Throttle Body - Remove large screw and washer from counterbore in center of throttle body. On Cadillac, with air conditioning, remove idle speed-up control vacuum pipe. On all cars, remove three small screws and lockwashers from flange and carefully separate throttle body from bowl. Remove and discard gasket. Remove secondary auxiliary throttle valve assembly from carburetor body by lifting it out of secondary throttle bores. Remove both idle adjusting screws and springs, idle stop screw and spring, and fast idle screw and spring. On Cadillac, remove idle air by-pass screw and spring. *(NOTE - Keep each adjusting spring with its screw for easier identification).* On Cadillac and Oldsmobile, remove choke modifier lever and retaining screw from primary throttle shaft. On all cars, free secondary operating link by taking out cotter pin in each end. Unhook inner end of primary throttle shaft override spring from lever. Remove override spring retaining screw from primary throttle shaft, remove secondary throttle lever retaining screw and washer, then slide secondary throttle operating lever and override spring off primary shaft. Slide secondary throttle lever and spring from secondary throttle shaft.

▷ *CAUTION: Secondary Auxiliary Throttle Body and Main Throttle Body are furnished as an assembly with throttle valves and shafts and no attempt should be made to remove throttle valves (disturbing valves will upset low speed metering performance).*

Cleaning & Inspection: Wash all parts thoroughly in carburetor cleaning solvent except following parts which should be cleaned in clean gasoline: Choke cover and coil assembly, pump plunger, primary venturi cluster (with pump discharge nozzles). Blow out all passages in castings with air, remove all gum and carbon deposits (*CAUTION*-do not use drills to clean out jets and passages). Inspect strainer screens and replace if distorted or plugged. Check floats for dents, leaks, or wear at hinge pin holes. Inspect fast idle cam for wear on steps. Inspect throttle body carefully for wear at throttle valves and bore and shaft wear in bore (replace as an assembly if worn excessively). Inspect all parts for wear or damage and replace as required.

Reassembly: Use new gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Auxiliary Secondary Throttle Valve Assembly - Install the auxiliary secondary throttle valve assembly into base of carburetor body from bottom side (make sure the calibrated spring, nylon bushing and operating pin are in position in throttle body assembly).

Secondary Throttle Lever & Spring Installation: Install return spring on secondary throttle shaft with bent end of spring in hole in throttle body, wind up spring one

CONTINUED ON NEXT PAGE

ROCHESTER 4G & 4GC 4-BARREL CARBURETORS (C nt.)

complete turn, then install secondary lever on shaft over straight end of spring (bent portion of lever should be above shaft), install spacer and retaining screw in end of shaft. Install secondary throttle actuating link (insert plain end through lever hole, install cotter pin on shaft side to clear return spring)

Primary Throttl Lever & Spring–Start secondary throttle actuating lever on primary throttle shaft with curved slot portion outward and toward the rear. With inner portion of lever on shaft, start override spring on shaft with long end inward, then slide lever and spring on shaft and engage washer end of secondary throttle actuating link in slot in lever. Install override spring retaining screw through loop end of spring and into primary throttle shaft from upper side. Hook inner end of override spring over top edge of secondary throttle actuating lever. Install washer and cotter pin on end of secondary throttle actuating link. On Cadillac, install choke modifier lever and retaining screw on end of primary throttle shaft (lever must point upward when throttle closed and marking "RP" must be outward)

Throttle Body-t -Bowl Assembly Caution–Install new gasket on bottom surface of bowl with largest projecting tab on primary side and surrounding vacuum passage to power valve piston (*CAUTION*–gasket is not reversible) Install all throttle body attaching screws loosely (including large screw in center of throttle body), then tighten all screws evenly.

V nturi Clust r Installation Caution–Make certain that brass pump discharge needle installed in pump passage in bowl before installing primary venturi cluster. Use new gaskets and install each venturi cluster in correct position making certain that clusters correctly aligned by the tangs on the cluster. *CAUTION*–Primary and Secondary clusters not interchangeable and can be identified by brass pump discharge nozzles used on primary cluster only

Metering Jet Installation Caution–Primary and secondary side metering jets are DIFFERENT sizes (in general, secondary jets are larger size than primary jets) and must be installed in correct positions. *NOTE*–On later Cadillac carburetors, primary jets are brass finished, secondary jets are copper plated.

Accelerating Pump Plunger Assembly–When installing rubber seal on plunger stem, slide seal on shaft with larger end toward the piston, see that upper end engaged in groove in plunger stem. Insert assembly through bowl cover from below and pull seal through cover so that cover edge engages groove in seal. When installing cover guide pump plunger into cylinder

Floats and Intake Valve Assembly - Make certain that parts are installed in correct position (primary and secondary parts not interchangeable). On carburetors with spring balanced floats, make sure float arm is back of float balance spring. Adjust float level and float drop or travel. See *"Adjustments"* above.

Air Horn & Bowl Cover Installation - Use a new gasket, carefully align holes in gasket and cover. When installing cover, use care in guiding pump plunger into pump cylinder and power valve piston into its bore. Make sure floats are not bent by striking on edge of bowl. Install all bowl cover attaching screws, tighten inner screws first, then outer screws, evenly and securely.

Choke Valve Installation–After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows **Cadillac**-Press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. **Oldsmobile**–First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Assembly - With retaining screws loose, rotate cover counterclockwise until coil hook picks up choke lever tang, then position cover for correct choke setting *(see "Adjustments")* and tighten retaining screws. On Cadillac and Oldsmobile, install modifier lever loosely. If lever is installed correctly, metal pointer will be at scribed line of housing. Adjust modifier *(see "Adjustments" above).*

SERVICE PARTS: Gasket Sets - Rochester No. 7005740 (7010070, 7011570, 7015757) No. 7015741 (7010100, 7010101) No. 7015743 (7009661, 7011161) No. 7015744 (7009471, 7010926, 7009470, 7010925, 7015704) No 7015745 (7009829, 7009830, 7015705, 7015706) No. 7009953 (7009846, 7012126, 7015711)

① - 7015712 ② - 7015715 ③ - 7015719 ④ - 7009912
⑤ 7015759 ⑥ - 7015718 ⑦ - 7015708 ⑧ - 7015707

►CHANGES, CAUTIONS, CORRECTIONS

► *1957 PONTIAC ROUGH IDLE OR SURGE CORRECTION*

This condition caused by excessive leanness and can be corrected by installing new Venturi Cluster Assembly as listed below

NOTE - Revised cluster assemblies used in production on late cars Carburetors with these new clusters may be identified by letter stamped on carburetor tag as follows Synchro-mesh Cars -"D", Hydra-Matic Cars - "A"

Pontiac 2GC Venturi Cluster Change

Carburetor	First Type	Later Type
7009831 (Hydra-Matic)	7010603	7011561
7009832 (Synchro-mesh)	7010575	① 7010575

① - Modified cluster has same part number

► *1957 PONTIAC FUEL FILTER CHANGE TO CORRECT CARBURETOR FLOODING* Carburetor flooding can be corrected by thoroughly cleaning carburetor and installing new type AC Fuel Filter Element No 854347 *NOTE* - This improved filter element can be identified by **heavy blue line** between type designation GF 124 and part no 854347 on package The "blue star" formerly printed behind the numbers has been eliminated

DESCRIPTION: Dual or double barrel downdraft carburetors with manual choke control (2G) automatic choke (2GC) Carburetors are same design used on previous models except as follows

Chevrolet Governor - Governor is a spring-loaded, vacuum diaphragm type unit mounted on the throttle body and linked to the throttle valve lever The throttle linkage does not positively open the throttle valves but permits the spring in the governor unit to do so (when no vacuum applied) The vacuum unit is controlled by a vacuum valve in the Ignition Distributor This valve opens when the preset speed is reached, applying vacuum to the governor vacuum unit, so that the vacuum unit tends to close the throttle valves so that the preset speed will not be exceeded

Pontiac Automatic Choke - Choke assembly is mounted on the throttle body (to reduce overall height) and is linked to the choke shaft lever by a connector rod An internal fuel bowl vent is also provided in the air horn

ADJUSTMENT: *Make all adjustments exactly as detailed below.*

Idling Adjustment· If preliminary adjustment required to warm up engine, turn both idle mixture screws in until lightly seated, then back each screw out 1½ turns Set parking brake, place transmission selector lever in Neutral, run engine until normal operating temperature is reached (at least 15 minutes operation for cold engine)

CONTINUED ONNEXT PAGE

ROCHESTER 2G & 2GC (C nt.)

Connect tachometer and vacuum gauge, then adjust as follows:

Idle Mixture - With engine at normal operating temperature and idling at correct idling speed (see below) with choke valve wide open and fast idle inoperative, adjust each mixture adjusting screw separately for smoothest engine performance (highest vacuum and engine RPM). Recheck idle speed.

Idle Speed - With engine at normal operating temperature, adjust throttle stopscrew for correct idling speed as listed below *(CAUTION* - On "2GC" carburetors, stopscrew must be resting on lowest step of fast idle cam when adjustment being made).

Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans. Cars
Chevrolet Pass. Cars	475 RPM	① 425 RPM
Chevrolet Trucks	475 RPM	② 425 RPM
Pontiac	450-470 RPM	①③ 430-450 RPM

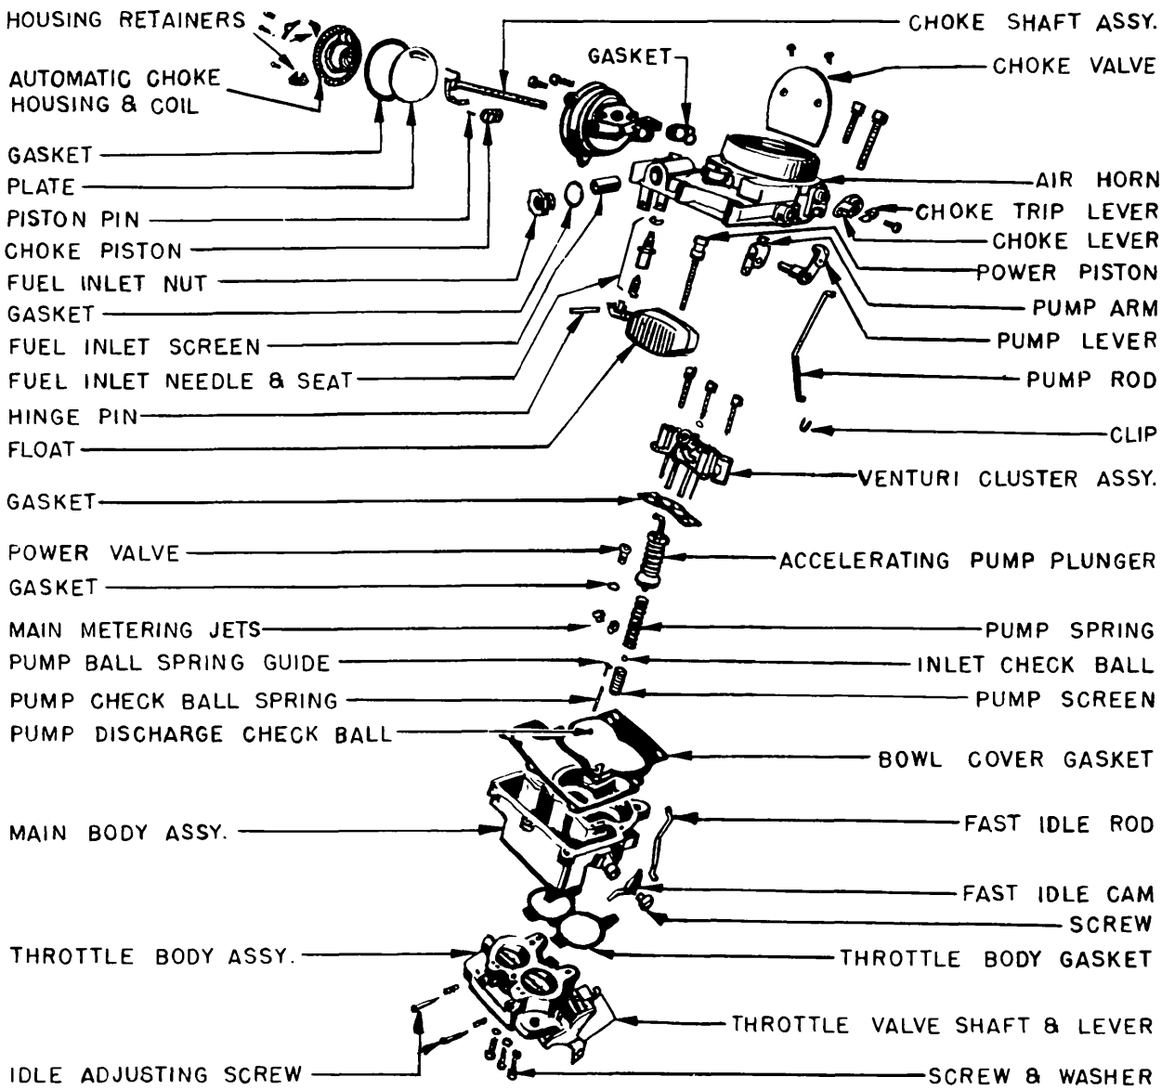
① - With selector lever in Drive range.
② - With selector lever in Neutral "N".
③ - On Air Conditioned Cars, set speed at 500-520 RPM in Drive range with air conditioning "off".

Float Level: *CAUTION - Two separate adjustments required as follows:*

1) Float Level Setting - Invert bowl cover and float assembly but DO NOT remove cover gasket. Install gauge (see table below) over float with one gauge leg against pump side of power piston and outer gauge leg in line with float center. Float should just clear top edge of gauge cut-out and sides of float should be parallel to gauge legs. Adjust by bending float hinge arm.

Float Level Setting

Car & Carb.	Checking Gauge	Float Level
Chevrolet Cars (All)	④ BT-129	1 1/4"
Chevrolet Trk.(7008394)	⑤ BT-130	1 15/64"
Chevrolet Trk. (Others)	④ BT-129	1 1/4"
Pontiac (All)	⑥ BT-133	1 15/64"



④ - Chevrolet No. J-6326. ⑤ - Chevrolet No. J-5916.
⑥ - Pontiac No. J-6629.

Float Drop Setting - Hold bowl cover and float assembly upright so that float hangs down at bottom of travel. Measure distance from lower face of gasket on cover to bottom of float at center using scale or Float Level Gauge (see above). If float level gauge used, place gauge sideways on underside of bowl cover with extension on lower leg extending under float. Bottom of float should be even with scribed mark on gauge. Adjust by bending float arm tang (behind needle seat) in or out.

Float Drop Setting

Model	Float Drop
Chevrolet Car & Trk. (All Carbs.)	1 29/32"
Pontiac (All Carbs.)	1 29/32"

Accelerating Pump Rod: *This is a linkage adjustment (pump does not have seasonal setting).* With throttle stopscrew backed out so that throttle valves tightly closed, place float level gauge (see table below), inverted, on pump shaft boss on bowl cover next to air horn with single leg of gauge extending down toward pump connector rod. Top of pump rod should just touch lower edge of gauge. Adjust by bending pump rod using bending tool BT-18.

ROCHESTER 2GC DUAL CARBURETOR (2G SIMILAR EXC. MANUAL CHOKE)

Pump Rod Setting

Model	Checking Gauge	⑦ Rod Height
Chevrolet (All)	④ BT-129	57/64"
Pontiac (All)	⑥ BT-133	53/64"

④ - Chevrolet No. J-6326.
⑥ - Pontiac No. J-6629.
⑦ - From top of bowl cover to top of connector rod.

Fast Idle (2GC Carburetors): *NOTE* - Fast idle speed is automatically set when hot or slow idle speed is adjusted (same screw controls both settings). Adjust choke rod (fast idle cam position) as follows:

Fast Idle Cam Positi n - Rotate fast idle cam until throttle stopscrew is on second (next to highest) step of cam and against the shoulder of the highest step, make certain that choke trip lever is in contact with choke rod lever. Check choke valve opening or clearance between upper edge of choke valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending choke lever tang using bending tool BT-69.

Fast Idle Cam S tting

Model	Checking Gauge	Ch ke Opening
Chevrolet Pass. Cars	⑧ BT-108	.089"
Pontiac	⑨ BT-134	.061"

⑧- Chevrolet No. J-5921 (Use small end of gauge).
⑨ -Pontiac No. J-5920 (Use small end of gauge).

CONTINUED ON NEXT PAGE

ROCHESTER 2G & 2GC (Cont.)

Unl ad r (2GC Carbur tors): Move throttle valves to wide open position which will open choke valve slightly (see Pontiac Note below). Check choke valve opening or clearance between upper edge of choke and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever which contacts fast idle cam using bending tool BT-69. **Pontiac Not** - If unloader checked with carburetor on engine, it is recommended that following procedure be followed: Open throttle valves by depressing accelerator pedal forcibly to floor. Make certain that pedal does not hit hump over transmission (Correct by moving upper end of pedal to left by enlarging left hand hole in pedal bracket and rotating pedal to the left). Check choke valve opening (above) and bend tang to secure valve opening of .143-.183" which will insure correct unloader action.

Unl oader Setting

M d l	Ch cking Gauge.	Choke Opening
Chevrolet Pass. Cars	(10) BT-108	.360"
Pontiac	(11) BT-134	.163"

(10)- Chevrolet No. J-5921 (Use large end of gauge).
(11)- Pontiac No. J-5920 (Use large end of gauge).

Automatic Ch k (2GC Carburetors): Adjust by loosening three retainer screws on choke cover and rotating cover and coil assembly. Centered setting is with scribed index mark on cover in line with longest (center) cast mark of scale on housing.

Ch k Setting

M del	Setting
Chevrolet Pass. Cars	Centered
Pontiac	Centered

OVERHAUL: *See "Rochester 2G & 2GC Carburetors" in 1956 Annual Data or latest Manual edition and note the following:*

Ch vr l t G v rnor Ov rhaul: R m val - Remove four governor cover attaching screws, remove cover and gasket. Detach and remove governor throttle spring. Remove diaphragm cover attaching screws, lift off cover. Hold throttle lever and loosen nut attaching governor lever and pin assembly to throttle shaft, free lever from throttle shaft and disengage it from diaphragm rod by rotating lever until tang on rod clears slot in lever. Remove diaphragm assembly from housing. Remove three governor housing mounting screws, remove seal retainer and leather seal. Detach governor housing from throttle body, remove housing gasket.

Cleaning & Inspection - DO NOT immerse throttle lever and bearing assembly in cleaning solution (will damage neoprene seal protecting ball bearings). Make certain that throttle bearings are completely dry (blow out with air) and lubricate with very light machine oil *(CAUTION* - Throttle shaft must rotate freely with no trace of any binding which would affect governor operation).

Installation - Install governor housing mounting gasket (narrower edge toward top of carburetor), install housing, leather seal, seal retainer, and mounting screws (DO NOT tighten screws). Check throttle shaft for free operation in seal, tighten mounting screws while holding throttle in closed position, recheck throttle shaft for free operation. Install diaphragm assembly in housing and align vacuum passage holes in diaphragm and housing. Assemble governor lever and pin assembly on end of diaphragm rod (in housing) and position lever on throttle shaft, install lockwasher and nut on shaft, tighten nut while holding throttle lever to prevent damage to valves. Align diaphragm with mounting screw holes in housing, install cover with cover restriction piloting through diaphragm and into vacuum passage in housing, install cover screws finger-tight. Hold throttle valves wide open (to provide maximum diaphragm travel), tighten cover screws to 25-28 in. lbs., install lockwire on screws. Install throttle spring over governor lever pin and stationary post in housing. Check for free operation of throttle shaft, then install governor cover and gasket, tighten attaching screws, install lockwire on screws.

Pontiac Automatic Choke Overhaul: Removal - Take out cover retaining screws, lift off cover and coil assembly, remove gasket and baffle plate. Remove choke piston lever attaching screw, remove piston link and lever assembly. Remove two choke housing to carburetor mounting screws, detach housing from throttle body, remove gasket. Intermediate choke shaft and lever can then be removed from housing.

Installation:- Install intermediate choke shaft and lever in choke housing, then install housing on carburetor throttle body using a new gasket. Install choke piston and lever assembly in housing and install attaching screw. Connect intermediate choke lever to choke valve lever by installing connector rod. Hold choke valve closed and adjust rod (by bending) so that choke piston is flush with end of choke housing bore. Install baffle plate, gasket, and choke cover and coil assembly. *See Automatic Choke under ADJUSTMENT above for setting.*

SERVICE PARTS: Gasket Sets - Rochester No. 7008534 (2GC No. 7010648), No. 7009949 (2GC Nos. 7010647 & 7010719), No. 7009950 (2G Nos. 7010649, 7010716, & 7010718), No. 7009951 (2G No. 7010717), No. 7015747 (2GC Nos. 7009831 & 7009832).
Repair Kit - Rochester No. 7009928 (2GC No. 7010648), No. 7009929 (2GC Nos. 7010647 & 7010719), No. 7009930 (2G Nos. 7010649, 7010716, & 7010718), No. 7009934 (2G No. 7010717), No. 7015728 (2GC Nos. 7009831 & 7009832).

1957 ROCHESTER SINGLE CARBURETORS

ROCHESTER "B" & "BC"

CHEVROLET PASS. CARS	Rochester Model No.
1957 6 Cyl. (Synchro-mesh)	① BC 7009657
1957 6 Cyl. (Powerglide)	② BC 7009656
CHEVROLET TRUCKS

1957 6 Cyl. 235" (Hydra-Matic)	③ BC 7009255
1957 6 Cyl. 261" Engine	B 7005140

① - Replacement (Service Pkg.) 7015710.
② - Replacement (Service Pkg.) 7015709.
③ - Replacement (Service Pkg.) 7009911.

►CHANGES, CAUTIONS, CORRECTIONS

►*METERING JET CHANGE FOR IMPROVED PART THROTTLE PERFORMANCE: See Rochester Single & Dual Jet Specification Table for latest jets.*

►*1957 CHEVROLET 6 LOADING UP DURING WARM-UP CORRECTION (Cars with "BC" Carbs.):* Caused by over-rich condition. Correct by setting automatic choke to new specifications. *See Automatic Choke Setting below.*

DESCRIPTION: Single barrel downdraft carburetors with manual choke control (Model B), automatic choke (Model BC). Same design as used on previous models except for new low air horn design (Pass. Cars only). These low air horn carburetors also have new type power piston (with solid stem for greater support) and larger fuel inlet with fuel strainer installed under fuel inlet fitting nut.

►*FUEL STRAINER NOTE:* Strainer screen (under fuel inlet fitting nut) can be removed for cleaning.

ADJUSTMENTS: Make all adjustments exactly as detailed below.

Idling Adjustment: If preliminary setting required to warm up engine, turn idle mixture screw in until it is lightly seated, then back screw out correct number of turns (see table below). Set parking brake tight, place selector lever in Drive "D" (Powerglide), Neutral "N" (Hydra-Matic), start engine and allow it to idle until normal operating temperature is reached. Then adjust as follows:

Idle Mixture - With engine at normal operating temperature and idling at correct speed (see below), turn idle mixture adjusting screw in or out until smoothest engine performance is secured. Recheck idle speed.

Idle Mixture Setting

Car Model	Idle Screw Opening
Pass. Car (All)	2½ turns
Truck (B Carb.)	1½-2½ turns
Truck (BC Carb.)	2½ turns

Idle Speed - With engine at normal operating temperature, adjust throttle stopscrew for correct idling speed as listed below *(CAUTION* - On "BC" carburetors, stopscrew must be resting on lowest step of fast idle cam when adjustment being made).

Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans. Cars
Pass. Cars	475 RPM	① 425 RPM
Trucks	450-500 RPM	② 425 RPM

① - With selector lever in Drive "D".
② - With selector lever in Neutral "N".

CONTINUED ON NEXT PAGE

ROCHESTER "B" & "BC" (Continued)

Float Level: *CAUTION - Two separate adjustments required as follows:*

1) Float Level Setting - *CAUTION - When removing air horn and bowl cover on "BC" carburetors, disconnect heat suction tube at upper coupling nut and use care not to disturb seal at lower end of tube.* Invert bowl cover and float assembly but DO NOT remove cover gasket. Install gauge (see table below) over floats with center tang on gauge in main discharge nozzle on cover. Bend float arms **vertically** so that each float just touches top of cut-out in gauge, bend arms **horizontally** so that each float is centered in gauge cut-out. Check setting by tilting assembly 90° to each side to make certain that floats do not touch gauge *(CAUTION* - This setting necessary to insure that floats will not rub on sides of float bowl).

Float Level Setting

Model	Checking Gauge	Float Setting
All Carbs	③ M-250	1 9/32"

③ - Chevrolet No. 3696192.

2) Float Drop Setting - Hold bowl cover assembly upright so that floats drop down to limit of travel. Measure distance from lower face of gasket on cover to bottom of floats at center using a scale. This distance should be 1¾" (All Carburetors). Adjust by bending tang at rear of float assembly

Fast Idle ("BC" Carburetors): *NOTE* - Fast idle speed is automatically set when hot or slow idle speed is adjusted (same screw controls both settings). Adjust fast idle cam position as follows:

Fast Idle Cam Position - Rotate fast idle cam until throttle stopscrew is on second (next to highest) step of cam and against the shoulder of the highest step. Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below) If clearance not correct, adjust by bending choke connector rod at central angle using bending tool J-4552 (Rochester BT-18)

Fast Idle Cam Setting

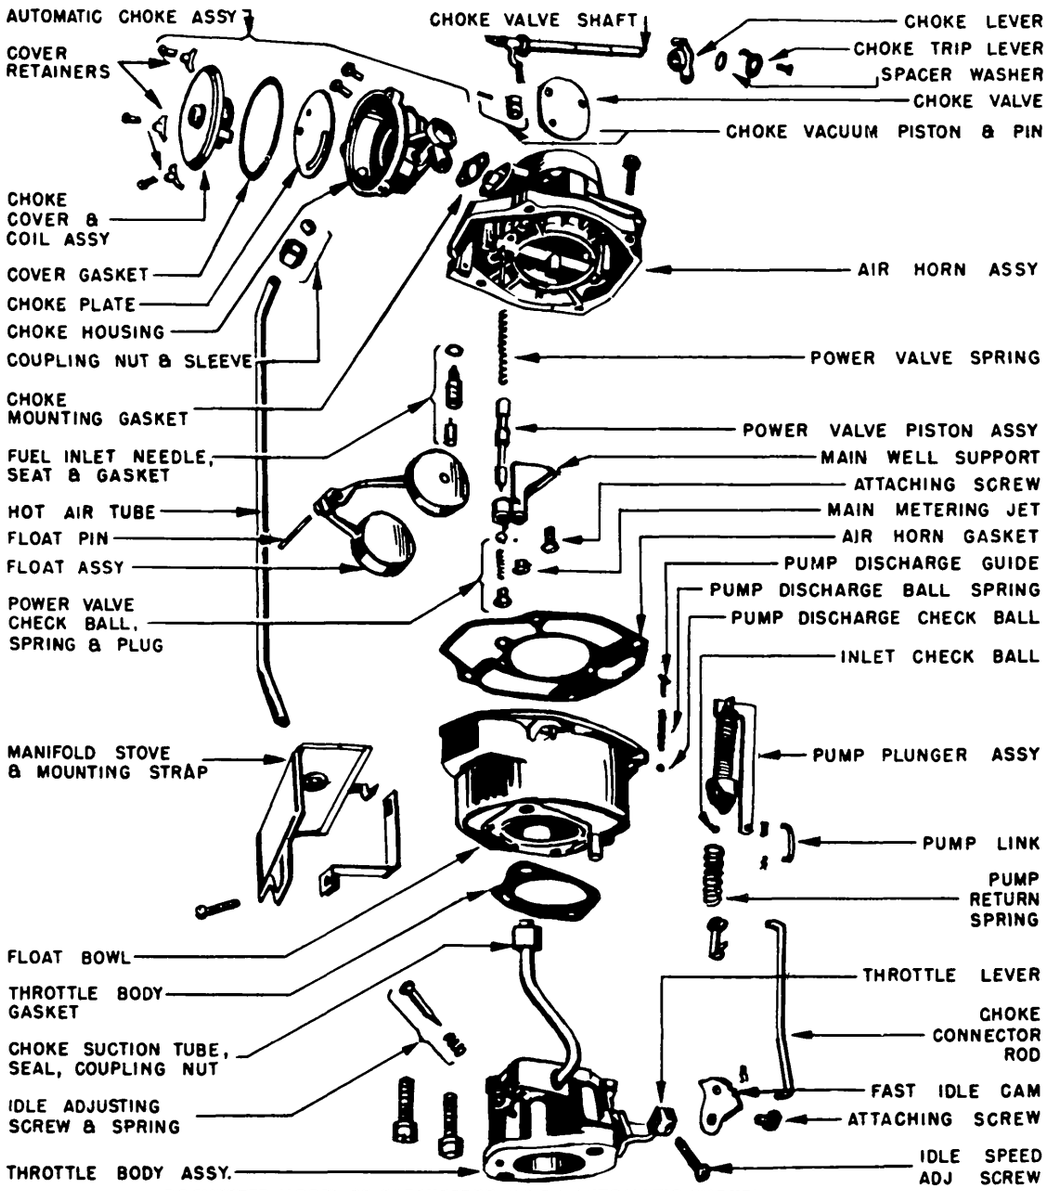
Model	Checking Gauge	Choke Opening
All Carbs	⑪ BT-99	.076"

⑪ - Chevrolet No. J-6838 (Use small end of gauge).

Unloader ("BC" Carburetors): Open throttle valves to wide open position which will open choke valve slightly Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below) If clearance not correct, adjust by bending tang on throttle lever which contacts fast idle cam using bending tool J-4552 (Rochester BT-69)

Unloader Setting

Model	Checking Gauge	Choke Opening
All Carbs.	⑤ BT-99	230"



⑤ - Chevrolet No J-6838 (Use large end of gauge)

Automatic Choke: Adjust by loosening three retainer screws on choke cover and rotating cover and coil assembly Centered setting is with scribed index mark on cover in line with longest (center) cast mark of scale on housing

Choke Setting

Model	Choke Setting
Pass. Cars (All)	Ⓒ 3 Notches Lean
Trucks (Hydra-Matic)	Centered

Ⓒ - New setting to correct loading during warm-up Supersedes previous setting of 1 Notch Rich (Synchromesh Cars), 1 Notch Lean (Powerglide Cars)

ROCHESTER MODEL BC CARBURETOR (WITH AUTOMATIC CHOKE)

OVERHAUL: *See "Rochester B & BC Carburetors" in 1955 Annual Data or later Manual edition.*

SERVICE PARTS: Gasket Sets - Rochester No. 7004595 (B No. 7004468), No. 7006126 (B No. 7005140), No. 7015749 (BC Nos. 7009656 & 7009657), No. 7004085 (BC No. 7009255).

R pair Kit - Rochester No. 7004363 (B Nos 7004468 & 7005140), No. 7015729 (BC Nos. 7009656 & 7009657), No. 7009311 (BC No. 7009255).

STROMBERG "WW" BUICK CARBURETORS

BUICK — **Stromberg Code No.**

1957 Series 40 (Dynaflow) ..... WW 7 - 106, A, B, C,

►CHANGES, CAUTIONS, CORRECTIONS

►*BUICK CARBURETOR PRODUCTION CHANGES:* Production changes designated by the letter suffix of the carburetor code no. (A,B,C, above) are as follows:

C d 7 - 106A - This carburetor has blunt ended float inlet needle valve to improve anti-vapor lock characteristic of the carburetor.

C d 7 - 106B - Choke positioning setting was changed to correct loading during warm-up period. *See "Adjustm nts" b low.*

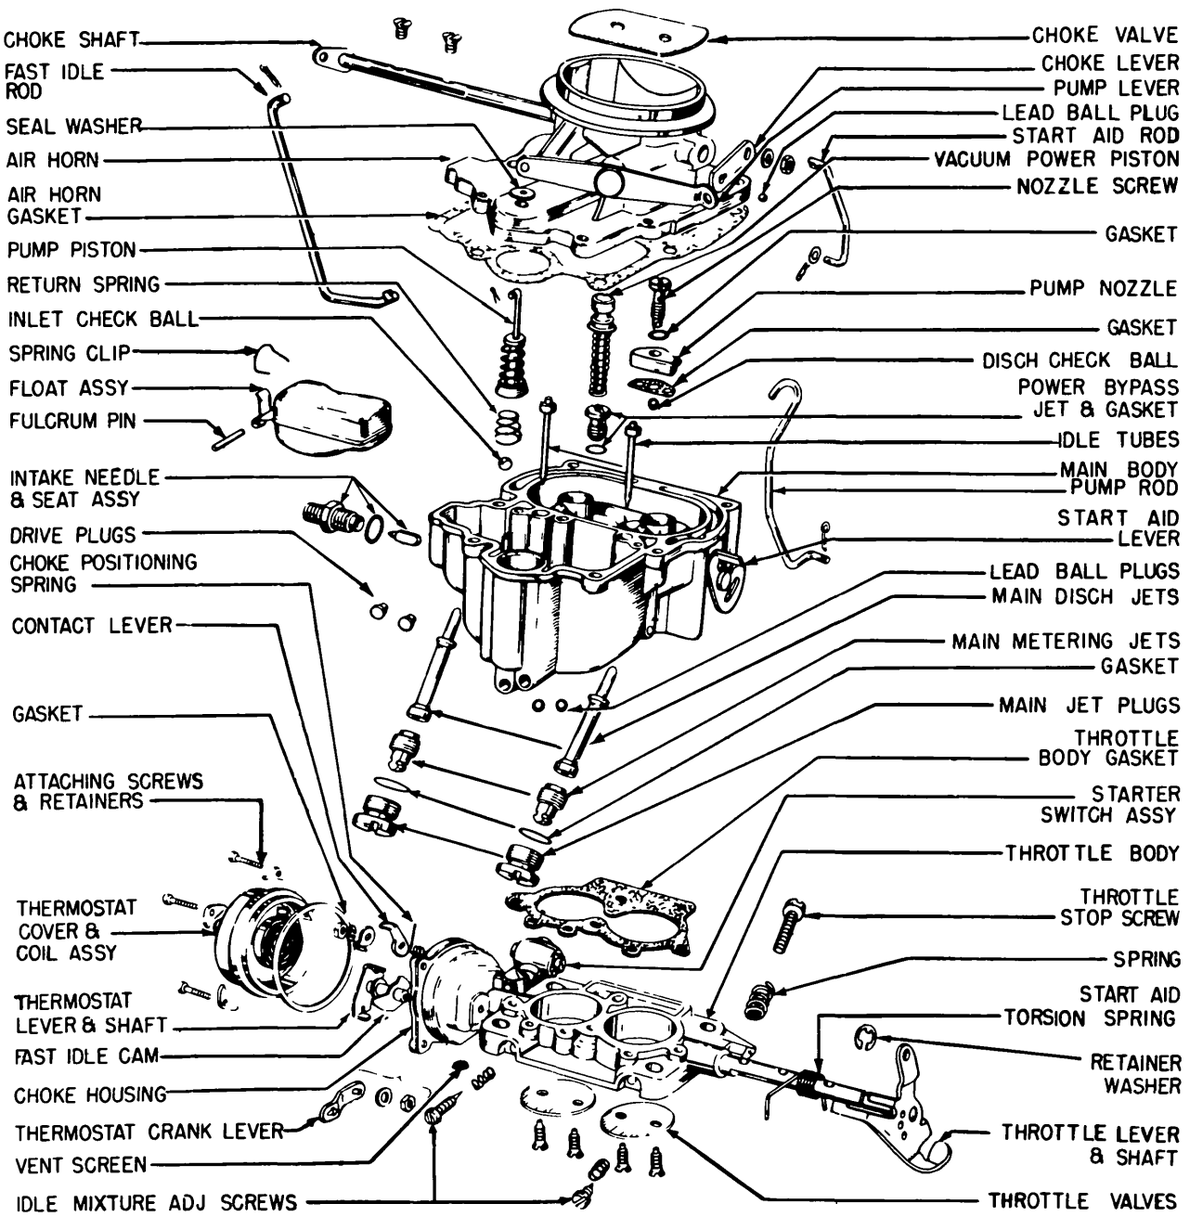
C d 7 - 106C - Filter screen added at intake needle valve seat fitting. This screen should be removed after first 1000 miles of operation.

►*ENGINE LOADING DURING WARM-UP PERIOD (Cars with Cod 7-106 & 7-106A): See Production Change Not abov for Chok Positioning Setting change. Adjust th s carbur tors as directed in "Adjustments" b l w.*

DESCRIPTION: Dual downdraft type of same design used on previous Buick models.

ADJUSTMENT: Make all adjustments exactly as outlined below. *NOTE* - Choke setting has been changed (see Production Note above) and should be adjusted as detailed.

IDLING ADJUSTMENT: If initial adjustment required to warm up engine, turn each idle mixture adjusting screw in until lightly seated, then back each screw out exactly one turn: back off throttle stopscrew until throttle valves fully seated, then turn screw in until it just contacts throttle lever, finally turn screw in **one additi nal turn.** Run engine until it reaches normal operating temperature (choke valve wide open and fast idle inoperative), then adjust as follows:



Idl Mixtur - With engine idling at 485 RPM in neutral or park, adjust each idle mixture screw in turn by turning screw in until engine begins to run irregularly due to lean mixture, then turn screw out until engine begins to roll due to rich mixture, finally turn screw in just enough to provide smoothest engine performance. Recheck idle speed.

Idl Sp d - 485 RPM with selector lever in Neutral or or Park. Adjust by turning throttle stopscrew.

Acc l rating Pump: Three holes provided in throttle lever for pump rod engagement to provide seasonal adjustment as listed below.

Pump S as nal S tting - For normal operation, engage connector rod in center hole in throttle lever (medium stroke). **Inn r hol** provides minimum pump stroke, **outer h l** provides maximum stroke.

Pump Str k Adjustm nt - With throttle stopscrew backed out so that throttle valves fully closed, and with pump connector rod engaged in center hole of throttle lever, measure vertical distance from top of bowl cover to top surface of pump plunger offset. This distance should be 7/8". Adjust by bending pump connector rod at lower bend. Check setting by opening throttle to wide open position. Pump arm must clear top of bowl cover by at least 1/32".

STROMBERG "WW" (BUICK) DOWNDRAFT CARBURETOR

Float Level: With air horn and bowl cover assembly removed from carburetor, place Gauge 6646 squarely on top edge of bowl at center of float (*CAUTION-* Use 7/32" side of gauge - opposite 3/16" side of gauge was used for 1956 cars). Hold float arm tang against seated intake needle. Top of float should just contact lower edge of gauge. Adjust by bending float arm tang. Make certain that float is centered in bowl and does not rub against walls of bowl.

Fast Idl , Ch k , Unl ad r & Start r Aid Adjustm nt: *CAUTION* - To prevent incorrect fast idle setting, unloader operation, or fuel mixture at idle and low speeds, **all f th f ll wing adjustm nts must b mad in th rd r indicat d.** Remove air cleaner, thermostat cover,

CONTINUED ON NEXT PAGE

STROMBERG "WW" BUICK CARBURETORS (Cont.)

throttle stop screw and spring, then proceed as follows:

Fast Idle Setting - Replace throttle stop screw without the spring, then with throttle valves held fully closed, turn stop screw in just enough to contact throttle lever. At this point, turn stop screw in 6 full turns. With choke valve fully closed and throttle lever held against its stop screw, the distance between fast idle lever and high step of fast idle cam should be .052" (No. 55 drill). To adjust, bend fast idle lever using Tool J-5197. *CAUTION - Fast idle lever must be parallel to carburetor mounting surface after bending.*

Choke Pick-up Lever Adjustment - Turn the throttle stop screw in 1 additional turn (7 turns in from fully closed throttle position). With throttle in this position, choke positioning spring pick-up lever should just contact choke positioning spring. Adjust as necessary by bending the pick-up lever with needle nose pliers.

Fast Idle Cam Adjustment - Remove throttle stop screw, then open throttle enough to clear fast idle cam and fully close choke valve by pushing up on thermostat spring lever. Close throttle until fast idle lever rests on high step of fast idle cam. The side of fast idle lever should just clear upper index lug on fast idle cam and rest in the corner formed by index lug and high step of cam. Bend choke rod as required for fast idle lever to just clear index lug on cam.

Start Aid Adjustment - Reinstall throttle stop screw and spring. Hold choke valve closed on a No. 53 drill (.60"). As throttle valve is opened, start aid spring should just clear tang on choke unloader plate. To adjust, bend unloader link (side opposite choke thermostat housing).

Unloader Adjustment - Hold choke valve closed with light pressure, then fully open throttle so unloader arm on throttle lever kicks choke partially open. Clearance between upper edge of choke valve and wall of air horn should be .144" (No. 27 drill). To adjust, bend unloader arm on throttle lever.

Choke Positioning Lever Adjustment - Close choke valve with light pressure upward on thermostatic spring lever until positioning spring lever just contacts choke positioning spring. Clearance between upper edge of choke valve and wall of air horn should be .209" (No. 4 drill). To adjust, bend choke positioning lever with needle nose pliers. Install choke cover and gasket. Rotate cover counterclockwise until index mark is aligned with correct mark on housing. See "Choke Adjustment" below.

Automatic Choke Setting: Centered (at Index).

Car Starter (Carburetor Vacuum Switch): Switch timing can be checked with carburetor on engine on Dynaflow Cars only. On all cars, switch can be timed with carburetor off engine as detailed below.

Switch Timing (Off Engine) - Connect battery and test lamp across switch terminals so that lamp will light when switch contact made. See that choke valve is wide open and fast idle cam is in hot or slow idle position. Close throttle valve against 1/4" drill rod inserted between lower edge of valve and carburetor wall at center. Lamp should light indicating that switch contacts are closed. Repeat test with 7/64" drill rod. Lamp should not light. If switch does not operate within above limits, adjust by adding or removing square timing shims located under contact spring. Shims furnished in thicknesses of .006" and .018".

Switch Timing (On Engine - Dynaflow Cars) - Place transmission selector lever in Park and apply brakes. Back off throttle stop screw so that throttle valves tightly closed (fast idle cam must be in hot or slow idle position). Place scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever. The difference between the two measurements should be 13/16-1 3/16". If switch timing not correct, adjust as for off engine timing (above).

OVERHAUL: Remove choke rod, unloader link, and unloader arm. Proceed with disassembly as follows:

Air Horn Disassembly: File off staked ends of choke valve screws, then remove choke valve and shaft. *(NOTE - The choke valve is made with a slight bend in it. Do not straighten this valve).* Remove air horn screws, air horn and gasket *(NOTE - Tip air horn to disengage pump lever from upper end of pump rod).* Remove pump plunger assembly from air horn. Remove power piston assembly by compressing spring and letting it snap repeatedly until hammering action of piston drives staked retaining disc from air horn. *(NOTE - If heavy staking is encountered, remove burrs).*

Main Body Disassembly: Remove pump nozzle with screw, washer, and gasket, then remove idle jet tubes and lower pump spring. Remove float needle seat and connector fitting together with gasket and float needle. Remove float retainer, float, and hinge pin. Remove power valve and gasket, then invert carburetor and catch the large pump inlet check ball and small pump outlet check ball. With main body inverted, remove main well plugs and gaskets using Tool T-19099. Remove main metering jets using wrench T-24924. Remove main discharge nozzles by screwing remover, Tool T-24967 (R. H. thread) into nozzle, then pulling nozzle from main body. *(NOTE - There are no lead gaskets under nozzles in this carburetor).* Remove throttle body screws, throttle body, and gasket from main body

Throttle Body Disassembly: Remove starter switch screws, terminal cap, return spring and guide block assembly. Tilt throttle body and catch plunger and ball. *(NOTE - If starter switch screen is not visibly damaged or plugged, it need not be removed.* Remove choke cover, gasket, screws and retainers. Remove choke housing shaft outside nut; then remove lockwasher, arm, choke housing shaft and lever assembly, spacer washer, and fast idle cam. Remove idle needles, idle stop screw, and springs. *(NOTE* - Throttle valves and shaft should not be disassembled for normal cleaning and inspection).

Cleaning & Inspection: Use Bendix Metalclene or comparable cleaner to soak all parts for cleaning, then follow cleaning operation by rinsing parts in clean solvent to remove all gummy deposits. Remove lead plugs, if necessary, to clean passages in main body. Remove plugs with remover, Tool T-25052; replace plugs with Tool T-25054 to prevent damage to plug seats. Inspect all parts for excessive wear or damage which might affect their usage, and replace all parts that are questionable. Check all passages for restrictions and check all nozzles and jets to make sure they are clear. Maximum allowance for throttle shaft bearing is .006". Replace throttle valves if bent or damaged. Clean and inspect vacuum switch parts.

Throttle Body Reassembly: Install throttle stop screw and spring and idle needles and springs. Seat idle needles lightly, then back each needle out 1 turn for initial setting. *(CAUTION - Do not force needle against its seat).* Install fast idle cam, spacer washer, choke housing shaft and lever assembly arm, lock washer and nut. Install starter switch ball, plunger, guide block assembly, return spring, terminal cap, clip, and screws.

Main Body Reassembly: Invert main body and install throttle body and a new gasket. Install main discharge nozzles using Tool T-24967 *(CAUTION* - Make sure that nozzles are positioned so flat surface is parallel with direction of air flow). Install main metering jets using Tool T-24924, then install main metering well plugs using new copper gaskets if available; otherwise make sure the plugs and seats are clean to insure a tight joint. Tighten plugs with Tool T-19099. Install power valve with a new gasket, then install float and hinge pin and float retainer clip, using needle nose pliers. Install float needle seat and connector fitting together with gasket and float needle. Hold float arm tang against needle, then check and adjust float setting (see above). Make sure that float is centered and does not rub on walls of bowl. Install idle jet tubes. Install accelerator pump check balls (use new balls if available); place large ball in plunger well and place small ball in discharge well. Install lower pump spring in plunger well. Install pump discharge nozzle and screw using a new washer and gasket.

Air Horn Reassembly: Install choke shaft in air horn with attached lever toward choke housing, then install choke valve with identification mark up. Install new choke valve screws loosely, then center valve by pressing up and endwise on choke shaft lever. Tighten screws and check with valve in closed position for uniform clearance and freedom from sticking. If necessary, loosen screws and adjust choke valve position. With valve in correct position and screws tight, check to make sure that choke valve will drop freely of its own weight. Support screw heads on a suitable steel block and stake opposite ends of screws. Install power piston assembly in air horn and carefully stake in three places. Piston must operate freely in cylinder *(CAUTION - D not apply any lubricant).* Lay a new air horn gasket on inverted air horn, then install pump plunger assembly in air horn with washer on top side of air horn hole and attach to pump arm with a new cotter pin. Slide pump lever on upper end of pump rod and install air horn assembly on main body making certain that pump plunger leather does not have any curled edges when it is inserted in cylinder in main body. Install air horn screws. Make sure lower end of pump rod is in the medium stroke hole. Install choke unloader arm, unloader link, and choke rod. Adjust carburetor *(see "Adjustment" above),* then install choke cover and gasket.

SERVICE PARTS: Gasket Set - Buick No. 1172374.
Repair Kit - Buick No. 1179000.

STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH

	Stromberg Code No.
DE SOTO S27 FIRESWEEP	
1957 (Synchro-mesh)	WW 3-149
1957 (Auto. Trans.)	WW 3-150
DODGE 6 CYL. D72	
1957 (Synchro-mesh)	WW 3-159
1957 (Auto. Trans.)	WW 3-160
DODGE V8 D66, 67, 70, 71	
1957 (Synchro-mesh)	WW 3-149
1957 (Auto. Trans.)	WW 3-150
PLYMOUTH V8 P31	
1957 (Synchro-mesh)	WW 15-23
1957 (Overdrive)	WW 15-24
1957 (Auto. Trans.)	WW 15-25

DESCRIPTION: Dual downdraft type. Carburetors are of same design used on previous models except for different types of automatic choke as follows:

Int gral Aut matic Chok (Dodge 6) - Choke assembly is mounted on throttle body (opposite side from throttle lever) and linked to choke valve lever by a rod. Fast idle mechanism is located within choke housing. This design similar to 1956 Dodge.

Cr ss-ov r Typ Aut matic Choke (DeSoto, Dodge, Plym uth V8) - Automatic choke is separate unit mounted in well in intake manifold (at exhaust cross-over passage) and is linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder on the air horn and is linked directly to the choke valve. See *"Stromberg Cross-over Type Automatic Choke"*.

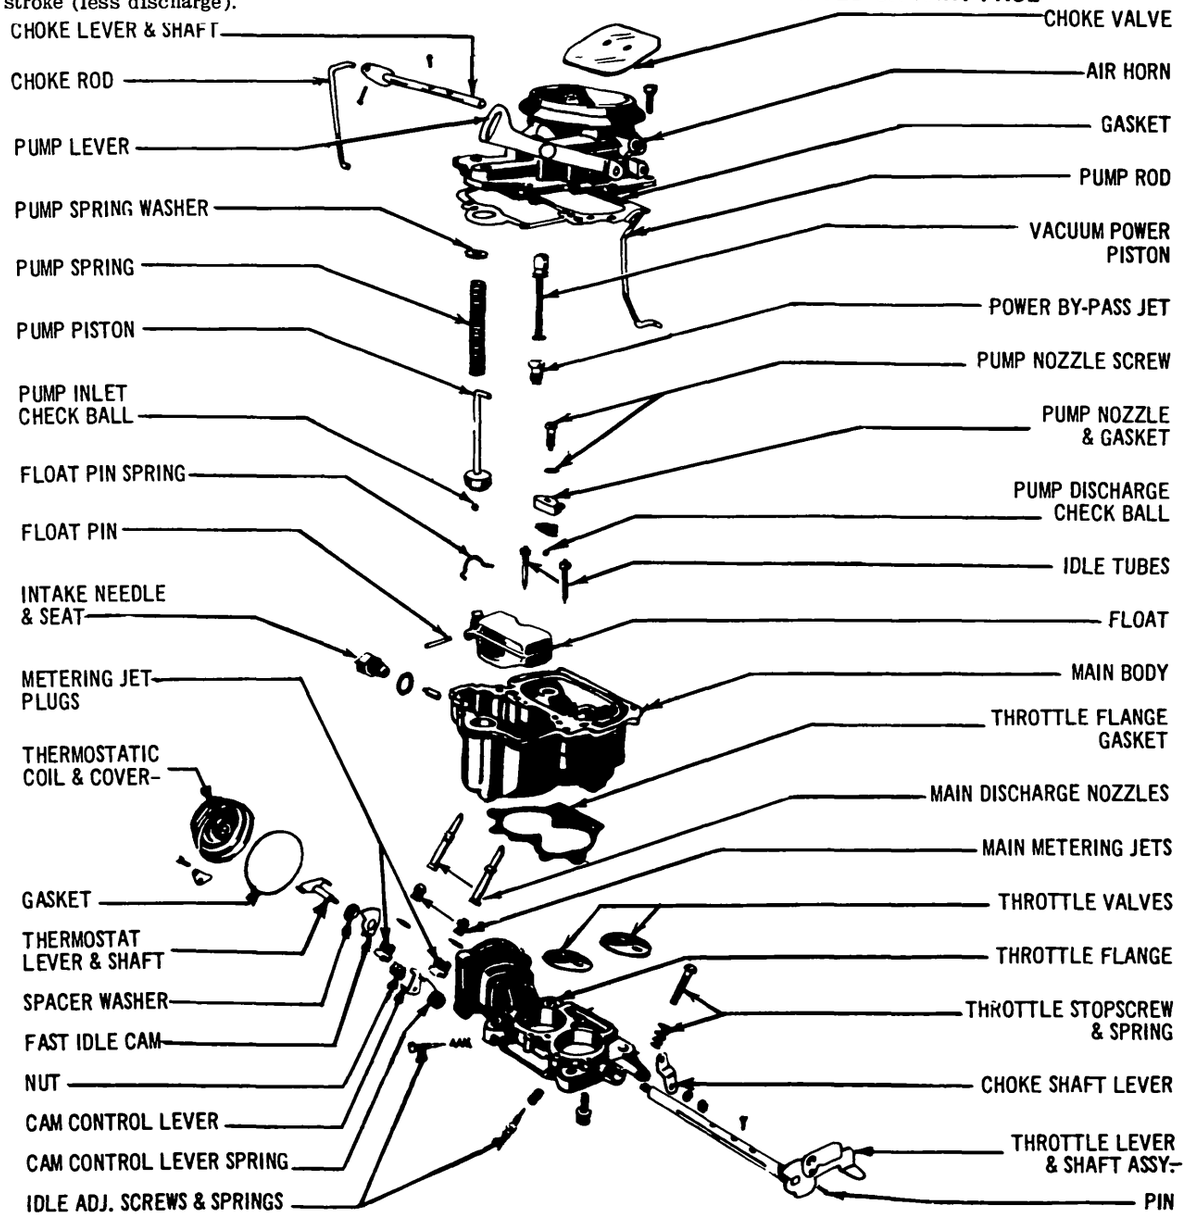
ADJUSTMENTS: *Make all adjustments exactly as listed b low.*

Idle Adjustment: Make a preliminary setting of both idle adjusting screws by turning them in until lightly seated and then turn screws out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows:

Idl Mixtur - With engine warmed up and idling at correct idle speed, turn each idle mixture adjusting screw in or out until highest engine speed and smoothest running is secured. Recheck idle speed.

Idle Sp d - 450-500 RPM. *NOTE* - On Auto. Trans. Cars, Neutral selector button must be pressed in.

Acc l rating Pump: Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting is listed below.



Pump Str k Adjustm nt - Back off throttle stopscrew so that throttle valves fully closed. Make certain that pump connector rod engaged in **Center** hole in throttle lever. Use scale on bowl cover to measure height of top edge of pump arm at pump plunger, open throttle wide, again measure height of pump arm. The **diff r nc** in the two measurements is **pump trav l or strok** and should agree with table below. Adjust by bending connector rod at lower angle using bending tool T109-213.

Car & Carb.	Pump Trav l S tting Pump Trav l
Dodge 6 (All)	3/16-7/32"
DeSoto, Dodge, Plymouth V8 (All)	9/32-5/16"

Pump Seasonal Setting - Std. setting is with connector rod engaged in **center** hole of throttle lever (medium stroke). **Outer** hole in throttle lever will provide maximum stroke (greater discharge), **Inner** hole minimum stroke (less discharge).

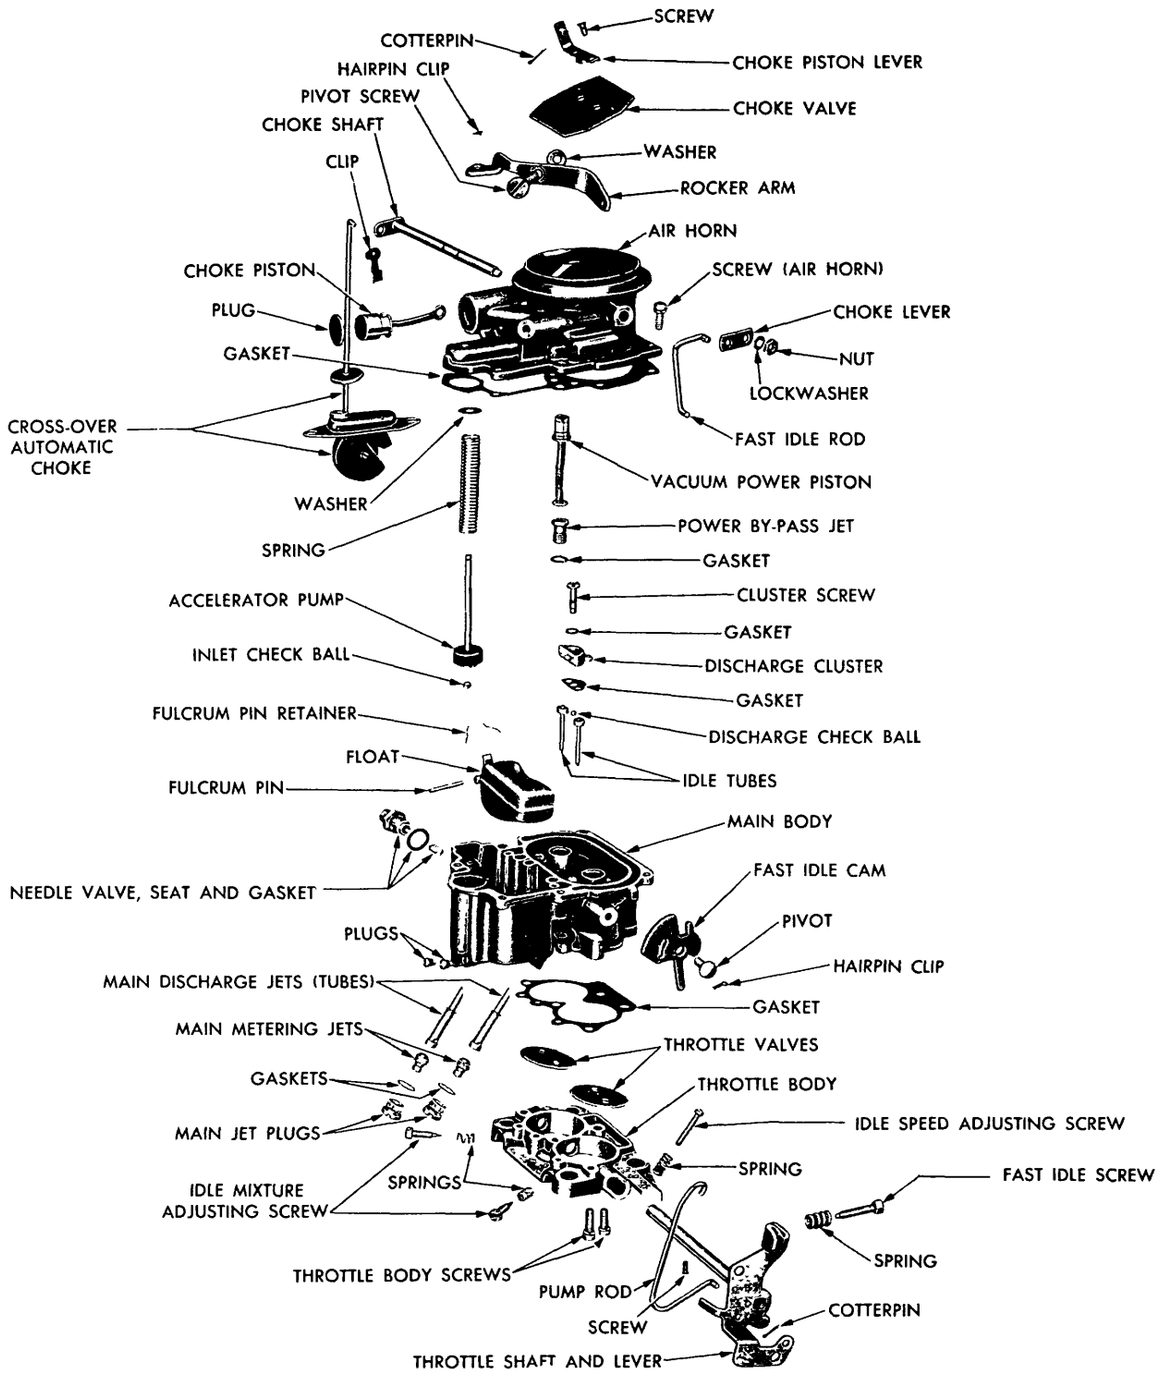
Float Lev l: To check float level, remove air horn and bowl cover assembly, and gasket. Place gauge (see table below) squarely on top edge of bowl at center of float (on far side and adjacent to slot in top of pump cylinder). Hold float arm lip firmly against seated needle valve. Top of float should just touch step on gauge. Adjust by bending float lip using bending tool T-24733.

CONTINUED ON NEXT PAGE

STROMBERG "WW" D WNDRAFT CARBURET R (INTEGRAL AUTOMATIC CHOKE)

STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH (Cont.)

Car & Carb.	Float Level Setting Checking Gauge	Float Level
DeSoto (All)	T-26019	7/32"
Dodge 6 (All)	T-25569	3/16"
Dodge V8 (All)	T-26019	7/32"
Plymouth (All)	T-26019	7/32"



Fast Idle (Dodge 6): Fast idle mechanism is located in choke housing on throttle body and thermostatic coil housing and gasket must be removed before making fast idle adjustments. **Three** different adjustments required as listed below. *NOTE - Special calibrated spring must be installed (to take place of thermostatic coil) while adjustments being made. Install this spring as follows:* **Calibrated Spring Installation** - With thermostatic coil housing removed, install calibrated spring, Tool T-25096, by inserting one cover screw through loop at one end of spring and installing screw in right hand upper mounting screw hole in housing and hooking opposite end of spring over long tang of thermostatic lever. Leave this spring in place while making all Fast Idle and Unloader adjustments.

1) Fast Idle Speed (Throttle Opening) Adjustment - Remove spring from throttle stopscrew, reinstall screw and turn screw in until it just contacts throttle lever with throttle valves held closed, then **turn screw in additional 5 1/8 turns** (this will position throttle valves in correct fast idle position). Hold choke valve closed and hold throttle lever against stopscrew, check clearance between tang on contact lever on throttle shaft and **first step** of fast idle cam with a No. 48 drill rod (.076"). If clearance not correct, adjust by bending tang on contact lever toward or away from cam using bending tool T-25863 *(CAUTION* - Tang must be parallel to throttle shaft after adjustment). Reinstall spring on throttle stopscrew *(CAUTION* - Idle speed must be reset after other adjustments completed).

2) Fast Idle Cam Position Adjustment - Open throttle valve to clear fast idle cam, close choke valve tightly, then close throttle valves fully against tension of choke positioning spring. In this position, tang on cam contact lever should just clear **high step** of fast idle cam, but clearance at this point should not exceed .020" (measure with feeler gauge). Adjust by bending fast idle connector rod at upper angle near choke lever using bending tool T109-213.

3) Choke Positioning Spring Adjustment - With carburetor in vertical position, install slide weight, Tool T-25864, over choke lever (between choke shaft and connector rod). Close throttle valves to make certain that cam contact lever tang is resting on high step of fast idle cam (Rotate cam as necessary to secure this position). Lightly close throttle valves which should cause slight opening of choke valve (choke positioning spring acting against slide weight on choke lever). Measure choke valve opening by inserting correct size drill rod (see table below) between upper edge of choke valve and air

CONTINUED ON NEXT PAGE

STROMBERG "WW" DOWNDRAFT CARBURETOR (CROSS-OVER CHOKE)

STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH (Cont.)

horn wall. Adjust by bending tang on thermostat lever that contacts choke positioning spring using long nosed pliers. Remove slide weight. Adjust UNLOADER before removing calibrated spring and reassembling choke.

Choke Positioning Spring Setting

Car & Carb.	Drill Rod Size	① Spring Color
Dodge 3-159	#31	Black
Dodge 3-160	#37	Copper

① - Springs are calibrated and can be identified by color as indicated.

Fast Idle (DeSoto, Dodge, Plymouth V8): Fast idle cam is mounted on main body (above throttle lever) and is linked to the choke shaft lever by a connector rod. A separate Fast Idle Screw on the throttle lever contacts the fast idle cam. Two separate adjustments are required as follows:

1) Fast Idle Speed - Back off throttle stopscrew so that throttle valves tightly closed. Turn fast idle screw out to clear fast idle cam, position cam so that fast idle screw is in line with first step of cam (and against shoulder of highest step), turn screw in until it just contacts cam, then turn screw in additional 5½ turns which will provide correct fast idle speed. *NOTE* - Throttle stopscrew must be adjusted for correct hot or slow idle speed after fast idle adjustments completed.

2) Fast Idle Cam Position - After adjusting fast idle speed, and with fast idle screw in same position as for fast idle speed adjustment (above), close choke valve as far as possible, measure choke valve opening or clearance between top edge of valve and air horn wall using correct size drill rod (see table below). If clearance not correct, adjust by bending fast idle rod at upper angle using bending tool T109-213.

Fast Idle Cam Setting

Car & Carb.	Checking Drill	Choke Opening
DeSoto & Dodge 3-149	#12	.189"
DeSoto & Dodge 3-150	#24	.152"
Plymouth (All)	#12	.189"

Unloader (Dodge 6): After completing fast idle adjustment, and with calibrating spring in place, close choke valve, open throttle valves wide which will open choke valve slightly. Check choke valve opening or clearance between upper edge of valve and air horn wall using a No. 19 drill (.180-.150" valve opening). If clearance not correct, adjust by bending tang of cam contact lever using long nosed pliers. After adjustment completed, remove calibrated spring and reassemble automatic choke (see choke data below).

Unloader (DeSoto, Dodge, Plymouth V8): Two different adjustments required as listed below. *NOTE* - Vacuum piston (Vacuum Kick Adjustment) is located in cylinder in air horn and is linked directly to an ear on the choke valve.

Unloader (Wide Open Kick) Adjustment - Hold choke valve closed lightly, open throttle valves to wide open position which will open choke valve slightly. Measure choke valve opening or clearance between upper edge of valve and air horn wall using a No. 19 drill (.180-.150" valve opening). If clearance not correct, adjust by bending tang on throttle lever using bending tool T109-214.

Vacuum Kick Adjustment - Make up a wire gauge by bending .040" diameter wire (paper clip) as shown in illustration. With choke valve open, insert wire gauge in vacuum cylinder and engage hooked end in slot at bottom of cylinder, close choke valve until inner end of piston grips wire gauge at inner end of slot. Measure choke valve opening or clearance between upper edge of valve and air horn wall using correct size drill rod (see table below). If clearance not correct, adjust by bending choke piston lever ear as required.

Vacuum Kick Setting

Car & Carb.	Drill Rod	Choke Opening
DeSoto & Dodge 3-149	"B"	.238" (¼")
DeSoto & Dodge 3-150	#7	.201"
Plymouth (All)	"B"	.238" (¼")

Automatic Choke (Dodge 6): Centered (At Index). When installing thermostatic coil housing (after fast idle and unloader adjustment), install housing with index mark down, then turn housing counterclockwise until index mark lines up with center (longer) line of scale on housing on air horn. Check by holding choke valve open while opening and closing throttle valves. If full throttle operation not obtained, choke has not been properly assembled or adjusted. Hold throttle valves wide open while opening choke valve. There should be no bind through entire choke valve travel.

Automatic Choke (DeSoto, Dodge, Plymouth V8): Automatic choke is separate "Cross-over" type mounted in well in intake manifold (at exhaust cross-over passage) and linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in the air horn and linked directly to the choke valve. This type choke ordinarily does not require adjustment. *See "Stromberg Cross-over Type Automatic Choke" for complete data.*

Overdrive Kickdown Switch (Plymouth V8): With throttle valves wide open, clearance between kickdown lever and switch stem guide should be 1/64-3/64". Adjust by loosening switch mounting nuts and changing position of switch in bracket.

Slow-closing Throttle Dashpot (Dodge 6 Auto. Trans. Cars): With throttle valves fully closed, it should be possible to move dashpot plunger shaft inward 3/32". Adjust by loosening locknut and screwing dashpot in or out of mounting bracket.

OVERHAUL: With carburetor off engine, proceed as detailed below. *NOTE* - It is recommended that carburetor be mounted on stand, Tool C-3225, to protect throttle valves from damage while carburetor is on the bench.

Disassembly: If dashpot used, remove two screws in mounting bracket and lift dashpot assembly off. Disconnect and remove pump connector rod and fast idle connector rod. Take out air horn and bowl cover attaching screws, lift assembly straight up and off main body. Remove hairpin clip in upper end of pump plunger, remove plunger assembly from air horn, slide seal washer and spring off plunger rod. Remove vacuum power piston from air horn *(CAUTION* - Edges of cylinder are staked and piston must be removed as follows: Place wood block on air horn as a fulcrum, use open end wrench hooked under end of power piston stem as a pry to force piston out). Remove staking of choke valve screws, remove screws, slide choke valve out allowing piston link and bracket to hang in air horn *(CAUTION* - Do not attempt to remove vacuum piston from air horn cylinder - welsh plug retaining piston and link is factory sealed), withdraw choke shaft and lever from air horn. Lift idle tubes out of main body, invert main body to drop out pump inlet check ball. Remove screw and gasket from pump discharge cluster, lift off cluster and gasket, invert main body to drop out pump discharge check ball. Remove fuel inlet needle valve seat, gasket, and needle valve. Pry out float fulcrum pin retaining spring, lift out float and fulcrum pin. Remove power bypass jet and gasket. *CAUTION* - Do not attempt to remove high speed bleeders from main body. Take out screws attaching throttle body, lift off main body and discard gasket. Invert main body and remove main jet plugs using Tools T-19099, T-24968, & T-25184, discard plug gaskets. Remove main metering jets using Tool T-24924. Remove main discharge jets using Tool T-24967 *(NOTE* - tool has right hand thread and should be screwed into jet - threads formed by tool will not damage the jet). Remove idle mixture adjusting screws and springs. Do not remove throttle valves or shaft unless new parts are to be installed (see Reassembly for removal and installation data).

Automatic Choke Disassembly (Dodge 6) - Take out retaining screws and washers, lift off thermostatic coil assembly and gasket. Remove nut on end of throttle shaft retaining cam contact lever using Tool T-25047 *(CAUTION - This nut has LEFT HAND threads),* remove lockwasher, slide cam contact lever and choke positioning spring off shaft *(NOTE* - Lever engages flats on shaft). Remove nut and lockwasher retaining thermostat crank lever on shaft on rear side of housing, remove lever *(NOTE* - Lever engages flats on shaft). Slide thermostat lever, shaft, and washer out of housing. Lift fast idle cam off shoulder in housing.

Cleaning & Inspection: Clean parts with denatured alcohol or cleaning solvent and dry with air. Blow out all passages with air. Do not use wire or drills to clean jets. Clean all parts of choke mechanism thoroughly *(CAUTION* - Do not attempt to separate thermostatic coil from heat retainer plate - coil, plate, and housing are serviced as an assembly).

Reassembly: Use all new gaskets. Reassemble carburetor by reversing disassembly procedure and note the following:

Throttle Valve Removal & Installation - If new shaft being installed, scribe mark both throttle valves before removal (to insure reinstallation in same position), remove valve screws (screws are staked), slide valves and shaft out. When installing valves, make certain that scribe marks (or dash stamped on valve) is upward and toward idle port and that notch in edge of valve is cen-

CONTINUED ON NEXT PAGE

STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH (Cont.)

tered over idle discharge port. Install new screws lightly, then close valves completely (back out stopscrew to insure valves seating), press on high side of valves and tap lightly to seat them in bores, tighten screws securely and stake by squeezing with pliers

Choke Valve Installation - Install choke shaft with lever end toward pump end of air horn. Install choke valve, position choke piston bracket on shaft and install new screws loosely. Hold valve in closed position and tap lightly to seat it in bore, tighten screws securely and stake by squeezing with pliers. Make certain that valve opens and closes freely.

Automatic Choke Assembly (Dodge 6) - Install fast idle cam on hub in choke housing with fast idle steps down and toward throttle shaft (weighted portion against stop). Assemble cam retaining washer on thermostat lever shaft with shoulder against thermostat lever, install assembly in choke housing with choke positioning tang between fast idle steps and weight on fast idle cam. Install thermostat crank lever on end of lever shaft at rear of choke housing (lever must engage flats on shaft), install lockwasher and nut and tighten securely. Install choke positioning spring on end of throttle shaft with coiled portion inward and against thermostat lever shaft housing. Slide cam contact lever over end of throttle shaft with lever tang against fast idle cam, install lockwasher and nut, tighten nut securely *(CAUTION* - This nut has left hand thread). Install thermostatic coil housing *(see Automatic Choke above).*

Main Discharge Jets & Metering Jets - Place main discharge jets firmly on Tool T-24967, seat jets firmly in main body with opening in end of jets (diagonal cut) facing opposite side of main venturi. Install main metering jets and tighten securely with Tool T-24924. Use new copper gaskets on main jet plugs and tighten plugs securely.

Accelerating Pump Assembly & Test - Install pump discharge check ball in discharge passage, fill bowl with clean gasoline to depth of ½", install pump plunger temporarily in cylinder, depress plunger to expel air from discharge passage. Hold discharge check ball down on seat with a small brass rod, operate pump plunger. No fuel should be emitted from intake or discharge passages. If fuel noted, clean passages thoroughly and inspect check balls and seats for damage. Reseat ball by using rod to tap ball down on seat *(CAUTION* - Install new check ball after using ball in seating operation). Recheck pump operation. Install discharge cluster using new gasket. Check pump operation. Discharge from each cluster jet should be a clear straight stream. If stream deflected or restricted, install new cluster. Remove pump plunger and install it in air horn.

Carburetor Adjustments - *Make all adjustments listed under ADJUSTMENTS above.*

STROMBERG "WW" STUDEBAKER

STUDEBAKER	Stromberg Code No
1957 Commander 57B	WW 6-117A
1957 President & Broadmoor 57H	WW 6-117A

▷CHANGES, CAUTIONS, CORRECTIONS

▷*ALTITUDE CARBURETOR MAIN METERING JET CAUTION* These jets have different flow characteristics than same size jets used on Studebaker Supercharged models and must not be interchanged Correct type jets may be identified by groove around wrench end *See Stromberg Jet Specification Table for all jet sizes*

DESCRIPTION: Dual barrel, downdraft type as same design as "WW" carburetors used on previous Studebaker models

CARBURETOR ADJUSTMENT: *Make all adjustments exactly as follows:*

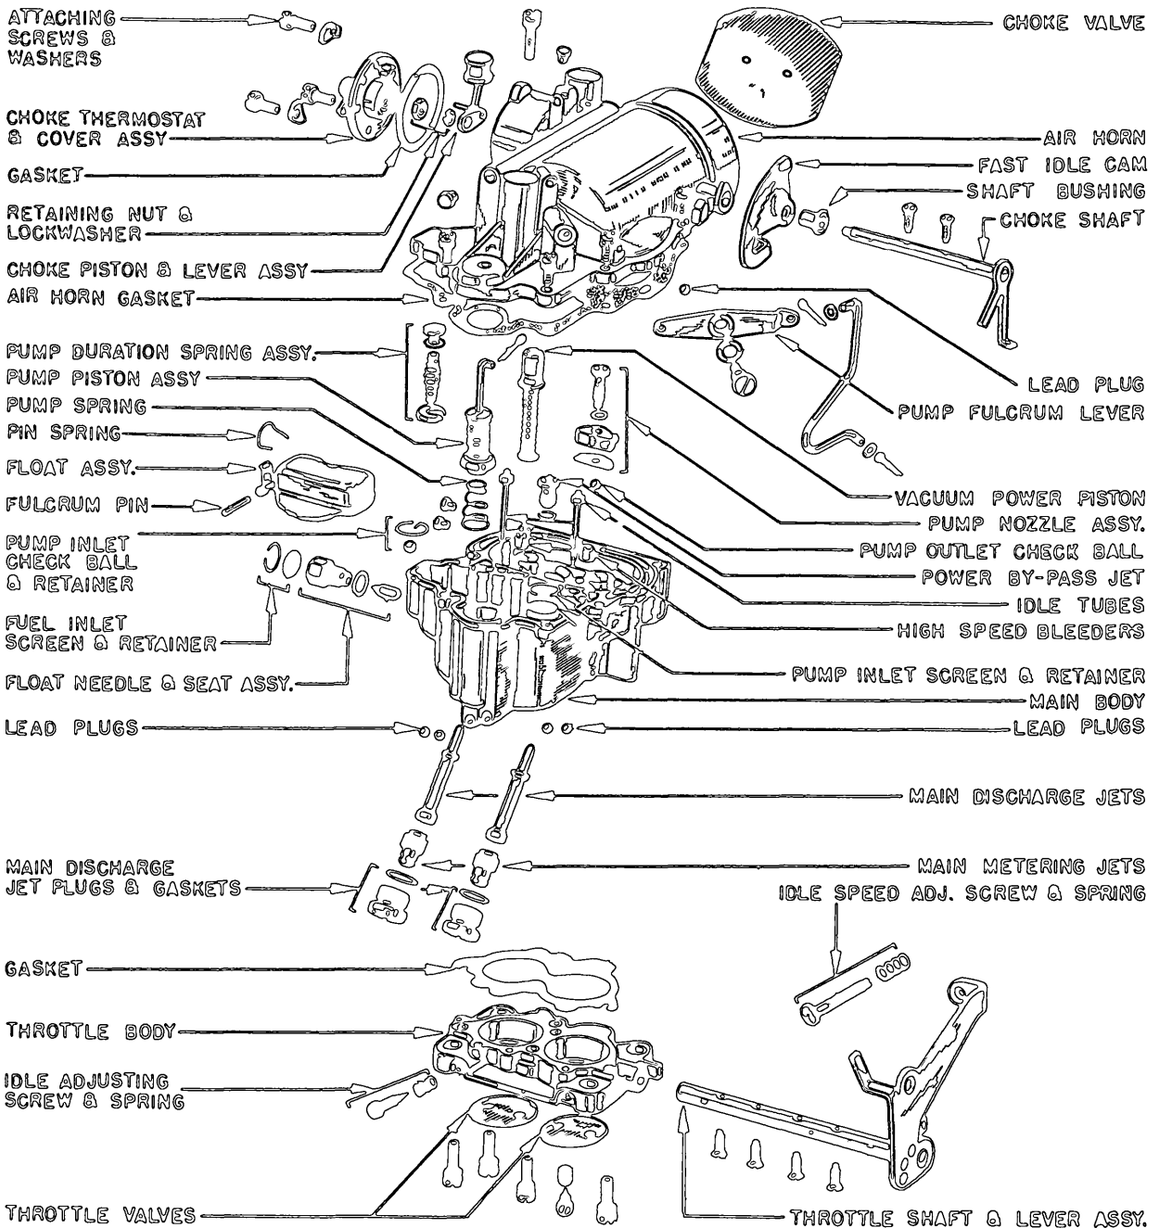
Idle Setting: Turn both idle mixture adjusting screws in until they are lightly seated, then back each screw out exactly 1¾ turns. Start engine and allow it to run until normal operating temperature is reached. With engine at normal operating temperature (choke valve wide open, fast idle inoperative) and with air cleaner in place, adjust idle speed and mixture as follows:

Idle Mixture—First check and adjust idle speed. Turn BOTH idle mixture adjusting screws in evenly and slowly until engine begins to run unevenly, then turn screws out evenly and slowly until engine again runs unevenly, finally set both screws approximately halfway between these two points where smoothest idling performance is secured Recheck engine idle speed. *CAUTION*—BOTH adjusting screws must be turned equally and in the same direction when making above adjustment

Idle Speed

All Transmissions	①550 RPM

① - With selector lever in Neutral on Flightomatic Cars



Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement:
Center Hole—Normal operating conditions.
Inner Hole—Shorter stroke, less fuel discharge.
Outer Hole—Longer stroke, more fuel discharge.

Float Level: To check float setting, remove air horn and bowl cover and gasket, hold float lever lip firmly against intake needle valve to place float in closed-valve position. Measure float height by placing Float Level Gauge T-25569 (Studebaker No. J-5475) squarely on top edge of float bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required using bending tool T-24733 (Studebaker KMO-269-S5).

FLOAT SETTING

Studebaker WW	3/16"①

①—Top of float below top edge of bowl.

STROMBERG "WW" (STUDEBAKER) DOWNDRAFT CARBURETOR

Fast Idle Cam Setting: Check with fast idle cam in fast idle position with choke valve fully closed. In this position, one-half of diameter of button on throttle stopscrew should rest on highest step of fast idle cam (button should hang over so that half-diameter travel of fast idle cam will cause screw to drop down on to next-lowest step of cam).

NOTE—Fast Idle setting can also be checked as follows With slow idle adjusting screw button resting on high step of fast idle cam, apply light closing pressure to choke valve, check remaining opening by inserting a #31 drill rod between lower edge of choke valve and air horn wall (choke opening should

CONTINUED ON NEXT PAGE

STROMBERG "WW" STUDEBAKER (Cont.)

be .105-.135"). Adjust by bending ear on choke lever which contacts fast idle cam up or down, as required, using bending tool KMO-478.

Unloader (Dechoke) Setting: To check setting, hold choke valve closed tightly, open throttle valves to point where stop on throttle lever rests against stop on carburetor throttle body and choke valve is opened slightly. Check choke valve opening by inserting #1 drill rod (.228") between lower edge of choke valve and air horn wall. If opening not correct (.203-.265"), adjust by bending ear on choke lever which contacts throttle lever using bending tool KMO-478.

Automatic Choke Setting: 1 Point Lean with arrow on cover 1 point lean from boss on housing.

Throttle Return Check (Cars with Automatic Transmission): Consists of a dashpot unit mounted on the carburetor with the dashpot plunger contacting the throttle lever during the last 3/16" of throttle movement toward closed throttle position. Dashpot will prevent too-rapid closing of throttle and keep engine from stalling. *See Throttle Linkage Adjustment under CARBURETOR on car model page.*

OVERHAUL: *See "Stromberg WW (Studebaker) Carburetors" in 1955 Annual Data or later Manual editions.*

STROMBERG "WW" STUDEBAKER & PACKARD SUPERCHARGED

PACKARD	Stromberg Code No.
1957 Clipper Model 57L	① WW 6-121
STUDEBAKER	
1957 Golden Hawk Model 57H-K	① WW 6-121

① - Supercharged Carburetors

►CHANGES, CAUTIONS, CORRECTIONS

►*HARD STARTING OR PROLONGED CRANKING WITH HOT ENGINE CORRECTION* Modify the carburetor and Supercharger Air Chamber as detailed below *NOTE* - Carburetor must be removed from engine but need not be disassembled if care is taken to prevent metal chips entering carburetor

1) Carburetor Vents - Drill a 7/64" hole through side of air horn casting into vertical section of balance vent passage (locate this hole to right and below end of choke vacuum piston cylinder and adjacent to the right hand edge of the passage wall) Drill two 5/64" holes in throttle body (locate holes in small bosses directly above mounting flange and at ends of square section of casting when viewing side of carburetor with automatic choke housing toward right side)

2) Air Chamber Cover Vent Valve - If air chamber cover does not have a vent valve install valve as follows Drill a 1" valve hole in cover (When facing air intake hole side of cover locate this hole 3" to left of right hand cover mounting hole and 3¼" up from mounting flange edge of cover) drill two 5/32" valve mounting holes on a line drawn 45° down and to the left of the valve hole center drill first hole 2" from valve hole center and second hole 5/8" beyond this point Install vent valve assembly No 1542765, in cover with two small flat washers between spring and cover use self-tapping screws No G453113 to attach valve Adjust valve by bending spring for opening of ¼" between cover and highest point at outer edge of valve Reinstall carburetor and adjust as directed below

►*STUDEBAKER GOLDEN HAWK CARBURETOR ADJUSTMENT NOTE* On early cars, Air Chamber Cover and Base provided with adjusting holes (closed by pipe plugs) for idle mixture and idle speed adjustments On later cars (and all Packard), extensions are provided on the idle mixture adjusting screws (extending through air chamber base), and the idle speed adjusting screw is located on the external throttle lever, so that all adjustments can be made without disturbing the air chamber cover

►*STUDEBAKER GOLDEN HAWK & PACKARD CLIPPER CARBURETOR CHANGES TO PREVENT STALLING AND IMPROVE PERFORMANCE & ECONOMY* Following changes have been made in production and can be made on earlier cars

1) Engine Stalling on Left Turn Correction - Due to gasoline foam entering air stream through bowl vent tube caused by float dropping on left turn. Correct by installing new Air Horn Gasket, Studebaker No. 1543362 (with vent hole in gasket moved out of line with bowl vent tube), and Float Bowl Baffle, Studebaker No. 1543363 (installed between float and needle valve to prevent fuel surging in bowl) *NOTE* - When installing these parts, check cover for flatness and correct by filing cover or body casting as necessary to insure good seal along vacuum passage to choke and vacuum power piston

2) Over-rich Condition After Starting (Cold Engine) - A ¼" hole should be drilled in the center of the choke valve on the wide side. Automatic choke should be set at Index (Centered). This setting supersedes 1 Notch Lean setting used on cars with first type carburetor

3) Lean Condition After Starting - Correct by shortening choke stove-to-carburetor pipe 1¼". See also Over-rich Condition correction (preceding)

4) Improved Fuel Economy - Install new Power Piston Assembly, Studebaker No 1543290. This assembly has different spring tension which allows power jet to come in at higher speed for improved gasoline mileage.

►*STUDEBAKER GOLDEN HAWK AIR CHAMBER VENT VALVE FLUTTER & NOISE (Engine Idling)* If not corrected by engine idle speed adjustment (when due to insufficient supercharger output or too slow engine speed), check and adjust vent valve as follows Remove air chamber cover, check distance from tip of valve to base or cover (depending on valve mounting location) which should be ¼" Adjust by bending the valve flat spring *See Air Chamber Production Change (following)*

►*STUDEBAKER GOLDEN HAWK AIR CHAMBER PRODUCTION CHANGES* See Carburetor Adjustment Note (above) for changes affecting carburetor adjustment. Other changes have been made as follows Beginning Engine No PS-2375, vent valves in base and cover were removed and holes were plugged. At the same time a vent pipe was installed in the base (extending forward from base and down in front of engine) to provide a vent and drain for the air chamber. These new parts are Drain Pipe Assy No. 1543107, Pipe Nipple (Base End) No. 1543108, Drain Pipe-to-Timing Gear Cover Clip No. 182317. *NOTE* - Vent Valve Assy. No. 1542765 is continued for service on first type air chamber.

►*STUDEBAKER GOLDEN HAWK & PACKARD CLIPPER HIGH FUEL CONSUMPTION OR POOR ENGINE PERFORMANCE* May be due to fuel leakage within air chamber (not visible from outside) caused by loose fuel line connections or porous base casting. Check these points when correcting above complaints.

►*ALTITUDE MAIN METERING JET CAUTION* These jets have different flow characteristics than same size jets used on other Studebaker models and must not be interchanged They may be identified by unmarked end (Jets for other models have groove around wrench end) *See Stromberg Jet Specification Table for all jet sizes*

DESCRIPTION: Dual downdraft type similar to design used on other Studebaker models except for straight air horn (vertical air intake) and fast idle cam mounted on main body above throttle lever and linked to choke valve lever Carburetor is mounted on an Air Chamber Base (on manifold) and is completely enclosed by a cover so that the entire carburetor is supercharged All carburetor connections are made to fittings in the base (fuel line, choke hot air stove pipe, and distributor vacuum line) *See Carburetor Adjustment Note above for other features*

ADJUSTMENT: Make all adjustments exactly as detailed below

Idle Setting: With engine at normal operating temperature and idling at correct idling speed, adjust idle mixture, then recheck idle speed and readjust as necessary

Idle Mixture - See Note below for early Studebaker cars with adjusting screws within air chamber Turn both idle mixture adjusting screws (extensions on forward edge of air chamber base) in slowly until engine begins to run unevenly, then turn screws out until engine again runs unevenly, finally set both screws approximately midway between these two points where smoothest idling performance is secured *CAUTION* - Both screws must be turned equally and in same direction when making this adjustment

►*EARLY STUDEBAKER NOTE* On these cars, idle mixture adjusting screw extensions are not used. To adjust,

CONTINUED ON NEXT PAGE

STROMBERG "WW" STUDEBAKER & PACKARD SUPERCHARGED (Cont.)

remove pipe plugs (on forward edge of air chamber base) and insert flexible shanked screwdriver through holes to engage slotted adjusting screws on carburetor.

Idle Speed - 575 RPM on all cars (with selector lever in Neutral "N" position on Flightomatic Cars) *NOTE - This setting supersedes previous recommendation of 550 RPM and will assist in correcting hard starting when hot (see Changes & Corrections above)* Adjust idle speed by turning throttle lever stopscrew located on bracket on left side of air chamber cover This screw serves as the stop for throttle outer arm.

►*EARLY STUDEBAKER NOTE:* On these cars, throttle stopscrew is located on inner throttle arm (within air chamber cover) and can be adjusted by removing pipe plug on rear face of air chamber cover and inserting small shanked screwdriver through hole to engage slotted adjusting screw. *NOTE* - Throttle stopscrew is outer or left hand screw (inner screw is Fast Idle Adjusting Screw) and adjustment will be facilitated by sighting through hole on left side of air chamber cover.

Throttle R turn Check (Flightomatic Cars): Consists of a dashpot unit mounted on the carburetor within the air chamber cover. *See Throttle Linkage Adjustment under CARBURETOR on car model page.*

Float Lev l: Air chamber cover must be removed and air horn and bowl cover assembly taken off for this adjustment With gasket removed, hold float lever lip firmly against intake needle valve to hold float in closed-valve position. Place gauge, Studebaker No J-6646 squarely on top edge of bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required.

Float Setting

Packard & Studebaker 6-121	① 7/32"

① - Top of float below top edge of bowl.

Fast Idle: This adjustment can be made with the carburetor on the bench (Off Engine), or On Engine as detailed below. *NOTE* - If carburetor on engine, it will be necessary to remove air chamber cover for access to fast idle adjusting screw.

Off Engine Adjustment - Manually close choke valve so that fast idle adjusting screw rests on highest part of fast idle cam. Adjust fast idle screw so that throttle opening is .030" Check by inserting 030" wire gauge between edge of throttle valve and carburetor wall on idle port side.

On Engine Adjustment - After adjusting hot or slow idle speed to 550 RPM, manually close choke valve so that fast idle adjusting screw rests oh highest part of fast idle cam *(CAUTION* - Fast idle screw is the inner screw to the right of the slow idle speed stopscrew). Back fast idle screw out until slow idle speed stopscrew just touches the stop, then turn fast idle screw in exactly 7½ turns. This will provide correct throttle valve opening of .030-.031"

Unloader (Dechoker): To check setting, open throttle valves fully, check choke valve opening by inserting No. 1 drill rod (.228") between lower edge of choke valve and air horn wall. If opening not correct (.203-.265"), adjust by bending ear on throttle lever which contacts lug on fast idle cam.

Automatic Choke: 1 Point Lean with arrow on cover 1 point toward lean side from boss on housing.

Kickdown Switch (Supercharger Control): Switch is mounted on bracket at auxiliary throttle outer lever and can be adjusted without disturbing air chamber cover. To adjust, loosen switch mounting nuts in bracket, position switch so that plunger is fully depressed and throttle outer lever rests against threaded sleeve of switch in wide open throttle position. Tighten mounting nuts after adjustment completed.

CARBURETOR REMOVAL & INSTALLATION: Removal - Loosen supercharger-to-carburetor air chamber hose clamps, remove air chamber mounting stud nuts and lockwashers. Lift cover and disengage studs on right side, then continue to lift and rotate cover to disengage studs on left side and slip hose off supercharger outlet. Disconnect and remove distributor vacuum line, choke heat tube, and fuel line (at carburetor and air chamber base connections). Remove idle mixture screw extensions by unscrewing plugs from base. Remove carburetor mounting nuts Hold auxiliary throttle outer lever so that slot in inner lever is vertical, lift carburetor assembly straight up.

Installation - Use new carburetor-to-manifold gasket on air chamber base. Install carburetor by reversing removal procedure.

AIR CHAMBER BASE REMOVAL & INSTALLATION: Removal - After carburetor removed, disconnect throttle return spring and throttle rod from throttle outer arm, disconnect kickdown switch wires. Disconnect fuel line and distributor vacuum line from base fittings. Remove oil filter bracket screws. Lift air chamber base from manifold.

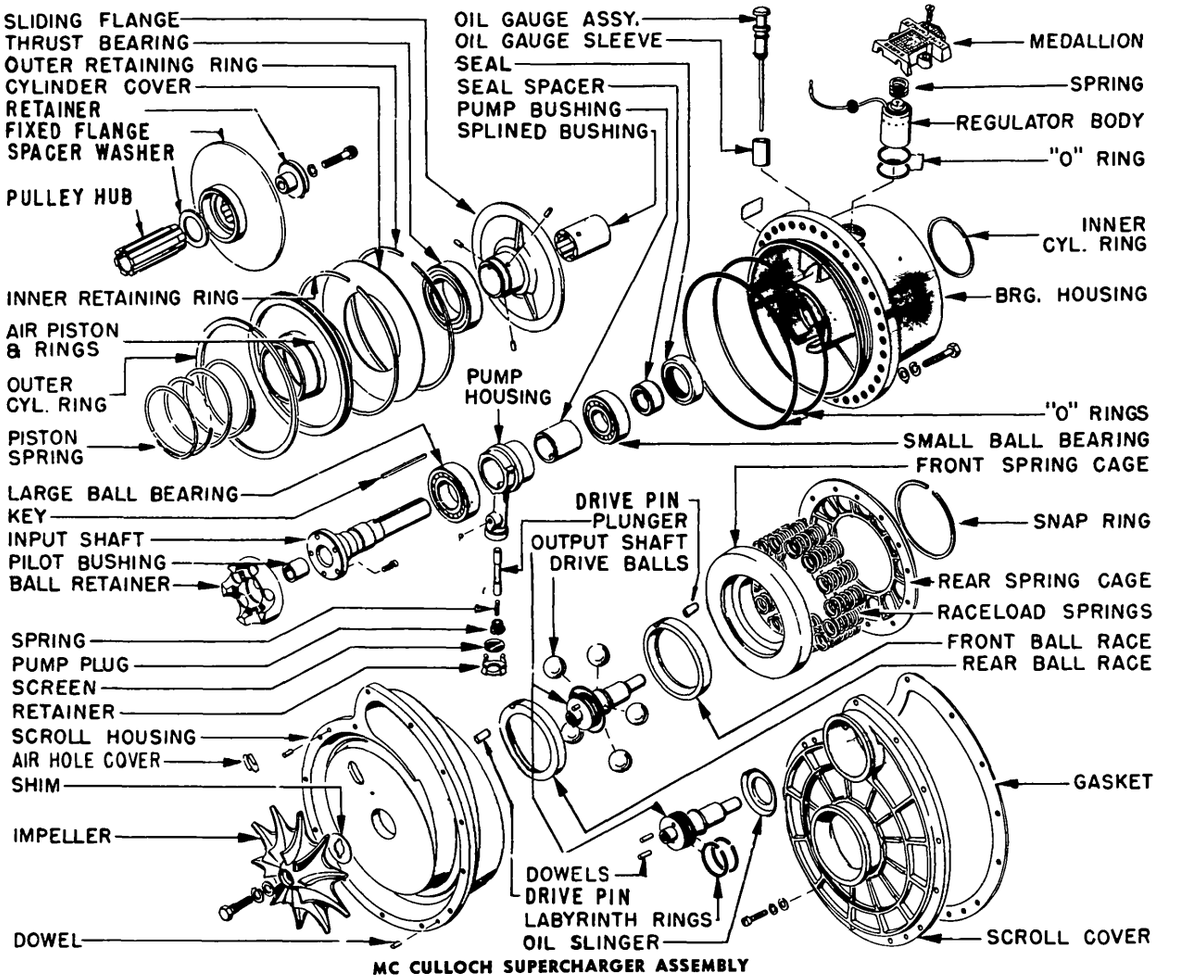
Installation - Use new gasket between base and manifold. Install base by reversing removal procedure.

CARBURETOR OVERHAUL: *See "Stromberg WW (Studebaker) Carburetors" in 1955 Annual Data or later Manual editions*

SUPERCHARGER OVERHAUL: *See "McCulloch (Studebaker) Supercharger".*

MC CULLOCH SUPERCHARGER

Ford, 300 HP High Performance Eng. (1957). See Note below
Packard Clipper (1957)
Studebaker Goldenhawk (1957)



►*1957 FORD SUPERCHARGER NOTE:* Service procedures for the supercharger used on early 1957 production cars are similar to the procedures outlined below.

DESCRIPTION & OPERATION: Supercharger is a centrifugal type mounted on engine and belt driven from the crankshaft. Supercharger has two step-up speeds: (1) Variable ratio drive pulley with belt tensioner, and (2) Planetary drive system between input and output shaft. A control system governs shift from LOW BLOWER to HIGH BLOWER and limits HIGH BLOWER boost output by governing the sliding flange of variable ratio pulley. LOW BLOWER step-up speed ratio is 1-5.7 and HIGH BLOWER 1-10 in relation to crankshaft speed. Planetary drive system consists of front and rear outer ball races, five steel balls, ball retainer and inner race which is milled in the output shaft. Drive is from input shaft to ball retainer, to steel balls, to output shaft with a ratio of 1-4.44. Spring tension from race load assembly applies pressure (from assembly) to front race, reducing space between front and rear outer races, forcing ball pressure on output shaft. Balls are forced to rotate around output shaft as well as on own axis causing output shaft to turn. The impeller fits on hub of output shaft and is driven by two dowel pins.

Lubricating System—Oil supply is contained in oil sump. A piston type oil pump driven off camway ground in input shaft supplies lubrication direct to input shaft bushing and to output shaft pilot bushing in rear end of input shaft. Seepage past these bushings supplies lubricant to input shaft roller bearings, air piston and air chamber, and to planetary drive balls and races. A dipstick is provided to check oil level and the oil level should be checked every 1000 miles. *See LUBRICATION below.*

Control System—Consists of an air pressure valve affected by spring pressure and a Solenoid Regulator. The electric switch for the Solenoid Regulator circuit can be operated either by intake manifold vacuum or by accelerator pedal (kickdown). A spring loaded diaphragm limits air pressure build-up by permitting valve to open at adjusted spring pressure.

Solenoid Regulator Operation—There are three phases:
1) Low air pressure, no circuit to Solenoid Regulator, spring between valve head and Solenoid Armature forces valve open permitting air pressure to enter air chamber forcing air piston and floating pulley flange forward causing shift to Low Blower.
2) Low air pressure, Solenoid energized, forcing Armature up, compressing valve spring and sealing off air passage to air piston resulting in shift to High Blower by the belt tensioner.
3) High air pressure against diaphragm offsets diaphragm spring pressure forcing diaphragm away from valve head. With Solenoid Armature in up position (energized), valve is now permitted to raise sufficiently to open air passage partially. Air piston moves forward reducing input shaft speed ratio and impeller speed, controlling pressure build-up.

MC CULLOCH SUPERCHARGER ASSEMBLY

LUBRICATION: Check oil level by means of dipstick on left side of housing every 1000 miles. Drain and refill sump at 25,000 mile intervals. Dipstick is marked to indicate "safe" oil level and "add oil" points.
Capacity & Recommended Lubricant—8 ozs. Use Mobil-oil ATF200 or Type A Automatic Transmission fluid.

OVERHAUL: *Supercharger is a precision unit with micro-finished surfaces and all precautions listed below must be followed when disassembling unit and handling parts.*

►*CAUTION:* Remove unit from engine before disassembling. Clean exterior thoroughly with solvent, wiping dry with rags or industrial wipers. DO NOT immerse unit in the solvent and avoid use of compressed air during cleaning operation. Work on clean surface with clean tools, using clean solvent and oils. Proper tools eliminate possible damage to precision built parts. Do not handle micro-finished drive line parts with bare hands (output shaft, drive balls, and ball races) to avoid rust and oxidation on these parts. Use clean dry cloth gloves or oiled patches of clean cloth (lint free paper wiping towels such as Scott Industrial Wipers etc. may be used).

1) Remove dipstick gauge and drain oil sump. Remove scroll cover and gasket by first removing retainer screws and then lifting, **not twisting,** the cover from housing and dowels. *(CAUTION - Impeller wheel is a balanced unit and chipping, scratches or gouges will destroy the balance. DO NOT use pliers or screwdrivers while removing retainer screw. If impeller is chipped or gouged, replace the part).*
2) Install Impeller Holder, Tool J-6684 and remove retaining capscrew and washer. Insert Impeller Puller,

CONTINUED ON NEXT PAGE

MC CULLOCH SUPERCHARGER (Continued)

Tool J-6690 into the impeller and turn it clockwise until impeller is lifted clear of output shaft boss, then remove impeller wheel shim or shims. Mount supercharger assembly in holding fixture, Tool J-6689, and using a suitable rubber hose or fan belt to hold the pulley, loosen pulley retaining screw and remove the screw, lockwasher, and retainer. Pull the fixed flange of pulley and splined hub off shaft. *(NOTE* - If splined hub remains on the shaft, use Puller, Tool J-6693 to remove it from input shaft).

3) Remove sealed bearing (ball thrust) from sliding flange using Puller Plate, Tool J-1298, and Puller, Tool HM-925 together with Puller Centering Button, Tool J-6685.

4) *(CAUTION - When removing retainer rings, and air piston cover, the air piston must be held down constantly).* Push in on hub of air piston to compress piston spring and remove pressure from piston cover. Insert a screwdriver in notch at bottom of bearing housing and snap out the outer retainer ring. Remove air piston cover, then snap out the inner retainer ring. Lift air piston and spring from air chamber then remove large oil seal ring from piston.

5) Remove medallion and solenoid regulator spring. Remove solenoid regulator from housing by grasping top shoulder of regulator with vise-grip pliers and then pulling straight out. Remove two seal rings from solenoid regulator well. Scribe an index mark on the scroll and regulator housings for correct reassembly. Remove hex-head screws, lockwashers, and flat washers retaining bearing housing to scroll housing, then remove bearing housing by twisting it free of scroll housing. After housings are separated, remove the two sealing rings from bearing housing. *(CAUTION - Do not use a tool to pry housings apart which may cause damage to housings or mating surfaces).* Remove inner air piston seal from housing.

6) Remove input shaft and oil pump assembly. *(NOTE* - If shaft and pump assembly remained in bearing housing when it was lifted free of scroll housing, tap pulley end of input shaft with a rubber mallet to drive assembly out of housing). Press the input shaft oil seal out of bearing housing. Remove race load assembly from scroll housing. *(CAUTION - DO NOT attempt to disassemble race load assembly without the use of an arbor press. Internal springs will cause damage if released suddenly).*

7) Remove drive balls of planetary system by lifting the output shaft until balls are free of rear ball race. Output shaft can then be removed by pulling it free of scroll housing. Remove ball races by lifting or tapping them from their seats in race load assembly and scroll housing. *NOTE* - Use Anvil, Tool J-6687 to pry against when removing race from scroll housing.

8) Remove hub key and shaft spacer from shaft using Puller, HM-925; Plate, J-1298; Collets, J-6729; and Centering Button, J-6686. Spring the screen retainer off lower end of oil pump and then remove the screen. Screw out slotted head plunger spring retainer and shake the coil spring out of pump body. *(NOTE* - If pump plunger will not shake out, hold pump body steady and rotate shaft until plunger is at high point of the cam. Pump body will now be free to slide off input shaft. DO NOT force pump body off shaft).

9) Remove bushing from body by pushing it out in direction of the staking tang. *(NOTE* - The small ball at foot of pump is staked in place and serves only to seal the drilled passageway). Remove the large ball bearing on input shaft using Puller, HM-925; Plate, J-1298; Collets, J-1298-3; and Centering Button, J-6686. Remove the ball driver by removing the five centering screws.

► *SOLENOID REGULATOR NOTE:* This unit must not be disassembled. If faulty, replace the unit.

REASSEMBLY: *CAUTION–A clean area for assembly is important. All parts must be thoroughly cleaned and well oiled. Lint and dust must be held to absolute minimum when assembling internal drive parts.*

1) Place a race pin in recess in side of ball race housing, then place a ball race in position in scroll housing. Ball race should be a light tap fit with a plastic hammer. Make sure that race is bottomed in scroll housing. Before installing output shaft, check to see that rings are in the first and third grooves of the shaft, and that chamfer on top ring is toward impeller end of shaft. Turn seal rings on output end of shaft so that gaps are 180° apart, and insert the shaft (dowel pins down) into center opening of scroll housing. Angle the shaft slightly away from gap in each ring as shaft moves down, and straighten it to vertical as top ring slides into place inside the bore. *(NOTE* - A slight taper is provided in face of the opening to compress rings as output shaft seats.

2) Place five drive balls around output shaft, then push down gently on one at a time to seat each in its proper place on the ball race. *(CAUTION - Balls are furnished in matched sets. Never install less than a complete set).* Place another race pin in recess in side of race load assembly and install the remaining race. Place race load assembly into position, ball race down, over the drive balls.

3) Install ball retainer or driver, on end of input shaft and tighten retaining screws to 30 inch-pounds, minimum. Using Tool J-6688, press the large ball bearing onto output shaft until it is seated against the shoulder *(NOTE - Lettering on bearing should face away from oil pump).*

4) Slide oil pump, with bushing insert onto the shaft. When installing the pump body, make sure the pump is not upside down before installing the outer ball bearing. *(NOTE* - When pump is correctly installed, the bore in pump body will align with camway ground on input shaft). Using Tool J-6688, press small bearing into place on shaft with the letters up away from oil pump.

5) Install oil pump plunger (spring opening toward the plug), plunger spring, and the pump plug in oil pump body, and secure the screen to end of pump body with the retainer. Install inner air piston ring on boss of bearing housing, and lock ends of ring together. Press input shaft seal into position inside bearing housing with the lips of the seal facing rearward or toward impeller.

6) Install "O" rings (two required) in the inside and outside grooves of housing shoulder (do not install ring in center groove). Lightly oil the two small "O" rings and install them in channels within regulator well. Oil the sides of solenoid regulator and push it down past the two "O" rings until it is firmly seated. Install outer air piston spring in nose section of bearing housing, then slide air piston into place. Oil liberally, then push in on the piston, depressing the spring, and install rear retaining ring on inside of the air chamber.

7) Install dust shield, and retain in place with the outer retainer ring. Fill bore of oil pump (through the screen), using Automatic Transmission Fluid Type A, and then rotate output shaft while holding pump body until oil can be seen pulsating just under the screen. Install input shaft assembly in bearing housing, then place shaft sealing spacer over pulley end of input shaft and push it down into position in shaft seal.

8) Lubricate all moving parts with Automatic Transmission Fluid Type "A". Install bearing housing onto scroll housing, aligning the marks made at disassembly. Secure in place with capscrews, lockwashers, and flat washers. Tighten capscrews evenly to 100 inch-pounds. Press the thrust bearing onto rear of sliding flange of pulley, then insert special washer into rear of the front (fixed) flange of pulley, with chamfered inner edge of special washer facing rear of pulley flange. Press splined pulley hub into place in front (fixed) flange of pulley. Position sliding flange of pulley on the splined hub. *(NOTE* - Sliding flange should fit splines closely but slide easily). Slide key into shaft keyway, then push pulley assembly down into position on end of output shaft and secure with retainer, lockwasher, and screw. Tighten screw to 200 inch-pounds, using a rubber hose or belt to hold pulley assembly.

9) Place retaining spring on top of solenoid regulator and install supercharger medallion. *(NOTE* - The retaining spring must be in place as it serves to ground the solenoid case to supercharger). Wipe face of diffuser, then measure depth of face of output shaft below face of diffuser. This measurement should be .015". Select shims .050" thick and assemble impeller and shims to boss of output shaft. Secure with a flat washer, lockwasher, and capscrew. Tighten to 200 inch-pounds, using Impeller Holding Tool, J-6684. Check clearance between impeller and diffuser at several points around the impeller using a feeler gauge. The allowable clearance is .046-.051". If not within these limits, add or remove shims as necessary. Assemble scroll cover and gasket to housing and tighten retaining screws securely.

AUTO-LITE 12-VOLT REGULATORS

►CHANGES & CAUTIONS

►*GENERATOR REPOLARIZING* Whenever regulator or generator leads are disconnected for ANY reason the generator must be repolarized as follows After generator and regulator leads are reconnected, connect jumper wire between "GEN" and "BAT terminals momentarily to allow a quick current surge through generator windings. This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of contact relay points).

►*NORMALIZING THE REGULATOR*· Before checking regulator, bring it up to normal operating temperature as follows Operate generator at speed of 1500 RPM, adjust charging rate to 10 amperes (connect .25 ohm resistor in charging line or use variable resistance connected across battery). Continue operation for 15 minutes to "normalize" the regulator or bring it up to operating temperature (temperature can be checked by placing an accurate thermometer 2" from cover).

►*VRX 6201A REGULATOR PRODUCTION CHANGE*· Two resistors were used on early regulators and three resistors were used on later regulators. *See Resistor Table and Wiring Diagram below for differences.*

DESCRIPTION: These regulators are similar in design to previous types except for use of a third "R3" resistor on some models.

CHECKING & ADJUSTING: *See "Auto-Lite 12 Volt Regulators" in 1956 Annual Data and note the following:*

V ltage Setting: After regulator normalized (see above), and with generator charging at 10 amps, note voltmeter reading and regulator temperature. If voltage setting not within range shown in Voltage Regulator Setting specifications below, adjust regulator. *See "Auto-Lite 12 Volt Regulators" in 1956 Annual Data.*

AUTO-LITE 12-VOLT REGULATOR WIRING DIAGRAM

Current Setting: Normalize regulator (see above). Current regulator setting should then agree with "Test A" specifications in Current Regulator Setting table below. For "Test B", operate generator at 2000 RPM, and add sufficient load to cause current regulator to operate (turn on lights and accessories, add additional load such as a lamp bank or carbon pile, or use a variable resistance across battery) with voltage of 13.7-13.9 volts (VAT Regulators), 13 6-13.8 volts (VRX Regulators). Continue operation for 15 minutes to normalize the current regulator by bringing it up to operating temperature (temperature can be checked by placing an accurate thermometer 2" from regulator cover). At end of the total 30 minute operation, current setting should agree with "Test B" specifications in Current Regulator Setting table below. If charging rate not within range shown in "Test B" column, adjust current regulator. *See "Auto-Lite 12 Volt Regulators" in 1956 Annual Data.*

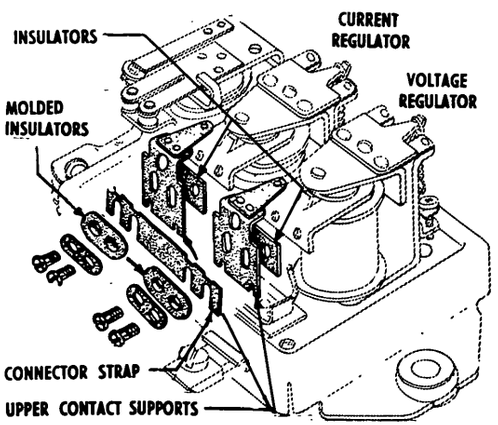
① - 3 Resistor Regulator. "R3" resistor marked "30", resistance is 28-34.5 ohms.
② - "R1" resistor on early production regulators were marked "80", later production marked "60".

CHECKING RESISTANCES OF 3 RESISTOR REGULATORS (With ut disc nn cting resistors and coil): Block cut-out relay and voltage regulator contacts open, then proceed as follows:

1) Connect ohmmeter between "F" terminal and current regulator yoke. The reading should be 34.5-42 ohms (value of "R2" resistor). Any other reading indicates that "R2" is defective.

2) Connect ohmmeter between "A" terminal and ground. A reading of **24.8-28.3** (All VAT models and VRX 6010A, 6011A, 6201B models) **22.7-26.2** (VRX 6011B, 6201A models) indicates "R1", "R3", Cutout Relay and Current Regulator resistances are within specifications. If reading is 31-35 ohms, either "R1" or "R3" is open. If reading is **32.2-37 ohms** (All VAT models and VRX 6010A, 6011A, 6201B models), **28.8-33.4 ohms** (VRX 6011B, 6201A models), the Cutout Relay winding is open. If reading is **57.2-66.7** (All VAT models and VRX 6010A, 6011A, 6201B models), **47.2-56.0** (VRX 6011B, 6201A models), the Voltage Regulator winding is open.

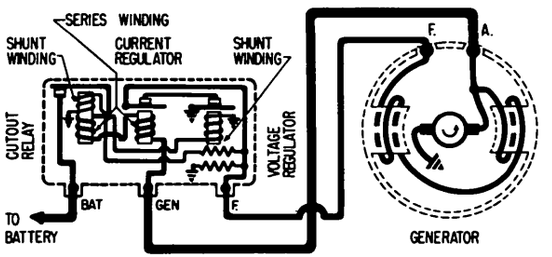
3) If the above checks indicate that either "R1" or "R3" is open, proceed as follows: Ground the "A" terminal and connect ohmmeter between "F" terminal and ground. A reading of 28-34.5 (all models), indicates that "R1" is open. A reading of 95-115 (all models) indicates that "R3" is open.



DELCO-REMY 12-VOLT REGULATORS "1119000 SERIES"

► *ADJUSTMENT CAUTION:* When checking Current Regulator on 1119000 Series Regulators, DO NOT use the "Quick Check Method" outlined for previous 1118825 Series Regulators. Using a screwdriver inserted in hole in regulator base to short out Voltage Regulator will short out BOTH the Voltage and Current Regulators and allow generator to operate without control.

► *GENERATOR REPOLARIZING:* Whenever regulator or generator leads are disconnected for ANY reason, the generator must be repolarized as follows: After generator and regulator leads are reconnected, connect jumper lead between regulator "GEN" and "BAT" terminals momentarily to allow a quick current surge through generator windings. This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of contac relay points).



► *NORMALIZING THE REGULATOR:* Before checking voltage setting, bring regulator to operating temperature as follows: Connect ¼ ohm resistance in series with battery, then with regulator cover in place, operate regulator for 15 minutes continuously with no other load than ignition. *(NOTE* - If variable resistor used in place of ¼ ohm resistor, set resistor for 1-10 ampere charging rate).

► *AMBIENT TEMPERATURE NOTE:* "Ambient Temperature" is the temperature of the air surrounding the regulator approximately ¼" from the regulator cover when the regulator is at operating temperature ("Normalizing" procedure as given above should result in an ambient temperature of 125°F.) and can be measured by placing a thermometer ¼" from the regulator cover. For ambient temperatures other than 125°F., see "Voltage Setting Range" table below.

DELCO-REMY 12-VOLT RE ULATORS CONTACT ASSEMBLY

DESCRIPTION: These regulators differ from preceeding "1118825" and "1118900" series **without Letter "B" following the model number** in that the direction of current flow through the Current Regulator contacts has been reversed (see Wiring Diagram and Contact Mounting illustration).

DELCO-REMY 12-VOLT REGULATORS WIRING DIAGRAM

CHECKING & ADJUSTING: *See "Delco-Remy 12 Volt Regulators" in 1956 Annual Data and note the following:*

Ambient Temp.	Voltage Setting Range (For "Normal" settings of 13.8-14.8 volts)					
165°	13.2	13.4	13.6	13.8	14.0	14.2
145°	13.5	13.7	13.9	14.1	14.3	14.5
125°	13.8	14.0	14.2	14.4	14.6	14.8
105°	14.1	14.3	14.5	14.7	14.9	15.1
85°	14.4	14.6	14.8	15.0	15.2	15.4
65°	14.7	14.9	15.1	15.3	15.5	15.7
45°	15.0	15.2	15.4	15.6	15.8	16.0

►CAUTIONS

►*REGULATOR CAUTION: When testing generator and this type regulator, observe the following precautions:*

1) *DO NOT GROUND GENERATOR FIELD WITH REGULATOR CONNECTED TO GENERATOR* - This will cause Lower Set of contacts in Voltage Regulator to burn up immediately.

2) *DO NOT FILE REGULATOR CONTACTS* - All contacts of the Double Contact Voltage Regulator are soft alloy and should be cleaned with crocus cloth or other fine abrasive and washed with carbon tetra-chloride.

DESCRIPTION: These regulators differ from other "1119000 Series" regulators in that a special "Double Contact" Voltage Regulator unit is used. Cutout Relay and Current Regulator units are same as units used in other 1119000 series regulators.

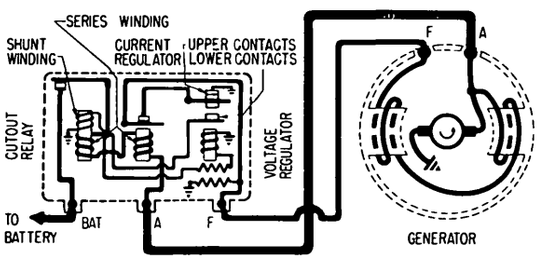
OPERATION: The Double Contact Voltage Regulator has an additional set of "Lower Contacts" connected directly across the generator field (in addition to the regular "Upper Contacts") and the regulating resistor is of lower value than on other type regulators. Regulator operates either on Upper Contacts or Lower Contacts, depending on load and battery requirements, as follows:

Upper Contact Operation (Low Speed & High Load - High Generator Field requirement) - Regulator armature travel opens and closes upper contacts (vibrating action) cutting the regulating resistance in and out of the field circuit. This operation is the same as on other voltage regulators with single set of contacts.

Lower Contact Operation (High Speed & Low Load - Low Generator Field requirement) - Under these conditions, upper contact operation is not sufficient to control generator voltage. Regulator armature travel opens and closes lower contacts (vibrating action), shorting the field out (contacts closed) or cutting the regulating resistance in the field circuit (contacts open). This provides additional regulation.

CHECKING & ADJUSTMENT: *See Regulator Caution above.* Cutout Relay and Current Regulator are checked and adjusted in same manner as on other 1119000 Series Regulators. *See "Delco-Remy 12-Volt Regulators" in 1956 Annual Data.*

Voltage Regulator (Double Contact Type): Battery should be fully charged so that charging rate limited to 1-10 amperes (If charging rate above 10 amperes, connect ¼ Ohm resistor in series with battery). Connect voltmeter from regulator "BAT" terminal to ground. Connect a 25 Ohm (25 watt) variable resistance in generator field circuit (between regulator "F" terminal and field lead normally connected to this terminal). *CAUTION* - Resistor should have an "open" position at the full resistance end to assist in cycling the generator.



Operation on Lower Contacts - Turn the field resistance completely out and operate generator at medium speed. Regulator should then operate on lower set of contacts. Continue operation for 15 minutes to bring regulator up to operating temperature, cycle generator by turning variable resistance to "open" position momentarily, then slowly cut all resistance out. Note voltmeter reading. This is the regulator setting on LOWER CONTACTS (see table below). Adjust in usual manner by turning double-slotted screw on armature spring lower bracket.

Operation on Upper Contacts - After checking operation on Lower Contacts (above), slowly increase field resistance until regulator begins to operate on upper set of contacts (voltmeter should indicate a slight voltage drop at this point). Voltmeter reading should be .3 to .5 volts below lower contact operation setting for all models. Adjust by turning air gap adjusting screw located on top of armature (turn screw clockwise to increase voltage differential, counter-clockwise to decrease voltage differential). *NOTE* - This adjustment will affect Voltage Setting on lower contact operation and entire checking procedure should be repeated.

►*ADJUSTMENT CAUTION:* If voltage setting on Upper Contacts is ever found to be HIGHER than voltage setting on Lower Contacts, it must be reduced by turning the air gap adjusting screw in a clockwise direction, and if the adjustment is taken up, **the nominal air gap must be reset (see below).**

Regulator Specifications
Cutout Relay
(1119149, 57, 58, 63, 67, 75, 83, 86)

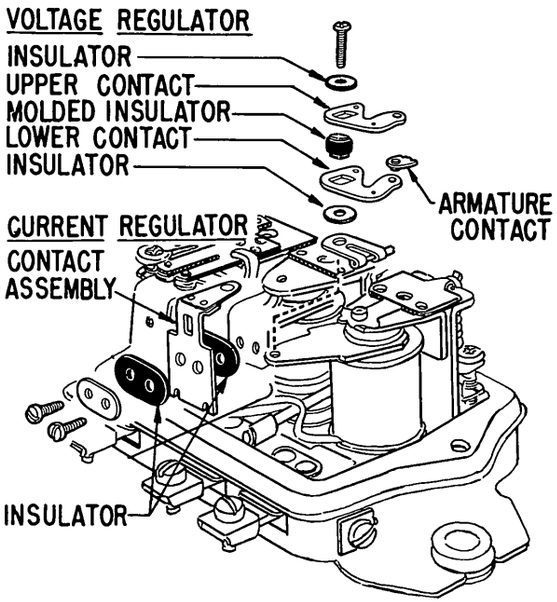
Closing Voltage - 11.8-13.5 volts.
Contact Gap - .020" (both sets).
Air Gap - .020" at center of core with contacts just closed.

DELCO-REMY REGULATOR
(DOUBLE CONTACT VOLTAGE REGULATOR)

Voltage Regulator
(1119149, 57, 58, 63, 67, 75, 83, 86)

Voltage Setting (Operating on Lower Contacts) - 14-14.6 volts with regulator at operating temperature.

Voltage Setting (Operating on Upper Contacts) - .3 to .5 volts below operating voltage on lower contacts.



Air Gap - .080" with upper contacts just touching. When adjusting air gap, first turn air gap adjusting screw all the way in a clockwise direction (*NOTE* - this is the adjusting screw for voltage setting when operating on upper contacts), then bend upper contact support for correct air gap.

Contact Gap (Upper Set of Contacts) - .016" with armature pressed down to point where lower contacts just touching. Adjust by bending lower contact support.

Current Regulator
Current Setting Rang

Regulator	Amperes	Regulator	Amperes
1119149	43-47	1119167	48-52
1119157	48-52	1119175	53-57
1119158	33-37	1119183	33-37
1119163	37-42	1119186	43-47

Air Gap - .075" with armature pressed down to point where contacts just touching.

DELCO-REMY REGULATOR CONTACT ASSEMBLY
(DOUBLE CONTACT VOLTAGE REGULATOR)

FORD, LINCOLN, MERCURY 12-VOLT REGULATORS

►CAUTIONS

►*GENERATOR POLARIZING: (NOTE* - Polarization is not necessary except when generator has been rebuilt or if new pole shoes have been installed). To polarize a generator on the car, disconnect the field wire and the battery wire from the regulator and momentarily connect the two wires together (engine not running). *CAUTION - Do not polarize generator by any method that applies battery voltage to field terminal of regulator.*

►*NORMALIZING THE REGULATOR:* **On the Car**—Clip special thermometer T56L-10505-A on regulator cover (see Note below). Operate engine with generator charging at 10 ampere rate for 30 minutes or until regulator temperature is stabilized.

On the Bench—Procedure is same as on the car except that a small fan should be mounted 12-15" from the regulator so as to circulate air over the regulator cover while it is being warmed up.

Thermometer T56L-10505-A Note—This thermometer is calibrated in 10° F. increments and has additional Voltage scales indicating the correct voltage regulator setting for each temperature reading (both 6 volt and 12 volt scales provided).

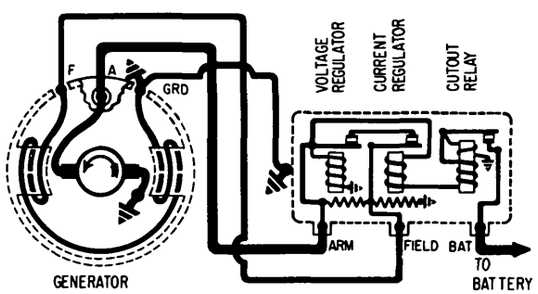
►*AMBIENT TEMPERATURE NOTE:* Ambient temperature is the temperature taken adjacent to the regulator, using Thermometer T56L-10505-A.

DESCRIPTION: These 12 volt regulators are the same design as previous 12 volt units.

CHECKING & ADJUSTMENT: *CAUTION*—Regulators are temperature-compensated and must be brought up to normal operating temperature before checks are made. This normal temperature is that existing adjacent to the regulator cover after 1/2 hour of operation in the car or after the regulator has been heated until the temperature is stabilized (standard normal temperature is 70-80° F.

►*TEST METER CONNECTIONS:* If special Test Sets used, make all connections in accordance with manufacturer's instructions. If individual meters used, make connections as follows: Connect test ammeter and 1-1/2 ohm fixed resistor in series in charging line at regulator "BAT" terminal (in series with battery). Connect voltmeter between regulator "ARM" terminal and ground (regulator base or battery grounded terminal). Connect a 50 ohm variable field rheostat (2 amp. rating) in generator field circuit (disconnect field lead at regulator "FIELD" terminal, connect rheostat between this lead and regulator "FIELD" terminal).

CUTOUT RELAY



Cut-in (Closing) Voltage: After regulator normalized and with test meters connected (see above), check cut-in voltage by either of the following methods: **(1)**—With resistance turned out of field circuit, slowly increase generator speed and note voltmeter reading at instant relay contacts close (pointer will drop back slightly). Repeat this check several times by decreasing generator speed until contacts open and then increasing speed until contacts close. If closing voltage not correct as shown in setting table below, adjustment is required. **(2)**—With field resistance completely turned in the field circuit, operate generator at 1500 RPM., slowly turn resistance out of field circuit and note voltmeter reading when relay contacts close (pointer will drop back slightly). Repeat this check several times by turning resistance in and out of field circuit.

Adjustment—Bend adjusting arm under armature spring (to left of relay contacts) upward to increase cut-in voltage, or downward to decrease cut-in voltage. Replace regulator cover and recheck the setting.

Cut-in (Closing) Voltage Setting

30 Amp. Models - 12.0-12.8 volts.
40 Amp. Models - 12.0-12.5 volts.

Cut-out (Opening) Discharge Current: This can be checked after checking cut-in voltage by increasing generator speed (or turning out field resistance) until charging current is approximately 10 amperes, then slowly decrease generator speed (or turn in field resistance) until maximum **discharge** current indicated on ammeter (ammeter will return to zero as contacts open). Discharge current should be approximately 2-6 amperes.

FORD, LINCOLN, MERCURY 12-VOLT REGULATOR WIRING DIAGRAM

VOLTAGE REGULATOR

Voltage Setting: After Cutout Relay checked (above), cycle regulator by decreasing generator speed until cutout relay contacts open and then increase speed to 1500 RPM. Clip special thermometer on regulator cover to establish regulator ambient temperature and corresponding voltage setting (see Voltage Regulator Settings for various ambient temperatures below). Turn resistance completely out of field circuit (charging rate should be approximately 10 amperes). Note voltmeter reading. This is the voltage setting and should agree with setting listed below.

Adjustment—Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase voltage setting, or downward to decrease voltage setting. Replace regulator cover and recheck the setting after each adjustment.

Voltage Setting

All Models—14.6-15.4 volts with ambient air temperature of 70-80° F. *See table below.*

Ford Voltage Regulator Settings
(Ambient Temperature Correction)

Ambient Temp. (° F)	Std. 30 Amp. Reg. (Volts)	H.D. 40 Amp. Reg. (Volts)
25°	15.1-15.9	14.3-15.1
35°	15.0-15.8	14.3-15.2
45°	14.9-15.7	14.3-15.1
55°	14.8-15.6	14.3-15.0
65°	14.7-15.5	14.3-14.9
75°	14.6-15.4	14.2-14.9
85°	14.5-15.3	14.1-14.8
95°	14.3-15.1	14.1-14.7
105°	14.2-15.0	14.0-14.7
115°	14.1-14.9	14.0-14.6
125°	13.9-14.7	13.9-14.5
135°	13.8-14.6	13.8-14.4
145°	13.6-14.4	13.7-14.3

CURRENT REGULATOR

Current Setting: This check requires that a load be added, or that the generator voltage be dropped to approximately 13 volts, to cause current regulator to operate. It is recommended that a heavy duty variable resistance (carbon pile) be connected across the 1-1/2 ohm fixed resistor in the charging line (connect resistance from ammeter lead terminal of fixed resistor to ground—see Test Meter Connections above). After Voltage Regulator checked (above), and with all resistance turned out of the field circuit, operate generator at 1500 RPM (Ford), 2000 RPM (Continental, Lincoln, Mercury), decrease the resistance of the carbon pile resistance until voltage drops to approximately 13 volts and ammeter reading is at maximum. This ammeter reading is the current setting. If not correct (see table below), adjust as follows:

Adjustment—Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase current setting, or downward to decrease current setting. Replace regulator cover and recheck setting.

Current Setting

Std. 30 Amp. Regulator—28-32 amperes (all models).
H.D. 40 Amp. Regulator—38-42 amperes (all models).

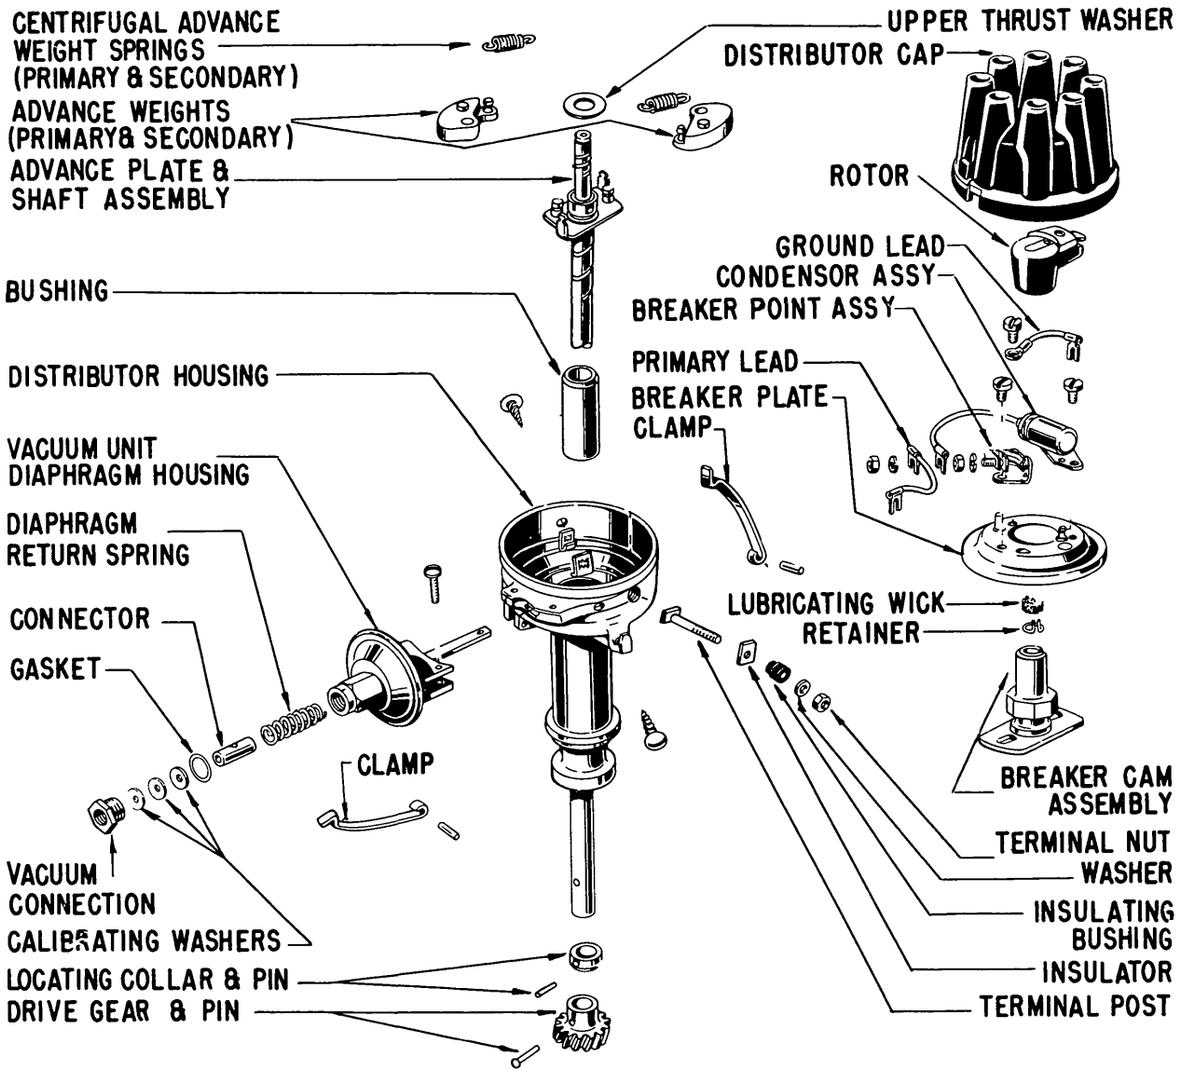
① - With Tachometer Drive attachment.
② - ECZ Engine. ③ - ECU Engine.
④ - Early production. ⑤ - Later production.

►*NOTE - Ford 6 cars and trucks, and Ford V8 trucks (except those listed above) have "Loadomatic" Distributors. See "Ford, Lincoln, Mercury Distributors" in 1956 Annual Data.*



►CHANGES, CAUTIONS, CORRECTIONS

►*1957 FORD 312" SUPERCHARGED ENGINE DISTRIBUTOR NOTE This distributor has "Double Breakers". Both sets of points must be adjusted to the same gap.*

►*1957 LINCOLN & CONTINENTAL DISTRIBUTOR PRIMARY WIRE PRODUCTION CHANGE.* A new primary wire with improved insulation, Part No. B7A-12216-B, having a shiny black vinyl covering, is used in production and should be used for service replacement to correct ignition failures caused by the former cloth covered wire.

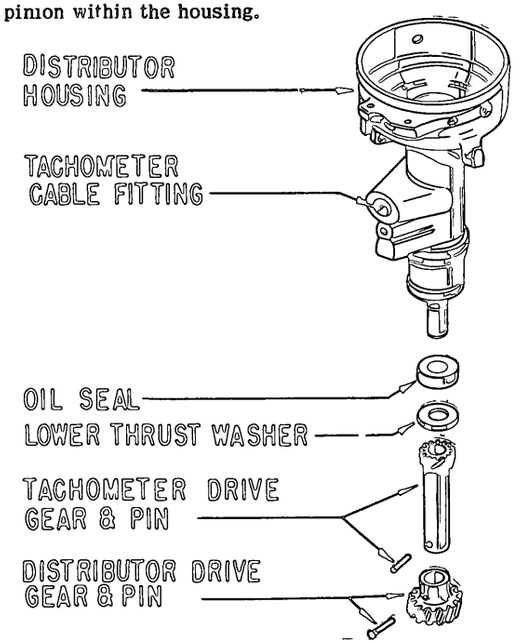
►*1957 MERCURY 368" ENGINE DISTRIBUTOR PRODUCTION CHANGE* Distributors, Part No. FEK-12127-E (Except Turnpike Cruiser), and FEL-12127-B (Turnpike Cruiser) replace the distributors used in early production. The later type distributors have different automatic and vacuum advance curves and different primary and secondary distributor weight springs. Early type distributors can be reworked for improved performance by installing new springs and adjusting the advance to later specifications. *See "Mercury FEK-12127-C and FEL-12127-A Distributor Rework for Improved P rformance" below.*

►*1957 MERCURY FEK-12127-C & FEL-12127-A DISTRIBUTOR REWORK FOR IMPROVED PERFORMANCE (NOTE - Before reworking these distributors check the automatic and vacuum advance characteristics to determine if they have been previously reworked).* Remove the early type primary spring, Part No. B7A-12192-A, and secondary spring, Part No. FEK-12191-A and install the new primary spring, Part No. FEL-12192-A-UP, and secondary spring, Part No. B7A-12191-B. Adjust distributor automatic and vacuum advance as indicated for "Late Production" cars. *See Mercury Car Model Pages for specifications.*

FORD, LINCOLN, MERCURY DISTRIBUTOR ASSEMBLY

DESCRIPTION: These distributors differ from previous designs in that a conventional centrifugal advance mechanism is used in conjunction with the vacuum spark control unit as described below. Some distributor models have a Tachometer drive mechanism built in the distributor.

Centrifugal Advance - Consists of two spring-loaded weights pivoted on a plate on the upper end of the distributor driveshaft. Drive pins on these weights engage slots in the base of the breaker cam subassembly so that the breaker cam is rotated by the movement of the weights. Weights move out against spring tension as distributor driveshaft RPM increases, rotating the breaker cam ahead of the driveshaft to advance the spark. With a decrease in driveshaft RPM, the springs pull the weights in and rotate the breaker cam in the opposite direction to retard the spark. Springs are identical but are adjusted for unequal tension to provide primary and secondary advance. Primary spring (greater



CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY DISTRIBUTORS (Cont.)

tension) controls advance at lower engine speeds, secondary spring (less tension) controls advance at higher engine speeds. Spring tension is adjusted by bending the posts at the outer ends of the springs.

Vacuum Advance - Spring-loaded, single diaphragm type unit mounted on distributor housing and linked to breaker plate. Manifold vacuum pulls the diaphragm outward (against spring tension) and rotates the breaker plate against the direction of rotation to advance the spark. When manifold vacuum decreases, the spring returns the breaker plate to the normal position. *NOTE* - Vacuum port in carburetor is above closed-throttle position so that vacuum advance does not operate during closed-throttle idling.

Tachometer Drive - A drive gear and sleeve is pinned on the distributor shaft (replaces regular locating collar on shaft). A boss is provided on the side of the distributor housing for mounting of the tachometer driven pinion and cable assembly. The drive gear engages the pinion within the housing.

FORD, LINCOLN, MERCURY DISTRIBUTOR WITH TACHOMETER DRIVE ATTACHMENT

ADJUSTMENT: Breaker Gap, Cam Angle, Breaker Arm Spring Tension, Ignition Timing, Distributor Automatic & Vacuum Advance - *See individual Car Model pages for specifications.*

Automatic (Centrifugal) Advance: Mount distributor on test set indicating distributor RPM and degrees of advance. Operate distributor in direction of rotation (counter-clockwise), increase RPM until advance begins, then decrease RPM to point where no advance indicated and set advance scale at zero. Increase RPM to first point indicated in Automatic Advance table, check advance and RPM. If advance not correct at this speed, stop distributor and adjust PRIMARY spring (see Adjustment Note below). Recheck minimum advance point. Then increase RPM to point just below maximum advance. If advance not correct at this speed, stop distributor and adjust SECONDARY spring (see Adjustment Note below). Recheck advance throughout entire speed range (first while increasing RPM, and again while decreasing RPM). Readjust as necessary.

▷ *AUTOMATIC ADVANCE SPECIFICATION NOTE: See individual Car Model pages for specifications.*

▷ *PRIMARY & SECONDARY ADVANCE SPRING ADJUSTMENT NOTE:* Springs can be identified by turning distributor to point where advance spring directly under adjustment slot in breaker plate, engaging a wire hook in the spring, and moving spring up and down to check spring tension. Primary spring will have greater tension with distributor at rest (secondary spring will be slack or not under tension at this point). To adjust, insert screwdriver blade through the adjustment slot, bend spring bracket (stationary post on base plate) outward to increase tension and decrease advance or inward to decrease tension and increase advance.

Vacuum Advance: Vacuum unit should be checked for free operation and diaphragm leakage whenever engine is tuned up. Vacuum advance performance can also be checked and adjusted as directed below.

Free Operation - Manually rotate breaker plate in direction of rotation (counter-clockwise). Plate should turn without binding and return to original position when released. If binding indicated, remove plate and clean and lubricate it as required.

Vacuum Diaphragm Leakage - Use vacuum source on distributor test set, set vacuum to highest possible figure. Connect vacuum line to fitting on distributor vacuum unit. Vacuum gauge reading should not fall off. Lower vacuum reading indicates diaphragm leak and diaphragm assembly should be replaced.

Vacuum Advance Check & Adjustment - Mount distributor on test set. After centrifugal advance has been checked and adjusted, operate distributor at constant RPM to eliminate centrifugal advance variations (see Specifications). Connect vacuum line to distributor vacuum unit fitting, set vacuum at first figure in specification table, check advance. If advance not correct, change calibration washers located at outer end of spring under vacuum connection. Recheck vacuum advance throughout entire range (*CAUTION* - Keep distributor RPM constant, vary vacuum). If all points not within limits, incorrect spring tension or vacuum leaks in diaphragm chamber or lines is indicated.

▷ *VACUUM ADVANCE SPECIFICATION NOTE: See individual Car Model pages for specifications.*

▷ *VACUUM UNIT ADJUSTMENT NOTE:* Decrease number or thickness of calibration washers to increase vacuum advance, increase number or thickness of washers to decrease vacuum advance.

SERVICING: Breaker Point Replacement - Breaker Point Assembly consists of Mounting Bracket & Stationary Point Assembly, Breaker Arm, and Primary Lead and complete unit can be replaced without removing distributor from engine. To remove unit, disconnect primary and condenser lead, take out screws mounting unit on breaker plate. To install unit, connect primary and condenser leads to point assembly terminal, position unit on breaker plate, install and tighten hold-down screws (*CAUTION* - Ground lead terminal must be attached to screw at breaker arm pivot end of bracket).

Vacuum Advance Unit Removal & Installation - Remove spring clip securing diaphragm link to breaker plate, take out two screws mounting vacuum unit on distributor housing, remove vacuum unit by withdrawing link through slot in housing.

Breaker Plate Removal & Installation - After removing vacuum advance unit (above), remove nut, washer, and bushing from primary terminal screw, remove terminal screw and insulator from within housing. Remove two screws and retainers in housing which retain breaker plate assembly, then lift breaker plate assembly out.

OVERHAUL: Disassembly - Remove spring clip and disconnect diaphragm link at breaker plate. Disconnect and remove diaphragm assembly from distributor base. Remove primary terminal screw, bushing, and insulator. Remove breaker point assembly and condenser, then remove two screws and retainers securing breaker plate in housing and remove plate. Remove lubricating wick from cam assembly, cam assembly retainer, cam assembly, and upper thrust washer. Remove distributor weight springs. (*NOTE - Mark the secondary spring and bracket to which it is attached for identification at reassembly).* If gear and shaft are to be reused, mark both parts so pin holes can be aligned for reassembly. Remove driven gear roll pin, then remove gear. On cars with a tachometer attachment, align tachometer drive gear roll pin with holes in distributor base, then secure distributor in a vise and remove roll pin. If gear is to be reused, mark gear and shaft so holes may be aligned at reassembly. Using an arbor press, support the assembly so shaft is clear of support plate, then press shaft out of tachometer gear and housing. Remove gear and lower thrust washer, then using an arbor press (and a shaft smaller in diameter than the bushing outer diameter), press bushing and oil seal out of housing. On conventional distributors, remove shaft collar roll pin, then press shaft out of collar and housing and remove distributor shaft bushing in same manner as for distributors with tachometer drive.

Inspection: Inspect all parts for damage or wear and replace as necessary. Check distributor shaft for wear at the bushing. Minimum allowable shaft diameter is .4675". Maximum allowable inside diameter of bushing is .4690". Clean all parts before reassembly.

Reassembly: Install new bushing, then with an arbor press and Bushing Installer, Tool T57L-12120-A or equivalent, press bushing into housing until installer tool bottoms against distributor base which correctly positions the bushing. Burnish bushing to proper size with Tool 12132. On distributors with tachometer drive, install a new oil seal. (*NOTE - If a new shaft is being installed, see "New Shaft & Gear Installation" below).* On distributors with tachometer drive,

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY DISTRIBUTORS (Cont.)

when the old gear and shaft are to be installed, install lower thrust washer, then install tachometer drive gear on shaft. Press gear into place until it bottoms on thrust washer. Align holes in gear, shaft and housing and install a new roll pin. On conventional distributors, place collar in position on shaft, then align holes in collar and shaft and install a new roll pin. Check shaft endplay with a feeler gauge placed between automatic advance stop plate and top of bushing. If endplay is not within limits of .022-.030", replace the shaft. On all distributors, press drive gear on shaft, using the marks made on gear and shaft at disassembly, to align the pin holes. Check gear location which should be 4.991-4.996" between bottom face of gear and bottom face of distributor mounting pad with gear pushed toward distributor base so there is no endplay. Install roll pin. *(NOTE* - Shaft and gear must be replaced as an assembly. Do not replace one part without replacing the other). Install weights and springs making sure that secondary spring marked at disassembly is replaced in the proper location. Fill groove of weight pivot pin with ball bearing lubricant. Lubricate inside of cam assembly with ball bearing lubricant, then install thrust washer, cam, and spring retainer. Lightly oil cam lobes, then saturate wick with SAE 10 engine oil and install wick in cam assembly. Lubricate breaker plate bearings and install breaker plate. Install condenser, breaker points and plate retainers. Be sure ground wire lug is attached to breaker plate attaching screw. Install primary wire and insulator on terminal screw and install bushing and screw in distributor base. Install diaphragm assembly. Align distributor points, adjust spring tension and point gap. Adjust automatic and vacuum advance.

Now Distributor Shaft & Gear Installation: Oil the shaft and slide it into distributor body. Attach Distributor Shaft Support, Tool T57L-12390-A (Detail 1) or equivalent, to distributor and place distributor in Holding Fixture, Tool T52T-12132-DJD or equivalent, and place assembly in press. Insert a .022" feeler gauge between automatic advance stop plate and top of bushing. Tighten backing screw on support tool enough to remove all shaft endplay. On distributors with tachometer drive, install lower thrust washer, then install tachometer drive gear on shaft and press it into position until it bottoms on thrust washer. Support shaft and align holes in shaft and distributor base, then drill a 1/8" hole through shaft using hole in drive gear as a pilot. Install roll pin. On conventional distributor, place collar in position and support the shaft. Hold collar against distributor housing and drill a 1/8" hole through shaft, using hole in collar as a pilot. On all distributors(support tool .022" feeler gauge still installed), press drive gear into position using an arbor press. Drill a 1/8" hole through gear and shaft, using the hole in gear shoulder as a pilot, then install a new roll pin. Remove support tool and feeler gauge and complete distributor assembly as indicated above.

① - With separate Relay No. 1116921.
② - Eldorado Brougham has Automatic Starter Relay.

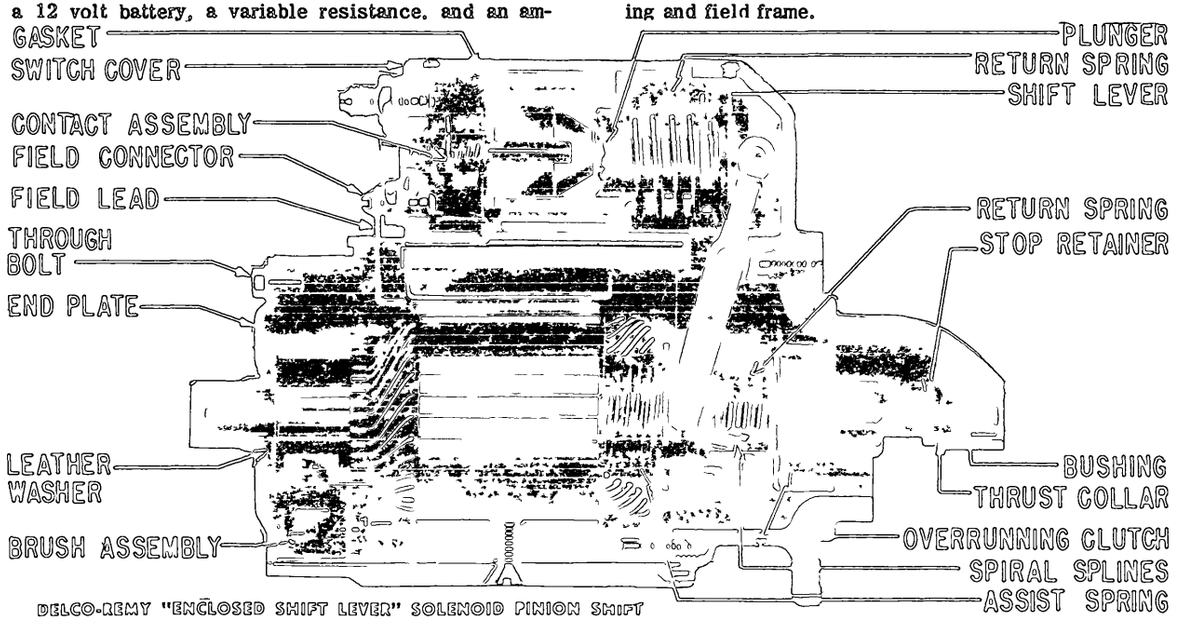
DESCRIPTION: "Enclosed Shift Lever" type combined starter switch and solenoid pinion shift operates in exactly the same manner as previous Delco-Remy "Solenoid Starter Switches (No Relay)". The solenoid has been redesigned for more efficient operation and the entire pinion shift lever mechanism has been enclosed in a housing which is integral with the drive housing and end plate. The starter is of the extruded frame type without any opening at the commutator end so that the entire starter and drive assembly is completely enclosed to protect it from dirt and splash. Drive pinion clearance is not adjustable.

TESTING & CHECKING: Solenoid Windings - With switch disconnected from starter motor, the two following current draw tests may be made.

Pull-In Windings (Both Windings in Parallel) - Remove screw from solenoid motor terminal and bend field leads slightly until clear of terminal. Ground solenoid motor terminal with a heavy jumper wire, then connect a 12 volt battery, a variable resistance, and an ammeter of 100 amperes capacity in series with solenoid "S" terminal. *(NOTE* - The "S" terminal is marked, and is located on engine side of motor field strap connector on front of solenoid). Connect a heavy jumper wire from solenoid base to ground post of battery, then connect a voltmeter between base of solenoid and solenoid "S" terminal. Slowly adjust resistance until voltmeter indicates 10 volts. Reading on ammeter should be as indicated in "Test Specifications" below.

Hold-In Winding - After completing above test, remove jumper wire from solenoid motor terminal and readjust the variable resistance until voltmeter reads 10 volts. Ammeter reading should be as indicated in "Test Specifications" below.

▷ *TESTING NOTE:* If solenoid does not test within specifications, replace the solenoid assembly.



Test Specifications

Pull-In Windings - 40-45 amperes at 10 volts with solenoid at room temperature.

Hold-In Winding - 10-12 amperes at 10 volts with solenoid at room temperature.

Pinion Clearance: *(NOTE - Pinion clearance cannot be adjusted. If not correct, motor must be disassembled and defective parts replaced).* To check clearance, connect a 6 volt battery between "S" terminal and ground. *(CAUTION* - Do not connect battery to "R" ignition coil terminal. To prevent motoring, connect a heavy jumper wire from solenoid motor terminal to ground). With the solenoid energized, push pinion away from stop retainer as far as it will go, then use a feeler gauge to check clearance between pinion and retainer. Clearance should be .010-.140"

▷ *SOLENOID INSTALLATION NOTE:* When installing solenoid, apply sealing compound on both sides of solenoid flange where it extends between drive housing and field frame.

DELCO-REMY "ENCLOSED SHIFT LEVER" SOLENOID PINION SHIFT

4-HEADLIGHT (QUADRI-LIGHT) SYSTEMS

Cadillac, Eldorado Brougham (1957)
Chrysler & Imperial, All Models (1957)
De Soto, All Models (1957)
Lincoln (1957)
Mercury, Turnpike Cruiser (1957)
Nash, Ambassador V8 (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*DE SOTO HEADLIGHT DOOR INTERFERENCE (First Cars):* Before re-installing door after aiming headlights, inspect inner side of door and make certain that lower slots in door flange provide clearance for ears on sealed beam mounting units. If necessary, lengthen slot (lower end of outer lamp slot, upper end of inner lamp slot) to completely clear the ears.

►*LINCOLN AUXILIARY HEADLIGHT WIRING MODIFICATION:* The headlight wiring system can be modified so that it will be IMPOSSIBLE to use the Headlights and Roadlamps (second set of Headlights) at the same time, wherever this is preferred or required by regulations. Proceed as follows: Disconnect lead wires on existing Auxiliary Over-ride Switch (on steering column), remove and discard switch. Install new switch, Part No. FDU-15224-C. Connect switch leads as follows: 1) Red Switch Lead with bullet terminal to Blue Lead in Wiring harness, 2) Tape Black Wire in harness (not used). 3) Route Yellow and Black Leads from switch along main wiring harness to Light Switch, 4) Disconnect Red-with-Yellow-Band Wire from Light Switch and connect new Yellow lead to this terminal, 5) Connect Black Lead to the Red-with-Yellow-Band Wire disconnected from the switch.

DESCRIPTION & OPERATION: The 4-Headlight systems on 1957 car models use new Sealed Beam units (see Lamp Bulb Data below). Conventional double filament headlights (Upper and Lower Beam) are supplemented by a second set of single filament headlights (Upper Beam only) mounted beside (toward center of car) or below the regular headlights. These additional headlights are connected directly to the upper beam lead of the regular headlights so that they are illuminated only when the upper beams are in use (except Lincoln - see Lincoln Wiring Note below). When the regular headlights are switched to lower beam the additional headlights go out, and the usual two-headlight pattern is presented to a passing car.

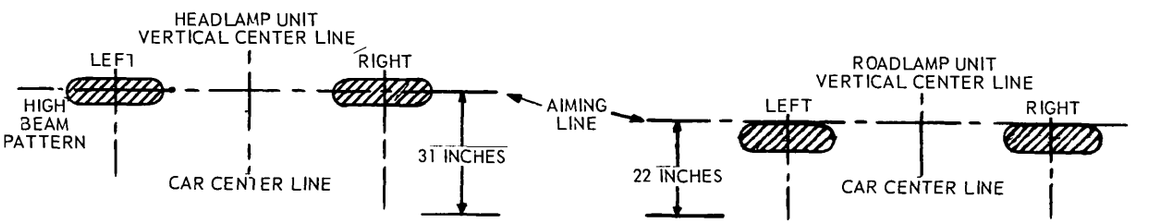
►*LINCOLN HEADLIGHT WIRING NOTE:* *See Wiring Modification (above).* The Auxiliary Headlights (additional headlights) are controlled by the main Lighting Switch and are lighted with the switch in the "Park" position (Parking & Tail Lights on, regular Headlights off) and also with the switch in the regular "On" position (Regular Headlights and Tail Lights on, Parking Lights off). The Auxiliary Headlights are not controlled by the Beam Selector Switch and do not go out when the regular headlights are switched to Lower Beam. However, an Auxiliary Over-ride Switch is provided (on right side of steering column) so that the Auxiliary Headlights can be switched off whenever they are not wanted.

Lamp Bulbs (All Models except Lincoln - see Lincoln Bulb Note below): New 5¾" Special Sealed Beam Units. Regular headlight units (double filament) are three-prong type, auxiliary headlight units (single filament) are two-prong type and units cannot be installed incorrectly. **Regular Headlight (Outer or Upper Unit)** - No. 4002 (50-37½ W). Numeral "2" is molded in top of lens. **Auxiliary Headlight (Inner or Lower Unit)** - No. 4001 (37½ W). Numeral "1" is molded in top of lens.

►*LINCOLN BULB NOTE:* This model does not use the new small bulb units. Regular headlights are Sealed Beam Unit, No. 5400 (50.40W), Roadlamps (second set of headlights) are Sealed Beam Unit, No. 4415 (35W - single filament).

HEADLIGHT AIMING & ADJUSTMENT: All headlights are aimed with reference to the lamp "Vertical Center-line" and it will be necessary to establish separate center-lines on the screen for outer and inner headlights (side-by-side mounting). Where upper and lower headlights are used, the same vertical center-line can be used for both. A "Horizontal Lamp Center-line" is also used together with the usual horizontal line 2" below lamp center height. Correct light patterns for each type headlight are shown in the illustrations.

Headlight Aiming Gauges - Sealed beam units have the usual pedestals or gauge points molded in the lens and T-3 or other Gauges can be used for headlight adjustment if the necessary adapters are used.



Headlight Aiming Tolerances - Tolerances are Plus or Minus 2" (vertical limits), Plus or Minus 6" (horizontal limits).

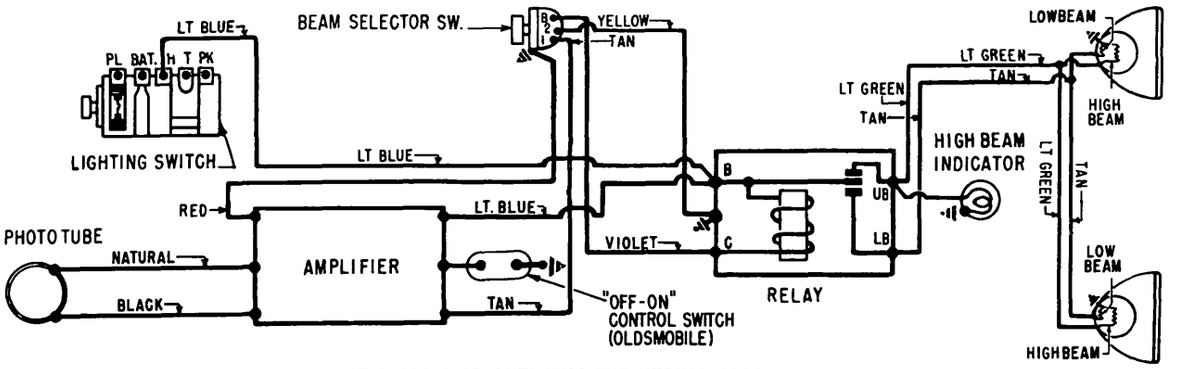
1957 MERCURY & NASH AMBASSADOR

4-HEADLIGHT AIMING CHARTS (ALL MODELS)

AUTRONIC EYE

Cadillac (1957)
Ch vrolet (1957)
Oldsmobile (1957)
P ntiac (1957)



DESCRIPTION: Similar in design and operation to previous models. A combination foot operated dimmer switch and Autronic Eye "over-control" switch is used which automatically controls the headlamps when switch is in the "high" beam position. The "low" beam position provides constant low beam operation. When the foot switch is in "high" beam, or automatic position, it can be used as an override switch to manually turn on the "high" beams by applying a slight downward pressure on top of switch. On Oldsmobile models, a separate "On-off" switch located in the headlamp switch, controls the Autronic Eye in addition to the dimmer switch. On all models, the dimmer switch must be in the "high" beam position before lights will operate automatically.

TESTING & ADJUSTING: *(CAUTION - The Autronic Eye unit develops 800 volts. Make sure the headlamps are OFF before removing cover from phototube unit).*

► *AIMING DEVICE AE-4 INSTALLATION NOTE:* Remove cover from phototube and install the aiming device in accordance with instructions enclosed with the unit. Adjust aiming dial on the Aiming Device to the number stamped on name plate at bottom side of phototube unit (number is a single digit located directly below the serial number).

V rtical Aiming Adjustment: Position car on a level floor (level within ¼" fore and aft of car), then rock car gently to equalize springs. Install Aiming Device AE-4 (see installation note above). Adjust phototube unit aiming screw with an Allen Wrench (screw is located on bottom of phototube unit at rear edge of pedestal), until bubble in aiming device is centered in level. *(NOTE* - If phototube unit is aimed too low, reflections from the car's own headlamps will cause them to be held on "low" beam. Also, the phototube unit must be aimed as low as possible to provide maximum tolerance for car loading).

H riz ntal Aiming Adjustment: Place two pieces of tape or chalk marks 24½" apart on a wall or screen at hood level height. With the car placed 25 feet from wall or screen, align centerline of hood with the right hand tape or chalk mark. Install Aiming Device AE-4, then aim over sights to left hand tape. If phototube unit is aimed more than 4" to right or left of left hand tape, reset phototube by loosening mounting stud nut under instrument panel. If necessary, one of the mounting holes in instrument panel may be elongated.

TYPICAL 1957 AUTRONIC EYE WIRING DIAGRAM

Hold Sensitivity Test: Install Aiming Device AE-4 (see above), then turn headlamps ON and **wait at least four minutes** for amplifier to stabilize. *(NOTE - On Oldsmobile, it will also be necessary to turn Autronic Eye switch ON).* Set foot dimmer switch to "high" beam which also places Autronic Eye in automatic position. Turn "zero corrector" on face of meter until meter pointer is on zero set line. Turn "intensity rheostat" of tester counterclockwise, then insert tester connector into cigar lighter receptacle. Operate engine at fast idle while making sensitivity tests and adjustments. Turn "tester selector switch" to DIM position (be sure to use proper DIM position for clear or tinted windshields). Turn "intensity rheostat" all the way clockwise to end of adjustment to obtain a lower beam. Turn "test selector switch" to HOLD position. Slowly turn "intensity rheostat" counterclockwise just to point where headlamps switch to "high" beam. Meter pointer should now read in the "hold sensitivity adjustment bar" on the meter scale. If not within this range, adjust as follows:

Adjustment - *(NOTE - Both the HOLD and DIM adjustment controls are located on the underside of the amplifier unit and each is identified by a stamp on the amplifier cover. THE HOLD SENSITIVITY ADJUSTMENT MUST BE CORRECTLY MADE BEFORE ADJUSTING THE DIM SENSITIVITY.* Turn the HOLD adjustment clockwise to the end of its travel, then rotate "intensity rheostat" all the way clockwise. Turn selector momentarily to DIM position to switch lights to lower beam, then switch back to HOLD position. *(NOTE - If lights do not switch to lower beam, the DIM adjustment control must be turned clockwise to end of adjustment and then readjusted after HOLD adjustment is correct).* Adjust tester "intensity rheostat" until meter pointer is in center of "hold sensitivity bar". Turn the HOLD adjustment control (on amplifier) counterclockwise SLOWLY just to point where headlamps switch to upper beam. Rotate tester "intensity rheostat" clockwise to end of travel, then turn "selector switch" momentarily to DIM position and back to HOLD. (Headlamps should now be on lower beam). Recheck HOLD adjustment by turning "intensity rheostat" SLOWLY counterclockwise just to point where headlamps switch to upper beam. Meter pointer should now be aligned with the right hand edge of HOLD adjustment green bar if adjustment is correct. If not, repeat the above procedure.

Dim Sensitivity Test: Rotate tester "intensity rheostat" completely counterclockwise. Turn "selector switch" to DIM position. Headlamps should now be on upper beam. Turn "intensity rheostat" SLOWLY clockwise, stopping at the exact point where the headlamps switch to lower beam. Meter pointer should be within the "dim sensitivity adjustment" line. If not properly adjusted, proceed as follows:

Adjustment - *(NOTE - Do not mak this adjustm nt until after "Hold Sensitivity Adjustm nt" is mad).* Rotate DIM control fully counterclockwise. Momentarily turn tester OFF, then back to DIM position. Headlamps should now be on upper beam. Adjust "intensity rheostat" until meter pointer reads in the right hand edge of "dim sensitivity adjustment" line. SLOWLY rotate DIM control clockwise just to point where headlamps switch to lower beam. DO NOT GO BEYOND THIS SETTING. Turn tester "intensity rheostat" completely counterclockwise, then momentarily turn tester to OFF and back to DIM. Rotate tester "intensity rheostat" SLOWLY clockwise just to point where headlamps switch to lower beam. Meter will read within "dim sensitivity adjustment" line if adjustment is correct. If not, repeat the above adjustments. Remove tester, and Aiming Device AE-4. Replace lens, cover and screw.

1957 POWER BRAKES

FORD "BELLOWS TYPE"

Ford Pass. (Except Thunderbird) (1957)

DESCRIPTION: The "Pedal-Assist Power Unit" consists of an air-vacuum bellows and control valves, with vacuum supplied from engine intake manifold, and vacuum reserve tank. Unit is mounted on driver's side of dash panel and attached to brake power lever. Brake power lever is linked to brake pedal. Brake pedal position controls closing of air valve and opening of vacuum valve. Master cylinder is mounted on engine side of dash panel, and is operated by master cylinder pushrod directly connected to brake pedal. Eccentric adjustments regulate the action of the air valve and the length of the master cylinder pushrod.

OPERATION: Bellows chamber is open to atmospheric pressure when pedal in released position. As pedal is depressed, finger on pedal contacts air valve causing it to close at the same time opening the vacuum valve. Intake manifold vacuum (or reserve tank vacuum) moves air from bellows chamber. As pressure decreased, bellows contracts and exerts a force on the brake power lever, which is transmitted through the connecting link to the brake pedal and assists the operator in depressing the pedal. When pedal is held in a fixed applied position the assist pressure is held constant. Assist pressure is directly in proportion to pedal apply pressure. As pedal is released, air valve is opened by spring pressure, admitting atmospheric pressure to bellows chamber so bellows expands to normal position.

ADJUSTMENTS: Air Valve - Turn valve-adjusting eccentric until unit chatters when pedal is depressed, then turn eccentric until chatter disappears. (*CAUTION* - Do not turn eccentric more than necessary or "cut-in" will be excessively high). *NOTE* - If satisfactory adjustment of eccentric cannot be made, look for bent pedal trigger. Pedal trigger is bent when distance from back of trigger to front edge of hole in pedal is less or greater than .950"±.005". To correct, bend trigger or replace pedal. Tighten nut to 180-220 inch lbs.

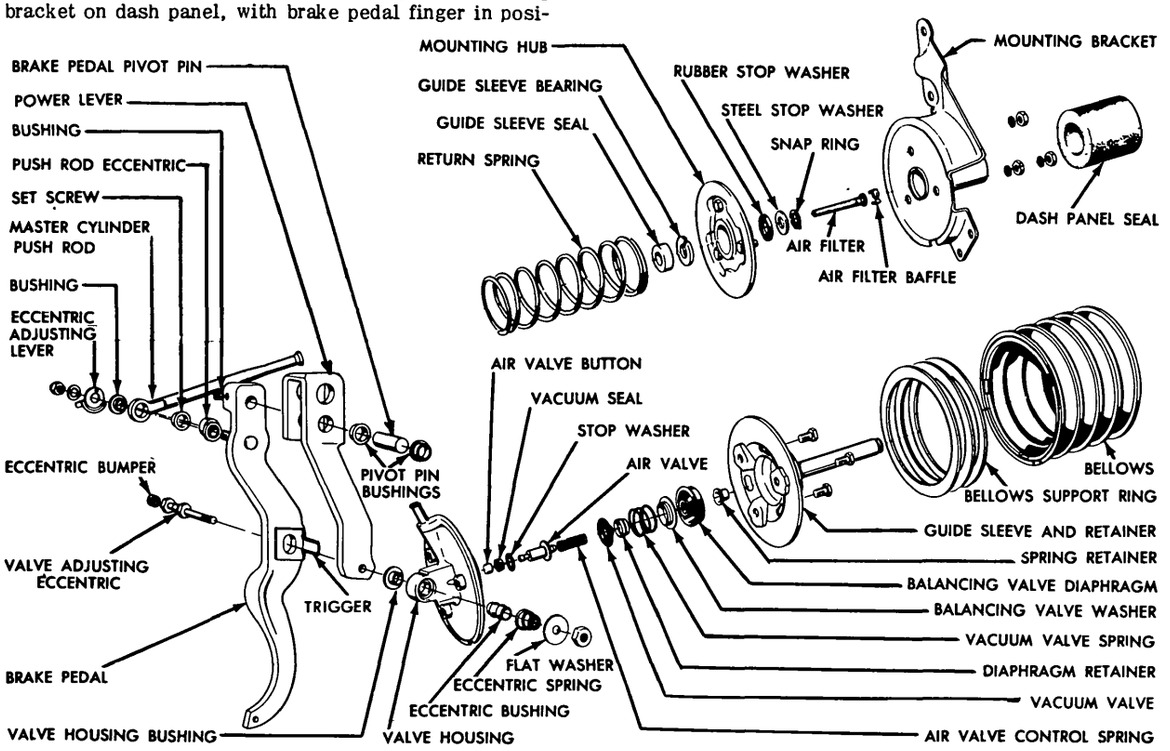
Master Cylinder Pushrod - Loosen pushrod eccentric locknut. Rotate eccentric clockwise to maximum to shorten pushrod so master cylinder piston will return to fully unapplied position. Rotate eccentric counterclockwise until master cylinder piston starts to resist movement of pushrod. Hold eccentric and tighten locknut to 180-220 inch lbs. Bubble or spurt at compensator port in master cylinder indicates pushrod properly adjusted.

REMOVAL: Power Unit - Remove vacuum hose from top of unit. Remove valve adjusting eccentric with flat washer, spring, and bushing. Remove nylon bushing from power unit valve housing. Remove two mounting bracket-to-dash panel screws and remove power unit from car.

Brake Pedal - (Cars with clutch pedal). Release clutch release assist spring tension at adjuster, remove spring, idler lever from clutch pedal lever. Remove clutch shaft retaining clip, spring washer, and flatwasher, clutch pedal and shaft from support bracket. **(Cars without clutch).** Remove brake pedal shaft, support

CONTINUED ON NEXT PAGE

FORD "BELLOWS TYPE" POWER BRAKE (C nt.)



brake pedal and power lever, and remove pedal bushing. Leave master cylinder pushrod attached to brake pedal. Pull master cylinder pushrod out of master cylinder boot. *NOTE* - Replace pedal pivot bushings as necessary. Remove pedal pivot pin set screw, drive out pivot pin, remove power lever. Lubricate new nylon bushings with silicone lubricant, reassemble power lever, install pivot pin and set screw, replace brake pedal and power lever in car.

DISASSEMBLY: Remove mounting bracket, push down and sideways and unhook air filter baffle from guide sleeve, remove baffle and filter. Remove snap ring, steel stop washer and rubber stop washer by pushing down on mounting hub and bellows. Hold down on mounting hub, remove bellows from hub, then remove mounting hub and return spring. Remove three retainer and guide assembly-to-valve-housing mounting screws, retainer and guide sleeve assembly and bellows from valve housing. Remove retainer and sleeve from bellows. Remove air valve control spring, valve balancing diaphragm, retainer, vacuum valve spring, vacuum valve and air valve.

INSPECTION: Wash all metal parts including air filter in alcohol or solvent which will not leave oil film, and dry all parts with moisture-free compressed air. Wash rubber parts in mild soap and water, rinse clean and dry with air. Replace worn or damaged parts, including valve housing if vacuum valve seat is damaged.

REASSEMBLY: Mount valve housing in vise with alignment marks visible. To install air and vacuum valves, reverse disassembly procedure after lubricating parts with silicone lubricant. *NOTE* - Retainer is installed on valve balancing diaphragm with small diameter toward the diaphragm, and the retainer and center diaphragm must be pressed down over the vacuum valve neck. Use three support rings when replacing bellows. Assemble bellows (either end) over retainer and guide sleeve assembly, with three bosses in retainer aligned with three slots in bellows. Place bellows and retainer over valve balancing diaphragm and in position on valve housing. Finger tighten three capscrews, then tighten to 85-115 inch pounds. *CAUTION* - Sight down guide sleeve to insure air valve control spring is seated squarely in retainer. Test air valve by pressing it in gradually and noting the increased spring tension from air valve spring to vacuum valve spring. Valve should snap back readily. Place return spring on guide sleeve, slide mounting hub on sleeve, hold down against return spring and assemble bellows over mounting hub. Hold mounting hub down, install rubber stop washer, steel stop washer over guide sleeve, then snap ring. Install air filter baffle on filter, filter and baffle in guide sleeve. Filter baffle fits in same groove with and above snap ring. Place mounting bracket on mounting hub, align notch in mounting bracket with tab on bellows, install lockwashers and nuts and tighten to 85-115 inch lbs. Install dash panel seal. Install nylon bushing in valve housing.

INSTALLATION: Pull brake pedal back until master cylinder pushrod hangs free. Position power mounting bracket on dash panel, with brake pedal finger in position against air valve button and tighten nuts and screws. Install valve-adjusting eccentric and bumper through brake pedal and valve housing of power unit. Slide eccentric bushing (either end) over valve-adjusting eccentric and into valve housing. Install eccentric spring with large coils toward housing, then flatwasher and nut. Tighten valve eccentric nut until eccentric bolt is firmly locked to power lever but can still be turned for adjustment. Adjust eccentric, see *Adjustments preceding.* Disconnect mounting bracket from dash. Pull power unit and pedal back toward car seat until master cylinder pushrod can be inserted in master cylinder boot. Reattach mounting bracket to dash panel. Adjust master cylinder pushrod, see *Adjustments preceding.*

FORD "BELLOWS" TYPE VACUUM POWER BRAKE ASSEMBLY

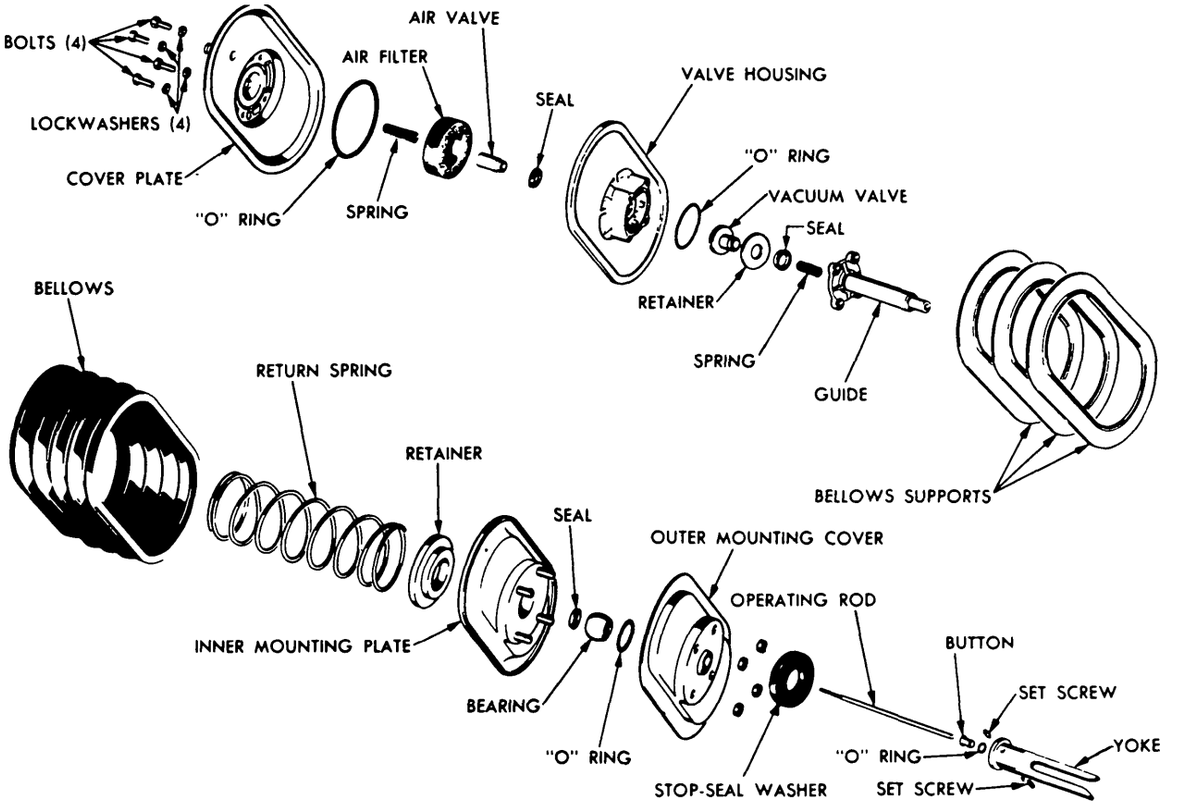
CHRYSLER, DE SOTO, PLYMOUTH "BELLOWS TYPE"

Chrysler & Imperial, All Models (1957)
DeSoto S-26 Adventurer (1957)
Plymouth, All Models (1957)

DESCRIPTION: This "Assist Type" power brake unit consists of an oval shaped air-vacuum bellows, control valve, and push rod. A control valve operating rod extends through the push rod and actuates the brake unit control valve. The unit is mounted on the engine side of the dash panel and is connected mechanically to the brake pedal linkage. A trigger arm on brake lever operates the control valve through the valve operating rod. In the event of power failure, normal manual brake action is assured as the brake pedal lever pin is free to slide in slot of power piston rod yoke when brake pedal is depressed.

OPERATION: Vacuum from the intake manifold is applied to unit, and air is evacuated from the air-vacuum bellows through the vacuum valve during brake application. When brakes are released, air (atmosphere) enters the unit through the built in air cleaner and is regulated by the air valve. The valve operating rod, which is controlled by the pedal, overcomes the spring pressure of the air valve and keeps atmospheric pressure inside the air-vacuum bellows. The return spring extends the bellows completely whenever brakes are not applied.

ADJUSTMENT & TROUBLE SHOOTING: *See "Power Brake Pedal Linkage Adjustment (following).*



REMOVAL: *(CAUTION – Before removing brake unit, place a wood wedge between brake power lever and the forward edge of triangular opening in brake pedal lever bracket to prevent trigger arm from extending through hole in dash panel which would cause damage to trigger arm).* Remove the nuts and lockwashers mounting unit to dash panel. Pull unit and mounting plate straight out and away from panel, using care not to lose the nylon bushings on pedal linkage pin which engage power unit yoke.

DISASSEMBLY: 1) Remove nuts attaching mounting plate to power unit and remove plate. Remove and discard "O" ring on mounting plate. With an Allan wrench loosen the two setscrews and remove yoke from power unit shaft. Discard the valve operating rod bottom seal.

2) Remove nuts attaching outer mounting plate. Using a screwdriver, gently pry up plate to loosen, and remove plate. Discard "O" ring seal. Compress bellows by hand sufficiently to remove the guide bearing. Remove and discard seal from inside bearing. Peel back outer lip of bearing completely around inner mounting plate (keep one hand on inner plate to keep it from snapping up). Remove plate and lift out return spring and retainer.

3) Place unit on its side and remove bolts and lockwashers attaching valve cover to valve. Lift off valve cover (if necessary, use a flat blade to separate cover plate from bellows flange). *(CAUTION – Use extrem care to avoid marking or scratching inner face of plate where it contacts bellows flange).* Remove "O" ring from valve cover and discard it. Remove air valve spring from center of valve, then remove the air filter. Slide air valve out of valve housing *(NOTE – It may be necessary to make a small hook from a paper clip to remove valve).*

4) Place valve housing end down on bench, then remove bellows from valve, by peeling back the outer lip of bellows. If a new bellows is to be installed, remove the three bellows supports. Remove bolts and lockwashers attaching guide to valve body. Lift out guide to expose vacuum valve, valve spring and seals. Discard seals. Remove vacuum valve and retainer and discard housing to guide seal. Invert valve housing and remove valve seal from its groove in valve body. *(CAUTION – If using a sharp instrument or pointed pliers, be very careful not to mark or scratch inside diameter bore of valve housing).*

"BELLOWS TYPE" POWER BRAKE ASSEMBLY

REASSEMBLY: Clean all parts except bearing, bellows, and filter and blow dry with air. Bellows may be cleaned with mild soap and water if necessary. Inspect all parts for damage and replace all defective parts. During reassembly, use new "O" and seal rings.

1) Insert a new air valve seal into bore of valve housing (lips of seal facing out when installed). Carefully position a new vacuum valve in retainer. Invert valve housing and install valve and retainer. Press down firmly on retainer to snap in place. Position a new valve housing to guide seal in groove provided. Install a new vacuum valve seal in bore of guide, with lips of seal toward bottom of bore.

2) Install the vacuum valve spring in center of valve (smallest). Position guide over vacuum valve, lining up bolt holes in guide with bolt holes in valve body. Carefully lower guide down against valve body, making sure that tapered portion of vacuum valve enters seal evenly. Press down on guide to seat, then install bolts and lockwashers. Tighten evenly and securely. *(CAUTION – Be sure that countersunk holes at end of guide line up with the long centerline of valve housing).*

3) If a new bellows is being installed, position the supports in bellows (bellows supports must be centered in the three center accordian folds and aligned with bellows and each other). Using holding fixture (made from a piece of four inch pipe) to support the guide and valve assembly, install the bellows. *(CAUTION – Be sure the arrows on edge of bellows and housing are aligned).*

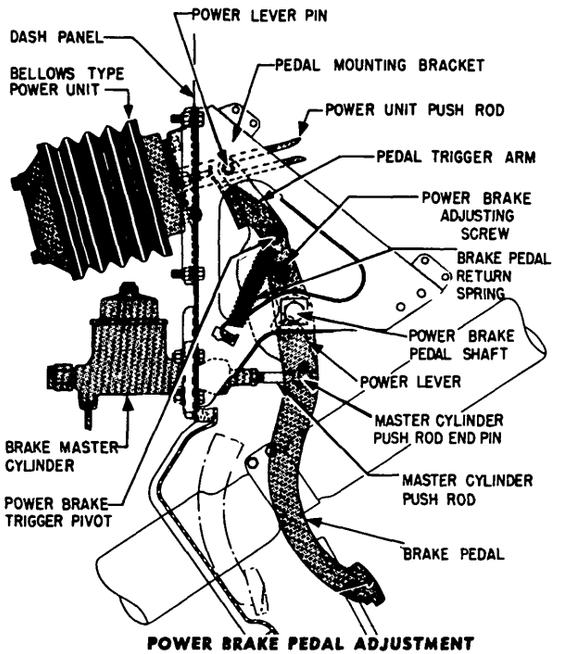
CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, PLYMOUTH "BELLOWS TYPE" POWER BRAKE (Cont.)

4) With the bellows in the holding fixture, lightly coat the outside surface of the air valve with silicone grease (do not use any other kind), then insert the **small end first** into bore of valve housing. Use finger pressure to test for free movement of valve against vacuum valve spring. Install air valve spring in recess in air valve and filter. Install a new valve housing cover "O" ring on shoulder of valve body hub. Position valve cover over housing, with notch in edge of cover matching arrow on bellows. Be sure that air valve spring nestles on dimple in center of cover. Press cover down evenly over valve housing to seat cover "O" ring. Install bolts and tighten securely.

5) Remove assembly from holding fixture and invert unit. Coat guide lightly with silicone grease, then install return spring. Position the spring evenly around hub of valve housing and guide. Place spring retainer and inner mounting plate over spring, being sure that arrow stamped on plate is in line with arrow on edge of bellows. Compress return spring, then fold edge of bellows over edge of plate so it fits evenly around plate.

6) Install a new guide bearing seal in groove inside bearing bore (seal must seat snugly in bearing). Using silicone grease, lubricate inside of bearing, then slide over guide while compressing bellows, (bearing must be installed with lip of seal facing out). Push bearing down over guide and into pocket of plate. Release bellows (bearing will ride up guide with plate into position. Install the bearing to mounting plate "O" ring, then lower outer mounting plate down onto assembly (the notch in edge of plate must be in line with arrows on bellows). Install nuts and draw down finger tight.



7) Slide a new valve operating rod seal ring over nylon bumper on end of rod and into groove, then install rod in center of guide. Press on end of guide to test for free operation of air and vacuum valves (a "two-step" movement should be felt when rod depressed and released fully). Place a new stop seal washer in position and install yoke on end of guide. Compress bellows slightly, then alternately tighten set screws (hub of yoke must be down snug against shoulder of guide, with the setscrews aligned with tapered holes in guide). Tighten mounting plate nuts securely. Place mounting bracket in position, with long center line of bracket at right angles to long centerline of power unit. The off set of the bracket must be so that when installed in car, the axis of the unit will be inclined down toward front of car. Install lockwashers, nuts and tighten securely.

INSTALLATION: Be sure that unit is so placed that its axis inclines down toward **front** of car and that vacuum inlet connection is toward engine. As the yoke passes through dash panel, be sure that it engages pedal linkage correctly by sliding over nylon bushings on power brake lever cross pin. Install mounting plate nuts and tighten securely.

CHRYSLER, DE SOTO, PLYMOUTH POWER BRAKE PEDAL ADJUSTMENT

ADJUSTMENT: Pedal Trigger –(*NOTE* – This adjustment is made with the brake pedal assembly removed from car). Install Gauge C-3508 (plastic material with scribed lines) over power lever pin, positioning center lines of gauge on center line of power brake lever. Position power brake adjusting screw so arrow on head of screw is pointing toward trigger pivot pin. Using a screwdriver, wedge the power brake pedal pivot to rear side of hole in power lever until the adjusting screw collar is compressed and metal to metal contact is made. With gauge installed and adjusting screw collar compressed, the outer curved surface of trigger arm must contact the inner circle scribed on gauge (distance between center line of power brake lever cross pin and outer curved surface of power brake pedal trigger arm must be .640" ± .005". If position of trigger arm not correct, adjust by turning power brake adjusting screw until trigger arm outer surface is aligned with inner circle of gauge. Tighten adjusting screw securely after correct adjustment made.

Arc of Trigger Arm - Install gauge, Tool C-3508 on power lever cross pin. With wedge removed and trigger arm-to-power brake lever cross dimension adjusted correctly, outer surface of trigger arm must contact outer circle of gauge within the angle scribed on gauge. NOTE - With pedal assembly clamped in vise, it will be necessary to move power lever (by hand) to locate trigger arm on outer circle of gauge. Carefully bend trigger arm to specifications or replace arm assembly. New trigger arm must be checked for correct arc.

POWER BRAKE PEDAL ADJUSTMENT

Pedal Free Play: Check adjustment as follows: Remove vacuum hose from power brake unit and press brake pedal several times to eliminate all vacuum in unit. Insert a screwdriver blade between rubber collar of power brake trigger pivot and rear side of elongated hole in power brake lever, forcing them apart (*NOTE – If brake pedal lever and power brake lever are not held apart, a false free play setting will be obtained).* Check the free play with linkage in this position by pushing lightly at pad end of brake pedal. Pedal free play should be between 1/16" & 1/8" (Dodge & Plymouth), 1/32" & 1/8" (Chrysler & DeSoto). Adjust as necessary by shortening or lengthening the master cylinder pushrod.

TROUBLE SHOOTING: If operation not satisfactory, correct by turning adjusting screw not more than 90° either way from original setting as follows:

Slow Pedal Release: Rotate adjusting screw counterclockwise.

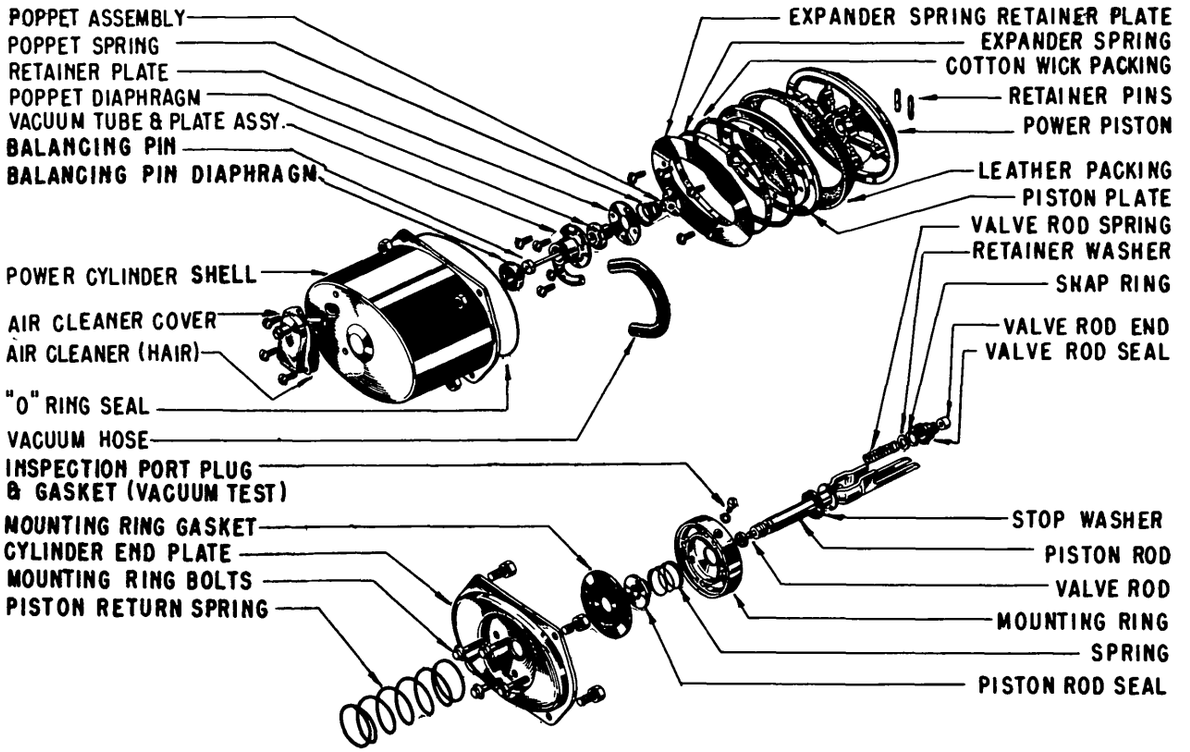
Time Delay During Fast Application: Rotate adjusting clockwise.

Pedal Vibrates (Unit Chatter): Rotate adjusting screw counterclockwise.

CAUTION - Adjusting screw should not be turned more than 90° from vertical (arrow up).

DE SOTO, DODGE "OVAL PISTON" TYPE

D Sot , All xc. S-26 Adventurer (1957)
D dg , All 6 & V8 Mod ls (1957)



DESCRIPTION: Consists of an oval-shaped air-vacuum unit mounted on engine side of dash panel and connected mechanically to the brake pedal linkage through the power unit pushrod. A yoke at end of piston rod is in contact with the power lever pin of the reactionary linkage. The valve operating rod is located at the center of the piston rod and is always in contact with a ramp at the upper end of the valve trigger arm of pedal linkage. A control valve operating rod moves within the piston rod to actuate the vacuum valve and poppet. Mechanical contact between power unit and brake linkage exists only when power unit is assisting in a brake application. If vacuum fails, brake pedal is free to act independently to apply brakes in conventional manner. A vacuum reservoir, with check valve, is provided for a vacuum reserve.

OPERATION: Vacuum from the intake manifold, through the vacuum reservoir, is applied to unit, and air is evacuated from the applied direction side of the piston through the vacuum valve during brake application. When brakes are released, air (atmosphere) enters the unit through the built-in air cleaner and is regulated by the air valve. The valve operating rod, which is controlled by the pedal, and piston, is forced away from applied direction side by a return spring when brakes are released, permitting air to enter both vacuum and atmospheric chambers. Atmospheric pressure remains on both sides of piston until brakes are reapplied.

ADJUSTMENTS: Pedal Linkage Adjustment - If pedal pressure releases slowly, adjust by rotating adjustment screw (accessible through slot in left side of brake pedal bracket) **count r-clockwise.** A time delay (noted during a fast brake application) can usually be corrected by turning screw **cl ckwise.** Should pedal vibrate (booster chatter) turn screw in **counter-clockwise** direction. *NOTE* - Rotation of adjustment screw should be limited to plus or minus 90° from original setting.

P dal Free Play Adjustm nt: Remove vacuum hose and press brake pedal several times to release all vacuum. Insert blade of screwdriver between rubber collar of power brake trigger pivot and rear side of elongated hole in power brake lever, forcing them apart. *(NOTE* - If brake pedal and lever are not wedged apart, a false free play setting (which includes booster valve travel) will be measured at pad end of pedal). Check free play with linkage in this position by pushing lightly at pad end of brake pedal. Free play travel should be 1/32-1/8". If not within limits, adjust by lengthening or shortening pushrod as required.

Free Play M asur m nt (Alternate Method): Remove master cylinder pushrod end pin. With light finger pressure, move pushrod forward until contact made with master cylinder piston. Attempt to insert pushrod end pin through power lever and pushrod end hole. If pushrod must be pulled back to allow passage of pin, free play is present. If pushrod must be pushed further into master cylinder to allow passage of pin, no free play is present and adjustment must be made at pushrod.

DE SOTO, DODGE "OVAL PISTON" POWER BRAKE ASSY.

LUBRICATION: Periodically place a few drops of SAE 10W Engine Oil on brake lever pin bushings. No other lubrication required.

TROUBLE SHOOTING: Pedal Releases Slowly After Application or Brake Pedal Vibrates (Booster Chatter) - Pedal trigger arm improperly adjusted. *See Adjustments.* **Delay in Application (during Fast Brake Application)** - Pedal trigger arm improperly adjusted. *See Adjustments.* **Lack of Power Assistance (When Cold):** *(NOTE* - This condition only occurs after long periods of disuse). To correct, disassemble, clean off all old lubricants. Soften seals and diaphragm with silicone grease.

TESTING (On the Car): Check brake operation on the car using engine vacuum. Remove screw plug from mounting ring, connect test fitting, hose, and vacuum gauge at this port. Run engine to provide vacuum and make test as follows:

1) With brakes released and engine idling, note vacuum gauge reading. Gauge should read Zero indicating that brakes fully released. Reading of 1-16" indicates brakes not fully releasing. Check pedal adjustment. If pedal adjustment correct, power unit is faulty.

2) Depress brake pedal slowly and note vacuum gauge reading. Reading of 1-16" indicates power unit is operating. A zero reading indicates incorrect pedal operation, restriction in vacuum line, or faulty power unit. Check pedal adjustment. If pedal adjustment correct, remove power unit and disassemble for overhaul.

Checking Vacuum Source (Without Gauge): With engine stopped, depress brake pedal several times to exhaust vacuum in system and reserve tank. Start engine while holding pedal partially depressed. As soon as engine starts, pedal should move away from pressure being applied (indicating action of power boost). Shut off engine. Depress brake pedal 6-10 times noting effort required to press pedal in same distance each time. Effort required should increase from first to last application as vacuum source is depleted. If no difference noted in pedal effort with engine running or stopped, check for restriction in vacuum supply line by disconnecting line at power unit and holding finger over end of hose with engine running. A high vacuum should be noted.

REMOVAL & INSTALLATION: Power Unit - Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket to prevent trigger arm from extending beyond extremities of bracket. *(NOTE* - If pedal linkage is allowed to extend through hole in dash panel, damage to trigger arm may result). Discon-

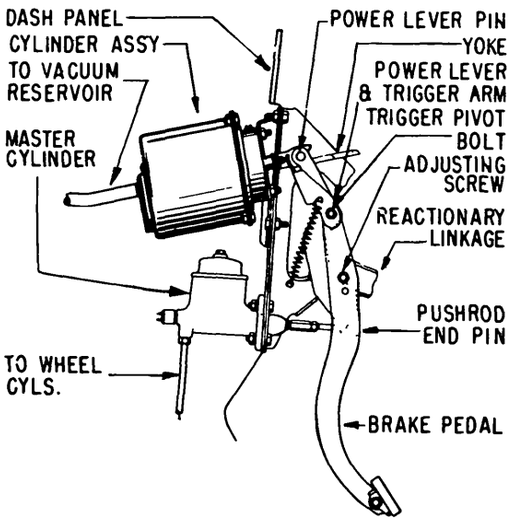
CONTINUED ON NEXT PAGE

DE SOTO, DODGE "OVAL PISTON" TYPE (Cont.)

nect vacuum hose at power unit. Remove attaching bolts at dash panel and carefully remove power unit assembly. (*NOTE* - Use care not to lose pedal linkage cross pin). To install, reverse removal procedure. Install unit on dash panel so its axis inclines down and toward front of car.

Pedal Linkage - Remove pedal return spring, master cylinder pushrod end pin and power brake pedal lever shaft. Rotate pedal linkage assembly counter-clockwise while withdrawing power lever cross pin from booster unit yoke. (*NOTE* - Pedal is slotted to provide clearance for removal of brake pedal assembly). To install, reverse removal procedure. (*CAUTION* - Use extreme care during assembly and handling of linkage. Trigger arm is easily damaged). If power brake unit has been removed, place a wooden wedge between power brake lever and forward edge of triangular hole in pedal bracket to prevent trigger arm from extending beyond extremeties of bracket.

OVERHAUL: Disassembly - Scribe mark across flange of power cylinder and end plate as a guide for reassembly. (*CAUTION* - Do not clamp yoke in vise at any time). Remove bolts mounting endplate on cylinder, separate endplate and "O" ring seal from cylinder shell, disconnect vacuum hose from fitting within cylinder. Take out air cleaner attaching screws, remove air cleaner and filter material from end of cylinder. Disconnect vacuum hose from fitting on tube and plate assembly. Separate and disassemble all sub-assemblies as follows:



Control Valve - Remove balancing pin diaphragm from end of plate assembly housing, withdraw balancing pin from housing (use long nosed pliers). Take out tube and housing attaching screws, separate housing from piston. Remove valve assembly. Remove valve retaining plate by compressing diaphragm and working plate off over diaphragm, remove spring, remove diaphragm from poppet valve by "peeling" it off. Remove nylon valve rod end button from valve rod (within yoke) by using a thin bladed screwdriver on a 1" x 1" wooden block as a pry. Slide valve rod seal off, remove snap ring retaining valve rod in piston, remove valve rod washer and spring, then slide valve rod out of piston.

Piston Rod - Drive out two piston rod retaining pins using a 3/16" drift (*CAUTION* - Do not allow return spring to snap piston off rod as pins are removed). Remove piston and return spring, then slide piston rod out of endplate and remove rubber stop washer from rod.

Endplate - Take out mounting ring attaching bolts and separate endplate from mounting ring. Remove seal retainer spring, piston rod leather seal and mounting ring gasket. Remove vacuum inspection port plug and gasket from mounting ring.

Piston Plate - Take out screws mounting retainer plate on piston plate, separate these parts, remove expander spring, wick, packing plate, and leather packing.

Cleaning & Inspection: Clean all rubber parts in alcohol. Thoroughly wash all metal parts. If inspection reveals

POWER BRAKE LINKAGE

nicks or scratches on piston rod, valve seat end of valve rod, or valve seat at center of piston plate, replace parts. Replace an excessively worn leather packing or piston rod leatner seal. If vacuum cylinder is rusted or corroded, polish with fine steel wool or crocus cloth.

Reassembly: Use all new gaskets. Lubricate parts with oil or silicone grease as noted below.

Piston Plate Assembly - *NOTE* - Installation will be facilitated by using Tool C-3578 to install packing parts on piston. Proceed as follows: Place piston in assembly tool with threaded holes in piston upward, install leather packing on piston with lip side up, place packing retainer plate on packing with the raised side up and align holes in plate with holes in piston. Coil cotton wick inside packing lip and cut to required length. Remove wick and dip in vacuum cylinder oil, allow excess oil to drip off, then install packing on piston. Install expander spring inside wick (with gripper points next to wicking) and engage notch at loop end of spring with hook at opposite end. Install expander spring retainer plate and align holes in plate with threaded holes in piston plate, install screws and tighten securely. *Leave piston assembly in tool until it is installed in vacuum cylinder.*

Mounting Ring & Endplate Assembly - Install vacuum inspection port screw and gasket in side of mounting ring. Insert ring retaining bolts through holes in endplate, apply silicone grease to outer face of gasket around center hole, install gasket on endplate bolts (*CAUTION* - Vacuum port opening in gasket must be aligned with opening in endplate). Install piston rod leather seal on gasket with raised shoulder up, slide spring over shoulder and seat spring against seal with both parts centered on gasket. Coat bearing surface of mounting ring with silicone grease, slide mounting ring down over mounting bolts with recessed side down and vacuum port holes aligned, tighten bolts securely. *NOTE* - Outer rim of mounting ring should contact endplate.

Piston Rod - Install rubber stop on the piston rod and against the steel washer. Install Pilot Tool C-3579 on end of piston rod (*NOTE* - If pilot not used, wrap approximately 1¼" of piston rod with scotch tape to prevent sharp edges of rod damaging seal). Insert piston rod through endplate, remove pilot tool or tape, install piston spring over piston rod so that it is seated against endplate, install piston assembly on rod and seat it against shoulder on rod, install two retaining pins in holes in piston boss (*CAUTION* - Hold rod seated against piston while installing pins).

Valve Rod Assembly - Insert valve rod through piston and piston rod, install spring and retainer washer on end of rod, compress spring and install snap ring in rod groove. Install valve rod seal on valve rod and piston rod (*NOTE* - To aid in seal installation, turn seal partially inside out and install small diameter over valve rod first, then slide large diameter over piston rod). Install nylon button on end of valve rod and press on until seated.

Control Valve Assembly - Assemble valve diaphragm on valve (small diameter of diaphragm on small diameter of valve), install valve spring over diaphragm (small diameter against valve), install retainer plate over large end of diaphragm (*CAUTION* - Keep assembly compressed to prevent spring separating diaphragm from valve). Install assembly on piston, place vacuum tube assembly in position on retainer plate (*CAUTION* - Bead on diaphragm must be in annular groove of housing and screw holes must be aligned), make certain that scribed marks are aligned, tighten attaching screws securely. Install balancing pin and diaphragm in end of vacuum tube assembly, slide vacuum hose over housing tube.

Final Assembly - Install air cleaner housing on end of cylinder and tighten attaching screws securely. Slide new "O" ring seal over piston and position on shoulder of endplate. Remove assembly tool C-3578 from piston, position piston assembly in front of cylinder, connect vacuum hose to air cleaner tube within cylinder. Slide piston into cylinder and install endplate, tighten bolts securely. Pack air cleaner housing with filter hair. Test brake assembly as follows:

TESTING (Brake Assembly after Overhaul): Operation Test - Connect vacuum source to vacuum tube at air cleaner end of cylinder, apply vacuum of 15-20". Piston and yoke should move to fully extended or applied position (if valve not depressed). Piston should move throughout full stroke without hesitation. *CAUTION - Piston will move out to end of stroke without restriction in above test (with no force applied to end of valve operating rod) and unit should only be tested when fully assembled.*

Leakage Test - Use a vacuum gauge and shutoff valve in the vacuum line near the brake power unit. Press in on valve operating rod, apply 15-20" of vacuum to power cylinder, close shutoff valve. Vacuum leakage (gauge drop) should not exceed ½" in 60 seconds. Open vacuum shutoff valve, release valve operating rod and allow piston to move to the end of its stroke. Close shutoff valve and check leakage which should not exceed 1" in 10 seconds.

BENDIX POWER BRAKE UNIT "HYDRAULIC REACTION" TYPE

Buick (1957) ①
Chevrolet Pass. Cars (1957)
Hudson & Nash (1957)
Oldsmobile (Later 1957)
Pontiac (1957) ①
Rambler 6 & V8 (1957)

① - Moraine Power Units also used in part production.

DESCRIPTION: This new "hydraulic reaction" type power unit is similar in design to previous Bendix units having the vacuum piston balanced in atmospheric pressure (both sides of the vacuum piston are open to atmospheric pressure when in the released position). A new "hydraulic reaction" feature transmits changes in hydraulic pressure to the vacuum valve through a reaction rod and rod membrane and provides the operator with a more definite brake "feel".

OPERATION: In the applied position, atmospheric pressure is blocked off from the forward side of vacuum piston as the valve plunger contacts the floating valve. Further movement of valve plunger pushes the floating valve from its seat in vacuum piston and permits vacuum to be connected to forward side of the vacuum piston. Atmospheric pressure on rear side of piston then moves piston and hydraulic plunger in the applied direction. The hydraulic plunger initial movement causes the compensating valve to close, sealing off fluid reservoir from the hydraulic cylinder. Further movement of the plunger in the applied direction increases pressure in master cylinder and forces fluid past the residual check valve and into the hydraulic lines. As fluid pressure is increased in master cylinder, a reaction force is transmitted to the reaction rod through the plunger seal (membrane) to overcome counter-reaction spring pressure and move valve plunger away from the floating valve. This allows the vacuum port to close and the atmospheric port to reopen, resulting in a reaction force which is in proportion to pressure in master cylinder and brake lines.

▷ *POWER BRAKE UNIT REMOVAL NOTE: The complete unit must be removed from car as an assembly.*

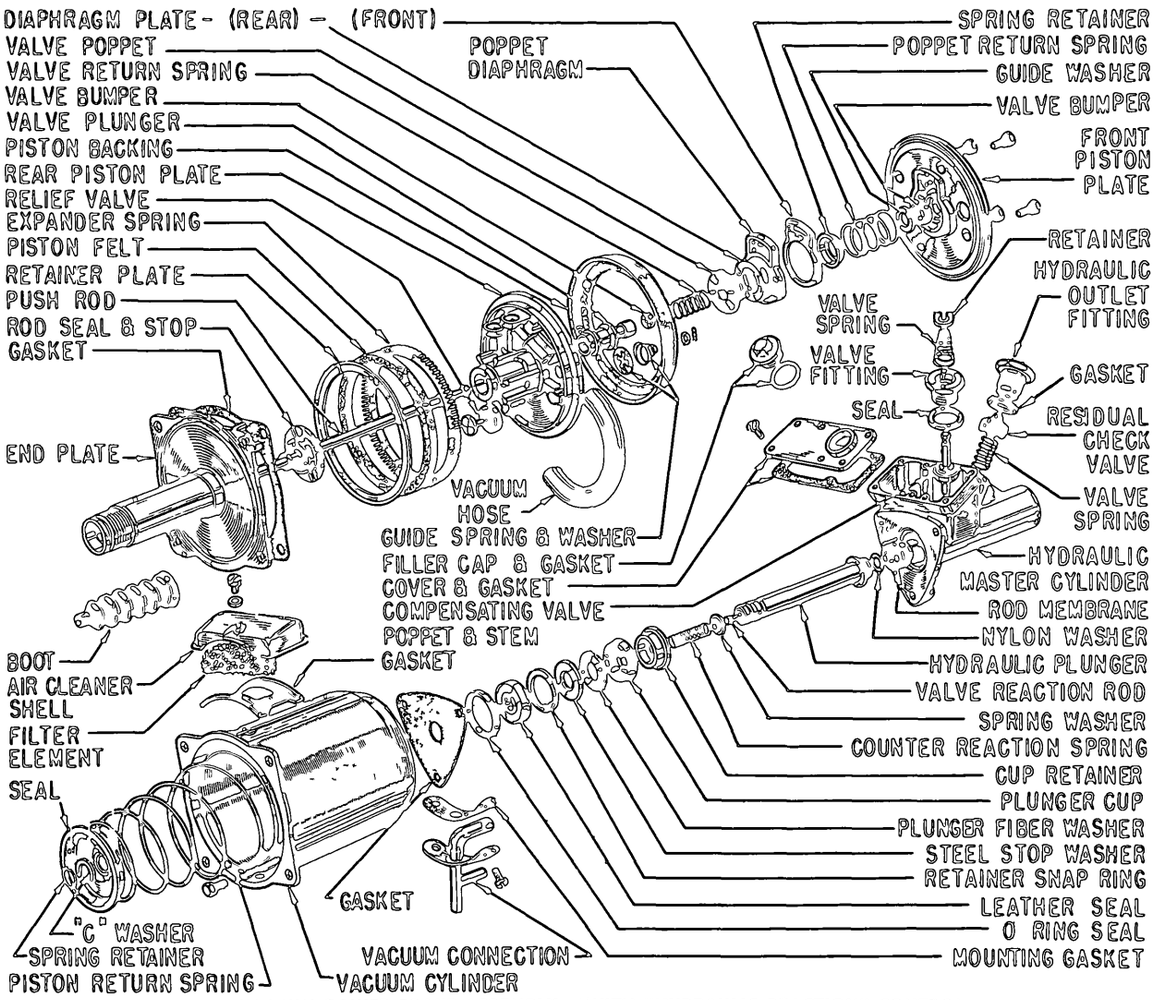
▷ *POWER BRAKE UNIT OVERHAUL CAUTION: Use extreme care to prevent the natural rubber parts in unit coming in contact with mineral oil, grease, gasoline or cleaning solvent. Clean exterior of unit thoroughly before disassembly and make sure that solvent is not allowed to enter unit.*

DISASSEMBLY: (End Plate & Air Cleaner) - With unit in Holding Fixture J-5433, or hydraulic cylinder end clamped in vise, remove rubber dust guard and felt from valve pushrod (a drop of brake fluid on end of pushrod eye will permit removal of guard without damage). Bend out tabs on end plate and remove end plate and gasket. Slide vacuum hose off tube attached to vacuum cylinder. Remove air cleaner attaching screw and remove shell, hair and rubber seal. (*NOTE* - Remove any burr inside cylinder at air cleaner screw hole to prevent damage to packing during removal).

Vacuum Piston & Valves: Remove tube and plate attaching screws, tube and plate and gasket. Pull out vacuum piston and valve assembly from cylinder. Remove counter reaction spring and washer from end of hydraulic plunger, then remove "O" ring seal from groove in hydraulic plunger.

Piston Return Spring: Push in on spring retainer plate to release "C" washer. While holding spring compressed, slide "C" washer out of groove in hydraulic plunger. Remove retainer plate and vacuum piston return spring.

Vacuum & Hydraulic Cylinder: Scribe line across hydraulic master cylinder and vacuum cylinder. Remove three vacuum cylinder attaching screws and lockwashers. Lift off vacuum cylinder, vellumoid gasket and rubber ring gasket. Push hydraulic plunger into master cylinder and remove leather seal from cylinder.



Plunger Seal, Plate & Valve Cover: Scribe a line across master cylinder and cover. Remove filler cap and remove cover attaching screws and gasket. Remove compensating valve (using 1 1/8" "thin wall" socket). Loosen outlet fitting (*CAUTION - Do not remove outlet fitting at this time*). Remove retainer ring. Pull hydraulic plunger out of master cylinder and remove steel washer, fibre washer, rubber cup and cup retainer from plunger. Remove membrane seal, and nylon gasket from plunger.

Residual Check Valve: Remove outlet fitting from master cylinder then remove residual check valve spring, valve cup and retainer. Remove gasket from fitting.

Compensating Valve: Clamp compensating valve fitting in vise and spread and remove spring retainer, then remove spring, valve stem and poppet and fitting gasket from valve fitting.

Piston: Remove valve rod seal and stop from piston and piston rod. Remove vacuum hose from piston assembly. Remove retainer plate felt and expander spring. Hold rear piston plate in vise and remove four capscrews, front piston plate, diaphragm plate and poppet return

CONTINUED ON NEXT PAGE

BENDIX VACUUM POWER BRAKE ASSEMBLY (WITH "HYDRAULIC REACTION" CONTROL)

BENDIX POWER BRAKE UNIT "HYDRAULIC REACTION" TYPE (Continued)

spring. Remove diaphragm parts as an assembly and then separate these parts. Lift off leather piston packing and valve return spring. Remove rubber bumper (using a sharp pointed instrument from end of valve plunger), seal and fibre washer from piston plate. Remove valve operating rod and valve plunger from piston. *(NOTE - If valve operating rod or valve plunger are to be replaced, inject alcohol in valve plunger opening around the valve operating rod to remove rubber lock. Hold valve operating rod in vise and drive valve plunger off operating rod using a ¾" wrench or similar tool against valve plunger).*

CLEANING & INSPECTION: Wash all rubber or parts containing rubber in alcohol. Blow all parts dry with air. Remove rust or corrosion from bore of vacuum cylinder with fine emery cloth. Inspect all parts for wear or damage and replace all parts that are cracked, pitted, scored, scratched or corroded. Make sure that valves and valve seats are sealing properly and are not pitted or damaged. *CAUTION - Do not attempt to refinish bore or plunger of master cylinder.*

REASSEMBLY: *NOTE - Before assembly, dip all hydraulic system parts in clean alcohol and place in a clean pan or on a clean paper.*

Residual Check Valve: Assemble new gasket over threads of hydraulic outlet fitting. Hold fitting in vertical position and insert cone end of cup and retainer in fitting. Place check valve spring in recess in retainer. Hold hydraulic master cylinder upside down and thread outlet fitting into hydraulic master cylinder hand tight.

Compensating Valve: Insert grooved end of valve poppet and stem through hole in fitting from threaded end. Assemble large diameter end of spring over stem, holding poppet valve on seat. Compress spring and assemble retainer washer in groove of valve stem. Squeeze ends of washer together with pliers. Assemble new gasket over threads of compensating valve fitting.

Plunger Seal, Plate and Valve Cover: With master cylinder in vise, assemble nylon washer and rubber membrane at end of hydraulic plunger. Insert membrane end of plunger in cylinder and assemble seal parts with seal installer Tool J-5405 over end of plunger as follows: Cup retainer (with counterbored side away from washer on plunger), cup, fibre washer, and steel washer. Slide seal parts into recess of cylinder, push plunger in to end of its stroke and assemble retainer ring in ring groove. Assemble compensating valve in threaded hole in cylinder and securely tighten. Place new gasket on master cylinder, align cover to scribe marks, replace and securely tighten. Tighten outlet fitting securely.

Vacuum & Hydraulic Cylinder: Pull out hydraulic plunger, then, with seal installer Tool J-5405 placed over end of plunger, assemble leather seal over seal installer with lip of leather toward hydraulic master cylinder. Press seal into recess of master cylinder and then remove seal installer. Place "O" ring seal in recess in master cylinder. Insert three capscrews through holes in end of vacuum cylinder and holes in gasket. Align vacuum cylinder, gasket and master cylinder to scribe marks and tighten sapscrews securely. Wipe out vacuum cylinder, pull master cylinder plunger to end of stroke.

Piston Return Spring: Place large diameter end of vacuum piston return spring in vacuum cylinder and assemble retainer plate over end of hydraulic plunger. Compress spring and assemble "C" washer in inner groove of plunger.

Piston: If valve rod and valve plunger are separated, dip valve plunger in alcohol before inserting valve rod. Make certain ball end of rod is locked in place in valve plunger. It may be necessary to tap end of valve rod to seat ball end in valve plunger. Insert bumper in end of valve plunger, insert valve plunger assembly into rear piston plate, and assemble spring over end of plunger. Assemble leather packing on piston with lip side down. Assemble diaphragm plate in groove of diaphragm then assemble diaphragm over shoulder of poppet valve. Place this assembly in recess in piston plate and assemble spring retainer and diaphragm plate in diaphragm. Assemble poppet return spring over flange of spring retainer. Remove burrs from center bore of front piston plate and assemble seal and fibre washer in recess of front piston plate. Stake in place at three points. Place front piston plate on rear piston plate, making certain by-pass holes are properly positioned, and loosely assemble four attaching capscrews. Place assembly ring J-5406 over piston leather and turn piston assembly upside down. Assemble expander spring against inside lip of leather packing. Dip felt in Bendix Vacuum Cylinder Oil and assemble on expander spring. Assemble retainer plate making certain plate is securely anchored in grooves of four projections of piston assembly. Tighten four attaching capscrews securely and remove assembly ring J-5406. Assemble vacuum hose on piston. Dip valve pushrod seal and bumper in brake fluid and assemble over end of valve pushrod making certain seal is seated in groove in piston assembly.

Vacuum Piston in Cylinder: Apply thin film of vacuum cylinder oil to inside of cylinder. Assemble "O" ring seal in groove of hydraulic plunger, then assemble counterreaction spring and washer in recess at end of plunger. Insert piston in cylinder. When end of hose lines up with elongated hole, assemble new gasket, tube and plate and attach with screw. Slide end of hose on vacuum tube approximately 5/8". Operate piston through its full stroke several times to make certain vacuum hose does not rub against cylinder or piston.

End Plate & Air Cleaner: Assemble rubber seal on edges or air cleaner shell. Attach air cleaner to vacuum cylinder using screw and gasket. With 6" scale, push hair into open spaces at each end of air cleaner. Align holes on end plate and gasket with holes in flange of vacuum cylinder and bend over two tabs of end plate to secure end plate and gasket to cylinder. Assemble pushrod felt in second fold of rubber guard. Dip small end of guard in brake fluid and assemble guard and felt over pushrod. Attach lip of rubber guard over "scallops" at center of end plate.

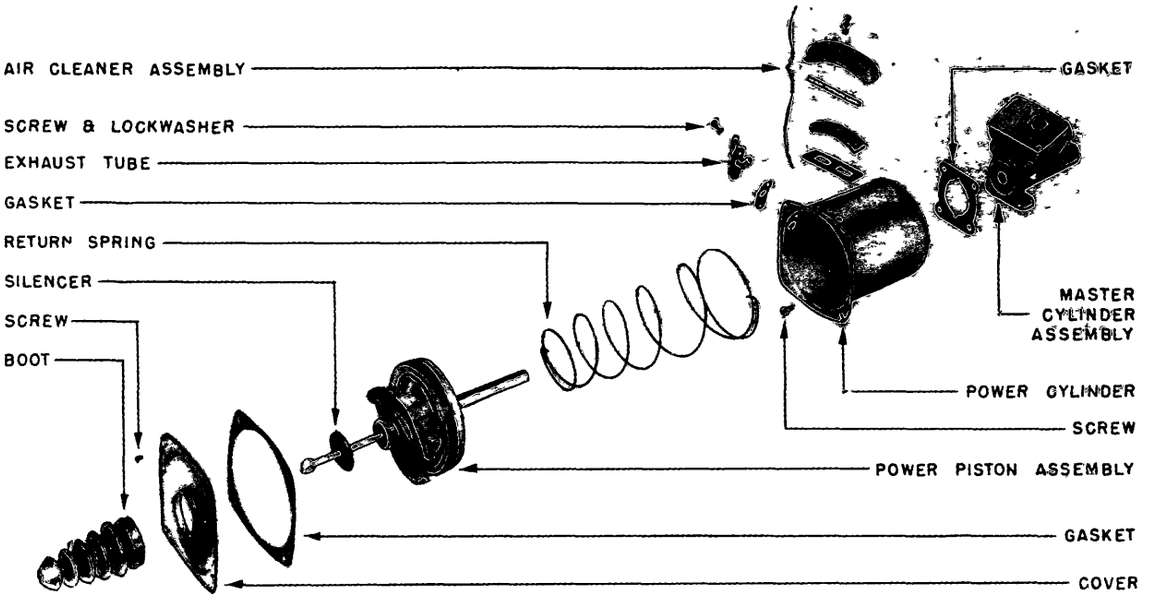
MORAINE POWER UNIT

Buick (1957) ①
Oldsmobile (1957) ①
Pontiac (1957) ①
① - Bendix Power Brake Unit also used in production.

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK BRAKE PEDAL HEIGHT ADJUSTMENT:* With brake pedal in the full "OFF" position, distance from floor mat (with mat depressed) to top of rubber pad on brake pedal should be 5½". If not correct, loosen pushrod locknut and rotate pushrod as necessary for correct adjustment.

DESCRIPTION: Self-contained, combined vacuum and hydraulic unit using intake manifold vacuum and atmospheric pressure for its pressure. In "brake-released" position power piston is balanced by atmospheric pressure on both sides of piston. Unit incorporates two main sections—vacuum power cylinder and hydraulic master cylinder. Unit replaces conventional master cylinder only.



OPERATION: With engine running, brake unapplied, both sides of power piston are under atmospheric pressure. On application of brake pedal, intake manifold port opens and creates vacuum right side of power piston. Atmospheric pressure then moves power piston to right thereby exerting thrust on hydraulic plunger. This increases line pressure to four wheels. Release of brake pedal restores atmospheric pressure balance in power cylinder. In case of engine failure and consequent loss of engine vacuum, several applications of brake are possible by using vacuum supply in vacuum reservoir. In case of complete vacuum loss, brakes can be applied in conventional manner, although more effort is required due to loss of power assist.

CHECKING & ADJUSTMENT: Check all parts of power brake system before disassembling Power Brake Unit whenever brake trouble experienced.

Adjustments: No special adjustments required. Anytime brake pedal goes to within 1" from floor (floor mat to underside of pedal pad), brakes should be adjusted. At time brakes adjusted, following inspections must be made.

1) Check vacuum lines and connections between intake manifold, check valve, vacuum reserve tank, and vacuum power cylinder for possible vacuum leaks.
2) Check fluid level in master cylinder reservoir. See Lubrication below.
3) Check condition of air cleaner element and insert clean element, if necessary.
4) Check steering column pedal plate for loose screws. Check for free operation of brake pedal. If binding exists, check for misalignment between pedal and vacuum cylinder pushrod.
5) Check stop light switch for proper operation.

Bleeding Brakes: Bleed in same manner as for standard brakes. Do not use vacuum assist while bleeding. Engine should not be running and vacuum reserve should be reduced to zero by applying brake several times before starting bleeding procedure. After power unit reinstalled, bleeding of power unit and flex line can be accomplished at junction block bleeder screw, provided remainder of system is free of air.

POWER BRAKE ASSEMBLY

LUBRICATION: Check level of brake fluid in reservoir every 1000 miles. Refill to ½-1" from top of filler plug opening (Buick), high enough to register on dipstick (Oldsmobile), ½" from top of filler plug opening (Pontiac). *NOTE*–Reservoir is separate and under hood on Buick.

PERIODIC SERVICE: Intake manifold tee connector should be removed and cleaned Spring and Fall or every 10,000 miles.

TROUBLE SHOOTING: Before checking Power Brake Unit for source of trouble check remainder of brake system.

Hard Pedal: 1) Vacuum failure due to faulty vacuum check valve, collapsed vacuum hose, plugged vacuum fittings, hose or pipes, leak between vacuum power cylinder and hydraulic master cylinder.
2) Bound up pedal mechanism.
3) Power Brake unit trouble–internal vacuum hose loose or restricted; jammed sliding valve; vacuum leaks in unit caused by loose piston plate screws, loose piston packing, faulty master cylinder piston, vacuum seal, or leak between hydraulic master cylinder and vacuum power cylinder; defective diaphragm; restricted air cleaner.

Grabbing Brakes (Apparent Off-and-On Condition): Power Brake unit valve trouble–reaction diaphragm leakage, faulty rubber bumper pad in reaction diaphragm; sticking sliding valve reaction; restricted diaphragm passage; master cylinder piston binding in power piston guide.

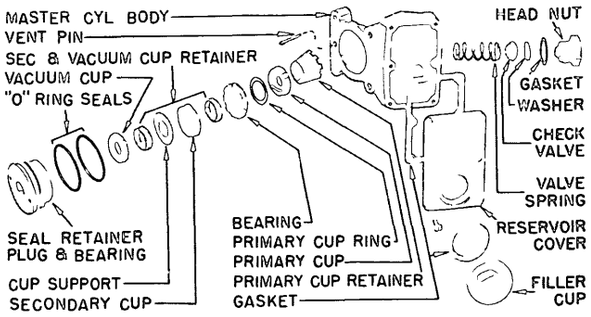
Pedal Goes to Floor (Or Almost To Floor): Brake adjustment; fluid reservoir needs replenishing, power brake hydraulic leakage–defective primary or secondary cup, defective vacuum seal, defective head nut or head nut gasket, cracked master cylinder casting, leaks at wheel cylinders or in pipes, or in connections, defective "O" rings on cylinder plug.

Brakes Fail to Release (Or Slow Release): 1) Bound up brake pedal linkage.
2) Weak brake shoe return springs, or rusty bosses on backing plate.
3) Faulty residual check valve, excessive hydraulic plunger seal friction, excessive piston packing friction, restricted air passage in vacuum piston, restricted air cleaner, sticky air valve, broken piston return spring, broken air valve return spring.

REMOVAL & INSTALLATION: Buick - Disconnect battery ground strap, then remove clevis pin from pushrod clevis. Lift brake pedal to pull linkage out of way, then remove large nut holding brake unit to cowl using Tool 6618. Disconnect stop light wire connector from switch. Disconnect brake pipe from hydraulic cylinder and tape end of pipe. Disconnect vacuum hoses from tee fitting. Remove bolts holding unit to ventilator air duct and remove power brake unit from car. To install, reverse removal procedure and bleed brake lines.

Oldsmobile: Disconnect positive battery cable at junction block on right fender filler plate. Disconnect solenoid lead wire (purple) from wiring harness, then pull cable through sleeve on power brake. Disconnect brake line at master cylinder, plug open ends. Disconnect leads from stop light switch and fold back floor mat. Remove three brake pedal bracket attaching bolts and lockwashers, then remove bracket and pedal assembly. Remove mast jacket grommet and retainer clamp

CONTINUED ON NEXT PAGE



MORAINE POWER UNIT (Cont.)

and slide them up mast jacket. Remove floor cover plate attaching screws and speedometer cable from clip. Remove cover plate-to-power cylinder bolts, and remove cover while positioning the power unit so it rests on edge of opening in floor pan. Disconnect vacuum hose and remove power brake unit through toe pan opening. To install, reverse removal procedure.

Pontiac: Disconnect vacuum hose from pipe leading to tee connector. Raise car and remove engine side apron from left side. Remove coiled hydraulic pipe from outlet fitting on hydraulic cylinder and from tee connector. Disconnect pushrod from pedal and disconnect wires from stop light switch. Remove nuts from U-bolt retaining pedal pivot bracket to steering column and remove pedal and pivot bracket. Remove accelerator pedal. Push rubber grommet up on steering column and move floor mat out of the way. Remove clutch pedal seal retainer (synchro-mesh cars), and steering column seal retainer and seals. On Hydra-Matic cars, remove screws retaining mounting plate to floor pan and remove mounting plate with power brake unit attached. On synchro-mesh cars, remove screws which retain power brake unit to mounting plate (brake unit will rest on frame). Remove screws retaining mounting plate to floor pan and remove mounting plate, jockeying it around to clear clutch pedal, then remove power brake unit. *CAUTION - Do not support or carry brake unit by the pushrod.*

OVERHAUL: *CAUTION: Use extreme care in the handling of hydraulic system parts to prevent their coming in contact with mineral oil or grease. DO NOT HANDLE HYDRAULIC PISTON CUPS OR SEALS WITH GREASY HANDS.*

Disassembly (Oldsmobile & Pontiac): Clean all dirt from outside of power brake unit. Remove dipstick and gasket (Oldsmobile), filler cap and gasket (Pontiac), from master cylinder and pour brake fluid out of reservoir (*NOTE*–Operate pushrod by hand with unit upside down to pump fluid from cylinder bore). Clamp master cylinder end of unit in holding fixture J-5433 with adapter J-5796 and remove cable guide. Remove screw that holds air cleaner unit to outside of power cylinder. (*CAUTION*–Removal of air cleaner unit must precede disassembly of internal parts to avoid damage to large leather piston cup inside power cylinder housing). Remove boot and felt silencer from pushrod end of brake unit. Remove end cover and gasket (held to power cylinder housing by two recessed flat head screws). Slip rubber exhaust hose from vacuum exhaust tube inside power cylinder housing (*NOTE*–Do not use compressed air to remove). Press power cylinder assembly back into power cylinder housing so that it does not rub against vacuum exhaust tube. Holding power piston in this position with one hand, remove two screws that hold vacuum exhaust tube to outside of power cylinder. Using fine emery cloth remove burrs from inside power cylinder housing at screw holes. Ease power piston out of power cylinder housing (There is a strong coil spring back of power piston assembly. Be careful to control piston by hand as it is removed from housing). Remove large coil spring from inside power cylinder housing. Remove hex head bolts at the

MASTER CYLINDER UNIT

inside base of power cylinder housing that hold it to master cylinder (*NOTE*–Power cylinder housing pilots on an extension of cylinder plug and should be removed carefully so as not to damage "O" ring on plug extension).

Air Cleaner Unit–Pull screw out through housing and assembled parts. Unseat rubber gasket from edges of housing, lift out element and hairpin spring.

Master Cylinder–Clamp master cylinder in fixture J-5433 with adapter J-5796 or in a vise in vertical position and remove cylinder plug assembly using special spanner wrench J-5794. Remove two "O" rings from outside diameter of plug. Remove secondary cup and washer from inside of plug. Inspect vacuum seal assembly in plug. If seal appears to be in good condition and there has been no indication of a vacuum leak, DO NOT attempt to remove vacuum seal assembly from cylinder plug. If vacuum seal defective, cylinder plug and vacuum seal must be replaced as an assembly. On Oldsmobile, from the bore of the master cylinder, lift out spacer, plunger bearing, primary cup washer, primary cup and retainer. On Pontiac, from the bore of the master cylinder, lift out expander, spacer, bearing, flat primary cup ring, primary cup and conical retainer. Reset master cylinder in vise or Tool J-5433 and remove head nut assembly and copper gasket (*NOTE*–Be careful so that check valve and check valve spring do not fall from hole as head nut is loosened). Remove rubber check valve seat washer which fits over button on head nut. Lift out check valve and check valve spring. On Oldsmobile, remove cover assembly. Note position of filler tube in relation to master cylinder body so that it may be installed in same position on reassembly. On Pontiac, inspect fluid reservoir through filler hole opening. If reservoir is dirty to the extent that it cannot be cleaned thoroughly through filler hole, remove reservoir cover and gasket. Make note of position of filler hole in relation to master cylinder body so that it may be installed in same position on reassembly. On Oldsmobile and Pontiac, inspect vent on underside of casting. (Vent pin is designed to keep this hold open). If hole clogged and cannot be cleaned out so that pin rides free, pin may be straightened and removed through counterbore end of vent hole.

Power Piston Assembly–Remove vacuum hose from power piston assembly if it is to be replaced (*NOTE*–Hose is cemented to tube). Carefully unseat triangular shaped lock ring with screw driver to permit removal of pushrod and air valve assembly. Use caution in removing lock ring so that it will not flip out and become lost or cause personal injury. Turn power piston assembly upside down. Stop plate washer will slide out of opening in power piston and down onto pushrod. Carefully pull out air valve and pushrod while holding piston in vertical position. Valve spring, shims (and snubber on Oldsmobile) will come out with air valve (*CAUTION* - Note number of shims which fit over valve shank and rest on valve shoulder). Remove "O" ring from air valve. (*NOTE*–It is not necessary to remove pushrod from air valve unless it is noisy or excessively loose). If necessary unseat snap ring by pinching snap ring with pliers J-5403. Pull out pushrod, remove rubber bumper from end of pushrod (ring and washer may be left on pushrod). Set power piston assembly on bench on hub end and loosen four screws that hold two halves of power piston assembly together. Before completely removing screws press down on top half (power piston guide) with one hand. (*NOTE*–There is an internal spring between two halves that will have a tendency to part the two halves unless controlled by hand). Gently lift off power piston guide and master cylinder piston assembly. Turn upside down and remove "O" ring from pilot on power piston guide. Slide power piston guide off master cylinder plunger and remove "O" ring from master cylinder plunger. Examine reaction plate, which is held to end of master cylinder piston by small Truarc ring. If necessary to remove remove reaction plate, expand Truarc ring with special pliers J-4880 and lift off reaction plate. From counterbore of power piston, remove in order six fingers (or reaction levers), reaction spring, valve plate, and valve diaphragm spring. Carefully lift large leather cup off power piston. Keep in mind that underneath leather cup is a metal lip expander and wick assembly that has a tendency to uncoil when released. Wick and expander may be separated for inspection. Eject floating valve assembly from power piston by pulling out or by thumb press from hub end. If parts stick together and cannot be pressed out with fingers, pry gently from opposite end to loosen. Remove rubber power piston stop bumper from hub of power piston.

Floating Valve Assembly–Unseat cup-shaped valve spring retainer with small screw driver (*CAUTION*–Use care to prevent screw driver from damaging diaphragm). Press floating control valve through inner diameter of diaphragm. This also frees diaphragm retainer plate. Unseat rubber diaphragm from groove in diaphragm retainer ring.

Disassembly: Buick - Measure distance pushrod projects through clevis. Record this dimension so clevis can be installed in same location, then remove clevis. Mount power brake unit in a vise with hydraulic cylinder down, being careful not to damage the loose vent pin in flange of hydraulic cylinder. Tighten vise only enough to hold cylinder firmly. Remove pushrod boot from housing cover tube and from pushrod. Proceed as follows:

1) Remove felt air silencer from pushrod boot, then take out air cleaner screw and remove cover and filter.

CONTINUED ON NEXT PAGE

MORAINE POWER UNIT (Cont.)

Remove vacuum tube screws. Remove end cover screws, cover and gasket. While holding power piston down, disconnect vacuum hose from vacuum tube and remove tube and gasket from housing. Slowly release power piston, making sure that lip of leather piston cup does not catch in holes as it comes out of housing. Remove vacuum hose from power piston if it is defective.

2) On pushrod side of power piston, remove lock ring and stop plate. Hold piston assembly with pushrod down and pull out pushrod and air valve. Lift off spring, snubber, and spacers (note number of spacers). Remove "O" ring from air valve. *(NOTE* - Unless pushrod is noisy or loose in air valve it need not be disconnected from valve. If necessary to disconnect, disengage snap ring, then pull out pushrod, bumper and washer). Remove sponge rubber piston stop bumper. Remove capscrews holding piston guide to power piston while holding assembly together against inner spring load. With piston flat, carefully lift piston guide straight up to avoid disturbing parts under piston guide. Lift off loose "O" ring.

3) Push hydraulic piston out through piston guide and remove "O" ring from hydraulic piston. If reaction plate or hydraulic piston is defective, separate them, using Truarc pliers to remove snap ring. Inspect relief valve (staked in place in piston guide). Remove if necessary. From power piston assembly, remove reaction levers, reaction spring, small reaction plate and diaphragm spring. Remove leather cup, cup expander and felt wick.

4) Remove floating control valve assembly from power piston and disassemble as follows: With a small screwdriver, pry retainer off diaphragm, then push floating valve through diaphragm, which also frees the retainer plate. Pull diaphragm from retainer. With hydraulic cylinder still clamped in a vise, remove power piston return spring. Remove four bolts and pull power cylinder straight up, then remove gasket. Unscrew master cylinder plug with Tool J-5794, then remove two "O" rings. From inside plug, remove secondary cup expander, secondary cup, flat support, vacuum seal retainer and vacuum seal.

5) Remove cup retainer, piston bearing, flat primary cup ring, primary cup and conical cup retainer from master cylinder body. Reclamp hydraulic cylinder in vise so head nut is straight up, then unscrew the nut being careful not to loose check valve and spring as nut is removed. Remove gasket and check valve seat washer. Inspect vent and vent pin. If necessary to remove for cleaning, straighten pin and remove it.

Cleaning & Inspection: Clean all parts in diacetone alcohol or clean brake fluid *(CAUTION—Do not use antifreeze alcohol, gasoline, kerosene, or any other cleaning fluid that might contain even a trace of mineral oil, as this could cause serious damage to all rubber parts in brake system).* Blow parts dry with air. As an aid in determining cause of power brake failure, carefully examine all rubber parts for nicks, cuts or other damage. After examination, discard these rubber parts if Overhaul Kit being used for repair. Blow dirt and cleaning fluid out of all internal passages. Make sure that small compensating ports in end of master cylinder plunger (hydraulic piston on Buick) are clear. If plugged, clean thoroughly and flush hydraulic system to remove all dirt. Outer surface of master cylinder plunger (hydraulic piston), bore of master cylinder (hydraulic cylinder on Buick) or vacuum cylinder, may be cleaned or reconditioned with fine crocus cloth if not too deeply pitted or scratched. If any parts indicate that heavy abrasive action has resulted from severe contamination of brake fluid, replace damaged parts and be sure to flush fluid reservoir and wheel cylinder lines thoroughly. Make sure that vent pin is properly retained in hole and that vent hole is clear. If using Overhaul Kit for repair of power brake use all new parts in kit, regardless of whether old parts appear fit for use. The six reaction levers may be flattened with a wooden mallet if they are not badly distorted.

Reassembly (Oldsmobile & Pontiac): *CAUTION—During reassembly make certain that no grease or mineral oil comes in contact with internal parts of unit. Until used, keep cleaned parts on clean paper or cloth.* Master Cylinder—1) Drop check valve spring into place in 1" threaded opening in master cylinder casting. Seat check valve assembly into check valve spring. Button check valve seat washer onto head nut, and fit copper head nut gasket over threaded end of head nut. Screw head nut in place carefully to avoid binding check valve as it is depressed into hole in casting. A few drops of brake fluid on check valve seat washer will facilitate assembly. Torque to 80-90 ft. lbs. (Oldsmobile), 85-100 ft. lbs. (Pontiac).

2) Replace reservoir gasket and cover. Install all screws with exception of cable guide attaching screw (Pontiac). Be sure cover is installed with filler hole (Pontiac), filler tube (Oldsmobile), in proper position. Install filler cap and gasket loosely (Pontiac), or dipstick (Oldsmobile) to avoid danger of dirt entering reservoir during reassembly of unit.

3) Clamp master cylinder in fixture or vise, in vertical position, with large counterbore facing upward. Wipe counterbore and threads with very thin coating of brake fluid. Place conical primary cup retainer with notched end down into open end of bore. Press primary cup into hole (Note that outer lip of primary cup fits around and over small end of retainer when it is properly centered in hole). Place primary cup retainer (thin blued steel washer) in place on back of primary cup. Set bearing into bore with notched side up, making sure that hub of bearing fits into counterbore on back of primary cup. Place spacer on top of bearing. On Pontiac, place expander on top of spacer with fingers toward bearing.

4) Assemble cylinder plug assembly as follows: Seat vacuum cup seal with ribbed sides up into bottom of counterbore cylinder plug. Place spacer on top of vacuum cup (this spacer is smaller in diameter than secondary cup spacer), follow with secondary cup washer. Seat secondary cup with ribbed side up in large counterbore. Slip 1 51/64" "O" ring into first groove on outside diameter (nearest end of plug opposite threaded section), slip second 1 51/64" "O" ring over threaded end and seat on hub which has same diameter as first groove. *CAUTION*—No "O" ring should be placed in second groove that has four small through holes.

5) Screw cylinder plug assembly into place *(CAUTION*—On Oldsmobile, spacer must be properly centered on top of bearing, then carefully install plug assembly so that lip of secondary cup fits around spacer when plug is screwed into place. On Pontiac, spacer and expander must be centered properly on bearing so that lip of secondary cup fits around expander when plug is screwed into place). Use special Spanner Wrench J-5794 for tightening cylinder plug assembly (20-30 ft. lbs.).

6) If necessary, replace vent pin in vent hole and bend to approximately 45° to hold in place. Head of pin rides in counterbore of hole.

7) Assemble power cylinder housing to master cylinder with four 5/16" hex head screw and lockwasher assemblies (12-14 ft. lbs.). Be sure to install gasket between housing and master cylinder and position notch in gasket over vent hole in cylinder. The housing pilots on the extended portion of cylinder plug assembly. Assembly is facilitated by wiping bore of housing pilot hole with thin coat of brake or Hydra-Matic fluid. In assembling the housing be sure that two 3/8" air intake holes are on top (match reservoir cover side of master cylinder). Exercise care in installing housing so that "O" ring on cylinder plug extension is not damaged.

Floating Valve Assembly—Fit rubber diaphragm over small diameter of diaphragm retainer ring. Hold diaphragm retainer plate on back of diaphragm with one hand, flat side of plate adjacent to rubber; press floating control valve into place over retainer plate. The hub end of valve fits through the hole in the rubber diaphragm. Press cup shaped valve spring retainer over hub of floating valve and inner flange of diaphragm. Wipe outside diameter of floating valve with Hydra-Matic fluid or Dow Corning No. 4 Silicone Grease.

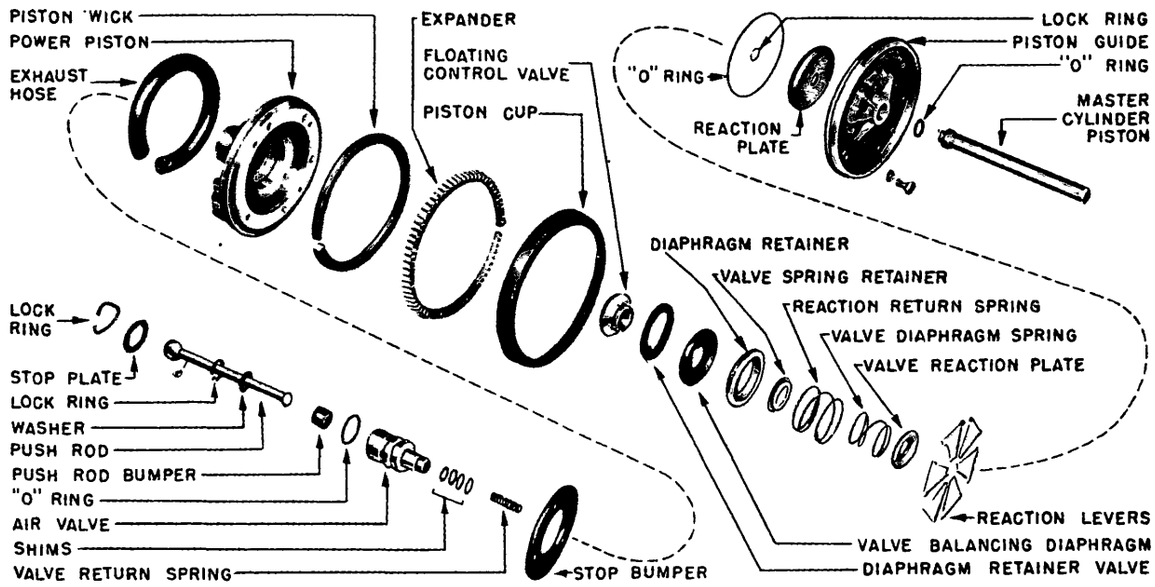
Power Piston—Set power piston casting on bench, hub end down. Press by hand the floating valve assembly, with rubber valve face down, into power piston counterbore. Assemble felt wick in channel of metal lip expander. *(NOTE*—If new wick is used, soak in Hydra-Matic or Shock Absorber fluid, allowing excess to run off). Install wick and expander assembly into outer groove of piston with expander fingers on outside and pointing toward hub end of power piston. Holding expander in place, slip rubber cup in place with lip also pointing toward hub end of piston. If new leather cup is installed use cardboard cylindrical retainer to confine cup during installation. This will avoid any sluggishness in operation during first few days of use or until leather becomes softened by fluid. Snap valve diaphragm spring in place over valve spring retainer. Seat valve plate on top of valve diaphragm spring so that center portion nests in spring. Place reaction spring around valve diaphragm spring and seat in recess of valve diaphragm retainer. Set six reaction levers in place. Ears on levers fit into mating slots in face of power piston. Small ends of levers will extend toward middle and rest of reaction spring.

Piston Guide—Place 5/8" "O" ring in groove of master cylinder plunger. Place reaction plate over

CONTINUED ON NEXT PAGE

MORAINE POWER UNIT (C nt.)

small end of piston with raised edge extending outward. Retain reaction plate on plunger with Truarc snap ring using pliers J-4880. Lubricate lightly "O" ring and adjacent surface of master cylinder plunger with Dow Corning Valve Seal "A" or equivalent silicone grease. Fit 3½" "O" ring onto machined hub of piston guide.



Power Piston & Piston Guide–Holding master cylinder plunger assembly in one hand, in vertical position with reaction plate down, start piston guide (ribbed side up) over upper end of plunger. Gently seat master cylinder plunger and reaction plate assembly onto reaction levers. Press down quickly and firmly until the six reaction levers are held in flat position. Be sure each lever is properly seated. Place hand on top of master cylinder plunger to hold in place. Gently slide piston guide into place indexing holes to match these in piston casting. Install four hex head ¼"screws and lockwashers to complete assembly (5-7 ft. lbs.) To assure that reaction levers are properly seated, check to see that master cylinder piston has slight movement in power piston assembly. Turn the assembled unit over and install rubber bumper in groove on hub of power piston.

Air Valve & Pushrod–1) Assemble rubber bumper onto end of pushrod. Insert bumper and pushrod assembly into air valve. Allow metal washer on pushrod to seat on back of rubber pushrod bumper. Using special pliers J-5403, snap Truarc ring into groove in air valve. Check carefully to make sure that pushrod is firmly locked into air valve. Assemble 1" "O" ring in narrow groove on outside of air valve. Coat "O" ring and outside diameter of air valve with light coat of Dow Corning valve Seal "A" or equivalent silicone grease.

2) Place same number shims that were on air valve, on Tool J-5805. Invert power piston and insert gauge into bore of power piston. Shims and body of gauge will rest on valve plate and pin will extend through hole in valve and rest on end of master cylinder plunger. Turn power piston over so that gauge is on top and check position of pin in gauge body. Pin should be flush or slightly above gauge body. If pin is flush or less than .010" above body, no further adjusting is required. If pin is below top of gauge body, remove shims one at a time until pin is flush or not more than .010" above top of gauge body. If pin is more than .010" above top of gauge body, disassemble and inspect for bent reaction levers, reaction plate or valve plate. After proper number of shims have been added to small diameter of air valve, install snubber (if used), then insert valve return spring into small bore in air valve.

3) Holding power piston and guide assembly with master cylinder plunger pointing upward, insert from below the air valve, spring, and pushrod assembly into hub end of power piston. *CAUTION*–Assemble in this manner to avoid dislodging shims and valve return spring.

4) Carefully turn power piston, guide, air valve and pushrod assembly over and insert stop plate and triangular lock ring which holds air valve in place. Lock ring may be assembled by using small screw driver. After being locked in place, the air valve will have approximately 1/32" travel against valve return spring before picking up floating valve load. *CAUTION*–Care should be exercised during this operation to avoid damage to master cylinder plunger. Never put master cylinder plunger in a vise.

VACUUM POWER PISTON UNIT

Power Piston & Guide Assembly in Power Cylinder Housing–1) Lubricate lightly the large bore of power cylinder housing with Hydra-Matic or Shock Absorber fluid. Clamp the master cylinder in vise or Tool J-5433, in a vertical position with opening in housing extending upward. Place large coil return spring into housing with large diameter in bottom of housing. The tang on bottom of spring should be placed in narrow space between any one of hex bolt heads and closest locating dimple.

2) Wipe lip of leather cup with light coating of Hydra-Matic or Shock Absorber fluid to clean and lubricate. If rubber exhaust hose has been removed from power piston for replacement, coat exhaust tube with 3M Super Weatherstrip Cement and slip new hose on tube as far as it will go.

3) Place power piston and assembled parts on top of coil spring so that the boss plugged with the largest ball will enter housing below the exhaust tube hole in housing by approximately ¼". Press power piston assembly into housing. Depress power piston assembly into housing against coil spring load. This permits assembly of exhaust tube and gasket to outside of housing. Install tube in proper direction so that inside connection will assemble correctly with rubber exhaust hose (Two filister head screws). Slip rubber exhaust hose onto metal exhaust tube inside housing (approximately 1/2-5/8"). Permit power piston to ease back against exhaust tube connection. Install power cylinder cover and gasket using two flat head screws. Press cover down by hand in order to start screws into housing. Slip felt silencer and boot over pushrod. Seat felt silencer against hub of power piston and fit boot snugly over flange on housing cover.

Air Cleaner–Lay hairpin spring inside air cleaner cover. Lay filter element on top of hairpin spring. Place rubber gasket on filter element, depress spring and element so that edges of gasket can be fitted over flanges of air cleaner housing. Insert cover screw with gasket in place through assembled unit and screw into top housing. *CAUTION*–Air cleaner assembly must not be assembled to housing prior to this time, otherwise there is danger of damaging leather piston cup, because air cleaner cover screw extends through inside of housing.

1) Clamp master cylinder body in vise with outlet hole straight up. Install check valve spring, then place a new check valve (concave side out) on spring. Install a new gasket and seat washer on head nut, then install head nut and tighten finger tight. Back nut off one or two turns to allow check valve to center, then tighten to 85-90 ft. lbs. Position cylinder in vise with large bore straight up and wipe bore and threads with brake fluid. Install conical primary cup retainer in body, with notched end inward. Dip primary cup in brake fluid and install lip side first over retainer (center lip of cup must fit into hole), then install cup ring on flat of primary cup. With notched face outward, place piston bearing on primary cup ring with hub of bearing fitting into opening in cup, then press to seat solidly. Install secondary cup to center on bearing and position expander on retainer with notched side in.

CONTINUED ON NEXT PAGE

MORAINE POWER UNIT (C nt.)

2) Install two "O" ring seals on master cylinder plug (in first and third grooves). *(CAUTION - Do not install in c nter groov with the four vent holes).* Install vacuum seal in bottom of bore in plug, with flat side down, then position retainer on seal and flat support on shoulder in bore. Place secondary cup flat side down against support. Moisten plug "O" rings with brake fluid and install plug assembly into body, checking to make sure secondary cup retainer and expander are centered. Tighten plug to 20-30 ft. lbs. using Tool J-5794. If vent pin has been removed, install and bend to about a 45° angle to hold in place.
3) Install a new floating control valve diaphragm on the retainer, then press floating control valve into center hole of diaphragm while holding flat side of plate against flat side of diaphragm. Stretch diaphragm over hub of control valve, then press spring retainer over valve hub and diaphragm lip. Lubricate outer diameter of floating valve with Dynaflow oil and press in place in power piston with rubber face of control valve facing in.

4) Soak felt wick in Dynaflow oil and allow excess to drain. Position wick in cup expander and install in groove in outer diameter of power piston with expander fingers pointing toward piston hub. Hold in groove while leather piston cup is slipped over expander with its lip pointing toward piston hub. If a new leather cup is being installed, use cardboard cylindrical retainer to confine cup during installation. Set piston on flat surface hub down. Install lighter diaphragm spring on spring retainer, then place smaller reaction plate on spring. Lower heavier reaction spring to seat in recess in diaphragm retainer. Set six reaction levers in place with small ends resting in reaction spring. *(NOTE* - If relief valve was removed from piston guide, install new valve and stake it securely being careful not to damage piston guide).
5) Lubricate a new "O" ring and install on hydraulic piston. If reaction plate has been removed from hydraulic piston, install it on piston with raised portion away from piston, and engage the snap ring. Lubricate a new "O" ring and install it on shoulder of piston guide. Lubricate center hole of power piston guide, then, while holding piston vertical with reaction plate down, start piston guide (ribbed side up) on piston. Set reaction plate squarely centered over reaction levers, then lower quickly to hold levers in position while compressing springs. *(NOTE* - Make sure that wide end of levers do not jump out of seats). Install piston guide over piston and install the screws. Tighten to 5-6 ft. lbs. *(NOTE* - Reaction levers must hold position, and piston guide must clamp leather cup while expander and wick hold position under cup). Master cylinder piston will have a slight movement in power piston assembly if reaction levers are properly seated. Install sponge rubber piston stop bumper in groove on hub of power piston. Retain in place with weatherstrip cement.
6) If pushrod was disconnected from air valve, install bumper, pushrod and washer, then install snap ring. Check for proper seating of snap ring with a hard pull on pushrod. Place shims on Gauge J-5805, then hold power piston assembly with air valve bore down and insert gauge and shims into air valve bore. *(NOTE* - Body of gauge rests against smaller reaction plate while pin of gauge extends through to contact the master cylinder piston). Turn the entire assembly over to bring gauge on top and check gauge pin in gauge body. *(CAUTION - Hydraulic master cylinder piston must be at its lowest limit. Do not hold assembly by hydraulic piston or allow hydraulic piston to contact bench).* If pin is flush or sticks out no more than .010", spacers are correct. If pin is low or high, add or remove shims until within the above limits. When shims are correct, remove gauge and install shims and snubber (rubber face out) on air valve. Install air valve return spring in end of air valve and install "O" ring in narrow groove of valve. Lubricate air valve and "O" ring with Dynaflow oil, then while holding power piston assembly with air valve bore down, install complete air valve assembly. Hold in position and turn power piston over. Install stop plate and wire lock ring in hub of piston. Check to see that air valve has about 1/32" movement before it picks up the floating valve, then pull out hard on pushrod to check seating of lock ring.

7) If vacuum hose was removed from power piston, coat outer diameter of hose with adhesive, then slip hose fully into tube so it lays parallel to power piston. Clamp assembled master cylinder in vise (vertically). Lubricate "O" ring on cylinder plug and install gasket so vent passage is open. Install power cylinder housing so air cleaner holes are in same direction as master cylinder filler cap. Install bolts and lockwashers and tighten to 12 ft. lbs. Lubricate inside of housing with Dynaflow oil, then install return spring in housing with large end in position so that bent end fits between bolt head and closest dimple.

8) Lubricate power piston leather cup with Dynaflow oil, then position power piston assembly on spring with large steel ball aligned with vacuum tube hole in housing. Push piston assembly in past vacuum tube hole, then place gasket against vacuum tube flange and insert vacuum tube through hole and slide into vacuum hose. Hold piston assembly in until vacuum tube attaching screws are tightened, then release piston slowly against tube. Operate power piston several times, then check vacuum hose to see that it lays flat against power piston without rubbing on piston hub or housing. If hose rubs, rotate power piston in relation to small end of return spring to correct. Install housing cover and gasket and install two screws. Place felt silencer half way up boot, then slide boot over pushrod ½" past threads and install in groove on cover tube. Install air cleaner filter, cover and screws. Install pushrod clevis so pushrod projects through clevis exact amount as measured before removing clevis nut. Tighten clevis locknut.

BENDIX HYDRAULIC SINGLE ANCHOR (WITHOUT ECCENTRIC)

Buick, All Series (1957)
Cadillac, All Series (1957)
Hudson Hornet V8 (1957)
Nash Ambassador V8 (1957)
Oldsmobile, All Series (1957)
Pontiac, All Models (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK BRAKE DRUM PRODUCTION CHANGE:* Motor Wheel drums now used on later production cars on front wheels only. These drums are identified by weld spots around circumference between rim and disk. *CAUTION:* If one drum requires replacement, another drum of the same make must be used. Under no circumstances should two different makes of drums be used on the same end of the car.

►*1957 BUICK ALUMINUM DRUMS:* New aluminum finned drums are used on front wheels of Models 75 & 75R. Special wheel attaching bolts are used with these drums and should not be used with other drums, nor should ordinary bolts be used with aluminum drums. Maximum rebore limit on all types of drums is 12.083".

►*1957 BUICK PEDAL LINKAGE CHANGE:* A change in linkage has been made to increase the clearance between brake pedal arm and idler lever arm. This consists of rotating arm on brake pedal slightly and lengthening brake linkage link which in turn increases clearance between arm of brake pedal and arm of idler lever. New brake pedals and old shorter links are not interchangeable. However, only new pedals are available for replacement which requires a new type link also.

►*1957 CADILLAC SILENCER SPRING ELIMINATION:* Effective Engine No. 012025 the brake drum silencer spring has been eliminated.

►*1957 CADILLAC "BUZZING" NOISE CORRECTION:* To eliminate "buzzing" or gurgling noise in power brakes caused by air trapped at control valve assembly, thoroughly bleed hydraulic system - twice if necessary. If condition is not corrected, check system carefully for leaks.

►*1957 HUDSON & NASH PARKING BRAKE PRODUCTION CHANGE:* A new parking brake cable bellcrank return spring is attached to bellcrank and torque tube. An anchor is welded to torque tube to hold it. Return spring hooks into eye of cotter key at bellcrank.

DESCRIPTION: Single anchor, "No-Eccentric", hydraulic type of same design used on corresponding previous models.

ADJUSTMENTS: Before attempting any adjustment, car should be placed on stands with all wheels free. Brake pedal should operate freely and there should be no bind in hand brake lever or cables.

Brake Pedal Adjustment: This adjustment should conform with recommendations before any other adjustment is made. See car model below.

Buick - Make sure large nut holding master cylinder to cowl is tight; tighten brake pedal mounting bracket attaching bolts. Measure from left top side of pedal pad perpendicular to toepan. With ruler pressed firmly against floor mat, pedal height should be 8" (standard brakes), 5½" (power brakes). Adjust by turning pushrod to obtain desired height. *NOTE:* On synchro-mesh cars pedal height same as clutch pedal.

Cadillac - With power brake pushrod in fully released position, pull carpet away from pedal-to-relay rod seal and check distance between pedal reinforcement and seal retainer. Distance should be 4 7/8" 1/8". Screw relay rod into or out of trunnion relay to obtain this distance.

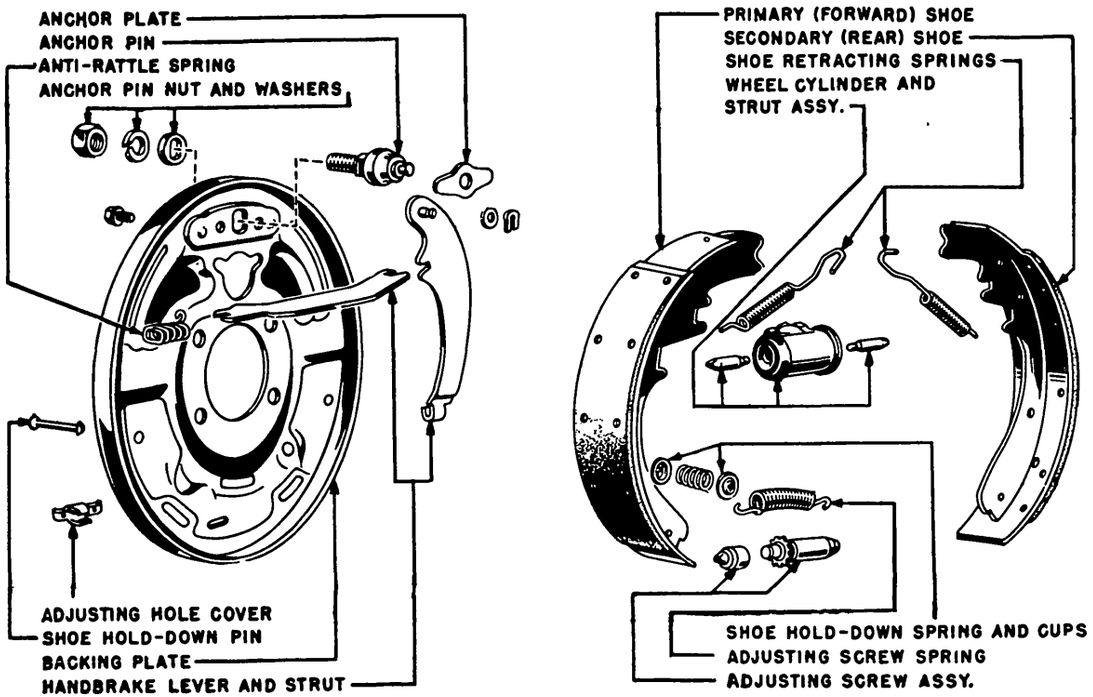
Hudson & Nash—Pedal free travel should be ¼-½" with master cylinder piston against stop. Adjust at master cylinder pushrod.

Oldsmobile—Adjust the master cylinder pushrod to obtain a minimum of 3/16" free travel. Pedal rubber bumper should be slightly compressed.

Packard—Brake pedal should have ¼" free play with master cylinder piston against stop. Adjust at master cylinder pushrod.

Pontiac—Brake pedal should have 4 3/8-4 5/8" clearance (distance from lower side of pedal pad to floor mat) with master cylinder piston against stop. Adjust at master cylinder pushrod.

Minor Wear Adjustment: Check and adjust brake pedal clearance (see Brake Pedal Adjustment), release hand brake lever, and see that cables are free and are not holding brake shoes against drum. At each wheel, expand brake shoes by turning adjusting screw up until wheel can just be turned by hand, adjust hand brake (cars where hand brake adjusted with shoes "expanded"-see Hand Brake Adjustment), then back off adjusting screw the number of notches or "clicks" as shown in table below. Check wheel for freedom of drag. If drag noted, tap backing plate to assist centralization of shoes, then recheck. If drag still exists, anchor pin adjustment may be in order. See Major adjustment.



Adjusting Screw Setting

Buick	© 15 Notches
Cadillac	14 Notches
Hudson	14 Notches
Nash	14 Notches
Oldsmobile	16 Notches
Pontiac	14 Notches

© - 17 Notches maximum.

Hudson Mechanical Follow-up Cable Adjustment: Disconnect cable from brake pedal and disconnect master cylinder piston pushrod from brake pedal. Place a 3½" spacer block between brake pedal rod pad and floor mat. Depress pedal rod until pad contacts spacer block; retain in that position and adjust the mechanical follow-up cable length at the clevis end so that the clevis pin can be installed freely with no slack in cable.

Major Adjustment (For New Shoes, Relined Brakes or when Minor adjustment not satisfactory): Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermediate lever, remove adjusting hole covers on backing plate and inspection hole cover on drums (remove wheels for access). Check Pedal Clearance (see Brake Pedal Adjustment). Adjust each wheel brake as specified by car manufacturer, given below.

BENDIX HYDRAULIC SINGLE ANCH R BRAKE ASSEMBLY

CONTINUED ON NEXT PAGE

BENDIX HYDRAULIC (Cont.)

CAUTION–If hand brake cables not disconnected or loosened, shoes may be held "ON" by cables.

Buick–Turn adjusting screw up to expand shoes until wheel can just be turned with both hands (if wheel off, drum should just turn with long bar). Back off 15 notches. (Max. 17 notches). Wheels should be free at approximately 6 notches. If not it indicates need for anchor pin adjustment or tight parking brake cables.

Anchor Pin Adjustment–Loosen the anchor pin nut just enough to permit anchor pin to slide in the slotted hole, (*CAUTION*–Loosening anchor pin nut too much will allow brake shoe spring to tilt pin), rap backing plate with hammer adjacent to anchor pin to insure anchor pin assuming central position between shoes, tighten anchor pin nut securely, then recheck drag. (If this has changed recheck anchor pin adjustment). Check and adjust hand brake (see Hand Brake Adjustment). Wheels should be free of any drag.

Cadillac - Loosen anchor pin lock nut ½ turn and tap anchor pin up with a hammer, then all the way down to bottom of its slot. On front wheels it will be necessary to loosen backing plate upper mounting studs slightly and tap anchor pin up, then all the way down to bottom of its slot. Turn adjusting star wheel to expand brakes until wheel can just be turned with two hands. Tap backing plate near anchor pin to raise it to a central position between shoes. Check brake drag. If centering of anchor pin has released brakes, increase expansion of shoes and reset anchor pin again. Repeat until there is no change in drag with change in anchor pin setting, then tighten anchor pin to 80-120 ft. lbs. torque. Loosen star wheel 14 notches, place .015" feeler through drum slot at bottom and rotate wheel until feeler is wedged between secondary shoe and drum. Primary shoe will be tight against drum for measuring secondary clearance. Reverse wheel rotation until .015" feeler is again at bottom and adjust star wheel to obtain .015" clearance. The clearance at top of shoe should now be .010". If upper clearance is greater or less than .010", loosen anchor pin locknut and reset anchor pin, tapping it up to increase clearance and down to decrease clearance. Reset clearance at lower end with star wheel and recheck upper clearance.

Oldsmobile - Expand shoes until heavy drag is felt on brake. Release all adjusting screws approximately 16 notches (until brake drums are free of drag) and replace adjusting screw hole covers. Move adjusting screw end at primary shoe against drum by inserting screw driver into slot provided in drum, then turn drum backward to force end of primary shoe against drum. Check clearance at anchor and adjusting ends of secondary shoes with .015" feeler inserted in brake drum slot. Clearance should be equal to within .002". If not adjust anchor and adjusting screw as required. *NOTE* - Clearance at anchor end should not be more than at adjusting screw end.

Pontiac - Insert a .015" feeler between lining and drum 1½" from adjusting screw end of secondary (rear) lining and expand shoes with adjusting screws until feeler gauge cannot be withdrawn. Back off adjusting screw until only a slight drag is felt on feeler gauge. *NOTE* - this ensures that shoes are against anchor pin and primary shoe is against drum. Withdraw feeler gauge and insert it between lining and drum about 1½" from anchor pin end of secondary lining. This should give slightly heavier drag than near adjusting screw. Adjust anchor pin to get this adjustment. Tighten anchor pin to 75 ft. lbs. Complete adjustment as shown in minor adjustment above, and hand brake adjustment below.

Eccentric Anchor Pin–Pin has square end and can be turned with a wrench after nut has been loosened. Turn pin in direction of forward wheel rotation to decrease clearance. End of anchor pin is beveled and high point indicates high side of eccentric cam. Hold pin with wrench while tightening nut.

Packard–Insert a .015" feeler gauge through inspection hole in drum at point 1½" above lower end of secondary shoe. Expand the adjusting screw (star wheel) until a slight drag is felt on the feeler. Remove feeler and insert a .010" feeler through inspection hole in drum at a point 1½" from upper end of secondary shoe. If clearance not within limits, loosen anchor pin locknut and adjust anchor pin. Turn anchor in direction of forward wheel rotation to decrease clearance. At the same time readjust the adjusting screw to maintain .015" clearance at lower end of shoe. Hold anchor in set position and tighten locknut. Turn clearance adjusting screw (star wheel) until drum can just be turned with both hands, then back off screw until drum turns free.

Hand (Parking) Brake Adjustment: *CAUTION–Brake shoes must be expanded on some cars when adjusting hand brake cables.* Adjust each car as follows:

Buick - *CAUTION* - Do not attempt to adjust parking brakes by simply tightening adjusting nut at brake cable sheave. Pull on both ends of rear brake cable to make sure cables operate rear brake shoes freely and do not bind in conduits. Cable must be free in sheave and spring must return lever to fully released position. Adjust brakes at anchor and adjustment screw as described in minor or major brake adjustment. Never make this adjustment without first making a minor brake adjustment. *NOTE* - When brake lever is in fully released position, signal switch plunger must be depressed 3/16". Adjust by loosening mounting screws and relocating switch.

Cadillac–Adjust the locknut on the equalizer link to obtain 1/8" clearance between the rear edge of the rear relay lever and end of slot in the frame X-member. Do not expand rear brake shoes. Adjust the equalizer lock nut until the rear brake cables are taut. Attach spring scale to hand brake lever and apply a pull of 50 lbs. Measure the distance the hand brake lever has moved from its fully released position. This should be 2 1/8-2 3/8" or 7 notches. Readjust cable tension, if necessary to obtain this amount of movement with 50 lb. pull. Recheck front cable for equalizer 1/8" clearance described above.

Hudson & Nash–Withdraw hand brake lever to rear to provide a 3½" clearance between hand brake lever handle and bracket face. With lever in this position, tighten hand brake cable at equalizer to a point where rear brakes are fully applied. This will prevent possible brake drag. To release parking brake, apply brake pedal pressure, turn the parking brake handle counterclockwise 70°, and push it into released position.

Oldsmobile - Release parking brake, and make minor brake adjustment if there is excessive brake pedal travel. Adjust front cable so that the intermediate lever is held from seating itself on end of the seat in left hand "X" member by ½". Adjust rear brake cables to remove all possible slack without moving brake shoes from released position. Distribute the adjustment between cables so that equalizer link is 90° to the propellor shaft when clevis pin installed. Lock clevis jam nuts and install cotter pins. Install clevis pins with head at top.

Packard–Tighten adjusting screws until wheel can just be turned by hand. Pull hand lever to first notch on ratchet. Adjust clevis on hand brake cable so that the clevis pin can be easily installed without any slack in the cable. Release hand brake lever. Back off adjusting screw at each wheel until wheel turns freely. Apply hand brake and check equalization by turning each wheel by hand. If not equal loosen adjusting screw on the tighter brake. Replace hole covers and road test.

Pontiac–Apply hand brake to first notch and check equalization. Loosen adjusting screw of tightest brake if not equal. If more than a few notches are required, loosen clamp screws on spreader and pull downward on the tight side of cable. This should equalize cable. Tighten spreader clamp screws while hand brake lever is still in the applied position. Brake cables are sufficiently tight if rear wheels can barely be turned by hand with lever in the first notch. When lever fully released, wheels should turn freely with cable pulled down approximately 1½" by gripping cable midway between conduit and clearance hole through frame X-member. When adjusting rear end of front cable for close adjustment for tension, be sure to turn clevis on or off cable end but do not twist cable. Coarse adjustment is secured by selecting the correct hole in the spreader.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

▷ *BLEEDING POWER BRAKE NOTE:* Bleed power brake master cylinder first by attaching bleeder drain hose to fitting on end of master cylinder, backing off fitting ¾ of a turn and bleed fluid into a partially full bottle of clean brake fluid until bubbles cease. Then proceed as for standard master cylinder.

▷ *BUICK FILLING & BLEEDING CAUTION:* Avoid spilling fluid on backing plates of finned aluminum drums as the perforated construction of these drums may cause fluid to come into contact with linings and cause damage.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

CHRYSLER, DE SOTO, DODGE & PLYMOUTH "CENTER PLANE" & "TOTAL CONTACT"

Chrysler & Imperial, All Models (1957)
DeSoto, All Models (1957)
Dodge, All Models (1957)
Plymouth, All Models (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*BRAKE "SQUEAK" CORRECTION:* To correct brake squeaks or other brake noises, proceed as follows:

1) Torque axle housing to rear spring U-bolt nuts to a specified torque of 65-80 ft. lbs.
2) Inspect for out of round drums, distorted support plates, or loose anchor pins. To correct loose anchor pins, remove support plates, check alignment, place support plate with the pin resting in vise, repeen end of pin until it is tight.
3) Torque the five rear wheel brake support to axle bolt nuts to 35 ft. lbs. The four front wheel brake support bolt nuts must be torqued to 55 ft. lbs.
4) Brake shoe guide spring, Part No. 1484680, which is held in place by the retainer, Part No. 1486945, must be very tight against brake shoe and support. Loose guide springs should be bent to restore their tension. The retainer must not exceed specifications of 15/32", measured between inside ends.

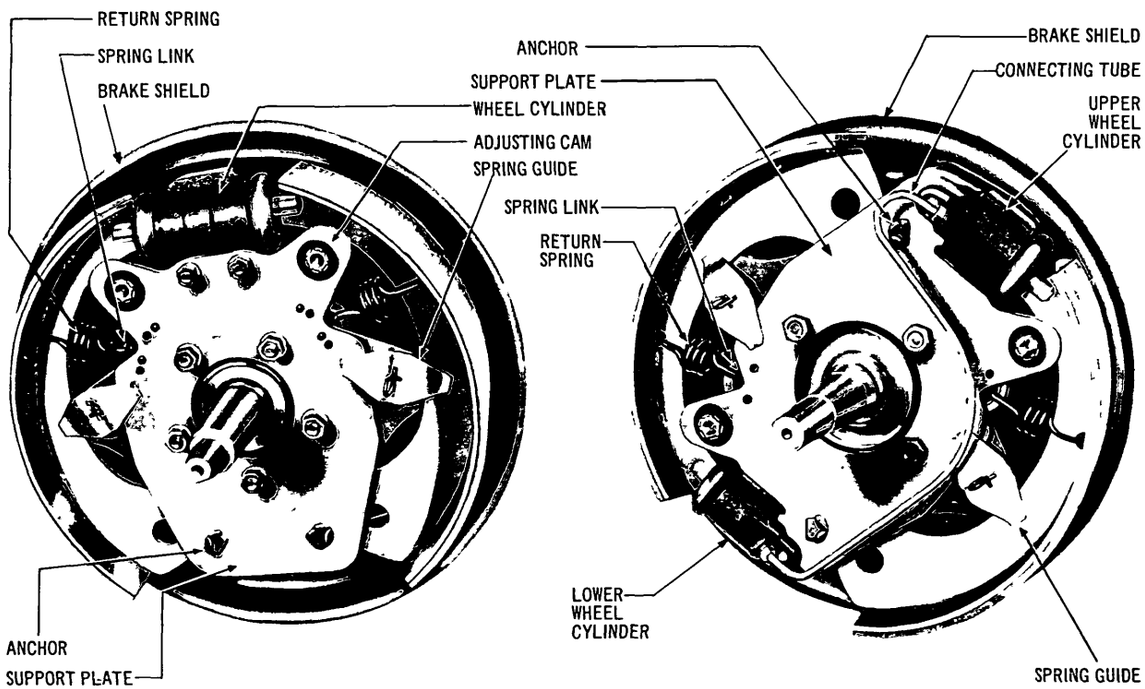
►*REAR WHEEL REMOVAL CAUTION:* **Do not apply service brakes to hold shoes against drum while using wheel puller.** To hold hub and drum from turning while using wheel puller back off brake shoes from drum with adjusting cams. Apply hand brake and allow one rear wheel to remain on floor, or block wheel in suitable manner.

DESCRIPTION: These hydraulic brakes have two floating shoes mounted between two plates located on the center plane of the lining. On front wheel brakes, two single piston cylinders (single action) are attached to the support plate assembly, the upper cylinder actuating the front shoe, and the lower cylinder actuating the rear shoe. On rear wheel brakes, one double piston cylinder (double action) is attached to the top of the support plate assembly and actuates both brake shoes. An anchor pin in support plate assembly holds spring link in a fixed position at one end. The other end of link is positioned by brake shoe adjusting cam, providing a constant-loaded spring length. Side rattle and twisting of shoe is controlled by spring guide, which maintains a constant pressure against side of web of shoe holding shoe against support plate.

ADJUSTMENTS: Place car on stands, so that all four wheels are free. Check master cylinder and see that fluid level is not over ½" below top of cylinder. Place parking brake lever in fully released position.

Brake Pedal Adjustment: Release locknut on brake pedal to master cylinder pushrod and rotate rod to obtain specified clearance.
Standard Brakes - 1/32-1/8" (Chrysler), 1/8-1/4" (Others).
Power Brakes - 1/16-1/8" (De Soto, Plymouth); 1/32-1/8" (Dodge, Chrysler).

Front Wheel Adjustment: Turn each adjusting cam on both front shoes in the direction of FORWARD wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.



Rear Wheel Adjustment: Turn front shoe adjusting cam in direction of **forward** wheel rotation and rear shoe adjusting cam in direction of **reverse** wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction until no drag is felt.

►*RELINED OR NEW SHOE ADJUSTMENT NOTE* – Apply brake pedal prior to adjusting brakes to properly center shoes in brake drum and to assist in adjustment.

Hand Brake Adjustment: Hand Brake is independent type mounted on drive shaft at rear of transmission. *See Car Model Pages and individual model Special Data Pages.*

BLEEDING BRAKE SYSTEM: Use compressed air refiller, Tool C-3496 attached to master cylinder to keep master cylinder filled. Back off adjusting cams all the way, then starting with right rear wheel cylinder, attach bleeder hose, Tool C-650 to valve, with other end in jar partially filled with brake fluid. Bleed intermittently, opening and closing valve (at wheel cylinder) until fluid runs out of bleeder hose in a solid stream without bubbles. Repeat this operation on left rear wheel, right front wheel and finally left front wheel. At front wheels (with two cylinders), bleed lower cylinder first to force air out of connecting line to upper cylinder, then bleed upper cylinder. Repeat bleeding operation if brake action indicates air still in lines. Readjust cams after completing bleeding operation.

BRAKE SHOE REPLACEMENT: Removal - 1) Remove wheel, hub and drum assembly using puller C-845 to remove drum assembly.
2) Insert wrench C-3462, in the inner support plate hole, with tool cam slot engaging the spring hook. Turn tool handle to disengage spring from spring link, and turn handle in opposite direction to release the spring. Remove both springs in this manner. *CAUTION* - Do not use brake spring pliers or damage to lining will result.
3) Turn brake shoe guide spring retainer 1/4 turn and remove (the lip on end of spring is for correct positioning on outer support assembly). Slide shoes from support assembly.
Installation: 1) Position brake shoe in support plate,

REAR WHEEL BRAKE **FRONT WHEEL BRAKE**

CENTER PLANE BRAKE ASSEMBLIES

CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE & PLYMOUTH "CENTER PLANE" & "TOTAL CONTACT" (Cont.)

(make sure that wheel cylinder pushrods properly engage toe end of shoes and that shoes are in alignment).

2) Check tension of springs which should be 70 lbs. plus or minus 5 lbs., installed length. This can be checked by hooking a scale at toe end of shoe and pulling shoe away from wheel cylinder. Scale should read 35-45 lbs., before contact is broken between web of shoe and wheel cylinder.

LINING REPLACEMENT: Drum diameter should not exceed .004" out of round at any point. Grind lining to specified clearance of .010"-.024" below drum diameter.

WHEEL CYLINDER & SUPPORT PLATE: Removal & Disassembly 1) Disconnect flexible brake hose at wheel cylinder (upper cylinder on front), and remove wheel cylinder mounting screws and lockwashers at rear of brake shield.

2) Remove support plate mounting bolts and remove support plate with wheel cylinders and connector tube attached.

3) With assembly on bench, remove cylinder connector tube and wheel cylinders.

Assembly & Installation: 1) Assemble wheel cylinders on support plate. (Install connector tube on front assembly).

2) Position support plate on brake shield and install cylinder mounting screws and lockwasners, but do not tighten.

3) Install support plate bolts, lockwashers and nuts. Tighten to 35 ft. lbs. and cylinder mounting screws to 20 ft. lbs.

WHEEL CYLINDER OVERHAUL: Wheel cylinder pistons that are badly scored or corroded should be replaced. Use new piston cups when reconditioning cylinders. Cylinder walls that have light scratches, or show signs or corrosion, can usually be cleaned up with crocus cloth. Cylinders that have deep scratches or scoring, may be honed using Tool C-3080. Diameter of cylinder bore should not be increased more than .002". If a cylinder does not clean up at .002" it should be replaced *(NOTE* - Black stains on cylinder walls are caused by piston cups and will do no harm).

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual.*

BENDIX (LOCKHEED) SELF-CENTERING

Rambler 6 Cyl. 5710 Series (Before Serial No. D-360492) (1957)
Willys, All Models (1957)

► *NOTE:* Later Rambler 6 cyl. cars have Wagner-Lockheed self-centering brakes.

► *WILLYS FORWARD CONTROL MASTER CYLINDER NOTE:* Master cylinder mounted on inside front panel of cab, just underneath instrument panel. Access to filler plug is through hole cover on panel to right of speedometer.

DESCRIPTION: "Self-centering" hydraulic type with non-adjustable anchor ramps for each shoe.

ADJUSTMENT: Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (see below), fully release hand brake and make certain that rear wheels are free, then adjust each wheel as follows:

Brake Shoe Adjustment (For Wear or New Linings):

► *CAUTION: Brake shoes must be "centralized" by several hard brake applications before adjusting.*

Eccentric Adjustment - Adjust eccentric for each brake shoe by turning eccentric out until brake shoe firmly applied and wheel is locked, then back eccentric off until wheel just rotates freely without drag. Shoe clearance will then be approximately .010".

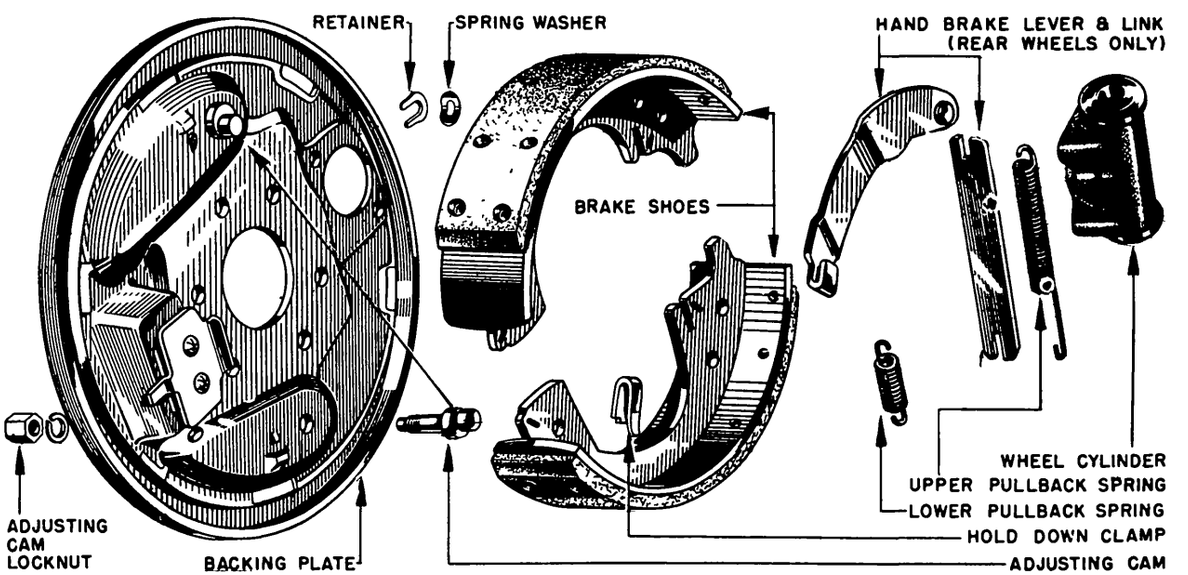
Anchor Lip Adjustment - Pressure required to pull shoe outward from support plate should be 15 lbs. Measure with spring scale hooked in end of shoe. Adjust by bending anchor lip slightly toward brake support plate to obtain this 15 lb. coil spring pressure to hold shoes on support plate ledges.

Hand Brake Adjustment: Remove all slack from rear wheel brake cables as follows:

Rambler - Withdraw hand brake lever to rear to provide a 3½" clearance between hand brake lever handle and bracket face. With lever in this position, tighten the hand brake cable at equalizer to a point where rear brakes are fully applied. This will prevent possible brake drag. Release control handle fully and see that wheels are free of any drag.

Willys, All Models Except Jeep - Pull hand lever "on" three notches, loosen front nut on connecting link between intermediate lever on frame crossmember and rear cable equalizer, tighten rear nut on link until slight drag noted at each rear wheel, then tighten front nut to lock adjustment. Release hand lever and check for freedom from drag.

CJ-5, 6, & 3B Jeep; & Forward Control - Hand brake is independent internal expanding type, mounted on rear of transfer case. *For adjustment procedure see Car Model pages.*



Brake Pedal Adjustment: Adjust master cylinder pushrod by loosening locknut and turning rod for following pedal free travel with master cylinder piston and pushrod back against stop:

Brake Pedal Free Travel

Rambler	¼-½"
Willys	½"min.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual for complete data.*

TROUBLE SHOOTING: *See "Hydraulic Brake Troubl Shooting" in Brake Section of Manual.*

BENDIX (LOCKHEED) SELF-CENTERING REAR BRAKE (FR NT SIMILAR EXCEPT HAND BRAKE PARTS MITTED)

WAGNER (LOCKHEED) SELF-CENTERING

Packard Clipper (1957)
Rambler 6 Cyl. 5710 Series Beginning Serial No. D-360492 (1957)
Rambler V8 5720 Series (1957)
Studebaker, All Models (1957)

►CHANGES & CORRECTIONS

►*RAMBLER PRODUCTION CHANGE NOTE:* Bendix (Lockheed) Self-centering type used on earlier cars.

►*STUDEBAKER & PACKARD FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary lining is ¼" thick **(Champion),** 7/32" thick (all other **Studebakers & Packard)** (3/16" on all other shoes), and is preground off-center at the factory to eliminate brake squeal. This lining is applied to the full length of the shoe, and is marked "Secondary" and "Top" and should be installed as marked.

DESCRIPTION: Wagner-Lockheed Hydraulic self-centering and self-energizing type (with Bendix type brake shoe assemblies). Brakes are not self adjusting. A self-centering device is used.

Rambler Rear Brake Cylinder - Single piston type, mounted on backing plate, linked to primary shoe.

Self-centering Device - The upper anchor pin end of each brake shoe rests against a wedge-shaped anchor block which is mounted on fixed brake anchor pin (shoes do not contact anchor pin directly) so that the shoes are free to move radially. The wide edge of the anchor block is toward the top. When the brakes are applied, the lining surface pressure tends to force the shoe to adjust its position on the block and center itself in the drum. This centering action takes place on light, or heavy brake application and is continuous with drum expansion. The anchor plate aids in keeping the shoes properly aligned at the self-centering block.

Adjusting Device - Consists of a "star wheel" adjusting screw and stud assembly mounted between the lower ends of the two brake shoes (similar to Bendix Duo-servo brake shoe assemblies). Adjusting screw spring serves a dual purpose, holding the shoes against notches of adjusting screw, and binding against ratchet on screw to serve as a screw lock.

ADJUSTMENTS: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid level is ½" below top of cylinder. Place parking brake handle in fully released position. Adjust as follows:

Rambler Brake Pedal Free Travel Adjustment: Adjust the brake pedal play ¼" to ½" by rotating the master cylinder piston pushrod to brake pedal attaching eccentric bolt.

Studebaker & Packard Brake Pedal Free Travel Adjustment: Loosen locknut on brake pedal-to-master cylinder rod, turn master cylinder rod until free travel is ¼" – 3/8" (Manual brakes), or 1/8" – ¼" (Power brakes).

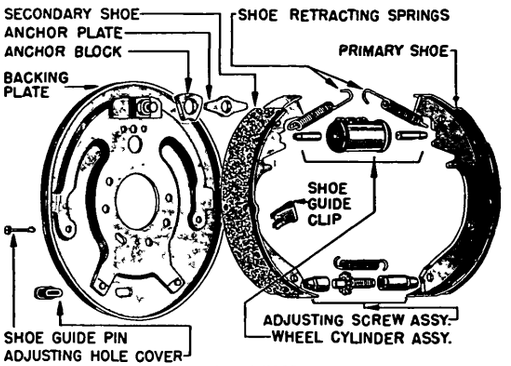
Brak Sh Adjustment: Remove adjusting hole cover from backing plate, insert screwdriver or special adjusting tool through adjusting hole and turn adjusting screw to expand shoes until drum is just locked (pivot tool on edge of slot, move handle upward to expand shoes). Then back off the adjusting screw 10 notches (Rambler), 8 notches or clicks (Others) move if necessary until drum is free of any drag. Replace adjusting hole cover, adjust parking brake.

Rambler Parking Brake Adjustment: Withdraw the hand brake lever to the rear to provide a 3½" clearance between the hand brake lever handle and bracket. With the lever in this position, tighten the hand brake cable at the equalizer to a point where the rear brakes are fully applied. This will prevent possible brake drag. Release control handle fully and see that wheels are free of any drag.

Studebaker & Packard Parking Brake Adjustment: Set control handle four notches from the fully released position. Adjust rear wheel cables at equalizer on frame side rail by backing off front nut and tightening rear nut until all slack is removed from cables and a heavy a drag noted when rotating rear wheels by hand, tighten front adjusting nut. Release control handle fully and see that wheels are free of any drag.

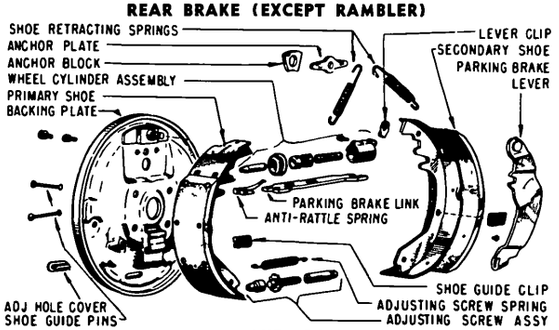
BRAKE SHOE REMOVAL & INSTALLATION:

Removal: Install wheel cylinder clamp to prevent hydraulic system leakage. Unhook the two shoe return springs at anchor. On rear brakes, swing the hand brake lever on the secondary shoe toward the axle to slacken cable. Lift cable from lever slot. Compress and remove hold-down spring clip on each shoe. Spread shoes and lift off brake support plate. On rear brakes, remove parking brake link and anti-rattle spring. Separate shoes by removing star wheel adjusting assembly and spring. On rear brakes, pull clip from parking brake lever mounted on secondary shoe and remove lever from shoe. Anchor plate and anchor block may now be lifted from anchor pin.



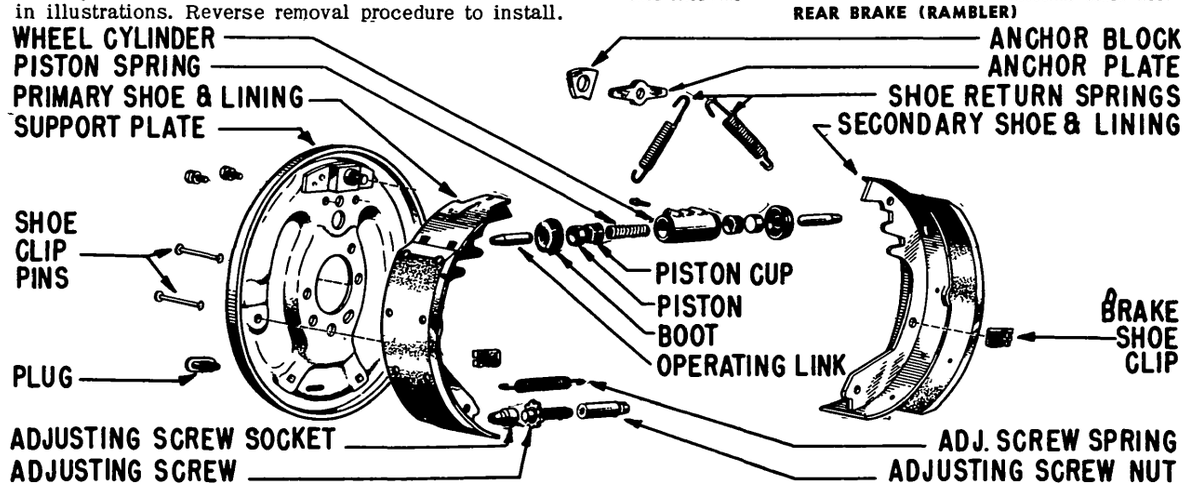
Installation: Reverse the removal procedure. *NOTE* - On Champion and Silver Hawk - 6, the parking brake lever is mounted on outer side of shoe web, inner side on all other models.

WHEEL CYLINDER: Removal & Disassembly - Disconnect flexible hose from cylinder. Remove screws attaching cylinder to backing plate. Remove cylinder.



Assembly & Installation: Assemble cylinders as shown in illustrations. Reverse removal procedure to install.

BLEEDING BRAKE SYSTEM & OVERHAULING OF MASTER CYLINDER & WHEEL CYLINDERS: *See "Hydraulic Brake Servicing" in Brake Section of Manual and note the following: CAUTION* - To bleed power brakes, engine must be stopped and no vacuum in power brake system. *NOTE* - On Studebaker equipped with power brake and/or hill holder, these units must be bled before the rest of the system.



TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

REAR BRAKE (EXCEPT RAMBLER)

REAR BRAKE (RAMBLER)

FRONT BRAKE (INCLUDING RAMBLER)

CHEVROLET-BENDIX HYDRAULIC

Chevr l t Pass. Cars, All Models (1957)
Ch vr l t Corvett (1957)
Chevr l t Trucks, 3. 4. 5. & 6000 Series except 1½ & 2 Ton R ar Brakes (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*PASS. CARS & HALF TON BRAKE SHOE GRINDING CAUTION:* If bench type grinder used, grind shoes to .057- 087" smaller diameter than drum size If spindle type grinder used, grind shoe to drum diameter.

►*POWER BRAKE NOTE·* Bendix Power Unit optional on passenger cars. Hydrovac Power Unit optional on trucks. *See "Bendix Power Unit" or "Hydrovac Power Unit" under Power Brakes.*

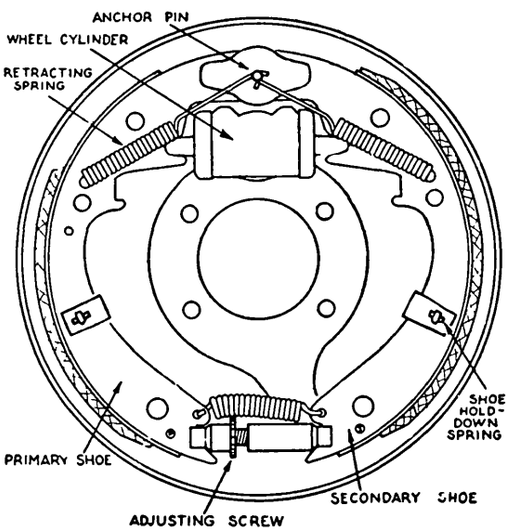
DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric adjustment.

ADJUSTMENT: Adjustments are made differently for wear (Minor Adjustment) and for new lining or shoe assemblies (Major Adjustment). Major adjustment should also be made whenever a minor adjustment is not satisfactory.

Brak P dal Adjustm nt: Before adjustments made, make sure pedal returns to fully released position freely, with no binding, and that pedal retracting spring has not lost its tension.

Passenger Cars - 1/8"-3/8" pedal movement before contact of pushrod and main cylinder piston. To adjust, loosen check nut on clevis. Turn pushrod in proper direction to secure adjustment. Tighten check nut on clevis.

Trucks (F rward Control)–¾' clearance between top of pedal arm and toe board. To adjust, loosen check nut at rear of clevis on main cylinder pushrod. Turn main cylinder pushrod by knurled portion ahead of boot, in proper direction to secure desired clearance. Tighten check nut.



Trucks (Others)– 1¾' (Low Cab Forward), 11/16' (Others except Fwd. Control), clearance between upper corner of lower pedal arm and seal around upper pedal arm in toe board. To adjust, remove cotter pin and loosen castle nut on adjusting bolt, then rotate adjusting bolt in required direction to obtain desired clearance, tighten adjusting bolt nut, recheck clearance, reinstall cotter pin in adjusting bolt nut.

Minor Adjustment (For Wear): Jack all wheels clear of floor. On passenger cars, loosen check nut at brake cable equalizer to remove tension from brake cable. On trucks, disassemble clevis of parking brake pull rod. On all cars and trucks, remove adjusting hole covers from flange plates. Expand brake shoes by turning adjusting screw with Tool J-4707 until a light uniform drag is felt on brake drum (move outer end of tool toward center of wheel to expand shoes). On passenger cars and ½ Ton truck, turn adjusting screw in opposite direction 7 notches to relieve brake drag. On all other truck models, back off adjusting screw just enough to eliminate drum drag (not to exceed 7 notches). *(NOTE–* If more than 7 notches required to eliminate drag, a Major Adjustment is required). Replace adjusting hole covers. Reconnect and adjust parking brake (see Hand (Parking) Brake below). Check brake pedal clearance (see above).

Major Adjustment (New or Relined Shoes): Pass. Cars & ½ Ton Trucks and Trucks (other than ½ Ton) adjusted differently *See "Pass Cars & ½ Ton Brake Shoe Grinding Caution" above*

Pass. Cars & ½ Ton Trucks - Same as Minor Adjustment above *See "Pass Cars & ½ Ton Truck Caution" above.*

¾ & 1 Ton (All Brakes), 1½ & 2 Ton (Front Brakes): Loosen anchor pin nut just enough so that pin can be rotated *(CAUTION–*if nut loosened too much, brake springs will tilt anchor pin). With tool J-4707, turn brake adjusting screw to expand brake shoes until a heavy drag is felt on the drum. Tap brake flange plate and turn eccentric pin in direction tending to reduce drag by allowing shoes to center in drum. If drag on drum is reduced, expand shoes by tightening adjusting screw several more notches and again turn eccentric anchor pin while tapping brake flange plate Repeat this operation until drag remains constant. Then tighten anchor pin nut to 60-85 ft. lbs. torque (¾ Ton Front & Rear Brakes, 1 Ton Front Brakes), 125-150 ft. lbs. torque (1 Ton Rear Brakes, 1½ & 2 Ton Front Brakes). Back off adjusting screw just enough to eliminate drag but **not more than 7 notches.** If more than 7 notches required to eliminate drag, repeat adjustment procedure. Adjust parking brake (below). *NOTE–*If heavy intermittent drag noted, brake drums should be rebored and new linings installed.

FRONT BRAKE ASSEMBLY

HAND (PARKING) BRAKE: Passenger Cars and ½ & ¾ Ton Trucks adjusted differently. 1, 1½, 2 and some ¾ Ton Trucks have propeller shaft mounted parking brakes. *CAUTION–*Service brakes must be properly adjusted before making parking brake adjustment.

Adjustm nt (Pass. Cars): Jack up both rear wheels. Check clearance between idler lever and mounting bracket at equalizer (approximately ¼"). To correct, disconnect equalizer, tighten check nuts on forward cable. Pull hand brake out 7 "clicks" (not same as notches). Loosen forward check nuts on equalizer and tighten rear one until there is a slight drag on both rear wheels when rotating drums. Tighten check nuts securely. Set parking lever back to 2 clicks from full release position, at which point no brake shoe drag should be felt

Adjustment (½ & ¾ Ton Trucks using cable connected to rear wheel service brakes) Jack up both rear wheels. If clevis of parking brake disassembled, place parking brake lever in fully released position, then install clevis to brake pull rod to obtain a dimension of 1 7/16" from end of pull rod to centerline of clevis. With parking brake lever in fully released position and pull back spring in place, adjust parking brake cable at idler lever to obtain a clearance of ¼" between idler lever and rear end of slot in guide. Pull hand brake lever back four notches from fully released position. Pull cables out of conduits by hand as far as possible and assemble cables into idler lever links. Tighten nuts and locknuts. Pull back hand lever until heavy drag is felt at one wheel. Check other wheel for drag, and if any difference is noted, loosen tight wheel until equal drag is obtained. With hand lever pulled out nine notches both rear wheels should be locked so that they cannot be turned by hand. *NOTE–*If more than nine notches are required to lock brakes, check service brake adjustment

Adjustment (¾ & 1 Ton Trucks using propeller shaft mounted parking brakes)· Place the hand brake lever in fully released notch of ratchet sector Loosen locknut on brake pull rod Remove cotter pin from clevis pin holding brake rod to brake cam (leave loose) Set brake cam rest flat on upper brake band bracket Back off adjusting nuts (at lower end of spring) and adjusting nut at top of adjusting bolt (bolt joins lower part of band to bracket) *(CAUTION–*Do not remove nuts, loosen only) Remove lock wire from anchor screw Adjust anchor screw until there is 010- 015"clearance between lining and drum at anchor screw Tighten adjusting bolt (bolt without spring) until there is 020" clearance between drum and lower end of brake band Tighten locknut Tighten adjusting nut at lower end of spring until there is 020" clearance between drum and upper end of brake band Tighten locknut Adjust brake pull rod so clevis pin can be installed while brake cam rests flat on upper brake band bracket Install cotter pin in clevis pin of brake pull rod and tighten locknut on brake pull rod Install lock wire on anchor screw Recheck all points of facing for correct clearances

Adjustment (1½ & 2 Ton Trucks): Propeller shaft mounted, shoe type. *See "Chevrolet Twinplex" for data.*

BLEEDING BRAKE SYSTEM: *See "Hydraulic Brake Servicing" in Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual.*

BRAKE SHOE REPLACEMENT: *See "Chevrolet-Bendix Hydraulic" in 1954 Annual Data or later Manual edition.*

CHEVROLET TRUCK TWINPLEX

Chevrolet Trucks 4, 5, & 6000 Series (1½ & 2 Ton) (1957) Rear Wheels Only.

►*BRAKE BOOSTER NOTE* Hydrovac Power Unit Standard on 2 Ton and 1½ Ton Special Models, Optional on others

DESCRIPTION: Two cylinder, four anchor type (each shoe anchored at each end and linked to wheel cylinder at each end) Brakes are radially self-centering

ADJUSTMENT: Each shoe has one adjustment (adjusting screw at adjustable anchor end) Adjustment is same for both wear and for new or relined shoe clearance

Brake Pedal Adjustment: *See "Chevrolet-Bendix Hydraulic" for data.*

Brake Shoe Adjustment: Jack up both rear wheels, remove adjusting hole covers from backing plates (two holes at each wheel—one for each shoe) Use tool J-4707 or screwdriver inserted through rear (lower shoe) adjusting hole and turn adjusting screw up (move outer end of tool toward center of wheel) until light brake drag is felt on wheel then back off adjusting screw 3 notches for correct running clearance Adjust upper shoe similarly by inserting tool through front adjusting hole

Parking (Hand Brake) Adjustment: Parking brake is independent type mounted on propeller shaft at rear of transmission

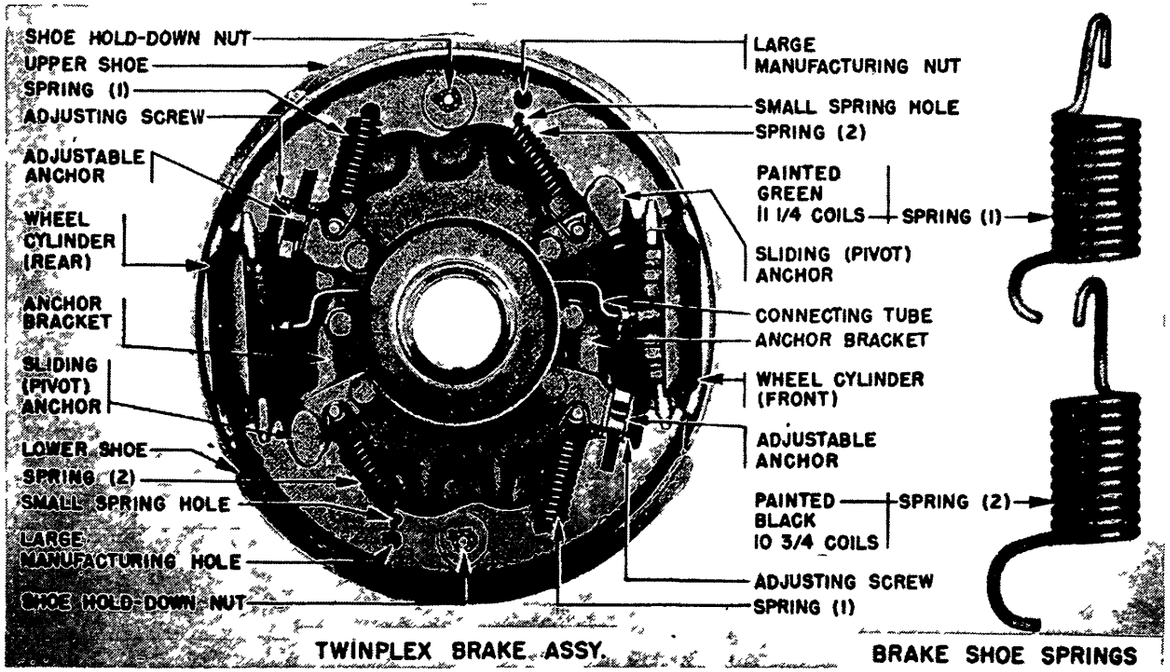
1½ & 2 Ton—Fully release brake lever Loosen locknut on outer shoe adjusting screw then tighten to secure a clearance of 010" to 015" measured at point directly above screw Tighten locknut Loosen locknut on link between hand brake lever and shoe actuating lever Tighten adjusting nut on link to secure a clearance of 010" to 015" between inner shoe and drum Tighten locknut

BLEEDING BRAKE SYSTEM: Pressure or manual methods can be used.

Pressure Bleeding: **1)** Back off adjusting screw all the way on upper shoes of both rear wheels Fill master cylinder reservoir to top of filler plug opening. Connect pressure bleeder to master cylinder and open valve in bleeder tank line *(NOTE*—Bleeder tank should be charged with 25-35 lbs air pressure and kept at approximately this pressure during bleeding operation. End of bleeder tube must be in a bleeder jar or bottle and covered with fluid while performing all bleeding operations).

2) Connect bleeder tube to bleeder valves in following sequence, open bleeder valve and bleed until all air bubbles disappear, then close bleeder valve. Sequence as follows.

a) Hydrovac slave cylinder (bleeder valve on end cap). *NOTE* - Will take approximately ½ pint of fluid.
b) Hydrovac valve (bleeder valve on top of control valve).
c) Left rear wheel, front cylinder.
d) Right rear wheel, front cylinder.
e) Left front wheel.
f) Right front wheel.



3) Adjust upper shoe on each rear wheel with pressure tank still connected Push down hard on brake pedal several times to centralize shoes Disconnect pressure tank and readjust all brake shoes

4) Apply approximately 75 lbs. pressure on brake pedal and check pedal clearance from toe board to forward edge of pedal pad Clearance should be a minimum of 5" with floor mat removed. If reserve less than 5", rebleed Hydrovac and rear brakes in sequence outlined above

Manual Bleeding: **1)** Install adapter and automatic filler J-713. Connect bleeder tube to Hydrovac bleeder valve (on end cap). Place end of tube in container having sufficient fluid to cover end of tube.

2) Open bleeder valve approximately ¾ of a turn, depress brake pedal a full stroke and allow it to return slowly, making sure end of tube is under surface of liquid in container Continue operating pedal, refilling jar at master cylinder when necessary, until liquid emerging from bleeder tube is air bubble free Close bleeder valve. Proceed to bleed system as outlined in steps **2) b)** through **f), 3) and 4)** under "Pressure Bleeding" above, using automatic filler in place of pressure tank.

TROUBLE SHOOTING: *See "Hydraulic Brak Troubl Shooting" in Manual.*

M rcury, All M d ls (1957 Early)
Thunderbird (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 FORD ANCHOR PIN BOLT TORQUE:* Torque specifications for front brake anchor pin attaching bolt is 80-100 ft. lbs. When checking sources of trouble for a brake pulling condition, it is recommended that anchor pin bolt be backed off and retightened to 80-100 ft. lbs.

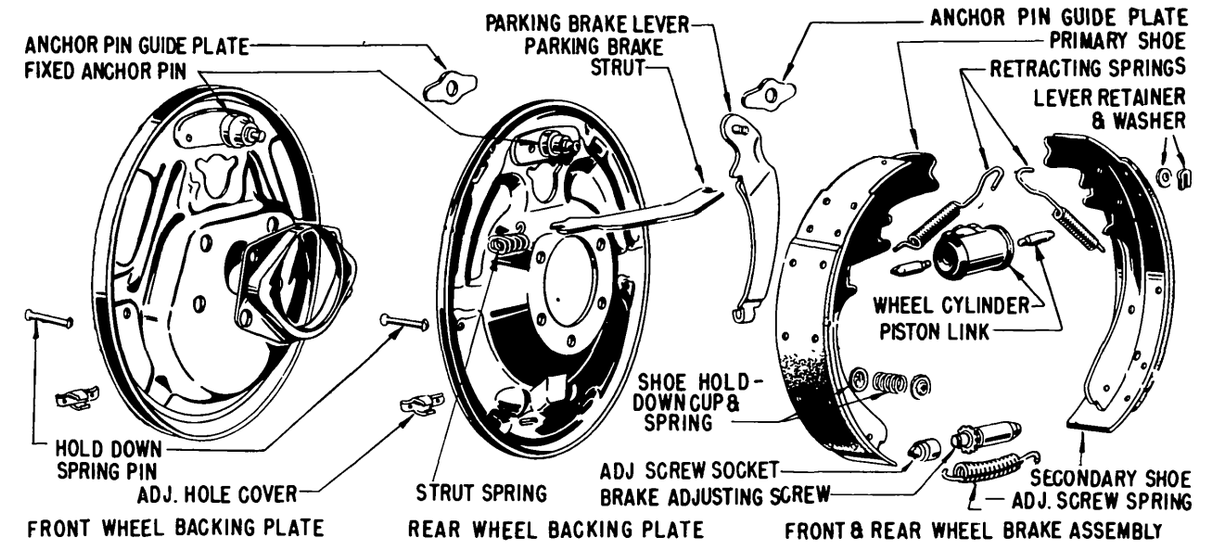
►*1957 MERCURY BRAKE HOSE RUBBING CORRECTION (EARLY CARS):* Rear brake hose may rub on left rear shock absorber. To correct, install new rear axle brake tube fitting Part No. MG-2074-B. *NOTE - Station wagons use Part No. MG-2074-A only.* If old fitting used, twist hose by removing from brake tube and twisting counterclockwise 1 hex flat.

►*1957 MERCURY REAR BRAKE HOSE TENSION CORRECTION (EARLY CARS):* Rear brake hose on some early cars may be under tension. Correct by bending frame bracket tab approximately ¼" to rear *(CAUTION - Do not damage connection between hose and brake tube),* or install ¾" longer hose, Part No. ED-MA-2078-A.

►*1957 MERCURY SPONGY PARKING BRAKE CABLE CORRECTION (EARLY CARS):* If cable has spongy feel, install dash panel retaining clip, Part No. 361767-S8-UP. Drill 13/64" hole in upper portion of "Y" dash panel reinforcement. Install clip with ¼" x 20 self-tapping screw no longer than ½". *CAUTION* - Cable must be free of binding and kinking and not interfere with speedometer cable.

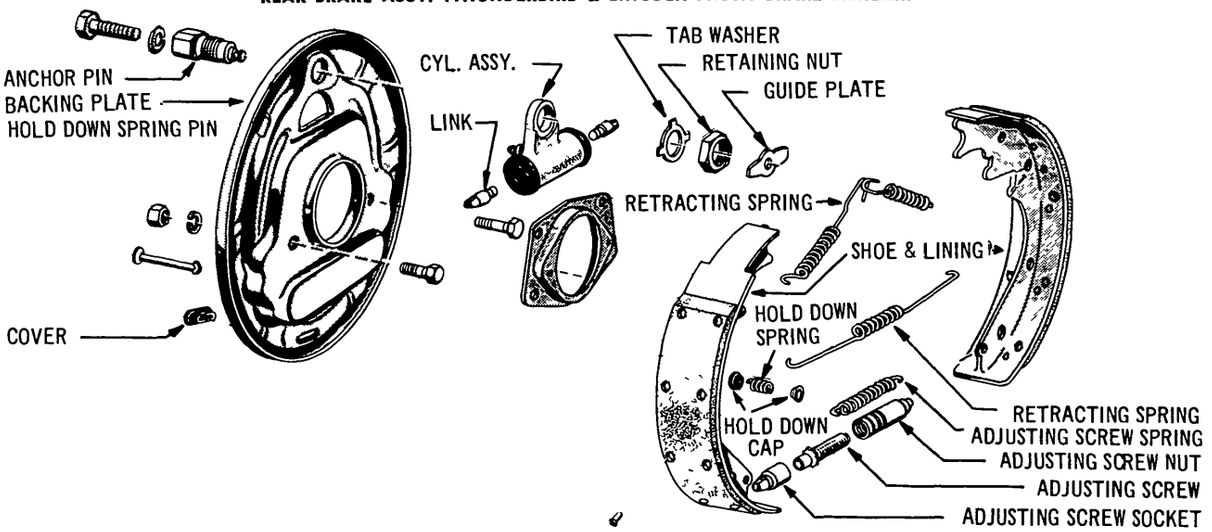
►*1957 MERCURY PARKING BRAKE SPECIFICATION CHANGE:* Two equalizer lever retracting springs installed on later cars to assure positive release of parking brake. When releasing difficulties occur install the second spring, Part No. MG-22794-A. *NOTE - It is important that b fore installing a second retracting spring, the parking brake mechanism be checked and any binding condition and/or improper adjustments be corrected.*

DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric. Anchor pins on all models except Ford Trucks are FIXED and no major adjustment is required on these models. On Ford Pass. Cars (except Thunderbird) and Mercury the front wheel anchor pin is mounted on the wheel spindle through the wheel cylinder and backing plate.



M rcury Parking Brake Pedal - Toe-set parking brake pedal used instead of T-handle. Located to left of regular foot brake pedal. Set by pushing forward on pedal, release by pushing bar on left end of instrument panel (Merc-o-Matic - mounted on selector keyboard).

ADJUSTMENTS: Before making any adjustments, jack up all four wheels, check brake pedal clearance (see below), fully release hand brake lever and make certain that all wheels turn free. Then adjust as directed below.



Brake Pedal Adjustment: Pedal must have more than 5/16" but less than 7/16" free travel (Ford Pass. Cars, Lincoln, Mercury); or more than 3/16" but less than 3/8" free travel (Ford Trucks), before master cylinder piston begins to move.

All Poss. Cars and Trucks - Loosen locknut on eccentric bolt attaching brake pedal to master cylinder pushrod and turn bolt for desired freeplay. Tighten to 25-30 ft. lbs. torque.

Minor (W ar) Adjustment: Remove adjustment hole cover, rotate adjusting screw until shoe begins to drag (Ford Pass. Cars & Trucks), or tight against drum (Lincoln & Mercury). Then back off adjusting screw 10 to 12 notches (Ford Pass. Cars & Trucks), 12 to 14 clicks (Lincoln & Mercury) until no drag is felt.

REAR BRAKE ASSY. (THUNDERBIRD & LINCOLN FRONT BRAKE SIMILAR)

FORD PASS. CAR & MERCURY FRONT BRAKE ASSY.

Major Adjustment (Ford Trucks with Adjustable Anch r Pin): Rotate drum until feeler slot is at lower end of Secondary (rear) shoe, then insert .010" feeler between brake shoe and drum, and rotate drum, moving feeler gauge up along secondary shoe until shoe assembly is wedged forward as much as possible. Turn adjusting screw until primary shoe contacts drum securely and secondary shoe is snug against feeler. Back off, adjusting screw to obtain .010" clearance 1½" from each end of secondary shoe. If .010" clearance cannot be obtained at both ends of secondary shoe, an anchor pin adjustment is needed.

Anch r Pin Adjustm nt - Loosen anchor pin nut just enough to permit moving pin up or down by tapping nut

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY (C nt.)

with soft hammer. *NOTE - DO NOT BACK NUT OFF TOO FAR AS SHOES WILL MOVE OUT OF POSITION WHEN NUT IS TIGHTENED.* Move anchor pin up or away from center of drum to reduce clearance at anchor end of secondary shoe, and down to increase clearance. Tighten anchor pin nut securely and recheck secondary shoe clearance.

Hand Brake Adjustment: Ford Pass. Cars & F-100, 250, P-350 Trucks - Adjust service brakes. With service brakes fully released, place parking brake lever in fully applied position. Equalizer should not touch frame crossmember. Adjust cable from control handle to equalizer lever as necessary. There should be no slack in parking brake cables with control lever in fully released position. To adjust, loosen locknut on equalizer rod, tighten adjusting nut to remove slack. Pull cables alternately to equalize tension on each through yoke, tighten locknut. *CAUTION* - Overtightening cables will pull rear brake shoes off their anchors.

Mercury Parking Brake Release Rod Adjustment - Disconnect parking brake release rod trunnion from release arm of pedal assembly. Turn trunnion on rod until it freely enters hole in pedal release arm with arm in locked position. Turn trunnion 1 turn to shorten rod.

Mercury Parking Brake Adjustment - Depress parking brake pedal 1". Make adjustment of cables as in Ford above. Distance from end of equalizer bracket to center of equalizer rod hole should be 2 1/16" 1/16". Parking brakes should be fully applied when pedal is depressed 2".

Ford P-400, All 500 & 600 S ries Trucks - These models have independent parking brake on propeller shaft at rear of transmission. *See "Ford Truck Self-Centering Brake" for adjustment data.*

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brak Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

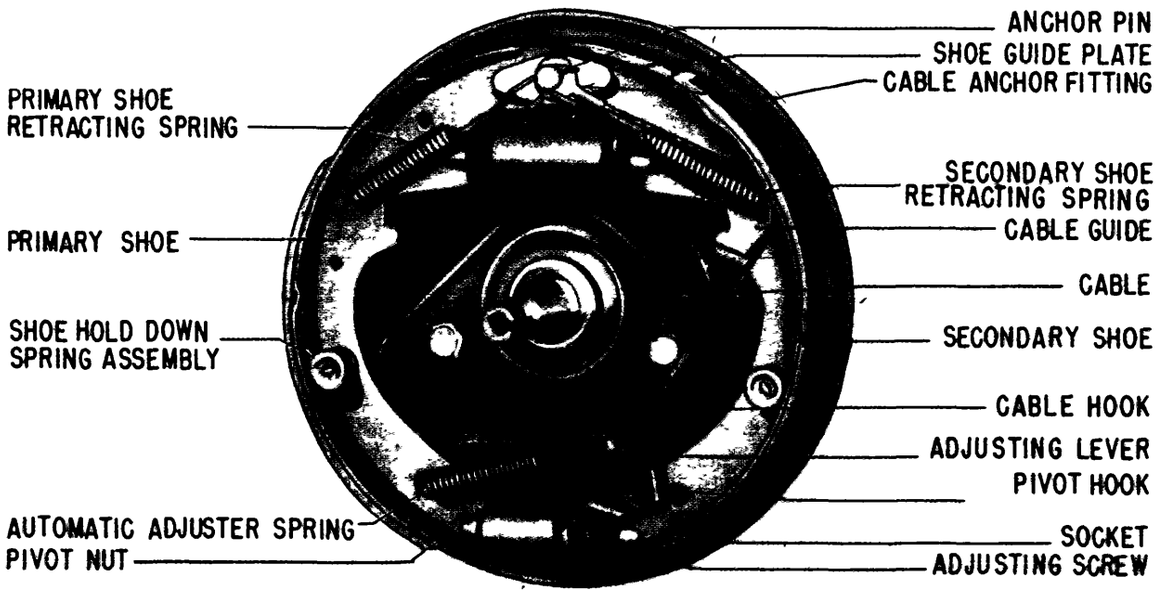
MERCURY (BENDIX) AUTOMATIC ADJUSTER

Mercury (1957 Later)

DESCRIPTION: Similar to previous Duo-Servo, single anchor, hydraulic type without eccentric, and incorporating an automatic adjuster to maintain proper lining to drum clearance. A cable guide on secondary shoe moves away from anchor pin on reverse braking, causing cable to lift adjusting lever into engagement with next tooth on adjusting wheel. The lever engages adjusting screw tooth and secondary shoe returns toward anchor as brake is released, shortening distance from anchor pin to cable guide so that cable and adjusting lever are pulled back to original position by automatic adjuster spring, turning adjusting screw. This is repeated on each reverse brake application when shoe-to-drum clearance is sufficient to cause cable to lift adjusting lever to next tooth.

INSPECTION: Inspect adjuster and brake assemblies every 16,000 miles. Check master cylinder fluid and parking brake at same intervals as for early type brake.

ADJUSTMENT: When the amount of reverse braking is not sufficient to maintain proper brake shoe to drum clearance the following procedure should be followed: Raise car, remove adjusting hole cover, turn adjusting screw upward from backing plate side to expand shoes (Use Tool No. 2081 or screwdriver), until wheel is locked. **Hold adjusting screw lever away from screw,** back off screw until wheel turns free, then back off screw one more notch (Approximately 12 strokes). Recheck that wheel turns free, replace adjusting hole cover. *CAUTION - DO NOT back off screw without holding lever away from adjusting screw.*



OVERHAUL: Removal - Remove adjusting hole cover, raise lever and back off adjusting screw to free wheels. Remove wheels and brake drum. Install wheel cylinder clamps, raise adjusting screw lever and back off adjusting screw as far as possible. Pull adjusting lever, cable and automatic adjuster spring down toward rear to unhook pivot hook from large hole in secondary shoe web (*CAUTION - DO NOT pry pivot hook out of hole*). Remove secondary anchor spring and unhook cable anchor fitting. Remove primary shoe anchor spring and shoe guide plate, then remove cable guide from secondary shoe. Remove shoe hold-down springs, shoes, adjusting screws, pivot nut and socket. *NOTE* - Exercise care when removing axle shafts to prevent damage to brake adjuster cable or lever.

R ass mbly: Reverse removal procedure and note the following:

1) Cable must be positioned in cable guide groove and not between guide and shoe web.
2) Turn adjusting screw into adjusting pivot nut to limit of threads, then back off ½ turn.
3) Install adjusting screw assembly with adjusting screw nearest secondary shoe.
4) Hook cable hook into hole in adjusting lever from backing plate side.
5) Adjuster lever pivot hook must be in large hole in secondary shoe web, and hooked end of adjuster spring in large hole in primary shoe web.
6) Use Tool 2086-L over adjuster hook to install loop end of spring to adjuster lever hook.
7) Check operation by pulling section of cable between cable guide and adjuster lever, toward secondary shoe web. Lever should lift past a tooth on screw wheel, then snap behind the next tooth. Release cable and spring should return lever to original position, while turning adjuster screw one tooth. *NOTE* - With brake in vertical position (anchor at top), lever should contact adjusting wheel 3/16" ± 1/32" above centerline of screw. If incorrect, check cable end fittings and replace if cable does not completely fill and/or extend slightly beyond crimped section. Cable length should be 11 1/8" ± 1/64". Replace guide if cable groove not parallel to shoe web. Repair or replace lever if hook surfaces are not square with body or lever for pivoting.

Initial Adjustment (Wheels r m v d): For initial shoe-to-drum clearance after overhaul, measure inside diameter of brake drum. Raise adjusting lever, turn adjusting screw to expand shoes so the diameter (use calipers) is .030" (1/32" approximately) less than drum diameter measured across shoes 90° from anchor.

NOTE - When calipers are not available, wheels and drums should be installed and initial adjustment made as outlined under **Adjustment** above.

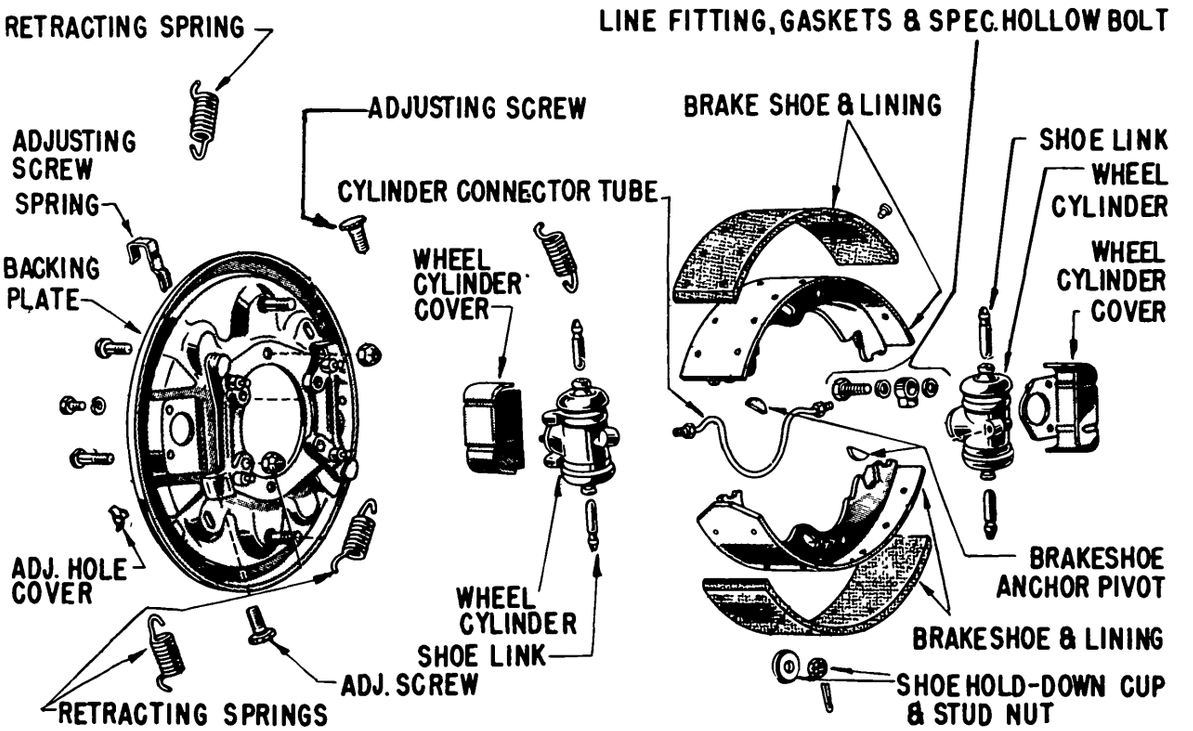
MERCURY BRAKE ASSY. (WITH AUTOMATIC ADJUSTER)

FORD TRUCK SELF-CENTERING

Ford Trucks - B, C, F, P-500; B, C, F, P-600 (1957) R ar Brakes Only.

►CHANGES, CAUTIONS, CORRECTIONS

►*FRONT WHEEL BRAKE CAUTION: Ford-Bendix "Uni-Servo" type brakes used on front wheels of these models.*



►*POWER BRAKE NOTE: "Hydrovac" or "Midland Hi-Power" Standard or Optional on these trucks. See "Hydrovac" or "Midland Hi-Power" under Power Brakes.*

DESCRIPTION: Two-cylinder, two-shoe, four-anchor type hydraulic brakes. Each shoe is anchored at each end and linked to wheel cylinder at each end so that all shoes are self energizing for both forward and reverse motion. All shoes are radially self-centering.

ADJUSTMENT: Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be turned to check for drag, make this check by striking drum with a hammer - sound will be deadened if shoes contacting drum). Remove two adjusting hole covers on backing plate (adjacent to right hand anchor bolt at each wheel cylinder), insert tool through slot and turn notched adjusting screw "star wheel" until linings drag on drum, then back off adjusting screw until wheel is free of drag. Depress pedal to centralize shoes and recheck wheels. Adjust each shoe in each wheel in this manner. *NOTE* - When brake linings are replaced, an additional adjustment is required. Adjust shoe hold-down bolt until a clearance of .025" is obtained (measure from brake shoe to gauge surface on brake plate). Gauge surface is machined boss on brake plate which is in line with hold-down bolt.

Brake Pedal Adjustment: Pedal must have at least 3/16" but not more than 3/8", free travel measured at pedal pad before master cylinder piston begins to move. To adjust, loosen locknut on brake pedal to master cylinder pushrod, rotate rod until free travel within limits, tighten locknut to 25-30 ft. lbs. torque.

Parking Brake Adjustment: On cable controlled parking brakes, move parking brake lever to fully released position. On transmission mounted parking brake levers set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, then adjust clevis rod to allow flat portion of cam to rest on brake band bracket. Install clevis pin and cotter pin. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until clearance of .010" is established between brake lining and brake drum at anchor bracket. Loosen lock nut on adjusting screw for lower half of brake band, adjust screw to establish .010" between brake lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting nut until .010" clearance established between upper half of band and drum. Be sure to install lock wire in anchor adjusting screw.

FORD TRUCK SELF-CENTERING BRAKE ASSEMBLY

DISASSEMBLY: *NOTE* - Brakes can be serviced without removing hubs or disturbing wheel bearings. Remove wheels, then screws holding drum to hub (mark drum and hub to insure correct assembly). *(CAUTION - If wheel cylinder connecting tubes and bleeder screws removed, mark ports to which tubes attached to assure correct reassembly).* Disassemble brakes as follows: Remove retracting springs with Tool 2035-N. Remove brake shoe hold-down screw, then brake shoes.

REASSEMBLY: *(NOTE* - For best results, new shoe and lining assemblies should have the lining of correct thickness ground to proper radius concentric with brake drum. If linings are not ground, it may be necessary to readjust the linings after the linings have been "worn in". Make sure no nicks or burrs are on shoe edge at point of contact with brake plate). Place light film of Lubriplate on primary (sliding pivot) anchor and shoe bearing surfaces on brake plate. Position brake shoes in anchors and in slotted ends of wheel cylinder. Apply light film of Lubriplate to hold-down screw, then install hold-down screw, washer and nut. Tighten hold-down nut until there is a clearance of .025" between center (of three) machined bosses on plate and edge of shoe. This clearance necessary to hold shoe parallel to drum or prevent shoe from binding against outer machined bosses. Install retracting springs (Tool 2035-N), wheel cylinder brake pipe, drum assembly, wheel. Adjust brakes.

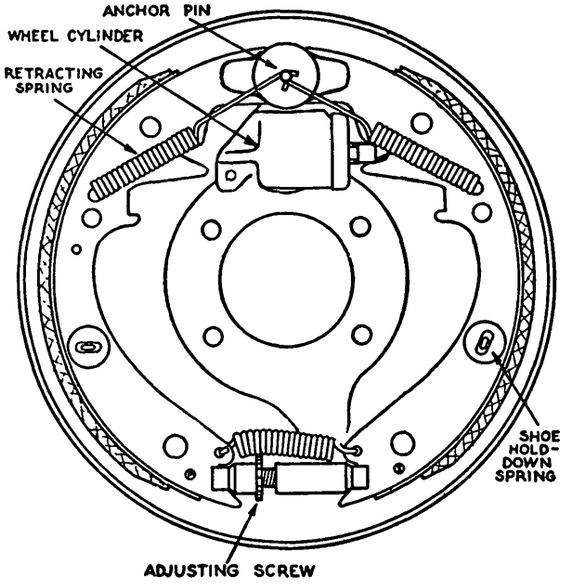
BLEEDING BRAKE SYSTEM: Bleed **top** wheel cylinder **first,** then lower. If power unit used, unit must be bled before wheel cylinders, with engine off and no vacuum in power unit system. *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

FORD TRUCK BENDIX UNI-SERVO

F rd Trucks - F-250; F, P-350; P-400; B, C, F, P-500; B, C, F-600 (1957) Front Brakes Only.

►*REAR BRAKE CAUTION: Different type brakes used on rear wheels as follows:*
F-250; F, P-350–"Ford-Bendix" Hydraulic, Duo-Servo type. *See "Ford, Lincoln, Mercury Bendix".* **B, C, F, P-500; B, C, F-600**–Ford "Self-Centering" type. *See "Ford Truck Self-Centering".*



►*POWER BRAKE NOTE: "Hydrovac" or "Midland Hi-Power" Standard or Optional on these trucks. See "Hydrovac" or "Midland Hi-Power" under Power Brakes.*

DESCRIPTION: Bendix "Uni-Servo" single anchor, hydraulic type with single-acting wheel cylinder mounted on the backing plate and actuating the primary shoe through a strut (no direct connection to secondary shoe). Brake shoes are conventional Bendix type (joined by adjusting screw at lower end, single anchor between shoes at upper end with retracting springs hooked to each shoe and anchor pin). Wheel cylinder has single piston and cup with a return spring seated in the end of the cylinder.

ADJUSTMENTS: Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be checked for drag, make this check by striking drum with a hammer–sound will be deadened if shoes contacting drum).

Minor Adjustment: Remove adjustment hole cover from brake carrier plate. Rotate adjusting screw, with a suitable tool, until shoe begins to drag, then back off shoe 10-12 notches until drum can be turned without drag.

Major Adjustment: Wedge primary shoe against the drum by inserting a .010" feeler gauge through slot in drum at center of secondary shoe and expand shoes by turning adjusting screw. Then adjust adjusting screw and anchor pin (slotted type) for .010" clearance at each end of secondary shoe (measure 1½" from each end of shoe).

UNI-SERVO BRAKE ASSEMBLY

Brake Pedal Adjustment: Brake pedal free travel should not be less than 3/16" nor more than 3/8" before push-rod touches master cylinder piston. Adjustable at master cylinder pushrod.

Parking Brake Adjustment: Set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, then adjust clevis rod to allow flat portion of cam to rest on brake band bracket. Install clevis pin and cotter pin. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until clearance of .010" is established between brake lining and brake drum at anchor bracket. Loosen locknut on adjusting screw for lower half of brake band, adjust screw to establish .010" between brake lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting nut until .010" clearance established between upper half of band and drum. Be sure to install lock wire in anchor adjusting screw.

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brak S rvicing" in Brak Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brak Tr ubl Shooting" in Brake Section of Manual.*

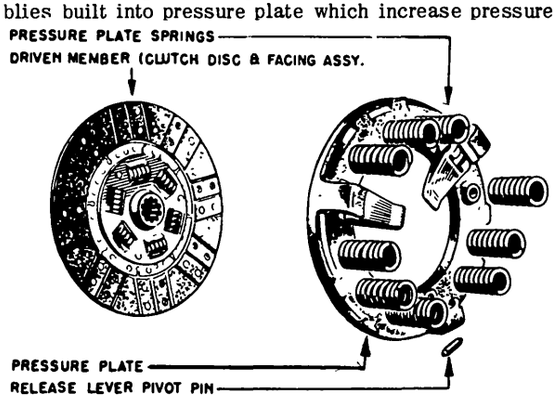
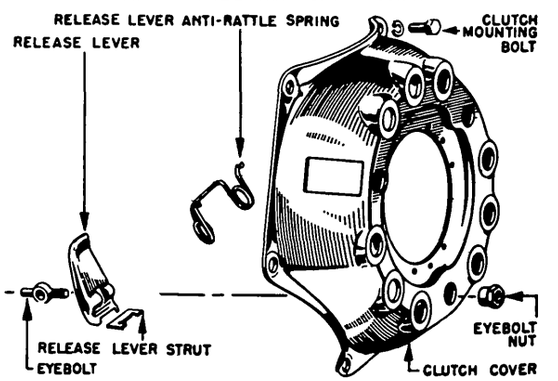
① - Same cover assembly used with both 10½" & 11" discs (10½" disc std. on V8, 11" optl.).
② - Metropolitan number.
③ - Use 361468 for replacement.

DESCRIPTION (Except Chevrolet): Single plate, dry disc. Three release levers mounted on bolts piloted in pressure plate and held in clutch cover actuate clutch through struts which provide "knife-edge" action.
Chevrolet - Semi-centrifugal, single plate, dry disc type. Centrifugal action provided by three roller assemblies built into pressure plate which increase pressure plate load with engine speed.



REMOVAL OF CLUTCH: *See "Clutch" on car pag s.*



OVERHAUL: Mark all parts before dismantling clutch and reassemble in same position (necessary to maintain balance). Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat.

Disassembly: Place clutch on fixture or arbor press (support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts by running hacksaw blade through slot, remove nuts. Release pressure slowly, remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together, lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

Reassembly: Place pressure plate on fixture or arbor press supporting plate under release lever lugs. Install lever, eyebolt and strut assemblies by reversing removal procedure. Place pressure plate springs on the plate, and install anti-rattle springs in cover. **(Chevrolet** - Install centrifugal rollers). Place cover on pressure plate. Make certain that springs are seated in

CONTINUED ON NEXT PAGE

BOR & BECK CLUTCH ASSEMBLY (TYPICAL)

BORG & BECK (C nt.)

cover recesses and anti-rattle springs in place on release levers. Compress cover slowly and guide eyebolts through holes in cover. If assembly made in fixture, use clamps to clamp cover flange to plate at mounting holes. Install eyebolt nuts and turn nuts down flush with head of bolt. Compress and release clutch several times to seat all working parts. Then adjust release lever heights.

Clutch Springs: Note spring color and install in same relative position (groups of two different springs used on some clutch models). Springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

⑥ - Metropolitan number.
⑦ - At height of 1 13/32".

Release Lever Adjustment (With Borg-Warner Universal Fixtures UF-300, 400): Special lands must be installed on fixture under pressure plate lever lugs. Set adjusting arm on adjusting sleeve so that height of lower side arm above bottom of sleeve is correct for each model (see table below). Install indicating plate on levers. Adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjusting nuts by peening nut against notches in eyebolt.

Release Lever Settings
(Borg-Warner Fixtures UF–300 & UF–400)

Clutch Assy.	① Lever Height
951	2 3/16"
360982	2 3/16"
361365	2 1/32"

361456	2 1/8"
361468	2 5/16"

① — Using 3J Lands and 3X Indicating Plate.

Release Lever Adjustment (Using Gauge Plate): Use gauge plate indicated in table below and install clutch on flywheel with gauge plate in place of regular driven member, with lugs on gauge directly under release levers. Use short straightedge placed on edge on gauge plate hub and adjust release levers so they just contact edge of straightedge for all models marked "flush" in table. If lever setting marked "high", a cut-out or step must be made in edge of straightedge at one end so that levers can be set higher than hub. If lever setting marked "low", cut-out or step should be cut in gauge hub end of straightedge so that end extends below hub. Cut-out or step should be in the amount "high" or "low" indicated in table. Lock adjustment by peening nut into notches in eyebolt.

AUBURN

Dodge, 6 Cyl. (1957) ①
Plymouth, 6 Cyl. without O.D.(1957) ①
Willys, 4 Cyl. (1957) ②
① - Borg & Beck Clutch also used.
② - Rockford Clutch also used.

DESCRIPTION: Single plate, dry disc type of same design used on corresponding previous models.

REMOVAL OF CLUTCH: *See "Clutch" on Car Model pages.*

OVERHAUL: Disassembly (using To l C-585A) - Place cover support plate over main screw of fixture. Install clutch cover assembly on Tool C-585A. Mark cover and pressure plate with punch and install compression washer and fully compress fingers. Remove adjusting screw, washer, and plate return spring or clip. Place ½" steel block under outer end of each finger. Back off compression nut slowly until release levers rise and contact steel blocks. Remove nut and compression washer, lift off cover. To remove release levers from cover, grind off one end of pin and drive out pin.

Reassembly: Assemble levers to cover, peen over ends of lever pins. Install pressure spring between lever and cover. Make sure springs rest on bosses of cover and are seated in the embossed seats of levers. Press down on release lever and then insert steel blocks under outer ends of levers. Place pressure plate on fixture and place cover assembly over the pressure plate. Match up punch marks so parts are in original positions. Place the correct spacer on the center screw of fixture Install compression plate, self-aligning washer, thrust washer and compression nut on center screw. Tighten compression nut on fixture. Install washers and adjusting screws in pressure plate. Release fixture compression nut slowly and install pressure plate return springs.

Release Lever Setting: Install the clutch cover plate assembly on fixture and make certain that housing clamps line up with tne holes With the correct spacer, compression washer, self-aligning washer, and compression nut installed, tighten nut until release levers are completely compressed. Install clutch housing clamps and tighten securely. Adjust clutch release levers until each of the three feeler gauges has the same slight drag when being pushed in and out. Tighten release lever screws to decrease drag or loosen them to increase drag. Recheck adjustment of each lever, tighten locknuts.

Willys Return Clip Spring Installati n - Engage slot on flat end of spring under head of release lever adjusting screw, engage loop on curved end of spring over ridge on outer end of release lever.

► *INSTALLATION ON CLUTCHES IN SERVICE:* Clips can be installed by working through inspection hole in bell housing without dismantling clutch. *CAUTION* - Use string attached to clip to prevent it dropping down into bell housing during installation.

DRIVEN MEMBER: *See Car Model pages for part nos.*

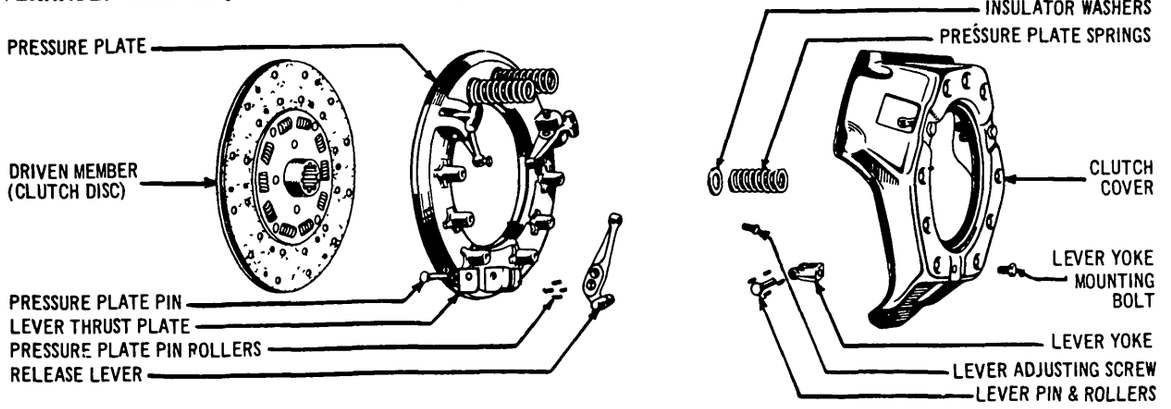
DESCRIPTION: Single plate, dry disc type. Release levers formed with weight on outer ends which increases pressure on driven member as engine speed increases. Levers pivoted on pressure plate on needle bearings with fulcrum located in yoke support on cover plate.

REMOVAL OF CLUTCH: *See "Clutch" on car model page.*

OVERHAUL: Mark all parts before dismantling and reassemble in same position. Replace grooved, warped, or checked pressure plates. Replace springs if pressure plate discolored from heat.

Clutch Fixture Note: Manufacturer recommends use of Borg-Warner Universal Clutch Fixture UF-300 or UF-400 for all servicing and rebuilding operations.

Disassembly: Place clutch on fixture (supporting pressure plate on special lands under lugs) or arbor press. Compress cover plate slightly, take out assembly screws (lever yoke mounting screws) on cover, release pressure on cover plate slowly, lift off plate. Note whether washers used on yokes under assembly screws (these washers must be reinstalled if old pressure plate used again). See special directions below on removing and reinstalling release levers. Remove and test clutch springs.



Clutch Springs: Pressure springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

Clutch Spring Specifications

Cover Assy.	Spring, No. & Color	Lbs. Pressure
L5167	9 - Tan	⑫ 163
L5222 ③	9 - Bronze	⑭ 142
265126	9 - Brn. & White	⑮ 159
266716	9 - Aluminum	⑯ 205
268594	6 - Aluminum	⑯ 205
267147	9 - Orange	⑫ 175
267346	9 - Bronze	⑭ 142

266978	9 - Brn. & White	⑮ 159
267371	9 - Bronze	⑭ 142

① - Plus or minus 5 lbs.
② - Pressure at height of 1 9/16".
③ - Some with 208516 (6 springs).
④ - Pressure at height of 1.747".
⑤ - Pressure at height of 1.736".
⑥ - Pressure at height of 1¾".

Release Lever Assembly: Mount lever yoke on release lever, fasten by inserting flat-sided lever pin (flat side out or toward cover) and roller (place roller on flat side of pin). Insert lever in pressure plate lug, use roller pin sawed off to length of lever width as a guide and insert needle bearings, insert roller pin, pushing guide pin out, lock both lever pins with cotter pins. Thread release lever adjusting screws in ends of levers, turning screws down completely.

LONG CLUTCH ASSEMBLY (TYPICAL)

Assembly: Place pressure plate on fixture or arbor press. Assemble pressure springs, locator washers or insulator washers on plate, place washers on lever yokes (if washers used previously and old pressure plate being used). Place cover plate in position (lining up marks made before dismantling), compress cover slowly guiding lever weights through holes in cover and lining up yokes under cover plate holes. See that pressure springs are seated, insert cover screws in yokes, using lockwasher under screw head, tighten screws securely. Compress and release clutch several times (using weight on release levers) to seat all parts. Then adjust release lever heights.

Release Lever Adjustment (on Fixture): Place special lands on fixture under pressure plate lugs, assemble lever adjusting arm and sleeve setting bottom of adjusting arm correct distance as shown in table (all figures plus or minus 1/32") above bottom of sleeve and lock the adjusting arm with the thumbscrew. Swing arm over each release lever in turn, back off adjusting screw on tip of lever until rounded screw head just contacts arm, lock screws by inverting clutch so that screw head is supported and stake or peen lever into adjusting screw slot. Do not disturb lever yoke screws when making this adjustment.

Release Lever Settings

268594	②1 13/16"

① — With 3J Lands.
② — With 3J Lands and 3X Indicating Plate.
③ — Factory set — no adjustment.

Release Lever Adjustment (without Fixture): Assemble the special lever setting disc or gauge (see table below) on the flywheel in place of driven member, placing gauge so that lugs are under release levers and gauge is centered in clutch. Tighten all clutch cover bolts evenly. Place short straightedge on edge on top of gauge shoulder, turn adjusting screws at tips of release levers up or down until they contact straightedge, lock screws by peening metal of lever into screw slot. Lever heights must be equal within .031" (except Oldsmobile .015").

Release Lever Adjustment Tools

Car	Tool No.
Buick	J-1036
Ford Pass. Cars	①
Ford Trucks	①
Oldsmobile	J-4389

① - Use a ¼" shim between pressure plate and flywheel directly under release levers. Measure relative finger height.

POWER-LOCK DIFFERENTIAL (PLATE CLUTCH TYPE)

Chevrolet Pass. Car & Corvette (1957)
Packard (1957 Later)
Studebaker (1957 Later)

DESCRIPTION: This assembly replaces the conventional differential assembly and consists of a multiple disc clutch located in the differential housing, which is splined to the housing and to the clutch body. Pinion gears are mounted on cross pins which are free to move on ramps of housing.

OPERATION: As engine power is transmitted from ring gear to differential case, the driving force causes the cross pins to move up ramps of cam surfaces and apply a load on the disc clutch. This action locks the axle shafts in normal, straight ahead driving, preventing momentary spinning of wheels when leaving the road or when encountering poor traction. The division of torque between axle shafts varies in accordance with traction of each rear wheel. When cornering, the faster turning outer wheel relieves the load from clutch surfaces so that wear is reduced to a minimum and the action is essentially that of a conventional rear axle.

► *DIFFERENTIAL ASSEMBLY REMOVAL & INSTALLATION NOTE: See conventional rear axle service procedures for removal, installation and adjustment.*

DISASSEMBLY: With differential assembly removed from rear axle housing, check to see that differential assembly halves are marked with a number or letter to aid in aligning the case at reassembly. If not, scribe an alignment mark across both halves of case at the joint. Remove eight attaching bolts and remove end housing. Remove clutch plates from side gear retainer (note relation of these clutch plates). Remove side gear retainer and side gear, then remove pinion mate shafts and gears. Remove remaining side gear, side gear retainer, and clutch plates.

INSPECTION: Clean all parts in solvent and dry with air. Check for worn, cracked, or distorted clutch plates. Check all other parts for nicks, burrs, and abnormal wear.

REASSEMBLY: Hold ring gear flange half on its side and install side gear retainer and clutch plates alternately so that an external flanged plate is installed first and an internal splined plate last. Make sure side gear retainer will rotate with a slight drag when in the case. Repeat for opposite side. Install side gear on ring gear flange half. With ring gear flange half of differential case in a vertical position, install one pinion shaft and gears, making certain that notch in shaft is upward. Install remaining shaft and gears. Install side gear in other half of case, then hold case half through bearing trunnion and install it on ring gear flange *(CAUTION - Make sure alignment marks are lined up).* Tighten eight attaching bolts evenly to 35-45 ft. lbs. Check clearance between pinion mate shaft and "V" of case by placing shim stock or feeler gauges on both ends of the same shaft and on opposite sides of the "V". Clearance should be .010-.035".

► *CHEVROLET CLUTCH ASSEMBLY NOTE:* For standard "On Road" operation, assemble the two internally splined plates between the two externally splined plates. For maximum traction "Off Road" operation, assemble plates alternately with an internally splined plate against differential carrier or case. *NOTE* - This later type of assembly (Maximum Traction) will result in tire squeal on turns and a slight tendency to oversteer. A slight clink (due to necessity for looseness in assembly for complete release) is normal.

CHEVROLET CLUTCH BACKLASH CHECK AND ADJUSTMENT: To check backlash, jack up one rear wheel and remove wheel. Wedge propellor shaft to hold it stationary. Rotate brake drum forward to remove all backlash and chalk mark both brake drum and backing plate. Rotate brake drum to the rear until all backlash is removed and again mark backing plate at mark on brake drum. The distance between marks on backing plate should not exceed ½". When greater than ½", it will be necessary to reduce backlash by installing a .005" thick shim washer (outer diameter 3¼", inner diameter 2 3/8") between the outboard clutch plate on both the differential carrier and case sides (total .010"). Reassemble differential, insert stub axle shaft and engage splined side gear retainer. Hold ring gear carrier and turn axle shaft. Axle should turn freely. Repeat check on opposite side. If axle shaft is "locked-up" on either side, decrease the shim thickness to .003" on side that "locks-up". If it still "locks-up" on that side, remove the .003" shim. Where axle will turn after installation of the two .005" shims it is advisable to add .002" shims until each axle locks, then remove the last .002" shim.

INSTALLATION: Install differential assembly in the same manner as for a standard differential assembly and note the following:

► *AXLE SHAFT CLEARANCE CHECKING:* Make sure splined end of axle shaft does not interfere with pinion mate shafts. To check, use a steel tape and measure from bottom of axle shaft bearing bore to pinion mate shafts. Then measure axle shafts from corresponding point of bearing to end of spline. Minimum clearance should be 1/8". Grind off spline end of axle if it is too long. Repeat check with other axle shaft.

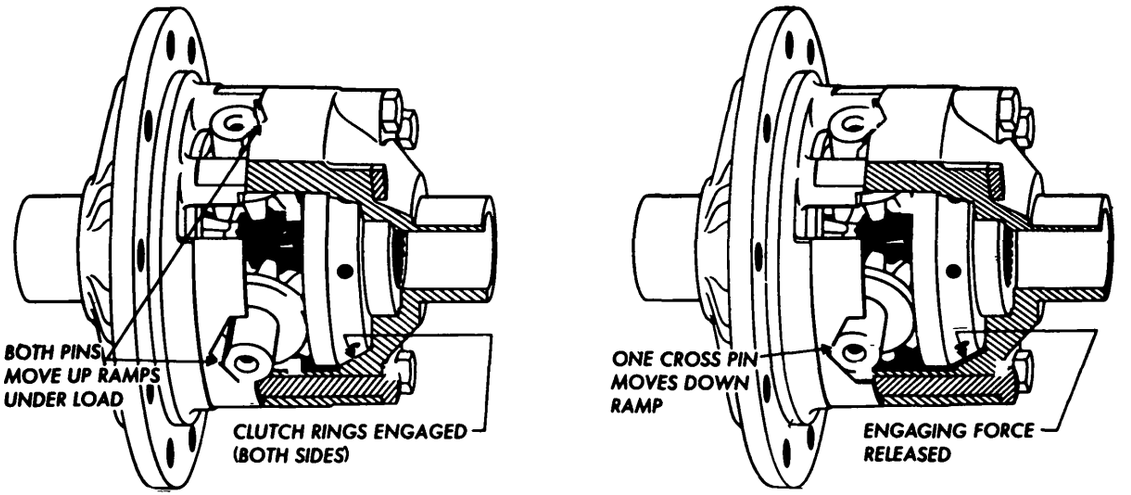
► *CAUTION: Do not spin wh els with one wheel levated as it is possible to have suffici nt driving load due to friction to actuat the clutch unit and caus the car to mov .*

POWER-LOCK DIFFERENTIAL (CONE CLUTCH TYPE)

Linc In (1957)
Packard (1957 Early)
Stud bak r (1957 Early)
Willys (1957)

DESCRIPTION: Partial locking type differential. The unit consists of a two-piece case, with each piece having two V-shaped ramps or cam surfaces diametrically opposite. When assembled, the V-shaped ramps of one piece are at a 90° angle to the ramps of the other piece, with the V's facing away from each other. The conventional mounting of pinions is replaced by two individual cross pins with a slidable joint at the center, permitting each one to move independently, although continuously engaged. Ends of the pins are machined in the form of a "V" and ride on the V-shaped ramps. Two internally splined clutch rings are fitted over each of the side gears and mate with tapered surfaces in the case halves. Two internally splined differential gears, as well as the clutch rings, are splined to the axle shaft at each end. Four pinions, carried by the cross pins, mesh with the differential gears. Pinions incorporate shoulders which contact the clutch rings. The unit is interchangeable with the standard Spicer differential.

OPERATION: . *NOTE* - The unit is operationally designed to avoid sudden transfer of full engine torque to one axle under unequal rear wheel traction conditions. As a torque divider, sufficient traction torque is supplied to the non-spinning wheel and always a certain percentage of torque is transferred to the wheel with poor traction. Percentage of transfer is dependent upon operating conditions.



Straight-Ahead Driving: With full traction on both rear wheels, both cross pins move up on the ramp of the cam (a very slight amount), applying a load to and locking the clutch rings and restricting turning of the differential through the friction clutches. This provides a torque ratio between the axle shafts, based on the amount of friction in the differential and the amount of load that is being applied to.the differential.

Turning: When turning a corner, the process outlined in "Straight-Ahead Driving" above is, in effect, partially reversed. The differential gears become a planetary gear set, with the gear on the inside of the curve becoming the fixed gear of the planetary. The outer gear of the planetary overruns as the outside wheel has a greater distance to travel. With the outer gear overrunning and the inner gear fixed, the pinions are caused to rotate. Since they are restricted by the fixed gear, they cause the cross pins to move down the ramps, thus relieving the thrust loads on the cone clutches. This permits the outer wheel to turn faster as in the conventional differential.

Unequal Traction Conditions Under Rear Wheels: When traction conditions under the rear wheels are unequal due to snow, slippery pavement, or rough roads, planetary action, similar to that in turning, takes place. In each case, there is a movement of a cross pin along the ramp to relieve pressure on the cone clutch on the side where less torque is needed. The wheel with traction gets the greater percentage of wheel torque while the wheel with poorer traction receives torque commensurate with that which it can use.

OVERHAUL: Serviced in same manner as conventional Spicer differential. Since replacement parts are not available, the differential must be replaced as an assembly. Ring and pinion gear sets are available for replacement.

LUBRICATION: Differential replacement units are furnished with two quarts of break-in lubricant. Do not attempt to break in a new unit with any fluid other than the recommended lubricant. Break-in period is 10,000 miles. If it is necessary to add or change the lubricant after the break-in period, use a standard brand of Multi-Purpose lubricant.

STRAIGHT-AHEAD POSITION — TURNING POSITION

PACKARD TWIN TRACTION DIFFERENTIAL

BUICK HYPOID

All Series (1957)

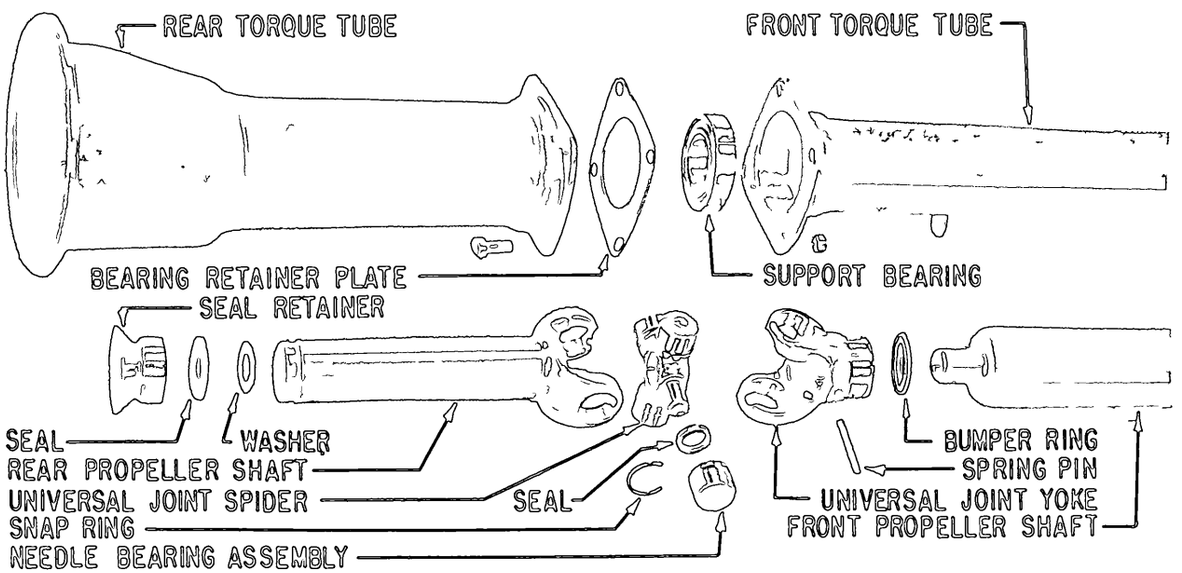
▷ *AXLE SHAFT BEARING PULLER TOOL J-6191 PRODUCTION CHANGE:* This tool has been superseded by Tool J-6525 which is constructed more heavily to avoid breakage. The new tool pulls through the retainer and it can be generally expected to damage this part.

▷ *DRIVE LINE RATTLE CORRECTION:* A new rubber "square cut" ring, Part No. 1181614 can be installed between the rear propeller shaft and universal joint at the bearing location. Install ring over splines and against face of rear coupling on front propeller shaft. Coat splines with type "O" grease, then reassemble front and rear propeller shaft assemblies and drive lock pin in place. *NOTE* - Force may be required to compress ring which can be done by inserting a small drift or punch as a lever to line up the holes.

▷ *REAR AXLE OIL LEVEL CAUTION:* To prevent overfilling of rear axle, the fluid level should be from 1/4 to 3/8" below bottom of filler plug opening.

▷ *REAR PROPELLER SHAFT REWORK TO PREVENT LOSS OF LUBRICANT FROM THE SPLINED COUPLING (Early Production Cars):* Drill a 1/16" diameter hole in plug located at bottom of spline coupling and another hole in propeller shaft tube. These holes act as vents to prevent pressure build-up which will force grease out. Remove the seal retainer and install an .029" thick steel washer, Part No. 5672246 (Saginaw shafts), No. 1179324 (Spicer shafts). *(NOTE* - Saginaw shafts can be identified by the "convex" plug at bottom of spline coupling. Spicer shafts have a "concave" plug at this location. As further identification, the seal retainer on the Saginaw shaft is "staked" around its entire diameter. On Spicer shafts, it is "staked" only in four positions). Before installing seal, washer, and retainer, use a sealing compound on both sealing face and coupling. On Saginaw shafts, stake retainer all the way around. On Spicer shafts, stake the retainer in four places.

DESCRIPTION: Hypoid gear, semi-floating type with torque tube drive. The propeller shaft is a two-piece type having two universal joints. The rear universal joint is welded to the front end of the rear propeller shaft and is supported in the torque tube by a sealed ball bearing.



REMOVAL: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Buick Hypoid" rear axle in 1956 Annual Data and note the following:*

Propeller Shaft Bearing Removal & Installation: Remove torque tube from rear axle assembly in the usual manner, then separate front and rear propeller shafts by driving out the spring pin. Place rear propeller shaft and bearing assembly in a press so that it is supported under bearing with shaft down. Using a sleeve or shaft slightly smaller than inside diameter of bearing, press universal joint yoke down through bearing. To install the new bearing, place rear propeller shaft in a press so that it is supported under both sides of front yoke. Start new bearing on yoke, then, using a heavy flat plate, press bearing on yoke until it bottoms against shoulder. *CAUTION - Be careful that bearing does not cock as it starts onto yoke.*

Rear Universal Joint Repair Kit Installation: Remove propeller shaft from torque tube. Rear universal joint can then be disassembled in the same manner as for conventional needle roller bearing type joints.

Propeller Shafts & Torque Tube Installation On Carrier: Pack rear propeller shaft coupling with semi-fluid fibrous lubricant, bringing level to inner end of splines. Install rear torque tube on carrier with brake return spring bracket down (no gasket is used). Tighten bolts to 50-60 ft. lbs. Rotate axle housing so that rear torque tube extends in a horizontal direction. Slide complete propeller shaft assembly into front torque tube until support bearing is seated against shoulder. Push front torque tube and propeller shaft assembly into place in rear torque tube. Rotate propeller shaft as necessary to engage splines. Position torque tube with strut rod bracket down (no gasket used between front and rear propeller shafts), and make sure that bearing retainer plate is in place. Install torque tube bolts and tighten to 65-75 ft. lbs. Connect strut rods and tighten bolts to 85-100 ft. lbs.

BUICK PROPELLER SHAFT & TORQUE TUBE

CHEVROLET HYPOID

Pass. Cars & Sedan Delivery (1957)
Corvette (1957)
½-Ton Truck (1957)

▷ *1955-57 PINION FLANGE OIL SEAL INSTALLATION CHANGE:* When installing the seal, do not bottom it against shoulder in differential bore. This could cause distortion and damage to seal. It is recommended that the seal now be pressed to a depth in carrier housing that permits face of seal case to protrude 3/16" to 7/32" from housing.

▷ *1957 REAR WHEEL BEARING REMOVAL PROCEDURE CHANGE:* Due to clearance restrictions, Press Plate, Tool 5741 will not fit properly on the 1957 axle. *See "Overhaul" below for revised procedure.*

DESCRIPTION: Semi-floating type with Hotchkiss drive. Design is similar to 1956 models.

REMOVAL: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Chevrolet Hypoid (Hotchkiss Drive)" in 1956 Annual Data and note the following:*

Rear Wheel Bearing Removal: With axle shaft and bearing assembly removed from housing, nick the soft metal ring retaining bearing on shaft enough to expand it slightly, then remove ring from axle shaft. Support rear wheel bearing retainer and knock the four serrated bolts from retainer. *(NOTE* - If this operation is performed carefully, the retainer may be reused, installing new serrated bolts at reassembly). Slide bearing retainer down against axle flange and install Press Plate, Tool 5741 on axle shaft between bearing retainer and bearing and fully close the two plate halves. Press bearing from shaft with press plate parting line supported on press bed.

CHRYSLER, DESOTO, DODGE PLYMOUTH HYPOID

Chrysl r, Imp rial, D Soto, Dodge, Plymouth (1957)

►CHANGES, CAUTIONS, CORRECTIONS

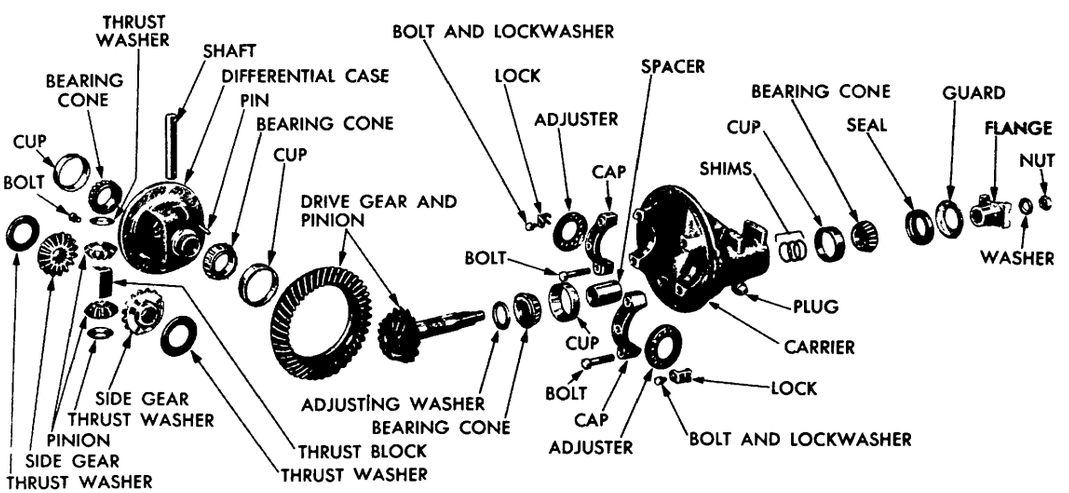
►*LUBRICANT LEVEL CAUTION (ALL MODELS):* DO NOT fill rear axle housing to level of filler plug opening. *See individual Car Model pages for correct quantity and lubricant l v l recommendations.*

DESCRIPTION: Semi-floating type with hypoid drive gear and pinion. Differential assembly is the "two pinion" type.

►*DRIVE PINION SHAFT NOTE:* Drive pinions used on Chrysler New Yorker & Imperial models (Exc. Town & Country) do not have a bearing spacer. Front bearing and pinion preload shims bear directly on shoulder on shaft.

AXLE SHAFT REPLACEMENT & ENDPLAY ADJUSTMENT: Loosen brake shoe cams and remove rear hub and drum assemblies with Puller, Tool C-845. *(NOTE- Dó not att mpt to r move brake drums by hammering on nd of axle driv shaft as damage to bearings and thrust block will r sult).* Disconnect brake line at each cylinder and remove brake support plates and dust shields as assemblies. Remove axle shaft keys and install Tool C-745 to protect outer axle seal. Remove the shims located between brake backing plate and axle housing flange, then remove inner oil seals with a sliding hammer. Clean all parts and check for bearing wear, or worn bearing and seal surfaces. To install, reverse removal procedure, then adjust axle shaft endplay. See below.

Endplay Adjustm nt: Install shims totaling .040" at one end of axle housing (shims are available in .005", .010", .0125", .015", .030" thicknesses). Lubricate bearing and install the axle shaft, bearing and cup, then using Tool C-413, drive bearing cup into axle housing until tool bottoms tightly against the shims. Remove tool and install dust shield, lockwashers and nuts. Tighten nuts to 30-35 ft. lbs. Working from opposite side of axle housing, install other axle shaft with bearing until inner end of shaft contacts the axle shaft thrust block. Lightly tap end of axle shaft with a fibre mallet to insure shaft is contacting the thrust block (opposite shaft will be forced away from thrust block to its full travel). Install bearing carefully until no axle shaft endplay exists without preloading the bearing (rotate shaft during bearing installation to check against preload). At this point the bearing cup will protrude beyond face of axle housing flange. Hold Tool C-413 firmly against bearing cup and measure the distance between end of tool and flange with a feeler gauge. To obtain the correct endplay of .013-.018" (Chrysler & DeSoto), .008-.013" (Dodge & Plymouth), add .013" (Chrysler & DeSoto), .008" (Dodge & Plymouth) of shims to the above measurement. *(NOTE* - If this gives a total thickness of shims that cannot be built up from the existing shims, use the next larger shim combination). Remove tool and install total shim pack and brake dust shield. Tighten nuts to 30-35 ft. lbs.



DIFFERENTIAL CARRIER ASSEMBLY REMOVAL & INSTALLATION: Raise car and block brake pedal so it cannot be depressed. Drain differential housing, then back off brake shoes with Tool C-845. Remove axle shafts (see above). *(NOTE - Retain shims found at each end of rear axle housing and mark them for reassembly in the same location).* Disconnect rear universal joint and drop the propeller shaft. Remove bolts attaching carrier to housing and remove the carrier assembly. To install, reverse removal procedure.

OVERHAUL: Carrier Disassembly - *(NOTE* - Before disassembling, check backlash of ring gear with a dial indicator, *see "Backlash Checking & Adjusting" below).* Mount carrier assembly in a suitable stand, then mark both differential bearing caps and adjuster. *(CAUTION - Bearing caps must not be interchanged as they are line bored with the carrier housing).* Remove universal joint companion flange with Tool C-452, then remove pinion front oil seal with Tool C-748. Remove pinion bearing oil slinger, bearing cone, preload shims and spacer (no spacer used on Chrysler New Yorker & Imperial). Remove differential bearing adjuster nut locks, then loosen differential bearing cap bolts and adjusting nuts to relieve bearing load before removing bearing caps. Remove differential case and drive gear assembly. Remove drive pinion, bearing and washer from carrier. Remove pinion rear bearing from pinion shaft with Tool C-293-C-1 and No. 36 plates. Drive pinion bearing cups out of housing with a hammer and punch.

Differential Case Disassembly: Remove drive gear to case attaching capscrews and remove drive gear *(NOTE-* Drive gear to case bolts are left-hand threads, turn clockwise to loosen). Tap ring gear off case using a fibre hammer. At this point, check differential case runout as follows: Mount case and bearings, without drive gear in carrier and adjust by installing bearing adjusters and removing all endplay. Mount a dial indicator on carrier mounting face and check drive gear mounting flange. Runout should not exceed .003". Remove differential case from carrier and check drive gear bolt holes for out of round. Remove bearings from case with Tool C-293 and No. 18 plates. Remove differential pinion shaft lock pins by driving pin from case with a hammer and punch. Drive long differential pinion shaft out of case, using a brass drift and hammer. Rotate one differential side gear until each pinion appears at large opening in case. Remove each pinion and thrust washer, then lift out thrust block. Remove differential side gears and thrust washers.

Differential Case Reassembly: Install a thrust washer over hub of each side gear and install gears in case. Install differential pinion gears and thrust washers so that holes of both gears and thrust washers are properly aligned. Rotate gears 90° so that pinion shaft holes in case are in alignment with holes in gears and thrust washers. From the pinion shaft lockpin hole side of case, insert the slotted portion of pinion shaft through case, thrust washer and just through first pinion gear. Install thrust block between the two pinion gears so hole in block is aligned with pinion shaft and with ground sides of block facing the two side

CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE, PLYM UTH REAR AXLE

CHRYSLER, DESOTO, DODGE PLYMOUTH HYPOID (C nt.)

gears. Keeping all parts in proper alignment, push pinion shaft through until locking pin hole is in exact alignment with hole in case. *(NOTE* - Before installing shaft lock pin, rotate differential gears, making sure they rotate freely through the complete revolution). Check clearance between each gear and case with a feeler gauge. Clearance should be .001-.008". Install pinion lock pin through case from pinion shaft side of drive flange. Position each bearing cone on hub of case with taper away from drive gear, then with Tool DD-1005, drive cone in until it seats. Position drive gear on case aligning the holes in gear and case. Start all capscrews into threads in flange, then tap gear onto case with a fibre hammer until it seats properly on flange. Position drive gear between brass jaws of vise and alternately tighten each capscrew to 55 ft. lbs. (Chrysler & Imperial), 40 lbs. minimum (DeSoto), 35-40 lbs. (Dodge & Plymouth).

Carrier Reassembly: *(NOTE* - If differential assembly was satisfactory from standpoint of noise before disassembly, the drive pinion may be assembled with original adjusting washers and shims. If replacement parts are installed, or differential adjustment is necessary, the proper thickness washers must be installed between pinion and rear bearing, and the pinion must be readjusted. *See "Pinion Preload & Pinion Setting" below).* Install pinion bearing cups squarely in carrier, then place rear pinion bearing over main screw of Tool C-758-D-3 and insert tool into carrier from gear side. Place front pinion bearing over main screw, followed by Adaptor SP-535, Washer SP-534 and Nut SP-533. Press bearing cups into place by tightening tool nut. *(NOTE* - Allow tool to rotate slightly in order not to damage bearings or cups during installation). Remove tools, then proceed as follows *(NOTE* - If pinion setting and preload adjustment required, make these adjustments at this point). With shaft end of pinion facing up, install selected washer on pinion shaft with chamfered side of washer facing the drive gear. Position rear bearing cone on pinion shaft, making sure that all parts are clean. Install rear bearing on pinion shaft with Tool DD-955 (Chrysler & DeSoto), Tool DD-996 (Dodge & Plymouth), using an arbor press. On Chrysler New Yorker & Imperial, install the selected shim pack. On other cars, install bearing spacer, then install selected shim pack. Insert drive pinion assembly in carrier, then install front bearing and seal (lip of seal facing front bearing). Drive seal into carrier until it is seated against shoulder. Support pinion in carrier and start companion flange with installer, Tool 496 or Tool DD-999. Install plain washer (concave side of washer down) and nut. Tighten nut to 240 ft. lbs. (Chrysler & DeSoto), 180-200 ft. lbs. (Dodge & Plymouth). Remove tool. Place differential case bearing cups over bearings and install complete assembly in carrier housing. Seat adjusters in pedestals and install caps and bolts, making sure that caps are correctly located. Using Tool C-406, turn right hand adjuster clockwise until backlash exists between gear and pinion. Back off adjuster nut several turns, then tighten lower pedestal bolts to 85-90 ft. lbs., leaving the top bolts slightly loose. Check gear backlash, *see "Backlash Checking & Adjusting" below,* and adjust as necessary. With backlash properly adjusted, install adjuster lock and attaching bolt, then tighten the right hand bearing cap attaching bolt to 90 ft. lbs. and check the other three. After final tightening of all pedestals, recheck the backlash. *CAUTION* - Whenever adjustment of differential assembly is changed to obtain correct tooth contact, readjust differential bearing preload and backlash between gears

Gear Adjustment for Correct Tooth Contact: Apply gear marking compound to drive gear teeth, then apply a load against back face of gear with a round bar as drive gear is rotated. The contact pattern of a correctly adjusted assembly is well centered on drive and coast sides about 1/16" from edges of teeth. If tooth contact is across length of tooth, narrow and high on the tooth face, correct by moving pinion gear in toward center of drive gear by installing a thicker washer behind pinion. If tooth contact is across length of tooth, but narrow and low on the flank, correct by moving pinion gear away from center of drive gear by using a thinner washer behind pinion.

Backlash Check & Adjusting & Differential Bearing Preload Adjustment: With differential case assembly installed in carrier (see above), mount a dial indicator on housing so plunger rests against one of the ring gear teeth. *(NOTE* - Make sure indicator is properly positioned so plunger will accurately indicate exact amount of backlash). Check backlash at 90° intervals as gear is rotated, the stop at point of least backlash. Turn left hand (tooth side) bearing adjusting nut clockwise until only .001" backlash exists. *(NOTE* - Be sure right hand adjusting nut is screwed out so bearing cup can move without interference). At the point where .001" backlash is obtained, screw the right hand adjusting nut in until indicator just starts to move (to decrease the backlash) and install adjuster lock and attaching bolt. Tighten the **upper** right hand bearing cap bolt to 85-90 ft. lbs. *CAUTION - It is very important to have .001" backlash before upper bolt is tightened).* Turn left hand adjusting nut **clockwise** until dial indicator shows .006" backlash. *(NOTE-* Considerable effort will be required to turn adjusting nut to last notch or two). This adjustment should be made so that adjuster lock and attaching bolt can be installed. Complete reassembly of carrier (see above).

Pinion Setting & Bearing Pr l ad Adjustment: Install Gauge Block S-528 on end of dummy pinion shaft, Tool C-758-D-3. On Chrysler New Yorker and Imperial, assemble Washer, SP-2921 followed by pinion rear bearing and Sleeve, SP-1730 on dummy shaft. Insert the tool assembly in carrier, then install front bearing. On other models, install Locating Washer, SP-2919 and pinion rear bearing on dummy pinion shaft, followed by pinion bearing spacer, with large bore of spacer next to rear bearing. Install Sleeve SP-1730 on tool, then install the assembly in carrier housing and install front bearing. On all models, install Compression Sleeve, SP-535, Centralizing Washer, SP-534, followed by Main Screw Nut, SP-533. Hold compression sleeve with Tool C-784 or C-3281 and tighten nut to 240 ft. lbs. (Chrysler & DeSoto), 180-200 ft. lbs. (Dodge & Plymouth). Install Bearing Arbor, Tool SP-561 in differential carrier bearing supports. Center arbor in pedestals, then insert a piece of .002" shim stock between arbor and each cap and tighten pedestal bolts to 10 ft. lbs. Select a pinion adjusting washer of sufficient thickness so it will just pass between gauge block end of setting tool and machined surface of arbor. For example, if a .090" washer can be installed, but a .092" washer cannot be forced between the two surfaces, the .090" washer should be used. Check end of drive pinion for an etched mark to determine thickness to be added or subtracted from the above selected washer. As an example, if mark on pinion is plus 2, a .002" **thinner** washer should be used for final assembly. If minus 2, a .002" **thicker** washer should be used. When correct washer has been selected for drive pinion, disassemble tool from carrier housing. Add the selected washer to tool, between tool spacer and rear bearing. On Chrysler New Yorker & Imperial, add Spacer SP-2920 over dummy shaft to seat against rear bearing. On all models, add the pinion bearing preload adjusting shims (removed at disassembly), then insert tool into carrier housing. Install front bearing on shaft and into position in bearing cup. Install tool spacer, nut and washer, then tighten nut to 240 ft. lbs. (Chrysler & Imperial), 180-200 ft. lbs. (Dodge & Plymouth). Rotate tool assembly to seat the bearings, then check bearing preload by revolving tool with an inch-pound reading torque wrench. The correct preload should be 25-35 inch-pounds (Chrysler & DeSoto), 20-30 inch-pounds (Dodge & Plymouth). Adjust preload as necessary by **adding a thicker** shim if preload is too great, or a **thinn r** shim if preload is not sufficient. Complete reassembly as indicated. *See "Carrier Reassembly" above.*

FORD & MERCURY "DEEP-OFFSET" HYPOID

F rd Pass. Cars (1957)
Thunderbird (1957)
F rd F-100 Trucks (1957)
Mercury (1957)

DESCRIPTION: New design, banjo housing, semi-floating, hypoid type with straddle mounted drive pinion gear. A separate differential carrier assembly is used which can be removed for overhaul without removing rear axle assembly from car.

AXLE SHAFT REPLACEMENT: Remove wheel and tire assembly and then remove nuts holding brake drum to axle flange. Remove brake drum. Working through holes in axle shaft flange, remove nuts attaching wheel bearing retainer. Pull axle assembly out of housing. *(NOTE - Be careful not to dislodge brake plate - install one nut to hold brake plate in place after axle shaft is removed).* To install, reverse removal procedure, tighten bearing retainer nuts to 30-35 ft. lbs.

Oil Seal & Wheel Bearing Replacement: Remove axle shaft from housing. Remove bearing inner retainer and bearing using Bearing Puller T57L-1225-P. Inspect machined surface of axle shaft and axle housing for rough spots which might affect sealing action of oil seal. Remove any burrs or rough spots. Press a new bearing on shaft using Tool T57L-1225-N, installed in an arbor press, until bearing is seated firmly against shoulder on shaft. Press bearing inner retainer on shaft with bearing installation tool until retainer seats firmly against bearing. Install oil seal.

REAR AXLE ASSEMBLY REMOVAL: *See "Rear Axle" on Car Model pages.*

OVERHAUL

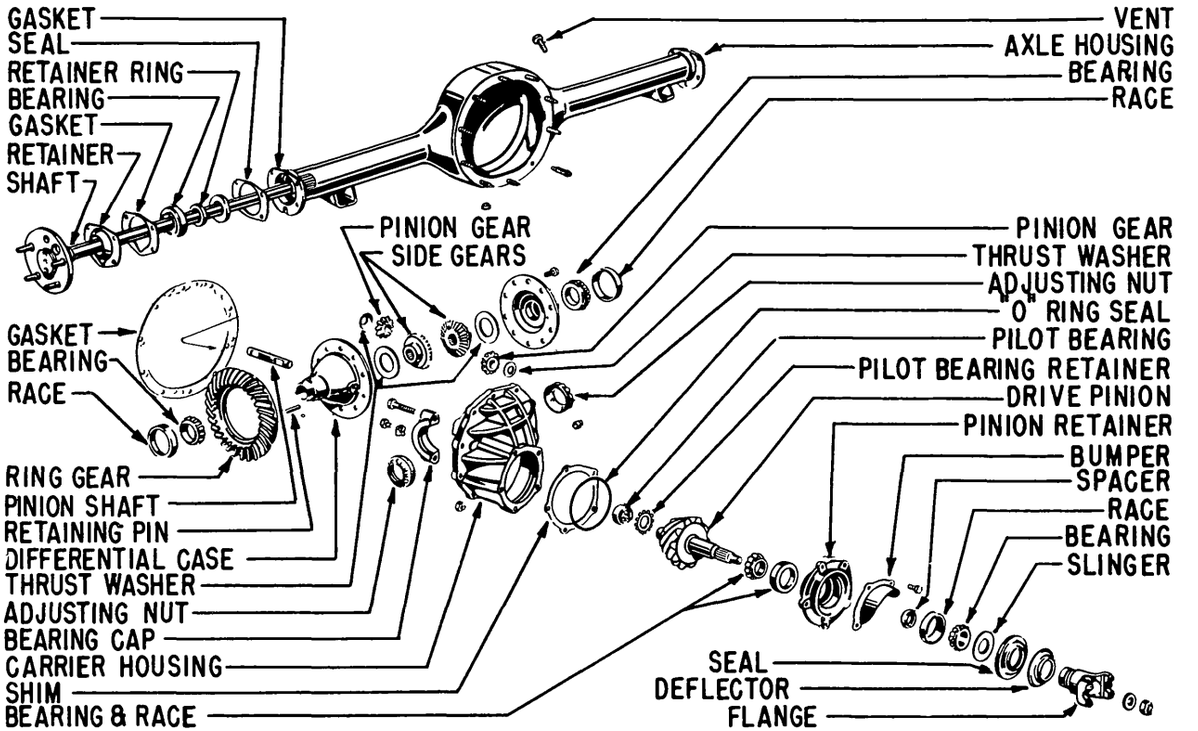
DIFFERENTIAL CARRIER ASSEMBLY REMOVAL: *(NOTE - It is not necessary to remove complete rear axle assembly from car for overhaul).* Drain rear axle assembly, then clean area around point where carrier and housing meet. Remove axle shafts, then remove nuts retaining carrier to axle housing. Remove carrier.

DISASSEMBLY: *NOTE* - Before disassembling differential carrier, mount a dial indicator on carrier and check ring gear backlash which should be .004-.009". Check contact pattern on gear teeth (see "Gear Tooth Contact Pattern" below), and if found to be erratic, check runout of gear which should be .003" max. Loosen differential bearing cap bolts, then tighten them to 25 ft. lbs. Remove adjusting nut locks, then carefully loosen one of the adjusting nuts to determine if any differential bearing preload remains. If there is at least one notch of preload remaining, bearings may be reused if they are not pitted or damaged.

1) Mark one differential bearing cap and support to insure proper reassembly. Remove adjusting nut locks, bearing caps, and adjusting nuts. Remove differential assembly from carrier. If differential bearings are to be removed, use Tool T57L-4220-A (Ford), 4221-AE and 4221-C-13 (Mercury), to remove bearings.

2) Remove bolts attaching ring gear to differential case, then press gear from case or tap it off with a soft hammer. Using a drift, drive out differential pinion shaft retaining pin and separate the two-piece differential case. Drive out pinion shaft with a brass drift and remove gears and thrust washers.

3) Turn carrier case upright and remove the five bolts securing pinion retainer to carrier, then remove pinion retainer assembly. Remove pinion "O" ring seal from retainer, and remove pinion shim *(CAUTION - Be careful not to damage mounting surfaces of retainer and carrier).* Measure thickness of shim for reference at reassembly.



4) If pilot bearing is to be replaced, drive pilot bearing and retainer out with Tool T57L-4625-A and T53L-200-A (Ford), 4625-K (Mercury). Use the same tools to install bearing, driving it in until it bottoms. Install retainer, with concave side upward, using the same tools as for bearing installation *(CAUTION - Be careful not to crack bearing support when installing bearing and retainer).*

5) Mount pinion retainer assembly in Fixture T57L-500-A (Ford) and using Tool T57L-4851-B (Ford), 4851-G (Mercury), remove pinion shaft nut and washer. Remove universal joint flange, oil seal and slinger. Remove pinion retainer from fixture, place a protective sleeve (use a piece of hose or wrap with tape) on pinion pilot bearing surface, and press pinion shaft out of front bearing cone. Remove spacer. *CAUTION - Do not reuse this spacer.*

6) Install pinion shaft assembly in Tool T57L-4614-A and T57L-4621-A (Ford), 4621-K (Mercury), and press pinion out of rear bearing cone. *(NOTE - Do not remove pinion bearing cups from retainer unless cups or bearings are to be replaced).* If it is necessary to remove cups, press cup from retainer with Tool T57L-4616-A1 (Ford), or remove cups with Tool 4615-D (Mercury). To install cups, use same tools as for removal (Ford), press cups into position with Tool 4615-E (Mercury). *NOTE* - After cups installed, make sure they are solidly seated in retainer by attempting to insert a .0015" feeler between cup and bottom of bore in retainer.

INSPECTION: Clean all parts thoroughly with cleaning solvent. Oil bearings immediately to prevent rusting. Check pinion and ring gear teeth for scoring or signs of excessive wear. Check bearing cups for rings, scores or galling, or erratic wear pattern. Make sure cups are solidly seated in bores. Check bearing rollers for pits, scoring, or roughness. Install bearing caps temporarily and test the fit of adjusting nuts in their threads. Nuts should turn freely when caps are tightened to specifications. Face of adjusting nuts must be smooth and square. If necessary, polish with a fine abrasive on a flat surface. Check end of universal joint flange that contacts oil slinger. This surface must be smooth. Polish if necessary. Inspect pinion retainer for damage and make sure bearing cups are solidly seated. Clean burrs and chips from ring gear mounting flange. Clean grooves for "O" ring seal and clean all lubricant passages. Inspect carrier housing for damage, making sure threads are not damaged and that bearing bores are smooth. Remove

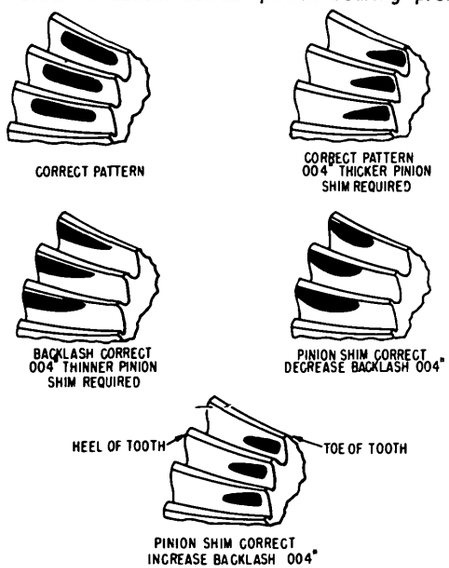
CONTINUED ON NEXT PAGE

FORD & MERCURY REAR AXLE ASSEMBLY

FORD & MERCURY "DEEP-OFFSET" HYPOID (C ntinu d)

nicks and burrs from mounting surfaces of carrier housing. Check bearing mounting hubs in differential for smoothness. Check fit of differential gears in counterbores. Inspect thrust surfaces for damage that might have occurred when bearing was removed.

REASSEMBLY: Differential Case - *(NOTE - Lubricate all parts with rear axle lubricant as they are assembled).* Place a side gear and thrust washer in differential case bore, then using a soft hammer, drive pinion shaft into case only far enough to retain a pinion thrust washer and pinion gear. Place second pinion and thrust washer in position, then drive pinion shaft into place, being careful to line up pinion shaft retainer holes. Place second side gear and thrust washer in position and install cover of differential case. Install pinion shaft retainer pin. *(NOTE* - Check for free operation of the assembly by inserting a pinion or axle shaft spline in side gear spline, and rotating the assembly). Insert two 7/16" x 2" (N.F.) bolts through differential flange and thread them three or four turns into ring gear as a guide in aligning ring gear bolt holes. Press or tap ring gear into position. Install and tighten ring gear attaching bolts evenly and alternately across gear to 60-65 ft. lbs. If differential bearings have been removed, press them on hubs using Tool T57L-4221-A (Ford), 4222-K (Mercury).



Pinion & Retainer: Install pinion rear bearing cone on pinion shaft using Tool T57L-4614-A and T57L-4621-B (Ford), 4621-L (Mercury), then install a new spacer on shaft. Place bearing retainer on shaft and install front bearing cone, pressing it into place with same tools used for rear cone *(CAUTION - As bearing is pressed into position, rock pinion retainer. Do not press bearing on shaft until all "play" is removed between pinion retainer and bearings as spacer may be compressed too much).* Lubricate both bearings with rear axle lubricant. Place slinger in position, coat outside of new oil seal with an oil resistant sealer and press seal into bearing retainer using Tool T57L-4676-A (Ford), 4676-C (Mercury). *(NOTE - It is not necessary to soak a new Ford or Mercury seal in oil before installation as they are prepared at the factory for immediate installation).* Install universal joint flange and flat washer. Start pinion shaft nut. Adjust pinion bearing preload (see below). *(NOTE - If a new ring gear and pinion, or rear axle assembly housing is being installed, or the tooth contact pattern is not correct, see "Pinion Setting" and "Tooth Contact Pattern" below before further reassembly).*

Carrier Assembly: 1) Lubricate the "O" ring seal with rear axle lubricant and install it in its groove in pinion retainer being careful not to twist the seal. Place correct shim on carrier and install pinion and retainer assembly. Install pinion bumper and retainer bolts and tighten bolts to 35-40 ft. lbs.

2) Wipe a thin coating of lubricant on bearing bores. Place cups on the bearings and set differential case in carrier. Slide the assembly along bores until a slight amount of backlash is felt between gear teeth. Set adjusting nuts in bores so they just contact bearing cups *(NOTE - Each cup should be engaging approximately the same number of threads).* Carefully position bearing caps on carrier, matching the marks made at disassembly. Install bearing cap bolts and tighten alternately to 75-80 ft. lbs. Adjust gear backlash (see below). Install adjusting nut locks and tighten to 12-15 ft. lbs.

DIFFERENTIAL CARRIER ASSEMBLY INSTALLATION: Install carrier assembly in rear axle housing and tighten attaching nuts to 35-40 ft. lbs. Install axle shafts *(CAUTION* - Axle shafts are not the same length and are not interchangeable), wheels, and tires. Fill axle assembly with lubricant until level with filler plug hole.

PINION BEARING PRELOAD ADJUSTMENT: Hold retainer flange and tighten pinion shaft nut until the torque required to turn pinion shaft, as determined by Torque Indicator 4610-N and 4858-N (Ford), 4209 (Mercury), is 8-12 **inch pounds** (used bearings), 17-27 **inch pounds** (new bearings). *(NOTE - A minimum tightening torque of 175 ft. lbs. should be required on pinion shaft nut in order to obtain correct pinion bearing preload).*

TYPICAL GEAR TOOTH PATTERN (DRIVE SIDE)

PINION SETTING (Shim Selection): *(NOTE* - Differential carrier assemblies are manufactured to require a .015" pinion setting shim. If a new carrier assembly is being built up, a .015" shim should be used tentatively, and then adjusted in relation to tooth contact pattern). Adjusting shims are available in .010" to .021" thicknesses in steps of .001". Matching marks are placed on edge of ring gear and on face of pinion gear *(CAUTION - Make sur that both ring gear and pinion have the same matching marks, usually a three digit numeral).* A plus (+) or minus (-) digit, or an "0" (indicating a standard pinion gear) is placed on the pinion gear following the matching number to indicate pinion setting shim requirements as follows: A minus (-) number means that the pinion should be moved closer to the ring gear, and a thinner shim is required. A plus (+) number means the pinion should be moved farther from ring gear, and a thicker shim is required. A pinion marked zero (0) is a standard pinion. To select a shim, measure original shim with a micrometer. Then note dimensional mark on original pinion. Compare the mark on original pinion with mark on new pinion to determine how the original shim should be modified (Example: Original shim is .015", original pinion is marked -1, and new pinion is marked +1. The new pinion would require a .002" thicker shim. Therefore a .017" shim must be used). If new pinion is marked the same as the old pinion, no shim change is required.

GEAR BACKLASH ADJUSTMENT: With differential case installed in carrier, and with adjusting nuts, bearing caps, and bearings in place (see "Carrier Assembly" above), loosen the bearing cap bolts from a fully tightened position, then tighten them to only 20 ft. lbs. before making adjustments. Loosen adjusting nut on pinion gear (right hand) side until it is away from cup. Tighten nut on ring gear side (left hand) until the ring gear is just forced into pinion with no backlash (recheck right hand nut to make sure it is still loose). Tighten the right hand nut two notches beyond the position where it first contacts the bearing cup. Rotate ring gear several revolutions in each direction while the bearings are loaded, to seat bearings in cups *(CAUTION - This st p is very important to insure proper seating of bearings).* Again loosen right hand nut to release the preload. If there is any backlash between gears, tighten left hand nut just enough to remove this backlash. Carefully tighten right hand nut until it just contacts bearing cup, and continue to tighten 2½ to 3 notches. Install dial indicator on carrier so that contact tip of indicator bears against face of a gear tooth on outer diameter of ring gear. Measure backlash which should be .004-.009". Repeat this measurement at several other teeth around ring gear. If measurements vary more than .003", there is excessive runout in gear or mounting. If backlash is not within specification of .004-.009", loosen one adjusting nut and tighten opposite nut an equal amount to move ring gear away from or toward pinion. *(NOTE - When moving the adjusting nuts, the final movem nt should always be made in a tightening direction. For example, if left hand nut had to be loosened one notch, loosen the nut two notches, then tighten it one notch).*

GEAR TOOTH CONTACT PATTERN: With completed carrier assembly mounted in a holding fixture, coat gear teeth with a suitable gear marking compound such as red lead and oil. Wrap a cloth around drive pinion to act as a brake, then rotate ring gear back and forth until a clear pattern is obtained. If tooth pattern is not correct, as indicated in the tooth pattern illustration, make the necessary adjustments for backlash and pinion position. *(NOTE - Tooth patterns in the illustration are typical and are not characteristic of any one gear).*

FORD TRUCK HYPOID

F rd F-250 & P-350 Trucks (1957)

DESCRIPTION: Spicer Model 60. Full-floating, hypoid gear with Hotchkiss drive. **This axle does not have a s parat diff r ntial carri r assembly.**

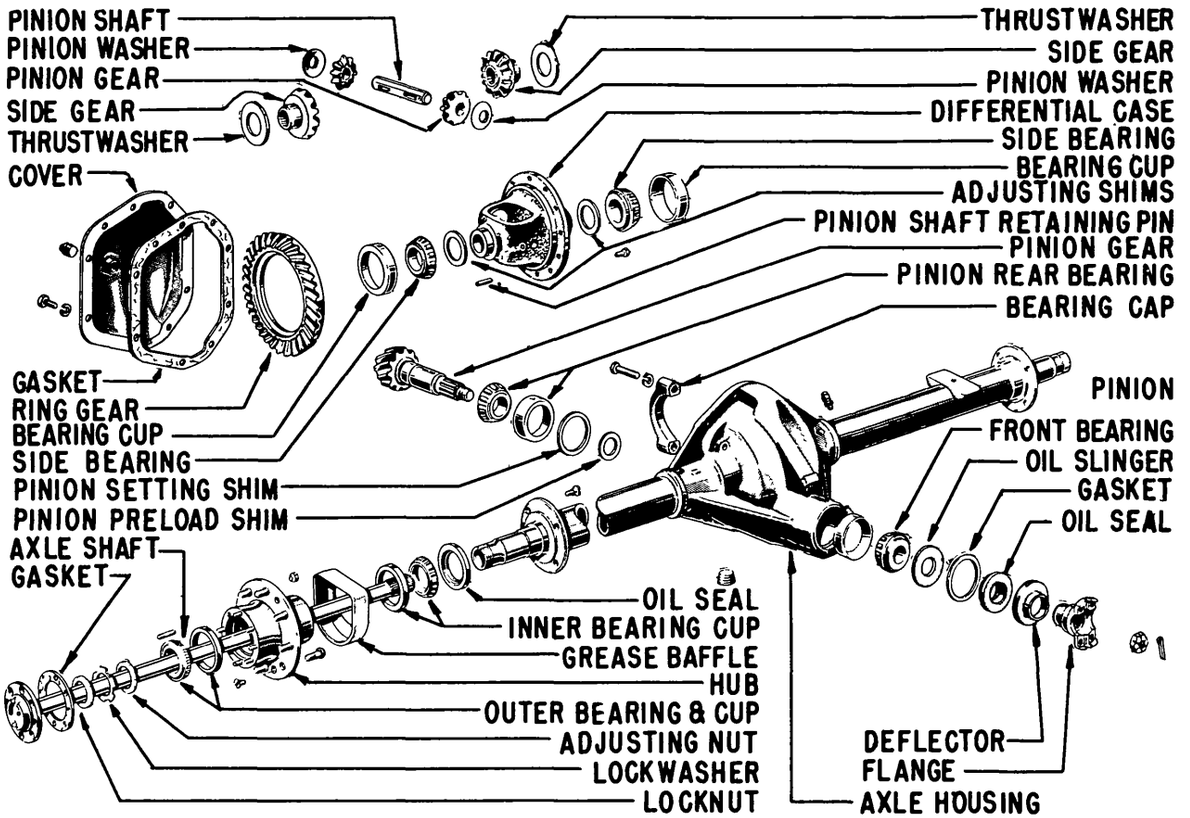
REMOVAL OF REAR AXLE ASSEMBLY: *See "Rear Axle" on Truck Model pag s.*

AXLE SHAFT REPLACEMENT: Remove axle shaft stud nuts and lockwashers. Strike center of axle shaft flange with a hammer and drift to loosen tapered dowels, then remove dowels. Pull axle shaft from housing. To reinstall, place gasket in position on housing and install axle shaft. Install tapered dowels, lockwashers and nuts on studs. Tighten nuts to 50-70 ft. lbs.

WHEEL BEARING ADJUSTMENT: Remove axle shaft (see above), bearing locknut and washer. Tighten wheel bearing adjusting nut while rotating wheel back and forth, until a noticeable drag is felt, then back off adjusting nut 1/8 turn. Install bearing lockwasher and locknut and bend one tab of lockwasher over adjusting nut and one tab over locknut. Install axle shaft.

OVERHAUL: With axle housing removed from truck, remove axle shafts (see above), then proceed as follows:

Disass mbly: **1)** Remove rear cover from rear axle housing. Rotate gears to check for roughness and inspect teeth for scoring, flaking, or abnormal wear. Check backlash and runout of ring gear (see below).



2) Mark side bearing caps and housing to assure reassembly of caps in same position, then remove caps. Install housing spreader Tool 4000-A, and spread housing until differential assembly can be forced out with a pry bar or heavy screwdriver. *CAUTION - Do not spread housing mor than .020" to remove differential assembly. Loosen th spreader immediately after lifting out dif f r ntial assembly to prevent springing the housing.*

3) Using Tool T56L-400-A, remove differential side bearings. Remove and tag shim packs which were installed under each bearing. Remove drive gears from differential case. Drive out pinion shaft lock pin with a punch and remove differential pinion shaft, differential pinions, and thrust washers. Remove side gears and thrust washers.

4) Hold universal joint flange with Tool T53L-4851-D & E and remove nut and washer from pinion shaft. Remove universal joint flange with Tool T53L-4851-A. Press pinion shaft out of housing. If rear bearing cone is to be replaced, use Tool T56T-4630-A (4.88-1 ratio axle), 4630-B (5.87-1 ratio axle), 4630-C (4.55-1 ratio axle), and press cone off pinion shaft. Remove oil seal with Tool 4676-N.

5) Remove oil slinger, pinion front bearing cone, and pinion bearing preload adjusting shim pack (located between front bearing cone and shoulder on pinion shaft). If pinion bearing cups are to be replaced, use Tool T55P-4616-B (front cup), T53T-4616-E (rear cup). Measure thickness of shims found back of rear bearing cup and record the reading or tie shims together for reinstallation.

Insp cti n: Wash all parts with solvent and blow dry with air, then oil all bearings. Check gear teeth for scoring or signs of wear. Check differential side gear hubs, thrust washers, splines and thrust surfaces for pitting or wear. Check bearing cups for rings, galling, scores, and for erratic wear pattern. Make sure that all bearing cups are seated properly in their bores. Temporarily install bearing caps and test fit of adjusting nuts in their threads. They should turn easily when bearing caps are tightened to specifications. Face of nuts must be smooth and square. Polish with a fine abrasive on a flat surface. Remove all nicks and burrs from mating and mounting surfaces.

FORD F-250 & P-350 TRUCK REAR AXLE

Differential Case Reassembly: Install side gears and thrust washers, pinion gears and thrust washers, and pinion shaft in differential case. Install pinion shaft locking pin. Install drive gear on differential case and tighten attaching bolts to 70-90 ft. lbs. Install both differential side bearings on case without shims. Make sure that bearings bottom on shoulders of case. Place cups on bearings and install complete assembly in rear axle housing. Install bearing caps and tighten cap bolts just enough to keep bearing caps in place. Mount a dial indicator on axle housing with indicator button against back side of ring gear. Pry differential assembly away from dial indicator with a screwdriver, then set dial indicator to zero. Pry differential assembly toward dial indicator and note indicator reading. Record this reading for reference when installing differential case in axle housing as it represents the total amount of shims (less those required for bearing preload) necessary to take up clearance between differential cups and case. Remove differential case assembly from axle housing. *NOTE - Do not install shims under bearings at this time.*

Pinion Gear Assembly Installation: With correct pinion depth adjustment shim pack and pinion bearing preload adjustment shim pack selected (see below), install front and rear bearing cups in axle housing (shim pack back of rear bearing cup), using Tool T56T-4616-A and T53T-1239-A. Press rear bearing on pinion shaft with Tool T53T-4621-B and install pinion assembly in housing. Install correct pinion bearing preload adjusting shims on pinion against shoulder and install front bearing. Install oil slinger, oil seal (soak new seal in oil for 30 minutes before installation). Install universal joint flange, washer, and nut. Tighten nut to 200-250 ft. lbs.

Pini n D pth S tting (Shim Sel cti n M th d) - *(NOTE - This method can be used when only a new ring g ar and pinion are installed. Should any of th carrier housing*

CONTINUED ON NEXT PAGE

FORD TRUCK HYPOID (C nt.)

parts be changed, or if tooth contact pattern not correct, the "Master Gauge Method", below, must be used). The thickness of shims required is determined by thickness of shim pack removed at disassembly and by the plus or minus figure etched on pinion. For example, if original pinion was marked +2 and had a .035" shim pack back of rear bearing cup, and the new pinion to be installed is marked −1, the shim pack must be increased by .003" to bring new pinion to its correct position. *NOTE* - A (+) marked pinion calls for the removal of shims in the amount of the marking. A (−) marked pinion calls for addition of shims in the amount of the marking. Replacement shims are available in .003"& .005" thicknesses.

Pinion Depth Setting (Using Gauge T56T-4020-A) - *(NOTE - This method must be used whenever any of the carrier housing parts are changed or when the original shim pack thickness is unknown).* Install pinion in housing (see above) without the front bearing preload adjusting shim pack. Install universal joint flange, flat washer and nut, then tighten nut until pinion bearing preload is 10-30 inch pounds (see "Pinion Bearing Preload" below for checking procedure); as pinion shaft nut is tightened, rotate pinion shaft to seat bearing rollers. Place gauge shaft and discs in differential bearing pockets and tighten caps on larger discs only. Attach dial indicator to its holder and place it on highest step of gauge block. Place gauge block squarely on pinion gear and squarely against gauge shaft. With indicator button resting on gauge block, set dial indicator to zero. Swing indicator to highest point on gauge block and note reading *(NOTE - The highest point on gauge shaft is highest indicator reading while indicator hand is moving clockwise).* The indicator reading at this point must correspond to marking on pinion gear. A (+) reading (clockwise from zero) at highest point on gauge shaft with a zero marked pinion means that the actual dimension is too great in the amount of the plus reading. To correct, add shims that correspond to the plus reading. For a (−) reading (counterclockwise from zero) at the highest point on gauge shaft with a zero marked pinion, remove shims equal to the minus reading. *NOTE* - A −3 marked pinion is installed at the proper depth when the indicator reads −3 at the highest point on gauge shaft. Similarly, a +3 marked pinion is installed at the correct depth when the indicator reads +3.

Pinion Bearing Preload Adjustment - *(NOTE - When pinion setting shim pack is changed (see above), add or subtract the same thickness of shims from pinion b aring preload shim pack at front bearing to maintain correct pinion bearing preload).* To check preload, wrap a strong cord around universal joint flange and attach a pound-pull scale to cord. Note the pull required to keep pinion shaft rotating (disregard pull required to start pinion rotating), which should be **10-30 inch p unds.** *NOTE* - The inch-pound torque required to keep pinion shaft rotating is calculated by multiplying the scale reading in pounds, with one half the diameter in inches. As an example, a 15 lb. pull on a 4" diameter is 30 inch pounds.

Differential Case Installation: With pinion shaft correctly installed in housing (pinion setting & bearing preload adjusted), install differential assembly (with correct shim packs back of bearing cones; see "Differential Bearing Preload & Backlash Adjustment" below), as follows: Install housing spreader Tool 4000-A and spread housing not more than .020". Install differential assembly, with bearing cups in position on bearings, into rear axle housing. Rotate and tap ring gear with a soft hammer to seat bearings properly in cross-bores. Install bearing caps (make sure indexing marks made at disassembly are in alingment), then remove housing spreader. Install and tighten capscrews to 70-90 ft. lbs. Check backlash (see below). Install rear cover and gasket and tighten capscrews to 15-25 ft. lbs.

Differential Bearing Preload & Backlash Adjustment - With differential bearings installed on case without shim packs, install case, with bearing cups, in housing. Install bearing caps and tighten bolts lightly. Mount a dial indicator on housing with indicator button bearing against back side of ring gear. Move differential assembly tight against pinion gear and set dial indicator at zero. Move differential assembly toward indicator and note maximum reading *(NOTE* - This reading indicates the shim pack thickness required behind bearing cone on ring gear side of case). To obtain shim pack required for opposite side of case, take the reading just obtained and subtract it from the reading taken when differential case was reassembled and checked in rear axle housing (see "Differential Case Reassembly) above). The remainder, plus .015-.020" for preload and backlash, will be total shim pack required on side of case opposite the ring gear. As an example, if the reading obtained when differential case clearance checked in axle housing was .070" and the reading obtained on dial indicator (above) was .038", then the thickness of shims required on opposite side of housing from ring gear, would be .070" minus .038"; or .032" to which should be added .015-.020" (.017") shims for preload and backlash, giving a total shim pack of .049". Remove bearing caps and take differential case out of housing. Remove side bearings and install proper amount of shims on each side. Press side bearings on case until they are firmly seated against shims. Install differential case in housing.

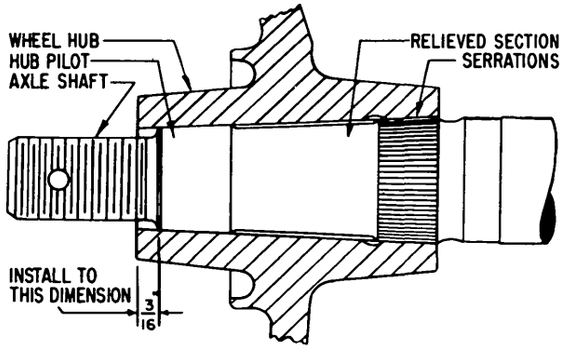
Differential Ring Gear Backlash Ch ck: Install a dial indicator to check backlash at four equally spaced points around ring gear. The backlash must be .004-.009" and must not vary more than .002" between positions checked. If backlash does not meet specifications, change the shim packs behind both differential side gears by taking shims from one side and installing them on the other as required. Total shim pack must not be changed.

RAMBLER HYPOID

Rambler Six (1957)
Rambler V8 (Early 1957). See note below.

► *1957 RAMBLER V8 REAR AXLE PRODUCTION CHANGE:* Spicer type rear axles used beginning Serial No. A-11296. Spicer type axles are identified by number "44" cast on housing.

► *1957 RAMBLER SIX AXLE SHAFT PRODUCTION CHANGE:* Beginning with Serial No. D-393951, serrated type axle shafts and hubs were used in production replacing the earlier "keyed" shaft and hub and drum assembly. See "Overhaul" below.



DESCRIPTION: Own semi-floating, hypoid gear type with torque tube drive and coil springs similar in design to previous models.

REMOVAL: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Nash, Hudson, Rambler Hypoid (Torque Tube Drive)" in 1956 Annual Data and note the following:*

Axle Shaft Replacement (Serrated Type): Remove tire and wheel assembly from brake drum and hub, then remove speed nuts holding drum to hub. Use Hub Puller, Tool J-736-B or J-1644-B to remove hub from axle shaft. To install hub, index serrations of hub with those on shaft and tighten with the axle shaft nut and washer. The hub is properly located on axle shaft when the measurement from outside face of hub to the taper of the axle shaft is 3/16". *(CAUTION - Ov r-tightening beyond this dim nsion will caus interference between drum and brak support plat).*

► *SERVICE REPLACEMENT HUB NOTE:* Service replacement hubs are not serrated. Serrations will be cut in the hub when it is installed on the shaft. The measurement of 3/16" from outside face of hub to the taper of the axle shaft applies to a service replacement hub without serrations.

RAMBLER (6 CYL.) SERRATED AXLE

OLDSMOBILE HYPOID

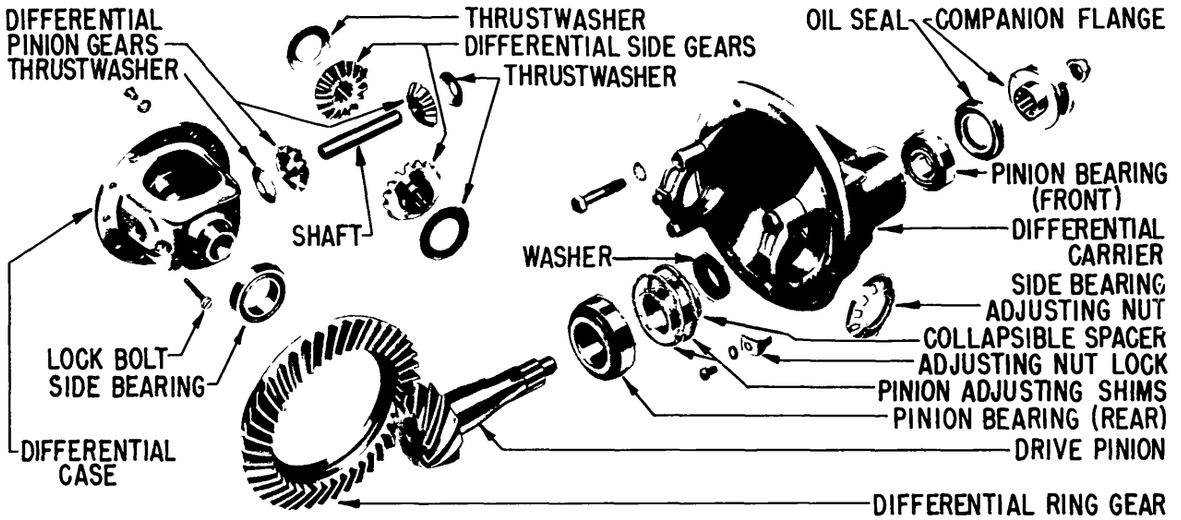
All Models (1957)

►CHANGES, CAUTIONS, CORRECTIONS

► *PINION BEARING PRELOAD CAUTION:* Pinion bearing preload must be adjusted whenever universal joint flange nut on pinion shaft is loosened. Preload is controlled with this nut and will be disturbed when nut loosened for any reason.

DESCRIPTION: Semi-floating hypoid gear type of same design used on previous models.

AXLE SHAFT REMOVAL: *See "Rear Axle" on Car Model pag .*



WHEEL BEARING & OIL SEAL REPLACEMENT: *(NOTE* - Wheel bearings have .012-.015" endplay between balls and the races. Do not reject bearing unless endplay is greater than .020" or if there is definite roughness between ball and race). With axle shaft removed, remove bearing retainer collar after splitting with a cold chisel. *(CAUTION* - Do not damage axle when removing collar). Using Tool J-947-2 and J-947-1, press off bearing in an arbor press. To install bearing, use Tool J-947-3 and Plate J-947-1 with an arbor press and press bearing over axle shaft, being sure that pressure is being applied to inner race of bearing. After bearing has been pressed firmly against axle shaft shoulder, press new bearing retainer collar on shoulder of shaft against bearing. Be careful not to damage shaft surface on which oil seal runs.

Oil Seal: With axle shaft removed, remove seal. Before installing a new seal, apply sealer around its outside diameter then install seal in housing with Tool J-5818. *CAUTION* - When installing axle shaft, be careful not to damage seal.

PINION SHAFT OIL SEAL REPLACEMENT: Mark pinion shaft nut before loosening so that it may be retightened to the exact same location. This will avoid necessity of resetting pinion bearing preload. Remove companion flange nut and washer, then remove companion flange with Tool 6295-01. Remove seal by driving it out of housing with a blunt chisel. Lubricate new seal and coat outer diameter with sealing compound. Tap seal into place using Tool J-5395. Apply seal lubricant, Part No. 567196 to outer diameter of flange and to lip of new seal. Install flange and tighten nut to marked position, then tighten nut 1/16" beyond alignment mark.

OVERHAUL: Carrier Removal - Remove axle shafts, then clean area around carrier to prevent entry of dirt. Disconnect propeller shaft at rear universal joint and support shaft in body tunnel. Remove nuts from carrier mounting studs and move carrier away from housing sufficiently to drain the lubricant. Remove carrier from housing. *NOTE* - Do not wash carrier assembly until after it has been completely disassembled. This will avoid washing dirt into bearings.

Carrier Disassembly: Mount carrier assembly in Holding Fixture, Tool J-3289-B. If original pinion and ring gear are to be reinstalled, install Dial Indicator, KMO-30 on carrier and measure backlash of ring gear at two points 180° apart. The lowest reading should be within .003-.012". Check tightness of ring gear to differential case cap screws which should be 55-60 ft. lbs. Mark the right side bearing adjusting nut, bearing cap, and carrier with **two** punch marks, then mark left side in same manner with **one** punch mark. *(NOTE - These marks will be used at reassembly if the original gear set is being used).* Remove bearing cap lock screws and locks, then check side bearing preload to determine if it is correct, as follows: Loosen each bearing cap attaching bolt ¼ to ½ turn (just enough to turn adjusting nut), then tap bearing lightly to assure freeness of nuts in threads. Back off right hand adjusting nut (right hand nut is opposite ring gear) and watch the outer race of bearing. *(NOTE* - If side bearing preload is correct, the outside bearing race should start to turn the instant the adjusting nut is loosened, and should continue to turn until adjusting nut is loosened 1½ to 3 notches. **Count and record the number of notches between punch marks on nut and those on carrier where race stopped turning).** Remove bearing cap bolts, bearing caps, and adjusting nuts. Remove differential case from carrier while holding outer bearing races against rollers. Check pinion bearing preload (see below), then turn carrier assembly to a horizontal position and remove companion flange nut, then remove companion flange with Puller J-6295-01 and Holding Tool J-6544. Remove drive pinion rear bearing and spacer as follows: Tap out front bearing with a plastic hammer, or if necessary, install carrier in an arbor press and press pinion out of front bearing. *NOTE* - In all cases, a shim washer .037" to .045" will be found between the compressible spacer and inner race of front bearing. A second shim is used in production to salvage the compressible spacer should recommended preload be exceeded. This second shim can be used in the same manner for service *(see "Compressible Spacer Note" below).* Remove oil seal by driving it out of housing with a blunt chisel, then remove front inner race and roller assembly. Press front bearing race out of carrier with Tool J-6198, and rear bearing race with Tool J-6533. Using Tool J-6531 and an arbor press, remove rear bearing from pinion shaft.

OLDSMOBILE REAR AXLE ASSEMBLY

Differential Case Disassembly: Remove lock screw and pinion gear shaft, then remove pinion gears, side gears and thrust washers from case. If ring gear or case are to be replaced, remove ring gear. *(NOTE* - Do not remove side bearings from case unless they are to be replaced). If necessary to remove side bearings use Differential Side Bearing Remover, Tool TR-278-R, making sure that ends of puller are placed in recess in case.

Differential Case Reassembly: Reverse disassembly procedure and note the following: Lubricate gears and thrust washers, then place side gear thrust washers over hubs and install side gears in case. While holding upper side gear up into its bore, position one pinion gear (without thrust washer) between side gears and rotate gears until pinion gear is directly opposite loading opening in case. Place the other pinion in position between side gears so that pinion shaft holes line up. Rotate pinion gears in position to assure pinion gear shaft holes in gears are lined up with shaft holes in case. If holes do not line up, pinion will require repositioning in side gear teeth. With gears properly meshed, rotate assembly just enough to permit working the pinion gear thrust washers into position between gears and case. Install gear shaft and lock it in place with lock screw and lockwasher.

Carrier Reassembly: Reverse Disassembly procedure and note the following:

Pinion Gear Setting - Before assembling the carrier, the correct number of shims required to locate drive pinion properly must be determined from markings on

CONTINUED ON NEXT PAGE

OLDSMOBILE HYPOID (Con.inued)

differential carrier and end of pinion. Carrier is marked on face of flange with either of the following codes: "D" (indicating "deep"); "S" (indicating "shallow"); "O" (indicating "standard"). The digit following the letter designates number of thousandths "deep" or "shallow". *(NOTE - A carrier marked "O" will require .016" of shims under pinion bearing, plus or minus the markings on pinion).* Pinions are marked plus(+) or minus (-) together with a number indicating in thousandths of an inch the shims required to position pinion in carrier. *(NOTE* - Drive pinions machined to zero specifications are not marked). Determine markings on carrier and on pinion, then refer to "Pinion Shim Chart" for correct thickness of shims to use.

PINION SHIM TABLE

Carrier Marking	Pinion Marking								
Mark	−4	−3	−2	−1	0	+1	+2	+3	+4
S-5	.007	.008	.009	.010	.011	.012	.013	.014	.015
S-4	.008	.009	.010	.011	.012	.013	.014	.015	.016
S-3	.009	.010	.011	.012	.013	.014	.015	.016	.017
S-2	.010	.011	.012	.013	.014	.015	.016	.017	.018
S-1	.011	.012	.013	.014	.015	.016	.017	.018	.019
O	.012	.013	.014	.015	.016	.017	.018	.019	.020
D-1	.013	.014	.015	.016	.017	.018	.019	.020	.021
D-2	.014	.015	.016	.017	.018	.019	.020	.021	.022
D-3	.015	.016	.017	.018	.019	.020	.021	.022	.023
D-4	.016	.017	.018	.019	.020	.021	.022	.023	.024
D-5	.017	.018	.019	.020	.021	.022	.023	.024	.025

► *PINION SHIM NOTE:* Pinion shims are furnished in the following sizes and are marked for identification as indicated. .004" (Plain), .005" (Blue Steel or 1 notch), .006" (Flash Copper or 2 notches), .007" (Plain), .008" (Blue Steel or 1 notch), .009" (Flash Copper or 2 notches), .010" (Plain).

Pinion Drive Gear Installation - Press rear pinion bearing race into carrier with Tools J-2940 & J-2937. Install front bearing race with Tool J-6133. Install correct number of pinion adjusting shims against shoulder of drive pinion shaft, then lubricate rear bearing and press it firmly against shims on pinion shaft with Tools J-2935 and J-358-1 and an arbor press. Place compressible spacer over pinion shaft (with large diameter against shoulder on pinion), then install washer. *(NOTE - See "Compressible Spacer Note" below).* Place drive pinion into position in carrier. Lubricate front bearing and install it over pinion shaft. *(NOTE* - If pinion shaft is a press fit in front bearing, use an arbor press and Tool J-6133 to install bearing while supporting the pinion shaft. Coat outer diameter of a new pinion seal with Permatex No. 2, then start seal into carrier by tapping lightly and then finish driving in place with Tool J-5395. Apply a coating of seal lubricant, Part No. 567196 to companion flange and sealing lip of new seal. Support drive shaft and tap companion flange onto pinion shaft. Oil flat washer and threads of shaft and install washer and nut, but do not tighten.

Pinion Bearing Preload - *CAUTION - Care must be taken in tightening companion flange nut to preload pinion bearings correctly. If specified preload has been exceeded, it will be necessary to install a new spacer or a second washer. DO NOT back off nut to secure proper preload.* With drive pinion properly installed in carrier (new compressible spacer, companion flange and nut installed), tighten companion flange nut using Flange Holding Tool J-6544, until all endplay in drive pinion assembly is removed. Continue to tighten carefully (not more than 1/6 turn at a time), and check bearing preload with an inch-pound torque wrench or a spring scale. Repeat tightening and checking until preload friction is 24-32 inch-pounds for new bearings, or 10-12 inch-pounds for old bearings.

► *COMPRESSIBLE PINION BEARING PRELOAD SPACER NOTE:* A second washer or a new compressible spacer and one washer must be used under the following conditions: When a new ring gear and pinion is installed. When either front or rear pinion bearings are changed. When a new carrier is installed, or when the compressible spacer is compressed too much and the preload has been exceeded. If two washers are found between spacer and bearing assembly, one washer should be discarded and a new compressible spacer used.

Ring Gear Backlash & Differential Case Side Bearing Adjustment - *(NOTE* - When new parts, such as gear sets, bearings, etc., are installed, the markings on the carrier and adjusting nuts which indicated original position of gears and side bearing preloads, should be disregarded. Whenever original parts are installed the markings can be used to reset the adjustments providing original settings were correct). With differential case installed in carrier and adjusting nuts installed, install the bearing caps and capscrews (no washers) and draw them down sufficiently to lightly hold caps in place. Using Tool J-972-A back off the right hand adjusting nut (one opposite ring gear) approximately three turns. Tighten left hand adjusting nut to move ring gear into mesh with pinion until all lash is removed, **then back ff adjusting nut three notches.** *(NOTE* - This is only a starting point and may need to be readjusted depending on backlash present after making the following adjustments). Tighten the right hand adjusting nut while watching the outer race of bearing. When bearing race just starts to move along with adjusting nut, indicating tension on bearing, continue to tighten two notches. Tighten adjusting nut to align closest notch with capscrew hole in bearing cap. Tighten bearing cap bolts to 70-75 ft. lbs. Clamp dial indicator to differential carrier and check backlash between ring gear and pinion using Dial Indicator, Tool KMO-30. *(NOTE* - If same ring gear and pinion were installed, the backlash should be adjusted according to markings on bearing caps and adjusting nuts providing the differential was not disassembled to correct a noisy complaint). If backlash is not within limits of .003" minimum, .012" maximum (.007-.008" preferred), loosen bearing cap bolts slightly, then move both adjusting nuts one notch at a time until correct backlash is obtained. To increase backlash, move ring gear away from drive pinion and to decrease backlash, move it toward pinion. If left nut is backed off one notch, right nut should be tightened one notch. Tighten bearing cap bolts to 70-75 ft. lbs. each time backlash is checked.

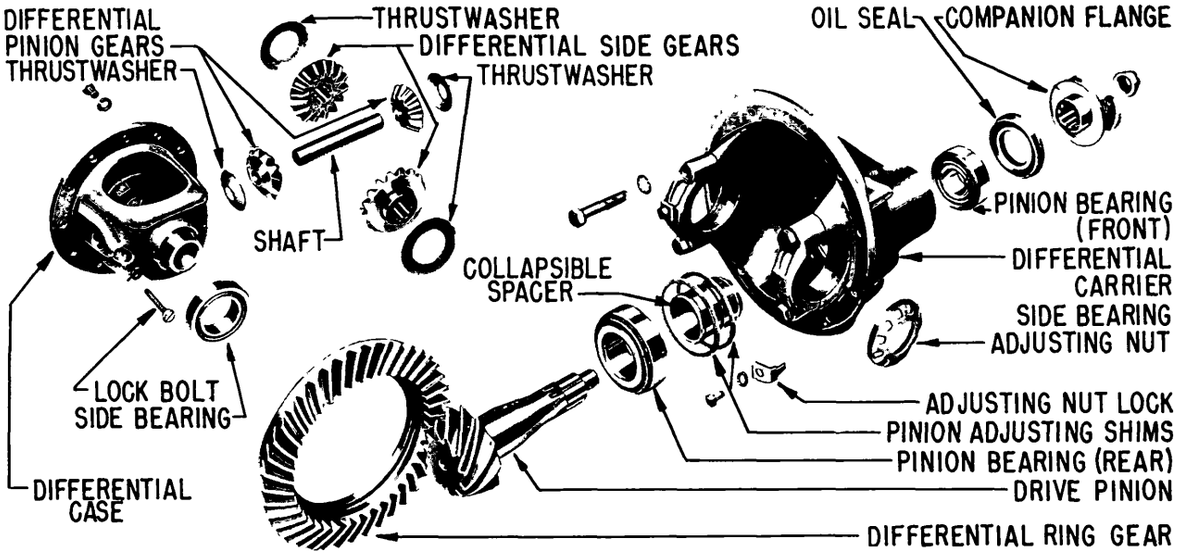
Pedestal Spread Measurement & Adjustm nt - Position Gauge J-511 over pedestal caps, then check clearance between gauge and machined surface of bearing caps. This clearance should be .004-.012". If clearance is less than .004", loosen the right hand bearing cap bolts and loosen adjusting nut ½ notch and again tighten pedestal cap bolts and recheck clearance. *(NOTE* - The right hand nut should not be loosened more than ½ notch from the original 2 notches tight position). If clearance is found to be more than .012", then the right hand nut should be tightened one notch. After side bearing preload is correct, install bearing cap locks and lock bolts.

Carrier Installation: Clean gasket surface on housing and install a new gasket. Install carrier over studs and carefully align carrier with housing so that both pedestal caps enter supports in housing. Apply Permatex No. 2 on stud threads, then install nuts and tighten equally to draw carrier pedestal caps evenly into support in housing. Tighten nuts to 50-60 ft. lbs. Complete installation by reversing removal procedure.

PONTIAC HYPOID

All Models (1957)

DESCRIPTION: Semi-floating, hypoid gear type with Hotchkiss drive. Design is similar to axle used on previous models.



AXLE SHAFT REMOVAL: *See "Rear Axle" on Car Model page.*

WHEEL BEARING & OIL SEAL REPLACEMENT: With axle shaft removed, remove bearing inner retainer by carefully cutting it with a cold chisel. *(CAUTION* - Do not cut into shaft). If a new bearing is to be installed, old bearing and retainer may be pressed off shaft together. With Tool J-947-P engaging outer race of bearing and ring enclosing bearing, press shaft out in an arbor press. *(NOTE* - If oil seal only is to be replaced, remove "O" ring from outer diameter of bearing race, then with an offset screwdriver, pry oil seal assembly from axle shaft bearing. Install "O" ring seal on bearing and start seal assembly into bearing, with lip side of seal toward bearing). To reinstall bearing, install oil deflector, bearing outer retainer plate, and a new gasket. Install bearing on shaft using Tool J-947-P to bear only on inner race and press bearing firmly against shoulder on shaft. Press a new bearing retainer ring in place firmly against bearing using Tool J-947-P. Reinstall axle shaft.

► *BRAKE DRUM INSTALLATION NOTE:* Inner edge of brake drum must not extend beyond edge of backing plate. Install Gasket, Part No. 499776 between axle shaft flange and brake drum as necessary to correctly position the brake drum.

PINION SHAFT OIL SEAL REPLACEMENT: Mark position on companion flange, pinion nut, and pinion shaft to insure reassembly in the same location. *(NOTE* - If companion flange is to be replaced, it will not be necessary to mark the above parts as pinion bearing preload will have to be readjusted). Remove drive pinion nut and washer using Holding Tool J-6289, then remove companion flange with Puller J-6295. Remove oil seal by prying it out of carrier with a blunt tool. Oil lip of new seal and coat outer diameter with Permatex No. 3. Install seal by tapping into place with Tool J-5395. Install companion flange, then install washer and nut. Tighten nut until it and the companion flange are in the same position as marked at disassembly. *(NOTE* - Pinion nut will turn relatively easy until original position is approached and bearings begin to preload. Stop turning nut at this point and check position).

OVERHAUL: Carrier Removal - Remove axle shafts, then disconnect rear universal joint at the companion flange. Clean differential carrier adjacent to axle housing and drain oil by loosening all differential attaching bolts. Pull carrier out about 1/8" to allow oil to drain. Remove nuts and remove carrier assembly.

PONTIAC REAR AXLE ASSEMBLY

Carrier Disassembly: Mark right and left bearing caps and adjusting nuts, then remove adjusting nut locks. Loosen bearing cap bolts and back off on left adjusting nut to relieve side bearing preload. Remove bearing caps and adjusting nuts, then remove differential case assembly from carrier. *(CAUTION* - Keep outer bearing races with side bearings so these mating parts can be reassembled in the same location). Remove drive pinion nut and washer using a heavy duty socket and Holding Tool J-6289, then remove companion flange with Puller J-6295 and Holding Tool J-6289. Remove pinion from carrier, being careful not to damage threads or oil seal. If pinion does not slide freely from front bearing, temporarily install pinion nut and lightly tap pinion out of bearing with a soft hammer. If necessary, use an arbor press to press pinion through bearing. Remove spacer and spacer washer (if washer was installed). Remove pinion oil seal from carrier by prying it out with a screwdriver. If front bearing is to be replaced, press outer race from carrier using Tool J-6198 and Drive Handle J-8092. If pinion rear bearing is to be replaced, press rear bearing race from carrier using Tool J-6533 and Drive Handle J-8092. Using Tools J-6555 and J-6407 and press pinion from bearing in an arbor press. Remove adjusting shims from pinion.

Differential Case Disassembly: Remove pinion shaft lockscrew and washer and drive pinion shaft out of case. Remove pinions, side gears and thrust washers. If necessary, remove ring gear from case. If side bearings are to be replaced, install Remover Tool J-986-P with hooks of puller in recesses in differential case and pull bearings off.

Differential Case Reassembly: Position ring gear on case. *(CAUTION* - Do not use hammer to force ring gear onto case). Install ring gear attaching bolts and tighten all bolts evenly to 55-60 ft. lbs. *(NOTE* - Tighten screws finger tight first, then tighten evenly and alternately across diameter in progressive steps until final tightness is reached). Install side bearing on hub of differential case using Tool J-5292. After bearing has been installed on one side, support side bearing with a front wheel bearing outer race or other suitable means, then install opposite side bearing. Lubricate gears and thrust washers, then place side gear thrust washers over hubs and install side gears in case. While holding upper side gear up into its bore, position one pinion gear (without thrust washer) between side gears and rotate gears until pinion gear is directly opposite loading hole in case. Place other pinion in position between side gears so that pinion shaft holes line up. Rotate pinion gears in position to assure pinion gear shaft holes in gear are lined up with shaft holes in case. If holes are not lined up, pinion will require positioning in side gear teeth. With gears properly meshed, rotate assembly just enough to permit working the pinion gear thrust washers into position between gears and case. Install gear shaft and lock it in place with lockscrew and washer.

Carrier Reassembly: Reverse disassembly procedure and note the following:

CONTINUED ON NEXT PAGE

PONTIAC HYPOID (Continued)

Pinion Gear Setting - Before assembling the carrier, the correct number of shims required to locate drive pinion properly must be determined from markings on differential carrier and on end of pinion. Carrier is marked on face of flange with either of the following codes "D" (indicating "deep"), "S" (indicating "shallow"), "O" (indicating "standard"). The digit following the letter designates number of thousandths "deep" or "shallow". *(NOTE* - A carrier marked "O" will require .016" of shims under pinion bearing, plus or minus the markings on pinion). Pinions are marked plus (+), or minus (−), together with a number indicating in thousandths of an inch the shims required to position pinion in carrier. *(NOTE* - Drive pinions machined to zero specifications are not marked). Determine markings on carrier and on pinion, then refer to "Pinion Shim Chart" for correct thickness of shims to use.

PINION SHIM TABLE

Carrier Marking	Pinion Marking								
Mark	−4	−3	−2	−1	0	+1	+2	+3	+4

D-4	.016	.017	.018	.019	.020	.021	.022	.023	.024
D-5	.017	.018	.019	.020	.021	.022	.023	.024	.025

► *PINION SHIM NOTE*· Pinion shims are furnished in the following sizes and are marked for identification as indicated. .004" (Plain), .005" (Blue), .006" (Copper), .007" (Plain), .010" (Plain). Use these shims in combination to obtain the required thickness as indicated in pinion shim table (above).

Pinion Drive Gear Installation - Press rear pinion bearing race into carrier with Tools J-6255 and J-8092. Install front bearing race with Tool J-6197. Install correct number of adjusting shims against shoulder of drive pinion shaft, then lubricate rear bearing and press it onto pinion shaft with Tool J-6547 and Press Plate J-6407. Place a new compressible spacer over pinion and install the assembly in carrier housing. Oil pinion front bearing and roller assembly and install on pinion shaft. Coat outer surface of seal retainer with Permatex No. 3 or similar compound, then install seal by tapping it into place using Tool J-5395-A. Install companion flange, then oil threads of pinion nut and face of washer and install these parts. Position the entire assembly horizontally and tighten pinion nut only enough to remove all endplay, using Flange Holding Tool J-6289 and a heavy socket.

Pinion Bearing Preload - *(CAUTION - Extreme care must be taken when tightening pinion nut to preload bearings correctly. Never back off nut to reduce preload. If torque required to keep pinion turning exceeds the following specifications, a new bearing spacer must be installed).* With drive pinion properly installed in carrier (companion flange, nut, and a new compressible spacer installed), tighten pinion shaft nut using Flange Holding Tool J-6289 and a heavy socket until all pinion shaft endplay is removed. Continue to tighten the nut a little at a time, stopping frequently to turn pinion several revolutions to seat rollers and to check turning torque with an inch-pound torque wrench (Tool KMO-652). Repeat this procedure until turning effort required to keep pinion moving is as follows· 10-12 in. lbs. (Old pinion seal and old bearings), 12-15 in. lbs. (New pinion seal and old bearings), 22-26 in. lbs. (Old pinion seal and new bearings), 24-32 in. lbs. (New pinion seal and new bearings).

► *NOTE.* Torque measurement may be taken using a spring scale hooked to Holding Tool J-6289 at a point 10" from pinion shaft center. Reading in lbs., times 10 will give the inch-pounds.

Ring Gear Backlash & Diff rential Side Bearing Adjustment - Hold outer races squarely on side bearings and install differential case into carrier, positioning ring gear against pinion gear. Place adjusting nuts (on correct sides as indicated by marks) into threads of pedestals and squarely against outer races. Install bearing caps and capscrews making certain that threads in caps match those in adjusting nuts. Tighten capscrews slightly more than finger tight. Tighten right adjusting nut, backing off left nut, if necessary, to bring adjusting nuts into full contact with outer races and to provide a slight amount of backlash. When turning nuts keep them in contact with races to maintain a slight amount of preload on bearings. Tighten left nut, backing off right nut, if necessary (keeping nuts against bearing), while rocking case until backlash has just been eliminated. If left nut is not in a locking position when backlash has been eliminated, back off to nearest locking position. Back off right nut to insure that nut and outer race do not turn together. Retighten right nut until outer race just starts to turn with nut, then mark this point on adjusting nut. Tighten right nut **one notch,** tap each bearing cap, and rock ring gear. Check backlash as follows Install Dial Indicator, KMO-30 on carrier flange so indicator button is bearing against rear face of a ring gear tooth, then measure the movement of ring gear against pinion. Continue to turn right nut until it has been tightened a total of two to three notches. Recheck backlash which should be .003-.012". Tighten bearing cap bolts to 70-75 ft. lbs. tapping each bearing cap several times with hammer while tightening to insure proper seating of caps.

Carrier Installation: Clean interior of axle housing with solvent and thoroughly clean surface of housing contacting carrier gasket. Install a new gasket, then install carrier over bolts in housing. Tighten attaching nuts to 45-60 ft. lbs. Install axle shafts (see above), then connect rear universal joint to companion flange. Tighten nuts to 14-20 ft. lbs., then bend ears of lockplate up against flat side of nuts.

1957 SUSPENSION & WHEEL ALIGNMENT

BUICK

All Series (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 LOWER BALL JOINT LOOSENESS NOTE:* With the car jacked up (no load on front wheel), the lower ball joint is normally loose and no corrective measures should be taken unless the looseness, measured at outer circumference of tire is greater than ¼" laterally. If movement of the front wheel exceeds this specification, replace lower ball joint.

►*1957 LOWER CONTROL ARM-TO-FRAME BOLT PRODUCTION CHANGE & TIGHTENING CAUTION:* Two different type bolts have been used at this location. On early cars, bolts having three radical marks in head should be tightened to 55-65 ft. lbs. *(CAUTION - Do not tighten in excess of this specification).* Later cars have bolts with six radial marks in head. Tighten these bolts to 70-80 ft. lbs. A special hardened steel plate, Part No. 1180406 is used with the later type bolts. The normal length of the later type bolts is 1¾", however, a few cars were produced with 1½" bolts. On these cars, if shimming of lower control arm is necessary, the longer bolts must be installed. *If bolts are to be replaced for any reason, be sure and install the later type together with the hardened steel plate.*

►*1957 TIE ROD INTERFERENCE (POWER STEERING CARS):* If an interference condition between outer and of intermediate rod and tie rod exists, it may be caused by the head of the cotter key used to lock plugs in end of intermediate rod rubbing against tie rod. Correct by loosening idler support arm attaching bolts and positioning idler arm support rearward as far as possible. It may also be necessary to change position of cotter key 45°, so that head of key is at rearward side of intermediate rod.

DESCRIPTION: New "ball-joint" suspension with ball and socket type joints connecting upper and lower control arms to steering knuckles. Coil springs and direct acting shock absorbers are mounted between spring seats on lower control arms and spring pockets in frame crossmember. Control arm shafts are bolted to frame crossmember and are connected to control arms by threaded type bushings.

ADJUSTMENT

CHECKING & ADJUSTING: Before checking or adjusting front suspension alignment, inflate tires to specified pressure. Check front wheel bearings for looseness and correct as necessary. Check for runout of wheels and tires and correct to within limit of 1/8" runout at side of tires. Check for looseness at upper ball joints and tie rod ends and correct if found excessive. Bring car to height specified below.

►*CAR HEIGHT (FOR CHECKING ALIGNMENT OF CASTER & CAMBER):* Place a 3/8" square pin 3 21/32" long between frame and front lower control arm at each front wheel (see illustration), making sure that pin is standing vertical and not leaning. Use sandbags or other suitable weight to hold car down on pins. Bring rear of car to proper trim height *(See "Buick Rear Suspension").* If the gas tank is full, trunk empty (except for spare tire), and if car is bounced and allowed to settle, it may then be considered at proper trim height. If these conditions cannot be met, a 3/8" square pin 5 13/32" long should be placed between axle housing and frame at each rear wheel location (see illustration). Use sandbags or suitable weight to hold car down on pins.

Tire Inflation: 24 lbs. (after car has been standing for 3 hours or driven less than 1 mile). **26 lbs.** (after car has been driven for 3 miles or more **below** 40 MPH). **28 lbs.** (after car has been driven 3 miles **above** 40 MPH).

Steering Axis Inclination: Approximately 6° at 0° Camber. Both sides should be within 1° or each other. No adjustment.

►*CAMBER & CASTER ADJUSTMENT CAUTION: Both camber & caster are adjusted by shimming in the same locations, therefore both should be checked before changing either setting.*

►*CONTROL ARM SHIMMING NOTE (FOR CAMBER & CASTER ADJUSTMENT):* If only a small adjustment is required to bring alignment within limits, make shim adjustments at lower control arm. If the amount of shims exceed .160" in any one stack on lower control arms, make adjustments at the upper control arm shafts. Under no circumstances should total shim thickness exceed .160" on lower control arm shafts, and .380" on upper control arm shafts. Replace necessary parts if proper alignment cannot be obtained within these limits.

Caster: Neg. ¼° to Neg. 2¾° (Neg. 1¾° desired), both wheels. *See "Shimming Procedure" below.*

Camber: Pos. 1° to Neg. ½° (Pos. ½° desired). Both wheels should be within ¾° of each other. *See "Shimming Procedure" below.*

Toe-In: 1/16" to 1/8". *(CAUTION - Car must be at curb weight and running height - bounce car and allow it to settle to running height. DO NOT ALLOW ALIGNMENT PINS (see above) TO REMAIN IN POSITION WHILE CHECKING OR ADJUSTING TOE-IN).* Loosen clamp bolts and turn adjusting sleeves at tie rod end as required. Turn right and left adjusting sleeves exactly the same amount but in opposite directions when changing toe-in, in order to maintain front wheels in straight ahead position when steering wheel spoke is straight down. Position tie rod clamps downward to 45° forward to provide frame clearance. *NOTE - It is very important to position bottom face of tie rod end parallel with machined surface at outer end of steering arm when tie rod length is adjusted.*

Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 23° (Manual Steering), 21¾° (Power Steering). Not adjustable.

Shimming Procedure: *NOTE - No lower control arm shims are installed in production, however, it is recommended that all shimming required for service adjustments be done at lower control arm shaft providing shim stacks at any one location do not exceed .160". If in excess of this thickness, adjustment must be made at upper control arm shaft.*

Shim Selection (For installation at both upper and lower control arms) - *(NOTE - Upper and lower control arm shaft shims are different and are furnished in sizes indicated in table below).* Adding shims at front location will change **caster toward negative** (Practically no change in camber or toe). Adding shims at rear location will change **caster toward positive** and camber toward negative (toe toward toe-out). Adding shims at both locations will **not change caster,** but will change **camber toward negative** *(NOTE* - A .040" shim installed at front location will change caster approximately ¼° toward negative. A .040" shim installed at rear location

CONTINUED ON NEXT PAGE

BUICK (C ntinu d)

will change caster approximately 5/16° toward positive (camber will be changed approximately 1/8° toward negative). A .040" shim installed at both locations changes camber approximately 3/16° toward negative (does not change caster), and toe approximately 3/16" toward toe-out.

Lower Control Arm Shaft Shims

Thickness	Part No
.040"	1179204
.120"	1179205

Upper Control Arm Shaft Shims

Thickness	Type ①	Identification ②	Part No.
.060"	Horseshoe	6	1171175
.080"	Horseshoe	8	1172986
.100"	Horseshoe	10	1175585
.060"	Round	6	1175794
.080"	Round	8	1175795
.100"	Round	10	1175796

① - Furnished with either "horseshoe slot" or round hole.
② - Identification number stamped on shim.

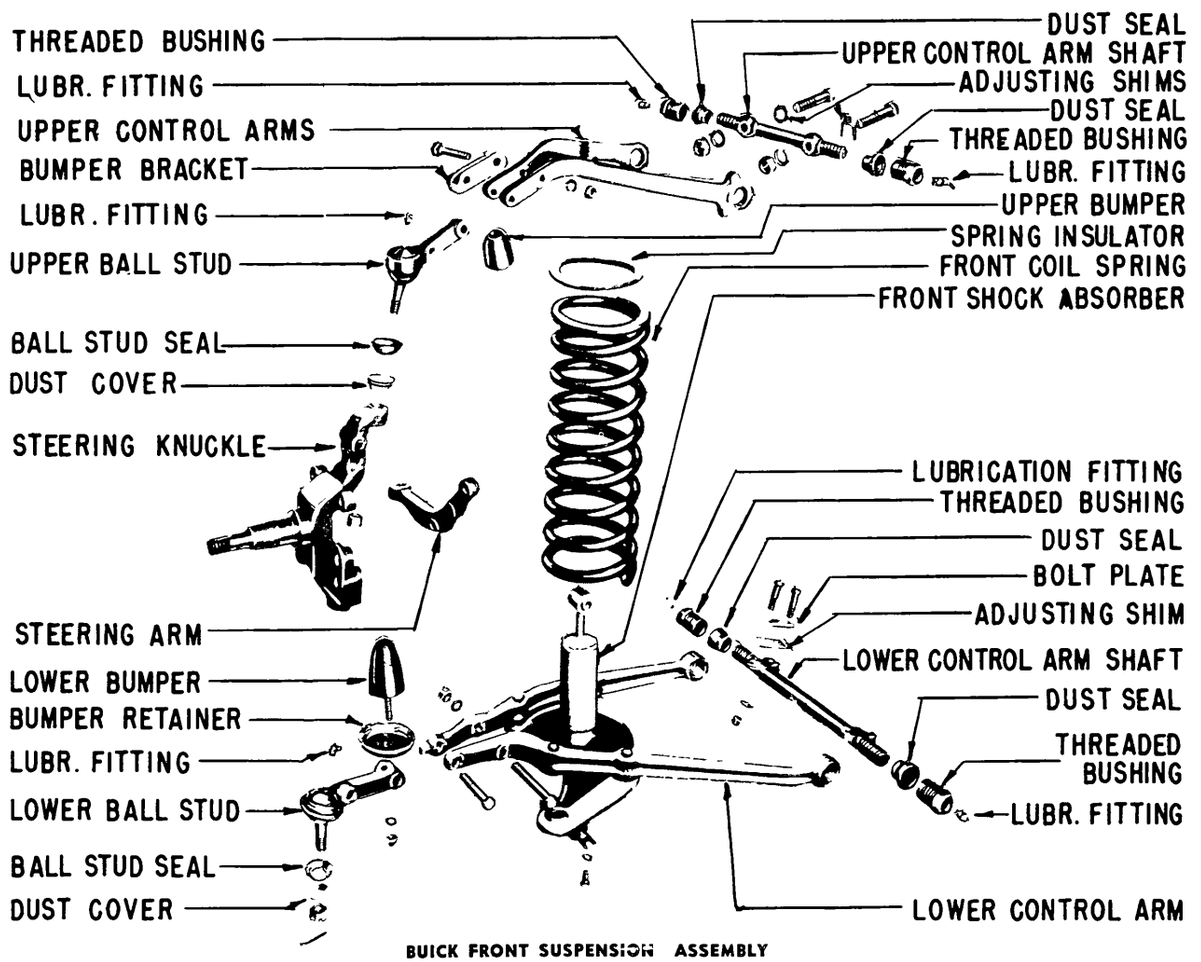
► *1957 LOWER CONTROL ARM-TO-FRAME BOLT PRODUCTION CHANGE & TIGHTENING CAUTION:* Two different type bolts have been used at this location. On early cars, bolts having three radial marks in head should be tightened to 55-65 ft. lbs. *(CAUTION - Do not exceed this tightening specification).* Later cars have bolts with six radial marks in head. Tighten these bolts to 70-80 ft. lbs. A special hardened steel plate, Part No. 1180406 is used with the later type bolts. The normal length of the later type bolts is 1¾", however, a few cars were produced with 1½" bolts. On these cars, if shimming of lower control arm is necessary, the longer bolts must be installed. If bolts are to be replaced for any reason, be sure and install the later type bolts with hardened steel plates.

Shim Installation (Lower Control Arm) - To prevent movement of lower control arm shaft on frame member during shim installation, loosen only one bolt at a time. Install shim and tighten bolt before installing shim at opposite end.

Shim Installation (Upper Control Arm) - On left side, disconnect negative cable from battery. Force lower edge of inner fender skirt toward wheel so that front shims and bolt head can be reached from engine compartment. On right side, remove generator from engine and move generator and bracket back out of way. Place a wedge between bolt head and frame bracket and with special wrench J-6771, loosen bolt (a 13/16" open end wrench ground to fit between head of bolt and frame bracket can be used in place of wedge). Free shim by either turning wheels to right or left or by prying on upper shaft. Tighten nut with Tool J-6771 to 100 ft. lbs. minimum. *(NOTE* - To determine torque wrench reading, multiply 100 ft. lbs. by length of torque wrench (in feet), then divide by the length of the torque wrench (in feet), plus 1.67 feet. The result will be the reading required on torque wrench. As an example: If length of torque wrench from center of square drive to center or pivot of handle is 13 5/16" (1.11 ft.), reading on torque wrench should be 40 ft. lbs.).

Trim Dimensions Adjustment (Front): *(NOTE - The following dimensions are for a standard car without undercoating or optional equipment and with the car at curb weight. Curb Weight includes gas, oil, and spare tire, but no passengers).* Before measuring trim dimensions, bounce both ends of car up and down several times to make sure there is no bind in suspension members and to let springs take natural position. When car is at rest, measure trim height between front arm of lower control arm assembly and frame at a point between rubber bumper and spring. Measurement must be made as vertical as possible. See table below for trim height limits. When trim dimension is found to be too low, install special 1/8" shims between upper end of spring and frame *(NOTE - If more than three shims are required, replace spring).*

Front Trim Dimensions



Model	Trim Height
46C, 66C, 56C, 76C	4-4½"
Other Models	4¼-4¾"

REMOVAL & INSTALLATION

FRONT SPRING: Removal - Place jack under lower control arm in a position that will not interfere with removal of shock absorber, and raise wheel off floor. Remove wheel and tire. Disconnect stabilizer link and disconnect outer end of tie rod from steering arm. Remove shock absorber *(see "Shock Absorber Replacement" below).* Remove upper ball joint-to-control arm attaching bolts. Support car frame with another jack, then slowly lower jack under lower control arm which will allow lower control arm to drop low enough to remove coil spring without damaging the brake hose *(NOTE - If necessary, remove brake pipe clip and move pipe slightly to gain enough slack).*

Installation: *(NOTE* - Before installing front spring, check the part number stamped on spring to make sure

CONTINUED ON NEXT PAGE

BUICK FRONT SUSPENSION ASSEMBLY

BUICK (Continued)

it is correct for the car model. *See "Front Spring Application" below).* Make sure rubberized fabric spring insulator is in place around spring centering flange on frame and is in good condition. Place one end of spring over centering flange, and as lower control arm is raised, position lower end of spring so that end coil seats in recess in spring seat. Support lower control arm on a jack. When lower control arm is raised far enough, install the two upper ball joint-to-control arm bolts with upper bumper pad to rear. Tighten bolts to 70-80 ft. lbs. Connect tie rod outer end to steering arm, and connect stabilizer link. Adjust stabilizer link grommets *(See "Stabilizer Link Grommet Replacement" below).* Reinstall shock absorber, wheel and tire assembly, and adjust camber, caster, and toe-in.

Front Spring Application

Series	Standard	Air Cond.
40 Synchro-mesh	1174155	1174154
40, 60 Dynaflow	1174154	1174153
50, 70 Dynaflow ..	1174153	1174152

FRONT SHOCK ABSORBER: *(NOTE - Rubber bushings in mounting eyes of shock absorber are not replaceable. If worn or damaged, the complete shock absorber assembly must be replaced).*

Removal: Raise car by center of frame crossmember far enough to allow removal of upper shock absorber bolt. Remove bolt and shove eye down through opening in frame. Remove bolts and lockwashers attaching lower mounting bracket to spring seat on lower control arm, then pull shock absorber assembly down through opening in spring seat.

Installation. Make sure that shock absorber being installed is correct for the car model *(See "Shock Absorber Application" below).* Insert shock through opening in lower control arm spring seat, and mounting eye up through opening in mounting bracket on frame. Install upper bolt, with nut forward, and tighten to 25-35 ft. lbs. Bolt lower mounting bracket assembly securely to lower control arm spring seat and lower car to floor.

Shock Absorber Application

Series	Part No.
40, 60 (Exc. Est. Wgn.) ①	5531037
40, 60 Est. Wgn. & 50, 70	5531038

① - Use Part No. 5531038 for 200 lbs. overload on these models.

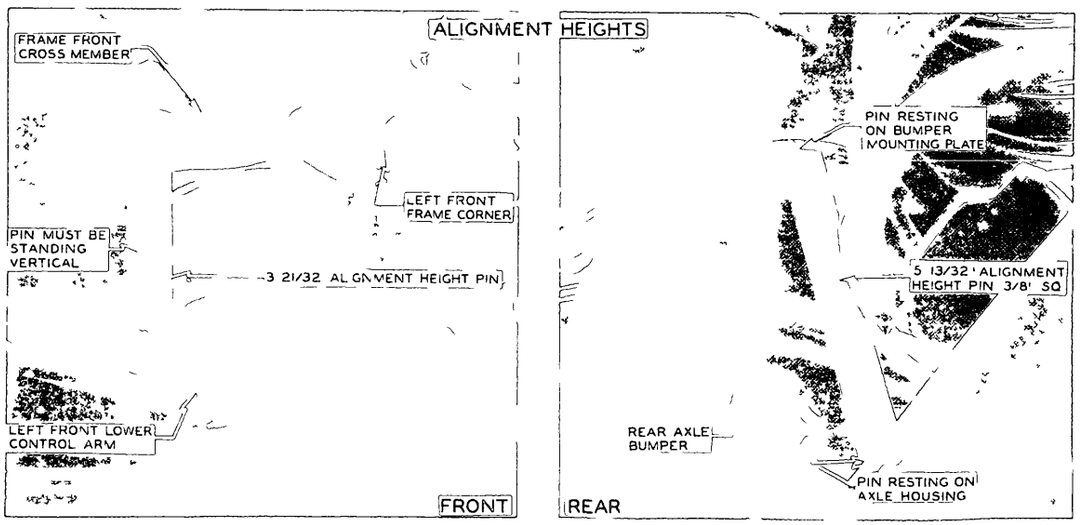
STABILIZER LINK GROMMET REPLACEMENT: Remove nut from lower end of link rod, then remove rod, spacer, retainer and grommets. When assembling, install rubber grommets dry and use care to center grommets in seats on stabilizer shaft and lower control arm. Also center retainers on grommets before tightening rod nut. Tighten rod nut to limit of thread on rod. When rod nut is tightened to limit of thread on rod, the overall dimension between both grommet retainers should be 1 11/16". If this dimension is not correct, adjust nut as necessary.

BALL JOINT & STEERING KNUCKLE: Removal - Jack up car and support weight on front spring seat. Remove wheel and tire assembly. Remove backing plate-to-steering knuckle attaching bolts and remove backing plate. Do not remove brake hose. Support backing plate out of way to avoid damage to brake hose. Remove bolts through lower control arms and ball joint. Lower steering arm out of the way, and remove rubber bumper from ball joint if ball joint is to be replaced. Remove bolts through upper control arms and ball joint. Remove knuckle and ball joint assembly from upper and lower control arms. *(NOTE - If ball joints are to be replaced, drive directly on studs to remove joints from knuckle. If ball joints are to be reinstalled, care should be taken to avoid damage to threads. This can be done by loosening nuts on tapered studs and installing short bolts half way into nuts. Tighten securely and drive ball joint out of knuckle).*

UPPER CONTROL ARM: *NOTE - Upper control arms are not furnished separately, their replacement must be made as an assembly.*

Removal: Jack up car, supporting weight on spring seat and remove wheel and tire. Remove upper control arm-to-ball joint bolts, supporting knuckle and brake drum assembly to avoid damage to brake hose. Remove shock absorber upper mounting bolt and force top of shock absorber down. On right side of car, it will be necessary to remove generator and bracket. Disconnect battery ground strap. Remove shaft attaching bolts *(CAUTION - Remove shims from between shaft and crossmember, noting position and number of shims in each pack).* Remove arm and shaft assembly from car.

Upper Control Arm Shaft & Bushing Replacement - Clamp control arms in vise and remove old bushings and shaft. Apply a liberal amount of Lubriplate to new bushings and ends of shaft. Install bushings and tighten to 150 ft. lbs. Install rubber dust seals on shaft and screw shaft into forward arm so center of attaching bolt hole is 1 9/16" from control arm. Thread rear control arm onto shaft until the distance between front and rear control arms is 7 13/16".



Installation: Using care not to disturb dimension between control arms, install assembly on car by reversing removal procedure. *(CAUTION - Be sure that the shim packs removed at disassembly are installed in their correct positions).* Tighten upper ball joint bolts to 70-80 ft. lbs. Tighten upper control arm shaft-to-shaft bracket bolts to 90-100 ft. lbs. Check and adjust front wheel alignment.

LOWER CONTROL ARM: *NOTE - Riveted parts of lower control arm assembly are not furnished separately.*

Removal: Remove front coil spring *(see "Front Spring Replacement" above),* then remove lower control arm assembly from frame crossmember.

Lower Control Arm Shaft & Bushing Replacement - Unscrew bushings and remove from control arm. Check distance between inner ends of control arm. The normal distance is 11¼" ± 1/32", from inside to inside. Install rubber seal over each threaded end of new control arm shaft, with the large or bell ends of seals outward toward ends of shaft. Insert one end of shaft (with seal in place) in one control arm end and force opposite end of shaft into other control arm end, using a piece of wood as a pry bar. Fasten control arm securely in vise close to one end to prevent springing or distortion. Apply a liberal amount of Lubriplate or white lead to both bushings, then start first bushing in shaft and into control arm at the same time. Turn bushing until head is tight against arm and tighten to a minimum of 150 ft. lbs. Center shaft between arms and install second bushing, turning shaft as required to thread into the bushing so that no binding exists. Rotate shaft to locate bolt holes at both ends so they are equally distant from inside surface of arms.

Installation: Place lower control arm assembly in position on frame crossmember and bolt in place. Tighten bolts to 70-80 ft. lbs. *(NOTE - Two different type bolts have been used at this location. See "Changes, Cautions, Corrections" above).* Install front spring and other parts. Check and adjust caster, camber, and toe-in.

ALIGNMENT HEIGHT PINS

CADILLAC

All Models (1957)

►*ELDORADO BROUGHAM SUSPENSION NOTE:* Front wheel alignment and front suspension linkage removal & installation is the same as for conventional cars, except where noted. *See "Cadillac Eldorado Air Suspension" for air spring removal, installation, and adjustment.*

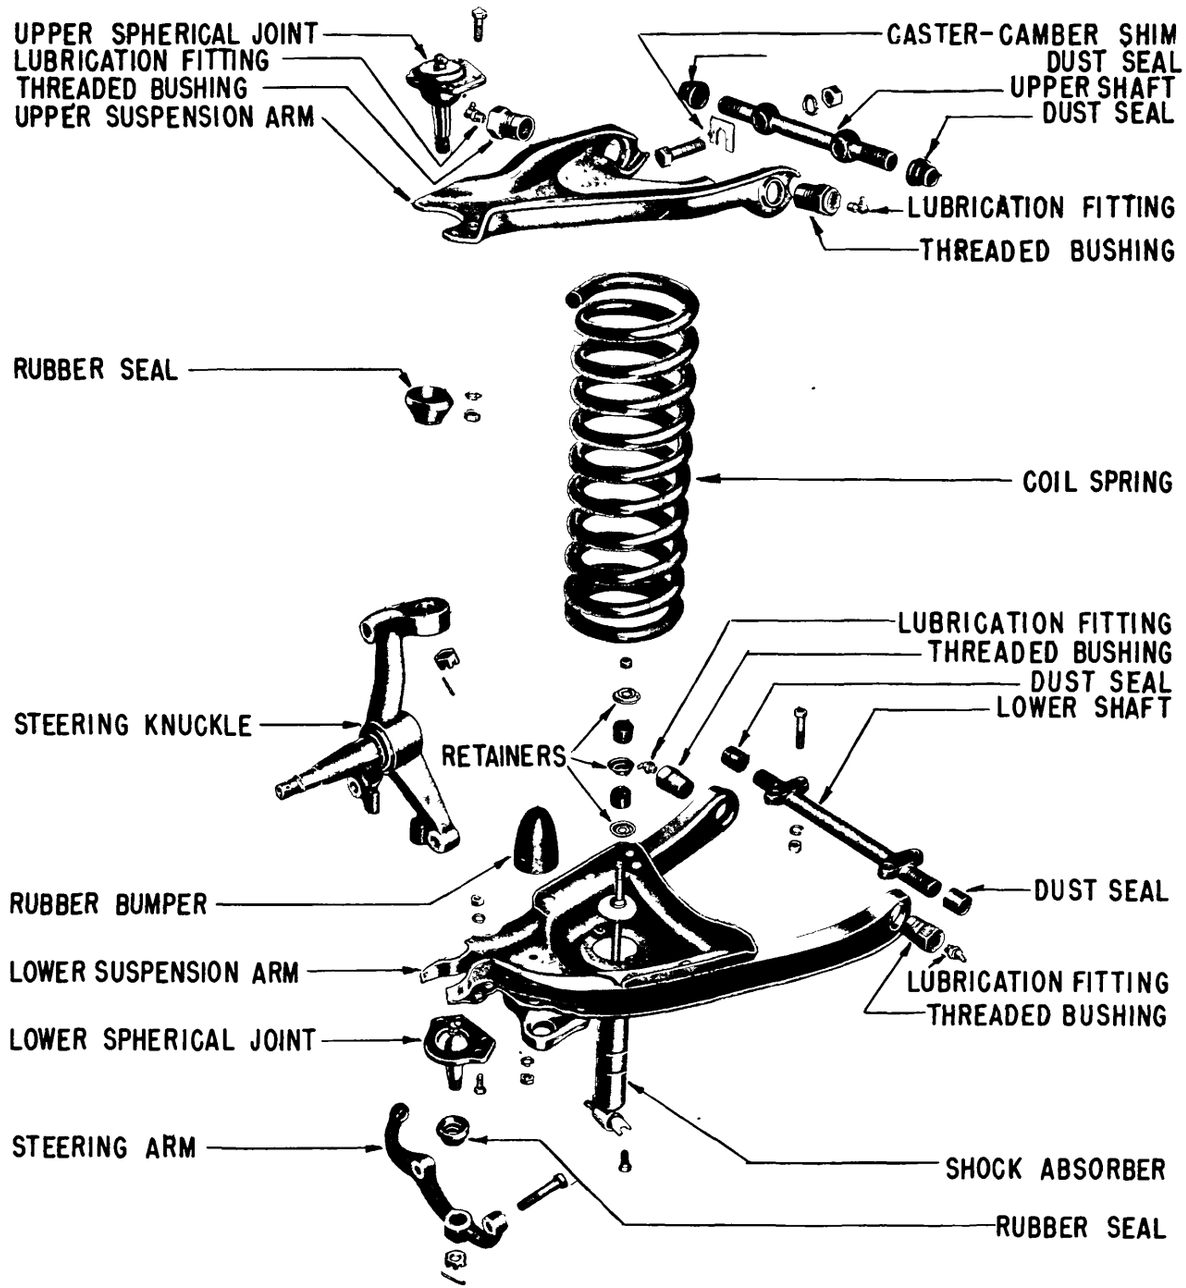
►CHANGES, CAUTIONS, CORRECTIONS

►*FRONT TIRES RUBBING ON STABILIZER BAR CORRECTION:* This condition occurs on sharp turns and can be corrected by installing Steering Knuckle Stop, Part No. 1468700. This "U" shaped stop is thicker than used in production and is attached to lower suspension arm by the rear outer spherical joint attaching bolt. If only one tire rubs on stabilizer bar, reposition stabilizer bar to center it on car before determining if thicker stops are necessary.

►*1957 DRAG LINK & TIE ROD PRODUCTION CHANGE TO IMPROVE STEERING GEOMETRY DURING BODY ROLL:* A new drag link and tie rod assembly is used in production beginning with Engine No. 023831. With this change, the clearance between frame and tie rod makes repositioning of tie rod sleeve clamps necessary which will eliminate the possibility of clamp interfering with frame when driving over severe bumps. On all cars above Engine No. 023831, the tie rod sleeve should be rotated so that openings in clamps are underneath the tie rod.

►*1957 LOWER CONTROL ARM MOUNTING BOLT PRODUCTION CHANGE:* Beginning with Engine No. 042036, mounting bolts, Part No. 1468512 having larger diameter heads are being used in production and for service replacement. When installing the later type bolt, the hardened steel flat washer formerly used should be discarded.

DESCRIPTION- New "spherical-joint" suspension using ball and socket type joints to connect upper and lower control arms to steering knuckle. Coil springs and direct acting shock absorbers are mounted between spring seats on lower control arms and spring pockets on frame member. Threaded type bushings are used to connect control arms to control arm shafts.



ADJUSTMENT

CHECKING & ADJUSTING: Before checking or adjusting front wheel alignment, check and correct any looseness in spherical joints, steering gear, and connections. Check and correct standing height *(see "Trim Dimensions" below).* Inflate tires to correct pressure and check for runout. Make sure car is at curb weight (full gas tank, no passengers).

►*ELDORADO BROUGHAM CHECKING & ADJUSTING NOTE:* Car must be at normalized standing height when checking front wheel alignment. Open any door and allow car to come to normalized standing height before checking each point. *See "Cadillac Air Suspension" for height adjustment and specifications.*

Tire Inflation: Series 62, 60S, & Eldorado Brougham - 24 lbs. (front & rear). Series 75 - 28 lbs. (front & rear). Series 86 - 24 lbs. (front), 30 lbs. (rear).

Steering Axis Inclination: 4° at 0° camber. Not adjustable.

CADILLAC FRONT SUSPENSION ASSEMBLY

Caster: 0° to Neg. 1°. Adjustment must be within ½° or less on both sides. *See "Shimming Procedure" below.*

Camber: Neg. 3/8° to Pos. 3/8° (¼° to ½° more positive camber preferred on left wheel). *See "Shimming Procedure" below.*

Toe-In: Exc. Eldorado Brougham - 3/16-1/4". Eldorado Brougham - 1/8" ±1/32". *NOTE* - On conventional cars after Engine No. 023831, and Eldorado Brougham, rotate

CONTINUED ON NEXT PAGE

CADILLAC (C ntinu d)

tie rod sleeve so that opening in clamps are underneath tie rod. *See "Drag Link & Tie Rod Production Change" above.*

T e-Out on Turns: (C nv ntional Cars) - With outer wheel at 20°, inner wheel should be 22°40'.

Shimming Proc dur : Caster and camber adjustments are made by adding or removing shims between upper control arm mounting shaft and frame mounting bracket. To change caster, remove or add shims at one of the mounting bolts. Addition of shims at front bolt or removal of shims at rear bolt will **d crease** positive caster. Removal of shims at front bolt or addition of shims at rear bolt will **incr ase** positive caster. To change camber, add or remove shims of equal thickness at both mounting bolts. Addition of shims at both bolts will **decrease** positive camber. Removal of shims at both bolts will **increas** positive camber. Tighten both upper and lower control arm shaft bolts to 130-140 ft. lbs. after changing shims. Camber and caster adjusting shims are furnished in .0149", .0418", & .1046" thicknesses. *See tables below for approximate amount of change made by adding or removing shims.*

Shim Selection

Shim Siz	Cast r Change (Shim at one bolt)	Camber Change (Shim at both bolts)
.0149"	1/6°	1/15°
.0418"	1/2°	1/5°
.1046"	1 1/16°	1/2°

► *CASTER CHANGE NOTE:* When possible, make caster adjustments by changing shims at **front bolt** as the resulting camber change will be small.

► *SHIM PACK THICKNESS NOTE:* If more than ¼" total thickness of shims are necessary to bring adjustment within specifications, check for bent or damaged parts.

Trim Dimension Adjustment (Exc. Eldorado Brougham): Before checking front trim height, make sure that trunk is empty and the gas tank full. Normalize position of springs by working bumper up and down and release slowly, permitting car to assume its normal position, Measure distance from top of lower control arm to center of second lower rivet on front of frame side rail. The standing height should be equal on both sides of car within 3/8". If heights are unequal, adjust low side by installing a shim between top of spring and seat inside the frame.

Trim Dimensi n Adjustment (Eldorado Brougham): Normalize position of air springs by working bumper up and down with car door open, permitting car to assume its normal standing position. Measure distance from top of left lower control arm to center of outer rivet on front of frame. This distance should be 3 5/8" ±1/16". *If this measurement not within specifications, see "Cadillac Air Suspension" for adjusting trim dimension.*

Front Trim Heights

M d l	Height
All Models (Exc. Below)	4 11/16-5 7/16"
6237S, 6267S	4 3/4-5 1/2"
7523, 7533	5 7/16-6 3/16"
86 Comm.	5 5/16-6 1/16"

COIL SPRINGS: *For spring replac ment, s e "Lower Control Arm" below.*

1957 Spring Applicati n

Model	Part N .
6039X, 6237SDX, 6267X (Air Cond.)	1465761

86 (Exc. Hvy. Duty)	1465766
86 (Hvy. Duty)	1465767

REMOVAL & INSTALLATION

FRONT SHOCK ABSORBER (Exc. Eldorado Brougham): *NOTE - Bushing in lower mounting bracket on shock absorber is not replaceable. If worn or damaged, the complete shock absorber assembly must be replaced.*

► *ELDORADO BROUGHAM SHOCK ABSORBER REPLACEMENT: See "Cadillac Air Suspension".*

Removal: Raise hood and remove shock absorber upper retaining nut, retainer, and rubber grommet at upper suspension arm frame mounting bracket *(NOTE* - Upper stem of shock absorber is square so that it may be held with a wrench when removing nut). Remove two screws holding shock absorber to lower spring seat and remove shock absorber from spring assembly.

Installation: Install retainer and rubber grommet on shock absorber upper stem. Install shock absorber assembly up through coil spring and guide stem through tower in crossmember. Place lower end in position on lower spring seat and install lockwashers and screws. Install grommet, retainer, and nut on upper stem and tighten nut.

FRONT COIL SPRING REPLACEMENT: *See "Lower Control Arm" below.*

UPPER SPHERICAL JOINT REPLACEMENT: *(NOTE* - To check condition of joint, lubricate it first, then using a regular spherical joint stud nut and a second nut as a locknut, turn joint in its socket with a torque wrench. It should require 2-4 ft. lbs. to rotate joint. Replace if joint is too loose or too tight.

Removal: Raise front of car and place jack stands under lower suspension arms. Remove front tire and wheel, then remove cotter pin from joint stud. Strike steering knuckle with a hammer in area of joint stud to loosen it. Raise upper suspension arm so that joint clears knuckle. With a 5/16" drill, drill out all four joint mounting rivets being careful to avoid damage to mounting holes. Remove spherical joint.

Installation: Install new spherical joint on upper control arm with bolts, nuts, and lockwashers (these items are provided in replacement kit). Tighten nuts to 20-25 ft. lbs. Position spherical joint stud in steering knuckle, install stud nut and tighten to 50-60 ft. lbs. Install cotter pin, then install tire and wheel.

LOWER SPHERICAL JOINT REPLACEMENT: *(NOTE* - The lower joint is designed to turn freely in its socket and cannot be checked with a torque wrench. To check, note amount of free play as joint is worked vertically in its socket. This movement should not exceed 1/16". Replace if movement is greater.

R moval: Raise front end of car and place stands under forward portion of frame side members. Place a hydraulic jack under lower control arm spring seat and raise arm approximately 1" (measured at its outer end). Remove cotter pin and nut from joint stud. Strike steering arm with a hammer in area of joint to break it loose. Remove four lower joint nuts, lockwashers, and bolts. Raise arm sufficiently to allow joint to be removed.

Installation: Install joint on lower control arm with four bolts, lockwashers, and nuts and tighten to 35-40 ft. lbs. *(NOTE* - Head of bolt should be under joint flange). Position joint stud in steering arm mounting hole and lower hydraulic jack to allow joint to seat itself in steering arm. Install stud nut and tighten to 50-60 ft. lbs. Install cotter pin.

STEERING KNUCKLE REPLACEMENT: Removal - Raise front end of car and place jack stands under lower control arms. Remove wheel, then remove cotter pin and nut from upper joint stud. Strike steering knuckle in area of joint to break it loose. Raise upper control arm and allow top of knuckle to move outward. Remove upper nut on knuckle and two lower nuts on side of brake backing plate (leave two lower screws in position). Remove brake backing plate and wire it to a convenient location to prevent damage to brake hose. Remove and discard gasket on spindle between knuckle and backing plate. Separate knuckle from steering arm.

Installation: Install two lower legs of steering knuckle on two lower screws (in steering arm). Install new gasket on spindle. Install backing plate on two lower screws and install lockwashers and nuts. Tighten to 90-100 ft. lbs. Install upper screw through backing plate and knuckle. Install lockwasher and nut and tighten to 85-95 ft. lbs. Position upper spherical joint in knuckle. Install nut and tighten to 50-60 ft. lbs. Install cotter pin. Install brake drum, tire and wheel assembly.

UPPER CONTROL ARM: Removal - Disconnect upper spherical joint from steering knuckle *(see "Steering Knuckle Replacement" above),* then remove mounting bolts on control arm shaft and remove control arm assembly.

Disassembly: Place control arm shaft in vise and remove threaded bushings from arm and shaft. Remove seals and suspension arm from shaft. Place suspension arm in vise and drill out with a 5/16" drill or grind off the four spherical joint rivets and remove joint.

Reassembly: Install new rubber seals on mounting shaft and lubricate threads of shaft. Center shaft in position in control arm and install bushing into arm and onto one end of shaft *(NOTE* - Lubricate new bushings with carbon tetrachloride or penetrating oil for easier installation). Tighten bushings to 140-150 ft. lbs. Install Upper Control Arm Spreader, Tool J-6590, between arms and tighten finger tight. Then, using a wrench, tighten tool **two additional flats.** Install other bushing in arm and onto shaft and tighten to 140-150 ft. lbs. Remove tool from arms and center shaft between arms by turning shaft in bushings. Install new spherical joint assembly *(see "Upper Spherical Joint Replacement" abov).*

Installation: Install arm in position on frame mounting

CONTINUED ON NEXT PAGE

CADILLAC (C ntinu d)

bracket with mounting bolts and tighten to 130-140 ft. lbs. Position joint stud in steering knuckle hole. Install nut and tighten to 50-60 ft. lbs. Install cotter pin.

LOWER CONTROL ARM: Removal - Raise front end of car and place jack stands under forward part of both frame side members. Place hydraulic jack under control arm to be removed, then disconnect front stabilizer link on side from which spring is to be removed. Remove shock absorber *(see "Shock Absorber Replacement" above).* Make sure hydraulic jack is supporting lower control arm. Remove lower spherical joint cotter pin and nut, and strike steering arm with a hammer in area of joint to break it loose. Move wheel downward and outward so it clears joint. Slowly lower hydraulic jack and remove spring and rubber insulator. Remove four bolts attaching control arm shaft to frame member, and remove control arm.

Disassembly: Place control arm shaft in vise and remove threaded steel bushings from arm and shaft. Remove seals and control arm assembly from shaft. Remove four joint mounting nuts and bolts and remove joint.

Reassembly: Install new rubber seals on shaft and lubricate threads. Center shaft in position in control arm and install bushing into arm and onto one end of shaft *(NOTE* - Lubricate bushings with carbon tetrachloride or penetrating oil for easier installation). Tighten bushing to 195-205 ft. lbs. Install Lower Control Arm Spreader, Tool J-6591, between arms, tighten center bar finger tight, then with a wrench, tighten **two additional flats.** Install other bushing in arm and onto shaft and tighten to 195-205 ft. lbs. Remove tool and center control arm shaft between arms by turning shaft in bushings. Install lubrication fittings. Install spherical joint with four bolts and tighten to 35-40 ft. lbs.

Installation: Install control arm shaft to crossmember and tighten bolts to 60-70 ft. lbs. Tape upper rubber insulator to top (flat end) of spring and place spring in upper seat of frame crossmember. Rotate spring so that lower tang end will fit in formed depression of lower control arm spring seat when arm is in position. With hydraulic jack placed under lower control arm, raise arm into position. Guide spring into place with tang end bisecting hole in spring seat. Guide spherical joint stud into steering knuckle and install nut. Tighten to 50-60 ft. lbs. Install cotter pin. Connect stabilizer link to lower spring seat. Install shock absorber. Remove car from jack stands and check front end alignment.

CADILLAC ELDORADO BROUGHAM

Cadillac Eldorado Brougham (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*TOWING CAUTION: Instructions for various methods of towing car are different as noted below. NOTE - When towing with front or rear wheels raised off the ground, disconnect battery strap to prevent any leveling action.*

Air in Suspension System (Front End Raised) - Hook chain around front bumper mounting bar through opening in underside of impact bar above fog lights (both sides). Attach both ends of chain to tow truck spreader bar. Place protective padding around front bumper bar extensions, hold a 6 ft. length of 2" pipe under bumper bar guards parallel with front bumper. Then raise front end of car with truck hoist until spreader bar and chains are bearing against length of 2" pipe and front end of car is raised sufficiently for towing purposes. *CAUTION - Check rear end to assure ground clearance at spare tire well.*

No Air in Suspension System (Front End Raised) - Attach tow chains as for "Air in Suspension System" above, then remove front wheels and lower front end of car until there is 6" clearance between lower edge of rear license plate holder and ground. *Disconnect propeller shaft if being towed more than a few blocks.*

Rear End Raised - Turn front wheels to straight ahead position and tie steering wheel securely to prevent movement of front wheels while towing. Hook chain around rear bumper outer mounting bar through opening under rear bumper exhaust ports (both sides). Place protective padding on under side of rear bumper outer impact bars where chain contacts, and connect chain to spreader bar of tow truck. Raise rear end of car with tow truck. *CAUTION - Make certain that front bumper is clear of ground.*

All Wheels on Ground - Hook chain around front bumper mounting bar through opening on underside of impact bar above fog lights. *CAUTION - Do not tow car at speeds over 10 MPH. Disconnect propeller shaft if being towed more than a few blocks.*

►*HOISTING CAUTION:* Use lifting equipment that engages suspension, axle, or wheels. When using a frame contact hoist, special adapters must be used on hoist rails to assure engagement with frame at a point 34" to rear of front wheel centerline *(CAUTION - Do not allow adapters to contact any portion of No. 2 body hanger)* and at extreme tips of widest crossmember which is approximately 97" to rear of front wheel centerline. In no case should rear contact points be less than 40" apart.

►*RAISING REAR OF CAR CAUTION:* Never raise rear end of car with rear shock absorbers disconnected as it is possible to raise rear end off its suspension and result in separation of rear air spring assemblies.

►*SERVICING CAUTION: Do not open any door or turn ignition on when any wheel of the car is off the ground, such as changing a tire or when car is on a hoist.*

►*AIR FILTER LOCATION & CLEANING NOTE:* Three pourex filters located in the high pressure air line fitting at top left side of control solenoid and in the two exhaust line fittings at lower right front and bottom of unit must be cleaned at six-month intervals (more often if car is operated in sandy or desert areas). *See "Overhaul" below for cleaning procedures.*

►*AIR COMPRESSOR OIL FILTER LOCATION & CLEANING NOTE:* A pourex type filter located in the compressor oil inlet fitting must be cleaned each time the engine oil filter is changed. *See "Overhaul" below for cleaning procedures.*

DESCRIPTION

DESCRIPTION: This new suspension consists of pressurized diaphragm units replacing the conventional coil and leaf type springs. Air, under 110-130 lbs. pressure, is controlled by three leveling valves (two at the rear and one at front) and maintains car level at a pre-determined height from the ground regardless of load. The front suspension is basically the same as on conventional models having upper and lower control arms connected to steering knuckle by spherical joints. The rear suspension consists of two lower control links and an upper control yoke which are connected between car frame and rear axle housing. A pressure of 110-130 lbs. is maintained in a 500 cu. in. accumulator tank by an electrically driven, low capacity, piston type compressor mounted on the car generator. An oil pressure switch in engine oil line prevents compressor from operating except when engine is running. Solenoid valves control air flow to and from the air spring units when car ignition is turned on or when a door is opened.

OPERATION

OPERATION: Leveling - (All Doors Closed - Ignition Off) - No leveling occurs. Restriction solenoid and lockout solenoid are closed. High pressure air from accumulator passes through restriction in restriction solenoid and stops at closed lockout solenoid. Lockout solenoid prevents movement of air to and from air springs.

Any Door Open - Ignition On or Off - Both the restriction solenoid and lockout solenoid are open which allows high pressure air to flow unrestricted to the three leveling valves. If weight is added, raising leveling valve arm, the inlet passage is opened allowing air to flow to air spring. If weight is removed, leveling valve arm is lowered, opening the exhaust passage and allowing air to escape from spring.

All Doors Closed - Ignition On - *(NOTE - Two-second delay dashpots in leveling valves prevent any leveling action taking place when wheels move rapidly up and down. Intake or exhaust action occurs only when car is above or below normal standing height for a sustained period of more than two seconds).* The restriction solenoid is closed and the lockout solenoid open. Air to or from the springs is metered as it passes through the restriction solenoid as regulated by the leveling valves.

Door Open - Ignition On - When more weight is added to one side, or when car is parked on an uneven surface,

CONTINUED ON NEXT PAGE

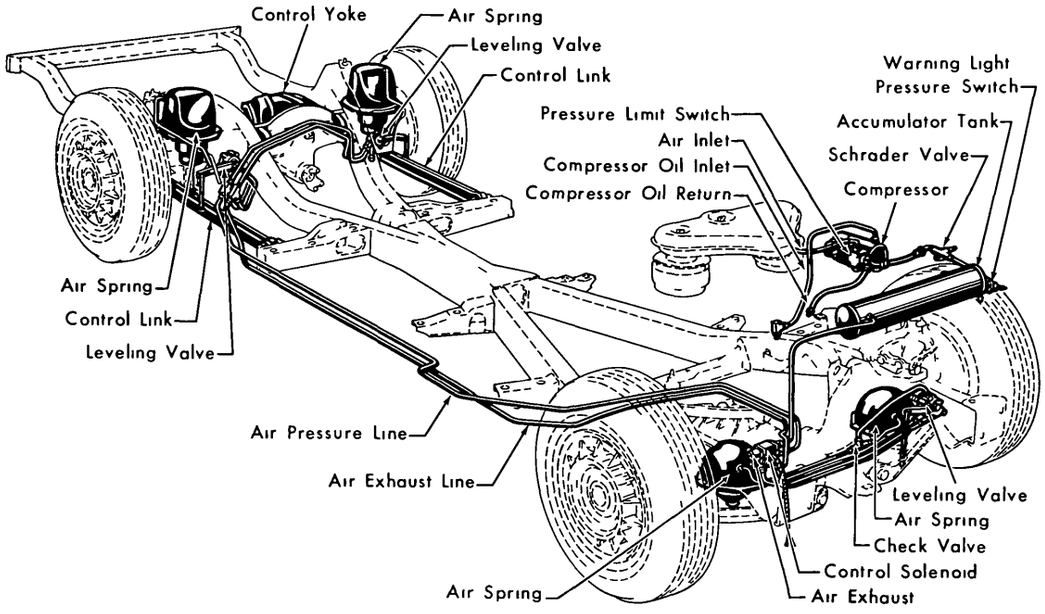
CADILLAC ELDORADO BROUGHAM (C ntinued)

both the restriction and lockout solenoids are open High pressure air from the accumulator flows unrestricted through control solenoid to leveling valves and levels the car as required by change in weight distribution

Air C mpr ss r: This unit is a low capacity, piston type compressor having an integral electric motor controlled by a pressure switch Pressure is maintained in the accumulator at 110-130 lbs The compressor is lubricated from the engine oil system which provides a restricted flow of oil into compressor reservoir A standpipe in the compressor reservoir returns overflow to engine oil pan The compressor electrical circuit is energized only when engine is running due to the feed circuit being connected to engine oil pressure tell-tale switch

Control S len id: Consists of two lockout solenoid valves and two restriction solenoid valves One of each type valve is in the inlet circuit and the other in the exhaust circuit to the leveling valves The lockout valves, when closed, prevent flow of air to or from the leveling valves The restriction valves, when open, provide fast leveling (with car standing), and slow leveling (with car moving) Both lockout valves open together as do the two restriction valves Operation of the valves is controlled by ignition switch and door switches

Accumulator Tank: This tank stores enough air at high pressure to re-level the car from curb weight to a five passenger load without additional air from the compressor A pressure switch on the accumulator actuates a red light on instrument panel when pressure falls below 82 lbs pressure (required for car leveling) A petcock at lower side of tank permits periodic draining of dirt and moisture A "Schrader" valve located in a tee fitting in air line leading from the air compressor is provided to fill accumulator with a service air hose



Restricted "Tee" Check Valve: Due to a single leveling valve being used for both front air springs, a check valve is provided to allow rapid flow of air between front springs and control solenoid for fast leveling, and at the same time restrict the air flow between the front air springs during car roll or cornering This valve is mounted on frame front crossmember just to right of left hand radiator support bracket

TROUBLE SHOOTING & DIAGNOSIS

► *TROUBLE SHOOTING & DIAGNOSIS NOTE: The following trouble shooting & diagnosis data indicates conditions and corrections peculiar to Cadillac Air Suspension only. Conditions arising from incorrect wheel alignm nt, loose or worn steering linkage, spherical joints, shock absorbers, or worn tires should be corrected in the usual manner.*

ROAD SHOCKS: May be caused by incorrect standing height or wrong type or size of tires *See "Adjustment" below.*

AIR PRESSURE WARNING LIGHT REMAINS ON: Check and correct any air leaks Check operation of air compressor and solenoid Check for grounded switch or connecting wire

CADILLAC ELDORADO BROUGHAM AIR SUSPENSION SYSTEM

AIR COMPRESSOR OPERATES CONTINUOUSLY: Pressure control switch diaphragm ruptured Air leak in system Valve plate in compressor head worn or broken Pressure limit switch not functioning Compressor relay defective

CAR WILL NOT RETURN TO LEVEL POSITION (AIR PRESSURE NORMAL): Front or rear leveling valve control links not adjusted properly Kink, leak, or obstruction in high or low pressure lines Air compressor relay will not actuate solenoid Control solenoid not operating

NO LEVELING ACTION WITH EITHER FRONT DOOR OPEN: An open circuit may exist between front door dome light switch and control solenoid relay Control solenoid not operating

NO LEVELING ACTION WITH EITHER REAR DOOR OPEN: An open circuit may exist between rear door transmission interlock switch and control solenoid relay Control solenoid not operating

AIR SYSTEM TOO SENSITIVE (EXCESSIVE LEVELING ACTION): Leveling valve dashpot does not delay valve action (replace leveling valve) Control solenoid restriction valve not operating Defective dome light switch at front door hinge or transmission interlock switch at rear door

AIR SPRING INOPERATIVE: Air leak in diaphragm, air dome, or air lines Defective leveling valve, control solenoid, pressure switch, compressor, or compressor relay Insufficient air pressure Defective restriction "Tee" valve Loose electrical connections

HARD RIDING: Insufficient lubrication Tires over-inflated Shock absorbers faulty Standing height incorrect Scuffed air spring diaphragm, Insufficient air pressure

BOTTOMING OF REAR SPRINGS: Incorrect standing height Worn or defective rear suspension linkage Insufficient air pressure in system

ADJUSTMENT

FRONT WHEEL ALIGNMENT: Alignment and adjusting procedures are the same as for conventional models *See "Cadillac Front Suspension".*

STANDING HEIGHT: *NOTE - Air pressure in accumulator tank should be maintained at 90 lbs. or above when checking standing height. All wheels must be on a level surface when checking or adjusting standing height.*

Checking: *NOTE - Normalize position of air springs by working the bumper up and down with a car door open, permitting car to assume its normal standing height.* **Front of Car** - Measure distance from top of left lower control arm to center of the outer lower rivet or front of frame This measurement should be 3 5/8" ± 1/16" If not within specifications, adjust as outlined below **Rear of Car** - Measure distance from top of rear axle housing to underside of frame at a point directly above the axle housing This measurement should be 4 13/16" ± 1/16" *(CAUTION - The rear standing height must be within 1/8" on both sides of car).* If not within specifications, adjust as outlined below

Adjusting: Front of Car - Loosen adjusting nut on leveling valve adjusting link at connection on lower control arm Raise or lower adjusting link until measurement between left lower control arm and center of rivet is 3 5/8" ± 1/16" Allow sufficient time for leveling action to take place, then tighten adjusting nuts and recheck measurement Check standing height on right side If

CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM (Continued)

measurement varies more than 1/4", check and adjust rear standing height.

Rear of Car - Loosen adjusting nuts on leveling valve adjusting link at connection on lower control link. Raise or lower adjusting link until measurement between top of axle housing and underside of frame is 4 13/16" ± 1/16" on both sides of car. Allow sufficient time for leveling action to take place, then tighten adjusting nuts and recheck measurement. Recheck front standing height and readjust if necessary.

OVERHAUL

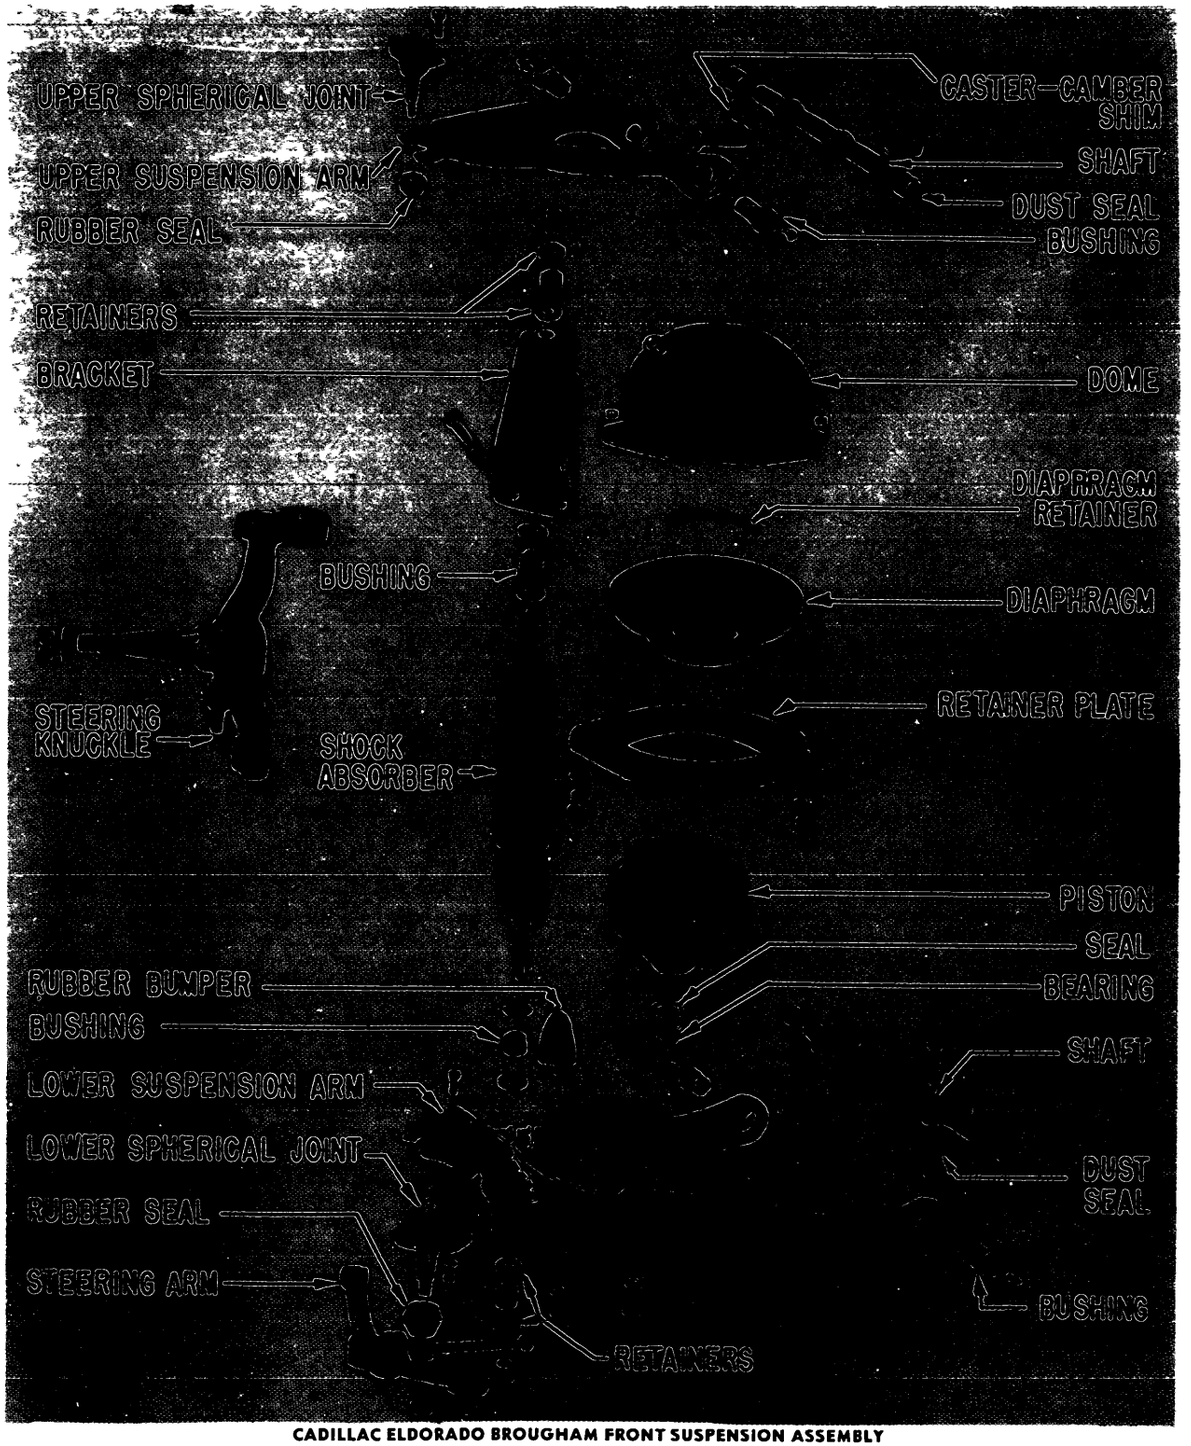
►*REAR UPPER CONTROL YOKE PRODUCTION CHANGE:* The spherical joint used on early production models has been replaced with a rubber bushing on later cars. The grease fitting formerly used with the spherical joint has been replaced with a threaded plug. Under no circumstances should the plug be replaced with a grease fitting on cars with rubber type bushings.

►*AIR SUSPENSION TUBING NUT TIGHTENING CAUTION:* Overtightening of the tubing nuts will damage the "0" ring seal, causing an air leak. Nuts should be tightened to 5-10 ft. lbs. for proper seating.

►*AIR SUSPENSION TUBING NUT FITTING CAUTION:* Whenever any air line fitting is disconnected, the "0" ring seal, Part No. 1467287, should be replaced. After tightening, each fitting should be checked for leakage

►*RAISING REAR OF CAR CAUTION: Never raise rear end of car with rear shock absorbers disconnected as it is possible to raise rear end off its suspension and result in separation of rear spring assemblies.*

►*SERVICING CAUTION: Do not open any door or turn ignition on when any wheel of car is off the ground.*



FRONT SHOCK ABSORBER: Removal - Raise front of car and place jack stands under lower control arms. Turn wheel for access to shock absorber and remove shock upper retaining nut, retainer, and rubber grommet at frame tower mounting bracket (*NOTE* - Upper stem is square at top so it may be held from turning). Remove shock lower retaining nut, lockwasher, retainer, and rubber grommet at mounting bracket and remove shock. **Installation:** Reverse removal procedure.

SPHERICAL JOINTS: Removal, Checking & Installation - Same as for conventional type suspension. See "*Cadillac Front Suspension*".

REAR SHOCK ABSORBER: Removal - Raise rear of car and place jack stands under rear axle housing. Remove upper and lower retaining nuts and lockwashers and remove shock. *CAUTION - Under no circumstances should rear of car be raised in such a manner that rear suspension is in rebound position with shocks disconnected* **Installation:** Reverse removal procedure.

UPPER CONTROL ARM: Removal - Disconnect battery ground strap. Raise front of car and place jack stands under lower control arms, and remove wheel. Remove cotter pin and nut from spherical joint stud. Strike steering knuckle with a hammer in area of spherical joint to break joint loose. Remove mounting bolts at mounting shaft and remove upper suspension arm with shaft.

CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM FRONT SUSPENSION ASSEMBLY

CADILLAC ELDORADO BROUGHAM (C ntinued)

Disass mbly & Reassembly: Same as conventional type. *See "Cadillac Front Suspension".*

Installation: Install arm in position on frame mounting bracket and tighten bolts to 130-140 ft. lbs. Use original caster and camber shims until alignment checked. Position spherical joint stud in steering knuckle hole, install nut and tighten to 50-60 ft. lbs. Install wheel and connect ground strap to battery.

LOWER CONTROL ARM: Removal - Raise front of car and place jack stands under frame side rails. Remove wheel. Disconnect stabilizer linkage from lower control arm. Disconnect leveling valve adjusting link at lower control arm and pull down on leveling valve control arm to exhaust air from front springs (battery must be connected and a door open). Disconnect battery ground strap, close all doors and remove air piston bearing retainer nut at lower suspension arm. Disconnect air line and remove Schrader valve from front air dome, using Valve Core Remover and Installer Tool J-6888. Disconnect shock absorber at lower control arm and remove lower spherical joint cotter pin and nut. Strike steering arm in area of joint to break it loose, then remove four shaft mounting bolts at frame front crossmember and remove lower control arm.

Disass mbly & Reassembly: Same as conventional type. *See "Cadillac Front Suspension".*

Installati n: Install mounting shaft on frame crossmember and tighten bolts to 60-70 ft. lbs. Guide spherical joint stud into steering knuckle and install nut. Tighten to 50-60 ft. lbs. and install cotter pin. Connect shock absorber at lower control arm. Install Schrader valve and connect air line in front dome. Install air spring piston bearing retainer nut at bottom of lower control arm Connect leveling valve adjusting link and stabilizer link at lower control arm. Connect battery ground strap and open car door. Install wheel, remove jack stands and lower front end of car. Replenish air supply in accumulator tank through Schrader valve. Check air line fitting on front dome for air leaks by using a soapy water solution. Check standing height and adjust as necessary (see above). Check wheel alignment.

STEERING ARM: Removal & Installation - Same as conventional type suspension. *See "Cadillac Front Suspension".*

REAR WHEEL & BRAKE DRUM: Removal - Raise rear of car and place jack stands under rear axle housing. Place jack under rear bumper on side that wheel is to be removed and raise car sufficiently to remove wheel. *(CAUTION - Do not disconnect rear shock absorber for removal of rear wheel).* Remove brake drum.

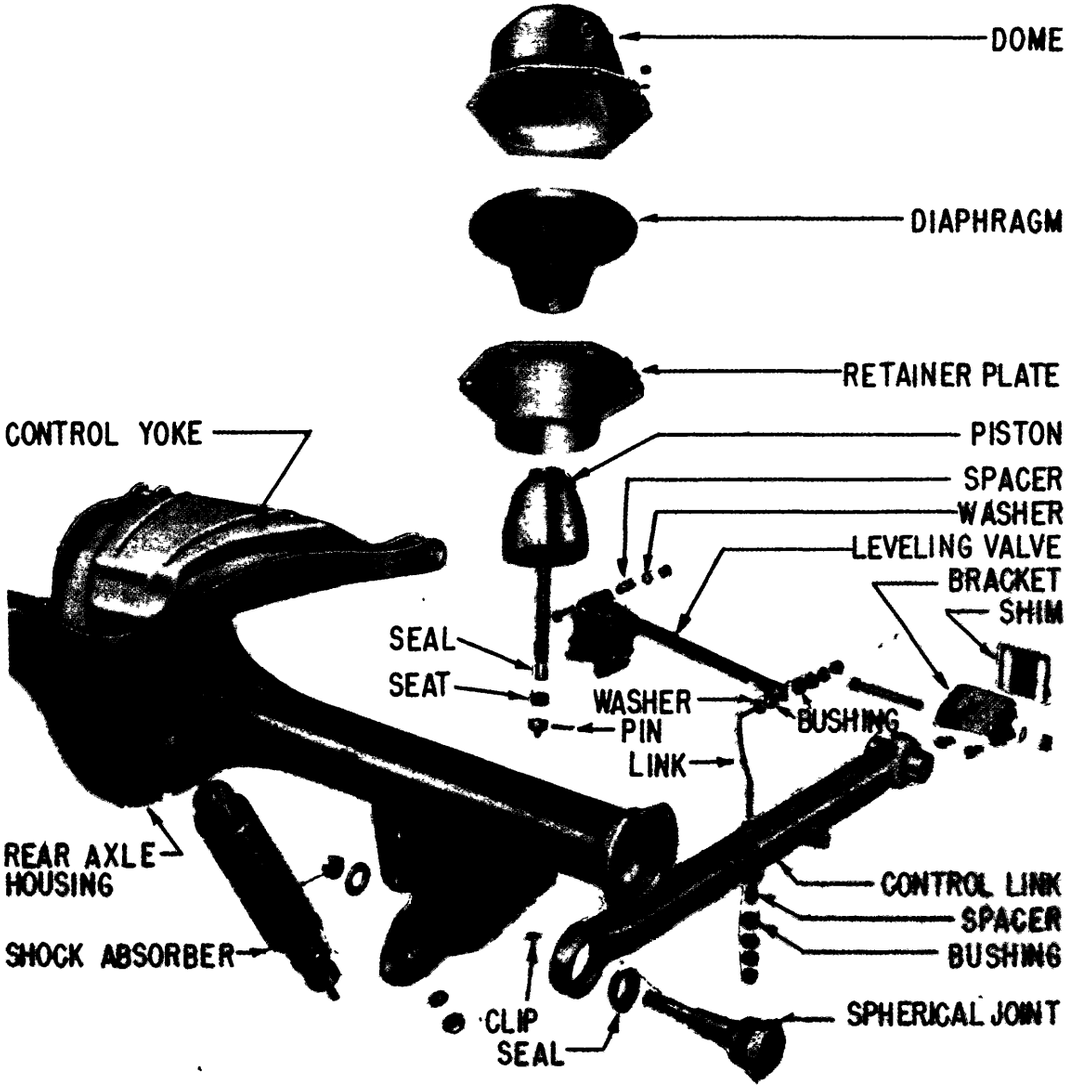
Installation: Reverse removal procedure.

AIR COMPRESSOR: *NOTE - If air compressor defective, replace it with a new unit. Do not attempt repairs other than replacement of pressure switch, diaphragm, relay, or oil inlet fitting.*

Removal - Disconnect battery ground strap and exhaust air in accumulator tank at Schrader valve. Disconnect oil inlet and return lines at compressor. Disconnect air cleaner hose at inlet side of compressor. Disconnect harness lead (black) at relay on compressor. Remove two bolts securing compressor to mounting bracket on top of generator and remove compressor.

Installation: Reverse removal procedure using a new "O" ring seal at accumulator tank air line. Replenish air supply in accumulator tank through Schrader valve.

AIR COMPRESSOR RELAY: Removal - Disconnect motor lead (black) at relay, and three pressure switch leads (green, white, and pink), at relay. Disconnect harness lead (black) at relay. Remove relay.



Installation: Reverse removal procedure.

AIR COMPRESSOR PRESSURE SWITCH: Removal - Disconnect three pressure switch leads (green, white, and pink) at relay. Remove two screws securing pressure switch cover to mounting on air compressor head and remove switch cover. Remove four screws securing pressure switch assembly to air compressor head and remove switch assembly. Remove rubber diaphragm from air compressor head.

Installation: Reverse removal procedure, making certain that rubber diaphragm is installed with raised side facing pressure switch plunger.

AIR COMPRESSOR FILTER: *NOTE - A pourex filter in oil inlet fitting should be cleaned when filter changed.*

CONTINUED ON NEXT PAGE

CADILLAC EL DORADO BROUGHAM REAR SUSPENSION ASSEMBLY

CADILLAC ELDORADO BROUGHAM (Continued)

Removal: With engine **not** running, remove oil inlet line at top of air compressor and remove fitting *(NOTE - The filter is an integral part of fitting and should not be removed).*

Cleaning: Soak oil inlet fitting in grease dissolving solvent and wash thoroughly. Blow air through fitting with air hose and wipe dry.

Installation: Install oil inlet fitting on compressor and connect inlet line. Run engine and compressor to check for oil leakage at fitting.

ACCUMULATOR TANK: Removal - Disconnect battery ground strap and remove radiator grille. Release air pressure in accumulator tank by opening pet cock at lower left side of tank. Disconnect two air line fittings at top of tank. Disconnect electrical lead on pressure switch at bottom left side of tank. Remove two accumulator tank attaching bolts from mounting brackets on each side of air conditioning condenser, and remove tank through grille opening, using care not to damage pressure switch.

Installation: *(NOTE - If new tank is being installed, check for air leakage before installation).* Reverse removal procedure using new "0" ring seals at ends of accumulator tank air lines. Replenish air supply in tank through Schrader valve. Test all fittings for leakage by using a soapy solution. Connect battery ground strap.

ACCUMULATOR TANK PRESSURE SWITCH: Removal - Disconnect battery ground strap and release air in tank by opening pet cock at lower left side of tank. Disconnect electrical lead at pressure switch and unscrew pressure switch from tank.

Installation: Apply permatex to bolt threads at bottom of pressure switch and install switch on tank. Connect electrical lead on switch. Replenish air supply in accumulator tank through Schrader valve. Check for air leakage using a soapy solution, then connect battery ground strap.

CONTROL SOLENOID: Removal - Disconnect battery ground strap, then raise front of car and place jack stands at outer ends of lower control arms. Exhaust air from accumulator tank at Schrader valve. Disconnect accumulator tank air line at top left side of control solenoid. Disconnect front and rear air spring high pressure and exhaust lines from control solenoid *(NOTE* - When exhaust lines are disconnected, front of car may lower slightly). Disconnect two electrical leads at relay on right front fender dust shield. Remove screws securing control solenoid to supporting bracket and remove solenoid.

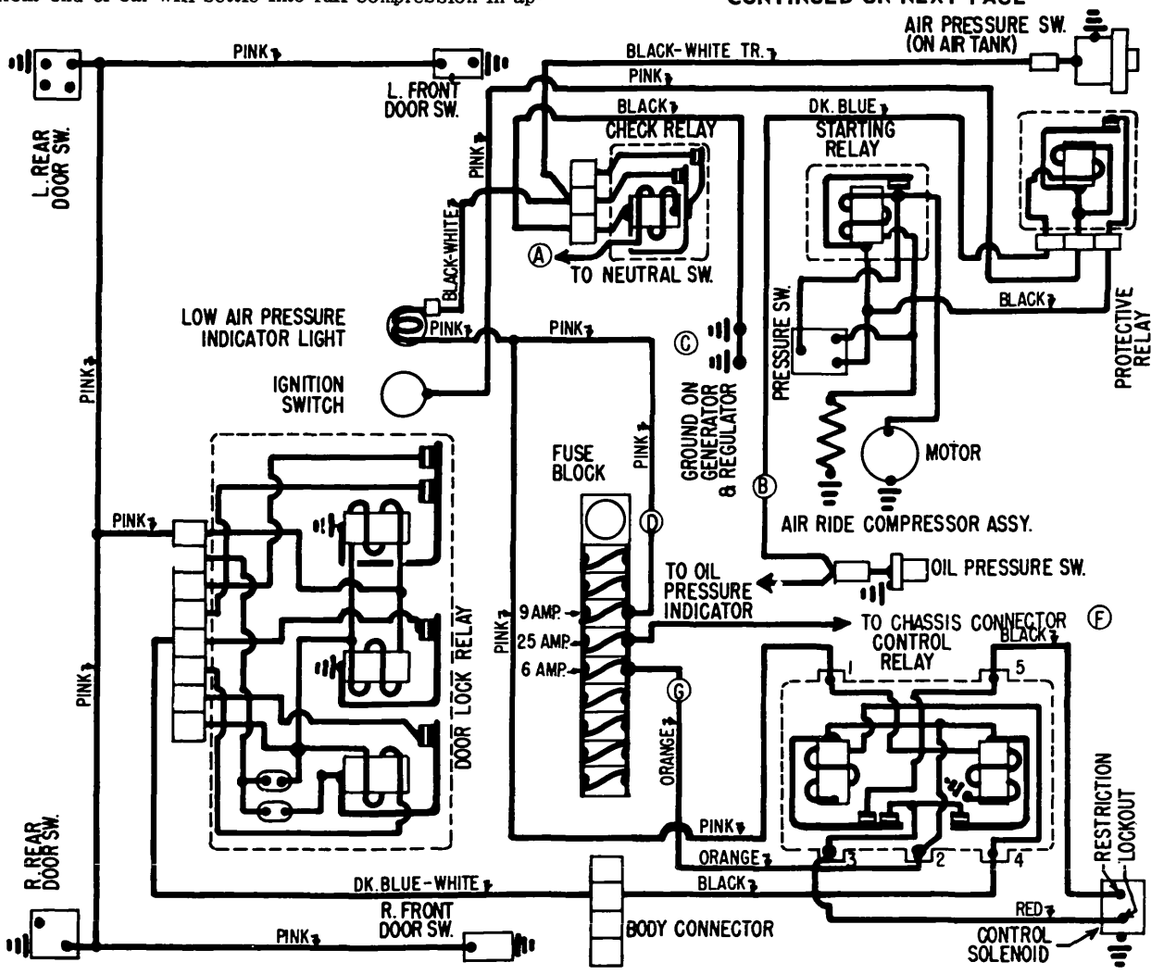
Installation: Reverse removal procedure, using new "0" ring seals at ends of all air lines.

CONTROL SOLENOID FILTERS: *NOTE* - Three pourex filters, located in the high pressure air line at top left side of unit and in the two exhaust line fittings at lower right front and bottom of unit, are used to prevent foreign particles in air lines. These filters should be cleaned at six-month intervals (more frequently in sandy or desert areas).

Removal: Disconnect battery ground strap. Raise front of car and place jack stands at outer ends of lower control arms. Exhaust air from accumulator tank through Schrader valve. Disconnect high pressure line at top left side of control solenoid. Disconnect exhaust lines at lower right front and bottom of control solenoid. Remove air line fittings from control solenoid where air lines were previously disconnected and lift out filters.

Cleaning: Clean filters in suitable solvent and blow dry with air.

Installation: Reverse removal procedure using new "0" ring seals at ends of air lines. Check for leakage at all air line fittings using a soapy solution.



RESTRICTION CHECK "TEE" VALVE: Removal - Disconnect battery ground strap. Raise front of car and place jack stands at outer ends of lower control arms. Disconnect leveling valve air line at top of check valve *(NOTE* - All air will exhaust from front air springs and front end of car will settle into full compression in approximately five minutes). Wait for front end to lower, then disconnect front spring air line at check valve. Remove screw securing check valve to front frame member and remove check valve.

Installation: Reverse removal procedure using new "0" ring seals on ends of all lines. Replenish air supply in accumulator tank. Check for air leakage at all fittings using a soapy solution.

FRONT LEVELING VALVE: Removal - Raise front of car and open any door. Disconnect adjusting link at leveling valve control arm and pull down on control arm to exhaust air from front springs. Disconnect three air lines from leveling valve *(NOTE* - A slight discharge of air might take place). Remove two bolts retaining leveling valve to support bracket and remove leveling valve.

Installation: Reverse removal procedure using new "0" ring seals at ends of all lines. Lower car and leave any door open. Replenish air supply in accumulator tank.

CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM AIR SUSPENSION WIRING DIAGRAM

CADILLAC ELDORADO BROUGHAM (Continued)

Check air line connections for leakage using a soapy solution. Check and adjust standing height (see above).

REAR LEVELING VALVE: Removal - Disconnect battery ground strap. Raise rear of car and place jack stands under rear frame side rails. Disconnect air line at rear spring air dome. Disconnect adjusting link at leveling valve control arm. Disconnect three air lines from leveling valve (NOTE - A slight discharge of air may take place). Remove two bolts retaining leveling valve to support bracket and remove valve. (NOTE - On right side only, remove two valve-to-support bracket spacers).

Installation: Reverse removal procedure, making sure to replace leveling valve-to-support bracket spacers on right side. Use a new "0" ring seal at ends of all air lines and check for air leakage. Check and adjust standing height (see above).

FRONT AIR SPRING (RIGHT OR LEFT): Removal - Remove lower control arm (see above). Remove three mounting bolts securing air spring assembly to front frame member and remove spring assembly.

Disassembly: Remove four attaching bolts securing retainer plate to dome, and separate retainer plate from dome. Remove "0" ring seal and phenolic resin bearing from bottom of piston. Remove piston and diaphragm from air dome. Remove diaphragm retainer from piston and lift diaphragm off piston.

Reassembly: Wipe inner surface of air dome and outer surface of piston with a clean cloth. Make sure that diaphragm contact areas are free from foreign particles or sharp edges. Apply DC-4 Silicone compound to outer edges of upper and lower diaphragm lips. Install diaphragm on piston and replace diaphragm retainer. Install piston and diaphragm assembly in air dome in as straight a position as possible, using care not to distort or bend out the upper lip of diaphragm. Install retainer plate on air dome and secure with four attaching bolts. Install Schrader valve core in air dome. Apply a liberal amount of heavy front wheel bearing grease in cavity at base of piston and install a new phenolic resin bushing and "0" ring seal.

Leak Test - Using a vise, install front air spring assembly in Holding Tool, J-6885, making sure that tool is securely attached as it will be subjected to extreme pressure. Insert Pilot Adapter, Tool J-6885-5, in hole at bottom of holding tool. Install Air Dome Valve Adapter, Tool J-6881, in air fitting in dome, making sure that fitting contains valve core. Introduce air slowly into air dome, guiding piston retainer bolt so that it seats properly in pilot adapter. Continue to add air until pressure builds up to 80-100 lbs., check air pressure with Pressure Gauge, Tool J-6840, and remove valve adapter tool. Remove complete assembly from vise, submerge in water and check for air leaks. Release all pressure in air dome by removing Schrader valve core. Remove spring from holding tool and install Schrader valve core in air dome.

Installation: Add a small amount of air to the air dome (approximately 5 lbs.) to prevent movement of diaphragm during installation. Reverse removal procedure using a new "0" ring seal at end of front spring line at air dome. Replenish air supply in accumulator tank and check for air leakage. Check and adjust standing height.

REAR AIR SPRING (RIGHT OR LEFT): Removal - Raise rear end of car, with any door open, and place jack stands under rear frame rails. Remove rear wheel (*CAUTION - Do not disconnect either rear shock absorber*). Disconnect adjusting link at leveling valve control arm and pull down on arm to exhaust air from rear spring. Disconnect battery ground strap. Disconnect air line at dome and remove Schrader valve core, using Valve Core Remover & Installer, Tool J-6888. Remove hairpin clip at bottom of piston rod, then push piston rod up and remove rod from socket in axle housing support bracket. Unscrew piston from diaphragm and remove piston assembly. Remove four mounting bolts securing rear air spring assembly to frame mounting bracket, and remove rubber bumper. Remove rear air spring assembly through wheel opening in fender

Disassembly: In the event piston is still attached to diaphragm in air spring, unscrew and remove it. Remove four attaching bolts securing retainer plate to dome and separate dome from plate. Remove rubber bumper. Remove diaphragm from air dome and tapered pin from lower end of piston rod. Remove seat and rubber seal.

Reassembly: Wipe inner surface of air dome with a clean cloth and make sure that diaphragm contact area is free from foreign particles or sharp edges. Apply DC-4 Silicone compound to outer edge of diaphragm lip, then install diaphragm in air dome in as straight a position as possible, using care not to distort or bend out the lip of diaphragm. Install retaining plate on air dome and secure with four attaching bolts. Install valve core in air dome. Install rubber seal on piston rod. Fill piston rod seat with heavy front wheel bearing grease, then install seat on rod and secure with tapered pin. Attach piston to diaphragm, tightening as much as possible by hand only.

Leak Test - *See "Front Air Spring (Right or Left)" above.*

Installation: Add a small amount of air to air dome (approximately 5 lbs.) to prevent movement of diaphragm during installation. Reverse removal procedure, installing rear air spring as a complete assembly with piston securely attached to diaphragm. Use a new "0" ring seal at end of air line at air dome. Replenish air supply in accumulator tank and check for air leakage. Check and adjust standing height (see above).

REAR UPPER CONTROL YOKE: *NOTE - Early cars are equipped with a spherical joint at rear mounting of yoke. Later cars have a rubber bushing. The lubrication fitting used with the spherical joint is replaced with a threaded plug on later cars having the rubber bushing. Under no circumstance should the plug be removed and replaced with a grease fitting on cars with rubber type bushings.*

Removal: Raise rear of car, with one door open, and place jack stands under rear frame rails. When air pressure is exhausted in springs, remove battery ground strap. Disconnect both rear spring air lines at leveling valves. Center jack under differential housing as a support (do not raise housing). Disconnect rear end of upper control yoke by removing mounting bolts securing yoke to spherical joint or rubber bushing on top of differential housing. Yoke will spring up to its design height position (*CAUTION - Note this position by measurement as control yoke front attaching bolts must be torqued with yoke in this position when yoke is installed*). Remove control yoke front attaching bolts at frame crossmember just forward of rear axle. Remove yoke over top side of differential housing.

Installation: Place control yoke in position and install the two front attaching bolts (do not tighten bolts). Position yoke to same position as noted by measurement at removal and tighten front attaching bolts to 85-95 ft. lbs. Pull down on yoke and attach rear end to spherical joint or rubber bushing. Tighten bolts to 35-40 ft. lbs. Connect both rear spring air lines at leveling valves, using new "0" ring seals at ends of lines. Lower car, open any door, connect battery, and replenish air supply in accumulator tank. Check all air line fittings for leakage. Check and adjust standing height (see above).

REAR LOWER CONTROL LINK (RIGHT OR LEFT): Removal - Raise rear of car with one door open. Place jack stands under rear frame rails, and remove rear wheel. (NOTE - Rear end of control link is not in rebound position, 5" below design height). When air in rear springs is exhausted, disconnect battery ground strap. Center jack under differential housing to support it (do not raise housing). Disconnect rear spring air line at leveling valve. Loosen parking brake equalizer locknut and disconnect cable. Remove spring clip retaining parking brake cable at No. 4 body bracket. Draw parking brake cable through grommet in bracket on outer side of control link. Disconnect leveling valve adjusting link at control link. Measure distance from ground level to centerline of spherical joint at rear of control link. Add 5 inches to this measurement to compensate for rebound distance, and note total. When control link is installed, front attaching bolt must be torqued with control link at design height. Remove attaching bolt from front end of control link at body mounting bracket. Disconnect spherical joint at rear end of control link under rear axle housing and remove control link.

Installation: Install front end of control link first. Replace attaching bolt but do not tighten. Position control link at design height as determined at removal, and tighten front attaching bolt to 85-95 ft. lbs. Pull down on control link and attach rear end to spherical joint under rear axle housing. Tighten stud to 70-80 ft. lbs. Complete installation by reversing removal procedure, using new "0" ring seals in all air lines. Lower car, open door, connect battery, and replenish air supply in accumulator tank. Check for air leakage at all fittings. Check and adjust standing height (see above)

CHEVROLET (EXCEPT CORVETTE)

Chevrolet Pass. Cars (Exc. Corvette) (1957)

DESCRIPTION: Same design as used on previous models.

ADJUSTMENT & PARTS REPLACEMENT: *See "Chevrolet Suspension" in 1955 Annual Data or later Manual dition and note the following:*

Tire Inflation: 22 lbs. (4 ply). 28 lbs. (6 ply).
St ring Axis Inclination: 3° to 4°. Not adjustable.
Caster: Pos. ½° to Pos. 1½°. *See "Shimming Procedure" below.*
Camber: 0° to Pos. 1°. *See "Shimming Procedure" below.*
T -In: 1/8" to 1/4". Adjust by loosening clamp bolts at each end of each tie rod and turning each tie rod equally to increase or decrease toe-in as necessary.
T -Out on Turns: With inner wheel turned 20°, outer wheel should be turned 18°10". Not adjustable.
Shimming Procedure: Adjustment is made by means of shims between upper control arm inner support and support bracket attached to frame side rail. Shims may be changed at either front or rear of inner shaft to change caster, or at both points equally to change camber. Addition of shims at front bolt or removal of shims at rear bolt will decrease positive caster. A 1/32" shim difference will change caster approximately 1/4°. Adding shims at both front and rear of inner shaft will change camber 1/6°. To adjust, loosen upper inner shaft-to-bracket bolts and add or remove shims as required.

1957 Spring Application

Model	② Part No.
Sed. & Coupe (Synchro-mesh) ①	3721372
Sed. & Coupe (Auto. Trans.) ①	3721373
Sed. & Coupe (Auto. Trans. & Air Cond.)	3722423
Sed. & Coupe (Synchro-mesh & Air Cond.)	3714506

Station Wagon (Synchro-mesh) ①	3721371
Station Wagon (Auto. Trans.) ①	3721372
Taxi (Synchro-mesh)	3719736
Taxi (Auto. Trans.)	3714506

① - Without Air Conditioning.
② - Springs are marked with the following colors for identification: Orange (3721372). Blue (3721373). Yellow (3722423). Dark Green (3714506). White (3737293 & 3713966). Light Green (3721371). Pink (3719736).

SHOCK ABSORBERS: Removal - Hold upper stem from turning and remove upper stem retainer nut, grommet retainer and grommet. Remcve two bolts retaining lower shock absorber pivot to lower control arm and pull shock absorber assembly and mounting out at bottom of spring housing.

Installation: Install grommet retainer and grommet on upper stem of shock absorber and install shock up through lower control arm and spring housing. Index upper stud through mounting hole in top of spring housing. Install grommet and retainer. Tighten nut to 4-6 ft. lbs. while holding upper. stem of shock absorber.

CHEVROLET CORVETTE

Chevrolet Corvette (1957)

DESCRIPTION: Independent linked parallelogram type with direct acting shock absorbers and coil springs. "Threaded Bushing" pivot points used on upper and lower control arms for connection to steering knuckle. Caster and camber adjustments made by rotating upper control arm pivot bolt (eccentric).

ADJUSTMENT & PARTS REPLACEMENT: *Se 1949 or later Manual editions and note the following:*

Tire Inflation: 24 lbs. (normal driving), 36 lbs. (sustained high speed).
Kingpin Inclination: 3½-4½° crosswise. Not adjustable.
Caster: Pos. 2¼° ± ½°. Loosen clamp bolt in upper end of knuckle support, remove lubricant fitting from rear bushing at outer end of upper control arm, insert Allen wrench through hole and turn pivot until correct caster setting secured. *NOTE - Pivot pin must b turned in full turns only for caster adjustment, otherwise camber be changed.*
Camber: Pos. ½° ± ½°. After adjusting caster (above), rotate pivot bolt not more than ½ turn in either direction to secure correct camber. Entire range of adjustment is obtained in ½ turn of pivot bolt.
Toe-In: 1/8". Loosen clamp bolts at each end of **l ft hand tie rod** and turn rod (right hand tie rod is one-piece non-adjustable type), tighten clamp bolts to 8-12 ft. lbs.
Toe-Out on Turns: With outside wheel at 20°, inner wheel should be 23°. Not adjustable.

① - Dot on second coil.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "TORSION-AIRE"

Chrysler, Imperial, DeSoto, Dodge & Plymouth (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 PLYMOUTH FRONT SUSPENSION BALL JOINT SEAL INSTALLATION CAUTION:* Failure to install seals and seal retainer in proper position will result in dirt and moisture entering ball joint and cause loss of lubricant and noisy front suspension. Seals and retainer positions are shown in front suspension assembly.

►*TORSION-AIRE SUSPENSION NOISE CORRECTION:* To properly lubricate ball joints, raise car so weight is on both lower control arms to unload lower ball joint and move upper control arm rebound bumper away from frame bracket. Use grease with not to exceed 10% lead powder and apply grease intermittently to cause ball joint action. When noise not corrected by lubrication, rotate ball joint stud ¼ turn as follows: Mark ends of both upper and lower ball joint studs and steering knuckle bosses. Start to remove knuckle or until stud-knuckle tapers are separated, then rotate studs 90° or ¼ turn from marked position. Retighten studs to specifications and thoroughly lubricate joints.

DESCRIPTION

DESCRIPTION: "Torsion-Aire" suspension consists oi a new rubber mounted ball joint type system using torsion bars instead of front coil springs. Torsion bar springs, one on each side, are indexed with the lower control arm at inner pivot point, the other end of bar is indexed in an anchor connected to frame side rail below drivers compartment. Steering knuckles are connected to upper and lower control arms by ball joints, eliminating the kingpins. Upper control arms are attached to brackets bolted to frame side rails, and shim packs between brackets and side rails control camber and caster settings at each wheel. The lower control arm pivot point is set in replaceable rubber bushings located on back side of intermediate front crossmember. Shock absorbers are connected to lower control arm and to a frame tower. Two struts, one on each side, prevent fore and aft movement of lower control arm, and a sway eliminator bar is connected between the two struts. The forward end of the strut is attached to a frame crossmember forward of the control arms, and the other end is attached to the lower control arms.

ADJUSTMENT

ADJUSTMENT: Before checking front wheel alignment inflate all tires to recommended pressure. Check adjustment of front wheel bearings, upper and lower ball joints, tie rod ends and idler arm for excessive looseness. Check for bent frame and rear spring "U" bolts for tightness or shifted axle housing. Grasp front and rear bumper at center and jounce car up and down several times to place torsion bar springs and shock absorbers in their normal "unloaded" position. Make adjustments in the following order:

Camber: *(See Specifications b low).* The addition of shims at both front and rear brackets will decrease positive camber. Shims are furnished in 1/16" and 1/32" thicknesses. One shim (1/16") at each bracket will change camber approximately 5/16°. *(NOTE - The shim pack at either front or rear brack t must not exc ed 9/16").* To install or remove shims, raise front wheel off floor with a jack placed under lower control arm as near to wheel as possible. Loosen upper support bracket bolts and add or remove shims.

CONTINUED ON NEXT PAGE

"TORSION-AIRE" (C nt.)

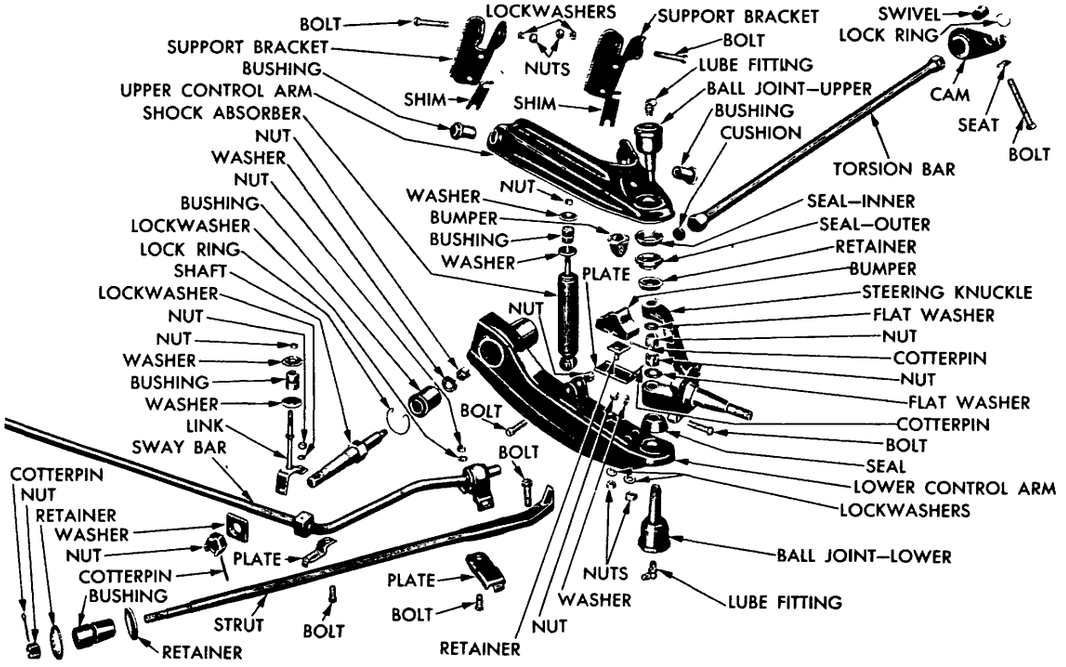
Camber Setting Specifications

Mod l	Right Wheel	Left Wheel
Chrysler	0° ±¼° ①	② Pos. ½° to 0°
Imperial	0° ±¼° ①	② Pos. ½° to 0°
DeSoto	0° ±¼° ①	② Pos. ½° to 0°
Dodge	0° ±¼° ①	② Pos. ½° to 0°
Plymouth	0° ±¼° ①	② Pos. ½° to 0°

① - 0° Preferred. ② - Pos. 3/8° Preferred.

Caster: *(See Specifications below).* The removal of shims at rear bracket or the addition of shims at front bracket will decrease positive caster. Shims are furnished in 1/16" and 1/32" thicknesses. One shim (1/16") will change caster approximately 3/8°. *(NOTE - The shim pack at either front or rear bracket must not exceed 9/16").* To install or remove shims see "Camber Adjustment" above.

Caster Setting Specifications



Model	Manual Strg.	Power Strg.
Chrysler	Neg. ¾° ± ¾°	Pos. ¾° ± ¾°
Imperial	Neg. ¾° ± ¾°	Pos. ¾° ± ¾°
De Soto	Neg. ¾° ± ¾°	Pos. ¾° ± ¾°
Dodge	Neg. ¾° ± ¾°	Pos. ¾° ± ¾°
Plymouth	0° to Neg. 1½°	Pos. 1½° to 0°

Steering Axis Inclination: (Chrysler) - 5° to 7°. **(DeSoto)** - 5½° to 7°. **(Dodg & Plym uth)** - 6½°. No adjustment provided. If camber can be adjusted within recommended limits it is unnecessary to check steering axis inclination. *CAUTION - Do not heat parts in order to straighten.*

Toe-In: 1/8"-1/32" (Exc. DeSoto). 3/32"-5/32", 1/8" preferred (DeSoto). Lengthen or shorten the tie rods an equal amount until wheels toe-in the specified amount. *NOTE* - Steering wheel hub, steering gear arm, steering tube and steering gear roller shaft are machined with master serrations to place front wheels in straight ahead position when steering wheel is centered. Do not alter these serrations to change position of these parts. Improper position of steering wheel must be corrected by adjusting tie rod lengths.

Toe-Out on Turns: 21°45' (Chrysler & DeSoto S25, S26). 21°37' (DeSoto S27, Dodge & Plymouth). No adjustment provided. *CAUTION - Do not heat parts in order to straighten.*

Front Susp nsi n Height: Checking - Make sure the car is on a level floor, tires inflated to recommended pressure, and car at curb weight (full gas tank, no passengers or load). Measure from lowest point of lower support arm ball joint to floor and from underside of lower control arm bushing (at center line of bushing housing). *(NOTE - Under car weight, the bushing housing will always be higher than the ball joint housing).* The difference between these two measurements should be as specified in table below. If the difference in measurements between the two sides of the car are less than ¼" of each other and are within the limits specified, suspension height is correct. If these measurements differ more than ¼" or if one or both of them are outside the specified limits, the torsion bar must be adjusted.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "TORSION-AIRE" ASSEMBLY

Front Suspension Height Limits

Model	① Height Difference
Chrysler (All Models)	2 1/8-2 1/4"
DeSoto (Exc. Sta. Wgn.)	2 1/8-2 1/4"
DeSoto (Sta. Wgn.)	2 5/8-2 3/4"
Dodge (Sed. & Coupe)	1 7/8-2 3/8"
Dodge (Suburban)	2 3/8-2 7/8"
Plymouth (Sed. & Coupe)	2 1/8-2 1/4"
Plymouth (Suburban)	2 5/8-2 3/4"
Plymouth Fury	1 5/8-1 3/4"

① - Difference between measurement at lower ball joint and at lower support arm housing. See "Checking" above.

Adjustment - Tighten or loosen the adjusting bolt at rear end of each torsion bar until measurement differences are as specified. *NOTE - Always jounce front and rear after making adjustment prior to a height check. Also when torsion bar spring adjustment is made, check alignment of front wheels and headlight aiming.*

REMOVAL & INSTALLATION

SWAY BAR: (Removal) - Remove sway bar link retaining nuts and washers and the two sway bar cushion retaining bolts (one on each strut). Slide sway bar out through control arm struts and away from car. *NOTE* - Sway bar cushions are not serviced separately.

Installation: Dip new sway bar link bushing in water, install in opening in frame bracket, using a twisting motion. When installed properly, the groove in bushing will index with opening in frame bracket. Thread sway bar into position over top of lower control arm struts. Engage sway bar cushion housing with struts and install lock plates. Insert bolts and lockwashers and tighten to 25 ft. lbs. Install washers over ends of links (concave side up), then slide links up through bushings. Install washers (concave side down), over ends of links and down on bushings. Install nuts and tighten to 15 ft. lbs.

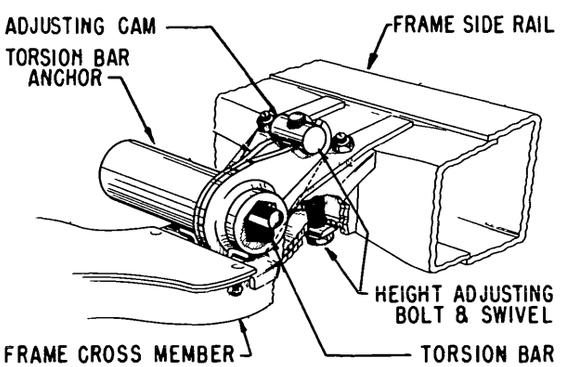
LOWER CONTROL ARM STRUTS: (Removal) - Remove bolts attaching sway bar bushing housing to struts. Disconnect sway bar from struts. Remove the strut-to-lower control arm mounting bolts and nuts. Remove cotter pin, nut and bushing retainer from forward end of strut at front crossmember. Slide strut and inner bushing retainer from bushing in frame. Cut old bushing out of frame with a knife.

Installation: Dip new bushing in water and with tapered portion toward rear of car, install in opening in frame using a twisting motion until groove in bushing indexes with frame. With cupped side out, slide washer over threaded end of strut. Push strut through bushing in frame. Slide outer washer over end of strut (cupped side in). Install nut and tighten sufficiently to install strut to lower control arm mounting bolts. Install bolts, lockwashers, and nuts and tighten to 65 ft. lbs. Tighten strut nut to 30 ft. lbs. and install cotter pin. Check caster and camber.

STEERING KNUCKLE: (Removal) - Remove wheel, tire and drum. Cover brakes with a clean cloth and remove cotter pins, nuts and lockwashers attaching steering arm and brake dust shield to steering knuckle. Remove steering arm and brake assembly from steering knuckle (leave brake hose attached). (Do not allow assembly to hang by the brake hose). Remove ball joint studs from

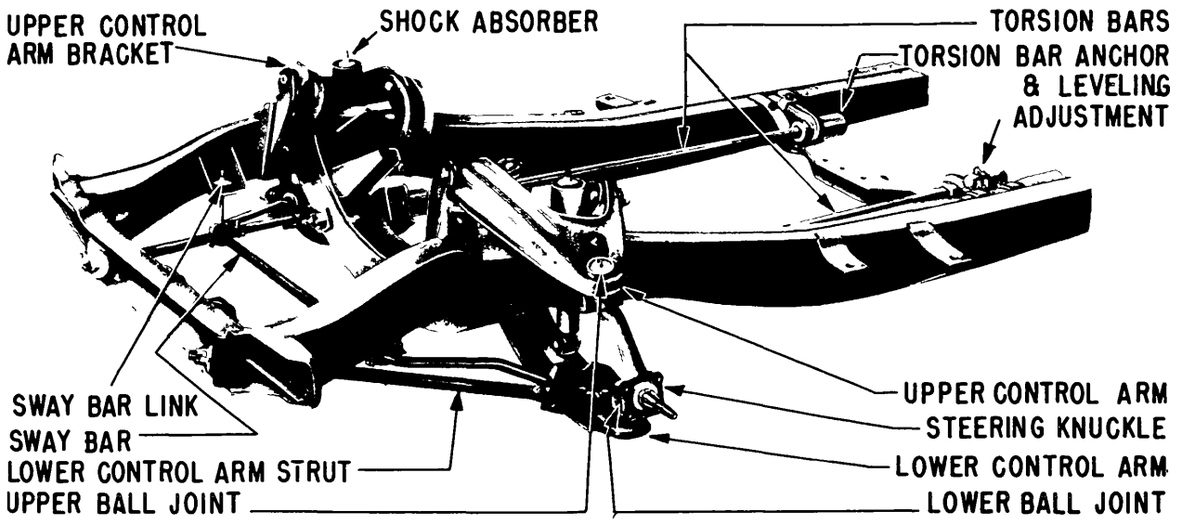
CONTINUED ON NEXT PAGE

"TORSION-AIRE" (C nt.)



steering knuckle (see "Upper & Lower Ball Joints" below). Lift steering knuckle up and away from car.

Installation: Slide upper and lower ball joints into steering knuckle and install lockwashers and nuts. Tighten ball joint stud to 135 ft. lbs. Install cotter pins. Slide brake assembly over knuckle and into position. Install lockwashers and nuts on upper rear and lower front bolts. Install upper front and lower rear bolts through dust shield and steering knuckle, then slide steering arm over bolts. Install lockwashers and nuts and tighten evenly to 55 ft. lbs. Install cotter pins. Remove covering from brake shoes, replace wheel and drum assembly. Adjust front wheel bearings.



UPPER & LOWER BALL JOINTS: (Removal) - *(CAUTION - Upper and lower ball joints are not interchangeable. The Upper joint is preloaded and should not be used in the lower control arm).* Remove wheel assembly, and remove upper and lower ball joint stud nuts. (Install Tool C-3564 (with threaded end upward to remove lower joint, and with threaded end downward to remove upper joint). Apply load to studs and rap knuckle at ball joint boss sharply with a hammer to loosen stud *(CAUTION - Do not attempt to hammer stud out of knuckle).* Reverse position of tool to remove the opposite ball joint and repeat the above procedure. Remove tool and disengage ball joint from knuckle. Remove dust cover and grease seal. Remove lubrication fittings. Using Tool C-3561, unscrew ball joint from control arm.

Installation: *(CAUTION - When installing new ball joints, make sure that ball joint threads squarely engage threads in control arm).* With lubrication fittings removed, screw ball joint into control arm using Tool C-3561 and tighten until ball joint housing is seated on control arm. Tighten to a minimum to 250 ft. lbs. Install seal and dust cover into position over stud and position stud in steering knuckle. Install cotter pin and lubrication fitting. Lubricate ball joint with chassis lubricant.

TORSION BAR: (Removal) - *(CAUTION Torsion bars are not interchangeable, side for side. Torsion bars are marked "L" (Left), "R" (Right), stamped on one end of the rod. These stamped markings must always be toward rear of car).* Raise car off floor *by jacking under front crossmember.* Release load from torsion bar by unscrewing the cam adjusting bolt partly out of swivel *(CAUTION - To prevent swivel from falling into frame bracket, do not loosen swivel bolt all the way out until torsion bar is removed).* Remove lock ring from rear of anchor. Slide torsion bar rearward until forward end is disengaged from lower control arm, then forward until rear end is disengaged from cam. Remove bar, bolt, swivel and cam from frame bracket anchor.

T RSI N BAR ANCH R & ADJUSTMENT

"TORSION-AIRE" SUSPENSION SYSTEM

Installation; With car raised off floor, assemble cam, swivel, bolt seat (oval side up) and bolt into frame anchor bracket. Check for torsion bar cushion in lower control arm housing and make sure it is in place at end of lower control arm pivot shaft. With cam bolt barely entered in cam swivel, slide torsion bar into rear cam. Rotate cam and torsion bar assembly until cam is positioned as close to floor pan as possible. Engage front of torsion bar in lower control arm shaft assembly as far as the bar will go (up against cushion). *(NOTE - Unless anchor blade is positioned properly, it will be impossible to adjust front suspension to proper suspension height).* Install lock ring in rear of cam housing. Tighten cam bolt until approximately 1" of threads show above anchor bolt swivel. Check and adjust suspension heights, caster and camber (see "Adjustments" above).

UPPER CONTROL ARM: (Removal) - *Place jack under lower control arm and raise front wheel off floor,* with jack placed as close to wheel as possible. Remove wheel. Remove cotter pin, nut and washer from upper ball joint stud. Install Tool C-3564 and remove ball joint (see "Upper & Lower Ball Joints" above). Remove upper control arm front and rear pivot bolts. Remove control arm from support mountings (do not remove brackets from frame).

Upper Control Arm Bushing Replacement - Remove bushings by pressing them out with Tool C-3558, or using a hammer and suitable drift. *(CAUTION - Make sure control arm is properly supported when removing bushings. If hammer and drift are used, extreme care must be used to avoid damaging bushing surface in control arm).* When installing new bushings, make sure control arm is supported squarely at point bushing is being pressed in. Position flange end of new bushing in Tool C-3558, and support control arm squarely. Using an arbor press, install bushings (flange out) into control arm until flanged portion of bushings seat on arm.

Installation: Position upper control arm in support mounting bracket and install front and rear mounting bolts, washers and nuts. With control arm in normal position tighten nuts to 65 ft. lbs. Place upper ball joint in steering knuckle and install washer and nut. Tighten to 135 ft. lbs. and secure with cotter pin.

LOWER CONTROL ARM: (Removal) - Raise car by placing jack under frame crossmember. Remove torsion bar (see "Torsion Bar" above). Remove shock absorber lower eye attachment nut and bolt from mounting bracket. Push lower portion of shock absorber up into frame opening. Remove strut to lower control arm mounting bolts. Remove lower ball stud from knuckle (see "Upper & Lower Ball Joints" above). Remove cotter pin, nut and washer from lower control arm shaft assembly. With washer removed, reinstall nut (to protect threads) until it is flush with end of shaft, (shaft is a tapered fit in crossmember). Use a hammer and brass drift for loosening, then remove nut from shaft. Slide lower control arm and shaft assembly from rear crossmember. *(CAUTION - Do not lose torsion bar spring cushion located in shaft assembly).*

CONTINUED ON NEXT PAGE

"TORSION-AIRE" (C nt.)

Installati n: Position shaft and lower arm assembly in crossmember in normal position, and install washer and nut. Tighten to 175-200 ft. lbs. and secure with a cotter pin. Position lower ball joint stud in steering knuckle and install washer and nut. Tighten nut to 135 ft. lbs. and secure with a cotter pin. Place shock absorber in position in lower mounting bracket and install bolt and nut and tighten to 40 ft. lbs. Install wheel. **Do not lower front f car until torsion bar spring is installed.** See "Torsion Bar" above.

LOWER CONTROL ARM PIVOT SHAFT BUSHING RE-PLACEMENT: (Disass mbly) - Remove lock ring from end of bushing housing. Support lower control arm assembly in an arbor press; then using a brass drift, press shaft and bushing assembly from control arm. Remove cotter pin, nut and washer; and slide bushing from shaft.

Reassembly: Position new bushing (flanged end of bushing first) on shaft and install washer and nut. Tighten nut to 100-150 ft. lbs. and install cotter pin. With lower control arm supported, install shaft and bushing assembly by using Tool C-3557 and pressing bushing into lower control arm until flanged portion of bushing is seated all the way into control arm. Install lock ring making sure it is properly seated in ring groove. Install torsion bar spring cushion in control arm.

UPPER CONTROL ARM SUPPORT MOUNTING BRACK-ETS: *(CAUTION - Brackets are bolted to frame side rails and should not be removed unless damaged due to accident).* When removing mounting brackets, extreme care should be taken so not to lose alignment shim pack located between bracket and frame side rail. In the event a shim pack is lost, a selection of shims 5/16" thick, **may be used as a starting point when re-assembling.**

FORD (EXCEPT THUNDERBIRD) & MERCURY

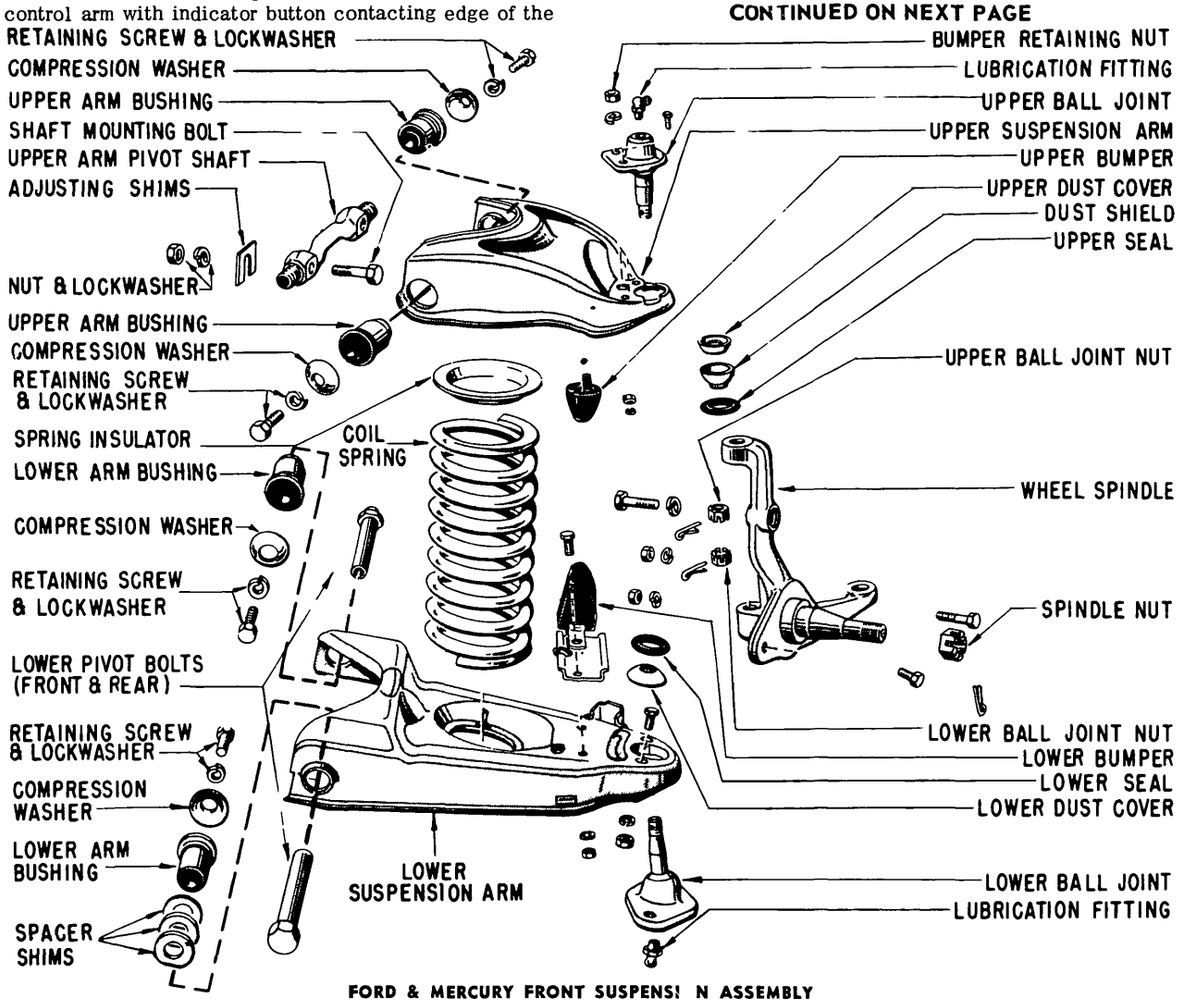
Ford, Exc. Thunderbird (1957)
M rcury, All M dels (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 LOWER BALL JOINT CHANGE & CHECKING NOTE:* Lower ball joints are not spring loaded and as a result, when there is no load on wheel, a slight looseness will be apparent that is entirely normal. *See "Lower Ball Joint" below.*

►*1957 MERCURY STABILIZER BAR INTERFERENCE WITH FRAME CORRECTION:* Loosen the two stabilizer bar-to-frame brackets and slide the two rubber mounting insulators along stabilizer bar as necessary to center the bar. Tighten clamps and check clearance between bar and frame. If clearance cannot be obtained in the above manner, replace stabilizer bar. *CAUTION - Do not apply heat to bar.*

►*1957 MERCURY "RUBBING" NOISE CORRECTION:* A metallic rubbing noise in front suspension may be caused by the coil spring upper shim being installed without a shim locator allowing shim and spring to shift out of frame pocket. Check clearance between outboard side of coil spring and spring pocket by jacking car up with the jack placed under car frame or crossmember (spring extended). If spring is found to be contacting the spring pocket, remove spring and shim and reinstall with a shim locator.



DESCRIPTION: "Ball-joint" type similar in construction and design to previous models. Upper and lower control arms have been changed and service procedures have been revised.

ADJUSTMENT

CHECKING & ADJUSTING: Before adjusting front end alignment, inflate tires to specified pressure (see below). Raise front of car and check front suspension ball joints for looseness, wear, or damage *(NOTE* - Lower ball joint is not spring loaded and a slight normal looseness will be found when car is raised and wheel is hanging free. *See "Lower Ball Joint Checking" below).* Check steering gear mountings and all linkage for looseness. Adjust front wheel bearings. Check tracking of front and rear wheels.

►*LOWER BALL JOINT CHECKING:* Raise front of car with a jack placed under lower control arm. Adjust front wheel bearing, then, using a dial indicator perpendicular to wheel, measure the in and out travel of wheel (Dial indicator should be clamped to front suspension lower control arm with indicator button contacting edge of the wheel rim). The total travel from extreme inboard to outboard position should be less than .125" (1/8"). Replace

CONTINUED ON NEXT PAGE

FORD & MERCURY FRONT SUSPENSI N ASSEMBLY

FORD & MERCURY (Cont.)

ball joint if in excess of this specification.

Tire Inflation: As follows.

Model	Front	Rear
Ford (Exc. Sta. Wgn.)	24 lbs	21 lbs.
Ford Sta. Wgn.	24 lbs.	26 lbs.
Mercury (All Models)	24 lbs.	① 24 lbs.

① - On Mercury Sta. Wgn. inflate to 28 lbs if loaded.

Steering Axis Inclination: 7°1' at 45' Camber (Ford). 7° at 0° Camber (Mercury). Not adjustable.

Caster: Pos. ½° to Pos. 1½° (Ford). 0° to Neg. 1½° (Mercury). *See "Shimming Procedure" below.*

Camber: Pos. ½° to Pos. 1½° (Ford). 0° to Pos. ¾° (Mercury). *NOTE* - Maximum variation between wheels must not exceed ½° with ¼° preferred *See "Shimming Procedure" below.*

Toe-In: 1/16-1/8" (Ford). 1/16-3/16" (Mercury). To adjust, place front wheels in straight ahead position and loosen two clamp bolts at each spindle connecting rod sleeve. If steering wheel spokes are in their normal position, lengthen or shorten both rods equally to obtain correct toe-in. If steering wheel spokes are not in their correct position, make necessary rod adjustments to obtain correct toe-in and steering wheel spoke alignment. *NOTE* - On left hand sleeve turn sleeve **downward to increase length.** On right hand sleeve turn **upward to increase length.**

Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 24¼° (Ford).

Shimming Procedure: Caster and camber adjustments are made by adding or removing shims between upper control arm mounting shaft and frame mounting bracket. To change caster, remove or add shims at one of the mounting bolts. The removal of shims at the front bolt or installation of shims at the rear bolt will cause ball joint on upper control arm to move forward. Reversing this procedure will cause joint to move to rear. A 1/16" change of shim thickness at either bolt will change caster angle ½° *(NOTE - The difference between shim stack thicknesses at the two bolts should not exceed 1/8" and the maximum thickness of shim stack at each bolt must not exceed 9/16").* To adjust camber, remove or install equal shim thicknesses at both bolts. Removal of shims at both bolts will move upper ball joint inward, and installation of shims will move upper ball joint outward. A 1/16" change of shim thickness at both bolts will change camber angle ¼°. Shims are available in 1/32" & 1/8" thicknesses. Tighten control arm shaft mounting nuts to 65-90 ft. lbs.

REMOVAL & INSTALLATION

SHOCK ABSORBER REPLACEMENT: Removal - Raise car and place stands under both lower control arms, making sure that shock absorbers are accessible for servicing. Disconnect shock absorber from lower control arm and mounting bracket on frame. Free lower stud and bushing from arm by removing one mounting bolt and loosening the other. Remove bushings and washers.

Shock Absorber Lower Bushing Replacement - Remove bushing, using Tool T57P-18201-A1 & A5, and pressing it out of shock absorber with an arbor press. To reinstall bushing, apply a vegetable soap solution to bushing and press it into shock absorber, using Tool T57P-18201-A1, A4, & A5. *NOTE* - One quick drive of the press ram should be used to position bushing.

Installation: Place bushings and washers on studs in their correct order. Extend shock absorber and install it inside coil spring with upper stud inserted through hole in mounting bracket. Install and tighten lower bolts to 12-15 ft. lbs. Install upper bushing and washer on upper stud and tighten nut to 25-29 ft. lbs. Install and tighten locknut.

COIL SPRING REPLACEMENT: *See "Lower Control Arm" below.*

► *COIL SPRING IDENTIFICATION NOTE: Springs are marked with various colors as indicated in table below.*

UPPER CONTROL ARM: Removal - Raise car and place a stand under lower control arm. Remove wheel and tire and remove cotter pin from nut on upper ball joint stud, then loosen nut one or two turns (do not remove nut at this time). Place a box wrench over lower end of ball joint remover, Tool T57P-3006A (Ford), then install the tool between upper and lower ball joints, making sure that tool seats firmly against ends of both studs and not against stud nuts. Turn wrench until tool places studs under tension, then tap spindle near upper stud with a hammer to loosen stud in spindle (do not loosen stud in spindle with tool pressure only). If both arms are being removed, loosen lower stud in same manner as upper stud. Remove nut from upper stud and remove stud from spindle. Support spindle to prevent damage to brake hose. Remove nuts from retaining bolts on upper arm inner shaft *(CAUTION - These bolts are pressed into inner shaft and should not be turned when removing the nuts).* Remove upper control arm from mounting bracket *(CAUTION* - Measure and note thickness of shim pack at each inner shaft bolt).

Inspection: Inspect upper arm and inner shaft for cracks, bends, or other damage. Check condition of bushings, rubber seal on ball joint stud, and rubber bumper on arm Replace as necessary. Install nut on ball joint stud, then turn stud in ball joint with a torque wrench. If turning effort is not within 25-40 inch pounds, replace the ball joint.

Upper Arm Bushing & Inner Shaft Replacement - *(NOTE - Replace both upper arm bushings if either bushing is worn or damaged).* Remove bolts and washers from both ends of inner shaft. Install bushing remover tools, T57P-3044-A & T54P-3044-A10 (Ford), at front bushing and press bushing out of arm *(NOTE* - Forward mounting bolt on inner shaft must be removed by tapping or pressing before remover tools can be installed). Remove inner shaft from rear bushing, then press rear bushing out of arm. Press a new rear bushing into arm with flange of bushing toward outer side of arm, using tools T57P-3044-A & T54P-3044-A5. Insert end of inner shaft in rear bushing, then press a new front bushing into arm. Install forward mounting bolt in inner arm by tapping or pressing it into place. Install bolts and washers on both ends of shaft but do not tighten bolts until upper arm is installed on mounting bracket.

Upper Ball Joint Replacement - *(NOTE* - The ball joint cannot be repaired and must be replaced if damaged). If ball joint is riveted to arm, drill a 1/8" pilot hole completely through each rivet, then drill off the rivet head through pilot hole with a 3/8" drill. Drive rivets out of holes. Remove burrs from hole edges and install new

CONTINUED ON NEXT PAGE

FORD & MERCURY (C nt.)

joint on arm, using only the specified bolts, nuts, and washers (furnished in Kit, Part No. B7A-3049-A). *(CAUTION - Do not attempt to rivet new ball joint to arm).* Tighten nut on suspension arm bumper to 20-35 ft. lbs. and other ball joint retaining nuts and bolts to 28-45 ft. lbs.

Installation: Position upper arm on frame mounting bracket, then install but do not tighten the nuts on inner shaft retaining bolts *(NOTE - "Keystone" type lockwashers must be used on these bolts).* Install adjusting shims on both bolts between inner shaft and mounting bracket (Install the same thickness of shims that were removed from both ends during disassembly). Tighten nuts on both bolts to 65-90 ft. lbs. Position upper ball joint stud in top of wheel spindle then install stud nut and tighten to 80 ft. lbs. Continue to tighten until cotter pin hole and slots line up. Install cotter pin. Install wheel and tire and remove stand from under lower control arm. Tighten bolts on ends of inner shaft to 40-46 ft. lbs. Lubricate upper ball joint (do not lubricate upper arm bushings). Check and adjust front end alignment.

LOWER CONTROL ARM: Removal - Raise car and place stands under frame side members just back of lower arms and under both front wheels. Remove engine splash shields, disconnect stabilizer from lower arms and loosen both outer stabilizer bushing brackets. Remove both inner brackets, then slide one end of stabilizer at a time out of outer bushings. Disconnect lower end of shock absorber and push it up through lower arm. Remove cotter pin from nut on lower end of ball joint stud, then loosen nut two or three turns (do not remove nut from stud at this time). Loosen lower ball joint (procedure is the same as for upper ball joint, see above). Place a jack under lower arm, then remove nut from lower ball joint stud and slowly lower control arm on jack *(CAUTION - On Mercury be careful to prevent coil spring from jumping out of its seat).* Remove coil spring and insulator. Remove lower control arm retaining bolts, sleeve, and shims, and remove arm from car.

Insp cti n: Inspect lower arm for cracks, bends, or other damage, and replace arm if necessary. Check condition of ball joint and socket, bushings, rubber seal on ball joint stud, and rubber bumper on arm. Replace damaged parts.

Lower Arm Bushing Replacement - *(NOTE - Replace both lower arm bushings if either bushing is worn or damaged).* Using bushing removing tools, T54P-3044-A13 and T57P-3044-A (Ford), press both bushings out of arms with an arbor press. Press new bushings into arms with tools T57P-3044-A and T54P-3044-A7 (Ford). Bushing flanges must be at inner sides of arm.

Lower Ball Joint Replacement - *(NOTE* - The ball joint cannot be repaired and must be replaced if damaged). Replace ball joint assembly in same manner as for the upper ball joint (see above), using parts furnished in Kit, Part No. B7A-3050-A. *(CAUTION - Do not attempt to rivet new ball joint to arm).* Tighten nut on suspension arm bumper to 20-35 ft. lbs., and other ball joint retaining nuts and bolts to 28-45 ft. lbs.

Installation: Position lower arm on frame crossmember and install shims as needed between forward arm and frame member to remove all fore and aft motion of control arm assembly. Install pivot sleeve and retaining bolt in each arm but do not tighten bolts. Tape insulator to top of coil spring, then position insulator and spring between upper spring seat and lower arm *(NOTE - Mercury springs require a special procedure for installation. See "Mercury Spring Note" below).* Raise lower arm with a jack and guide lower ball joint stud into bottom of wheel spindle. Install and tighten nut to 70-80 ft. lbs., then continue to tighten nut until cotter pin hole and slots line up. Install cotter pin. Remove jack from under control arm and tighten arm retaining bolts to 40-46 ft. lbs. (make sure arms are in normal load position when bolts are tightened). Pull shock absorber down through coil spring and lower control arm and secure it in place. Connect stabilizer to both lower arms. Coat parts with vegetable soap solution and slide ends of stabilizer into outer bushings. Install inner bushing brackets and tighten all inner and outer brackets to 12-15 ft. lbs. Install engine splash shields. Lubricate lower ball joint (do not lubricate lower arm bushings). Check and adjust front end alignment.

► *MERCURY SPRING INSTALLATION NOTE:* Due to free height of the coil spring being greater than distance between upper and lower spring seats, it is necessary to compress the springs approximately 4" before installation. Install spring in an arbor press (if possible, use a salvage 1957 Mercury lower control arm as a holding fixture to properly retain angled lower end of spring while it is being compressed). Compress spring approximately 4", then fasten chains on sides of spring coils so spring will have a slight curve. Remove from press and install in car, making sure that end coil is fully seated in lower control arm.

FRONT WHEEL SPINDLE: Removal - Raise car until front wheel clears floor, then place a support under lower control arm. Remove wheel and drum. Remove brake backing plate and support it to prevent damage to brake hose. Remove upper and lower ball joints (see above), and remove spindle.

Installation: Reverse removal procedure and note the following: Install brake backing plate and tighten upper retaining bolts to 62-72 ft. lbs. Tighten lower bolts to 25-29 ft. lbs. Check and adjust front wheel alignment.

STABILIZER: *NOTE - Removal & Installation of stabilizer is different on Ford and Mercury as noted below:*

Removal (Ford): Raise car and place supports under both front wheels. Remove engine splash shields and disconnect stabilizer from lower control arms. Loosen both stabilizer outer bushing brackets and remove both inner bushing brackets. Slide one end of stabilizer at a time out of outer bushings.

Installation (Ford): Connect stabilizer to both lower arms. Coat parts with vegetable soap solution and slide ends of stabilizer into outer bushings. Install both inner bushing brackets, and tighten all inner and outer brackets to 12-15 ft. lbs. Install engine splash shields.

Removal (Mercury): Remove engine splash pan and front wheel. Remove two stabilizer to frame mounting brackets and slide left rubber mounting insulator along stabilizer bar about three inches toward center of car. Disconnect stabilizer bar from links and remove rubber insulators from eyes of bar. With front suspension in full rebound, remove bar by moving it out to right of car. The right eye at end of stabilizer bar will just pass over right front brake drum. *NOTE* - It may be necessary to spread coils of left spring slightly to allow left end of stabilizer bar to pass through spring during removal.

Installation (Mercury): Reverse removal procedure. Tighten bracket bolts to 12-15 ft. lbs.

FORD THUNDERBIRD, LINCOLN & CONTINENTAL

Ford Thund rbird (1957)
Linc ln (1957)
Contin ntal (1957)

DESCRIPTION: "Ball-Joint" type of same design used on previous models.

ADJUSTMENTS

CHECKING & ADJUSTING: *ADJUSTMENT NOTE - Due to differences in mounting upper control arm shaft and location of camber & caster adjusting shims, Thund rbird models are adjust d differ ntly than Lincoln & Continental mod ls. S Adjustment data following:*

Tir Inflati n: Linc ln - 24 lbs. (front & rear). **C ntin ntal** - 26 lbs. (front), 24 lbs. (rear). **Th underbird** - 22 lbs. (front & rear).

Steering Axis Inclination: (Thunderbird) 7°7'. (Lincoln) 7°12'14". (Continental) 7°10' with ¾° camber.

Caster: (Thunderbird) Pos. ½° to Pos. 1½°. (Lincoln) 0° to Neg. 1½°. (Continental) Pos. 1° ± ¼°. Caster should not vary more than ½° from side to side. *See "Shimming Procedure" below.*

Camb r: (Thunderbird) Pos. ½° to Pos. 1½°. (Lincoln) 0° to Pos. ¾°. (Continental) Pos. ¾° ± ¼°. Camber should not vary more than ¼° from side to side. *S e "Shimming Procedure" b low.*

T -In: (Thunderbird) 1/16-1/8". (Lincoln) 1/8-3/16". (Continental) 3/32-5/32".

Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 25° (Thunderbird). With wheels at maximum turning angle, outer wheel is at 26° and inner wheel is at 36° (Lincoln & Continental).

Shimming Procedure: Caster and camber adjustments are made by adding or removing shims between upper control arm mounting shaft and frame mounting bracket. To change caster, remove or add shims at one of the mounting bolts. *(NOTE - On Thund rbird, th adjusting shims ar locat d betw n inn r sid of mounting shaft and frame brack t. On Lincoln & Contin ntal th se shims*

CONTINUED ON NEXT PAGE

THUNDERBIRD, LINCOLN & CONTINENTAL (C ntinu d)

are located between outer side of mounting shaft and frame bracket). On Thunderbird, to **increase positive caster,** add shim at **front** bolt or remove shims at **rear** bolt. On Lincoln & Continental, to **increase positive caster,** add shim at **rear** bolt or remove shim at **front** bolt. To change camber, remove or install equal shim thicknesses at both front and rear mounting bolts. On Thunderbird, for positive camber increase, add shims equally at both bolts. On Lincoln & Continental, remove shims equally at both bolts. A 1/16" shim change at either bolt will change caster ½°. A 1/16" shim change at both bolts will change camber ¼°. Tighten control arm mounting shaft bolts to 65-90 ft. lbs. (Thunderbird), 75-90 ft. lbs. (Lincoln & Continental).

► *ADJUSTING SHIM THICKNESS NOTE:* Difference in thickness of shim pack at front and rear bolts must not exceed 1/8". Total shim pack thickness at each bolt must not exceed 9/16".

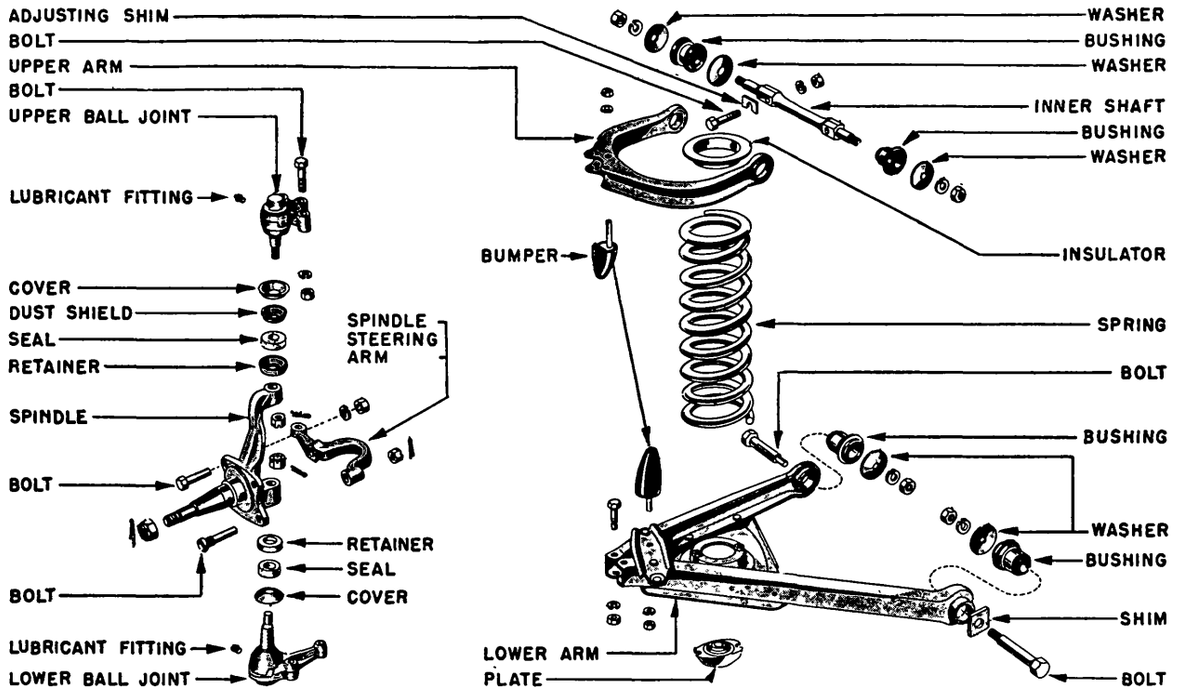
RIDING HEIGHT: (Lincoln) - 4.18-4.65" measured vertically from underside of frame to top of lower control arm adjacent to bumper.

Front Spring Application

Model	Spring No.
Thunderbird	B5A-5310-B
Lincoln, (Exc. Conv. & Air. Cond.)	LD-5310-K
Lincoln (Conv. & Air Cond. Cars)	LD-5310-L
Lincoln (Heavy Duty)	I-500915
Continental	4050384

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove nut and washer (also rubber bushing and seat washer on Thunderbird) attaching upper end of shock absorber to frame. Disconnect bracket on underside of lower control arm and remove shock absorber through hole in spring seat.



Upper Bushing (Lincoln & Continental) - This bushing is notched in hole in frame and can be removed easily by hand.

Lower Bushing (Lincoln & Continental) - To replace this bushing use Tool 4621-L to support eye of shock absorber and press it in or out with a 1" socket and an arbor press.

Installation: Reverse removal procedure and tighten mounting bracket or plate bolts to 10-13 ft. lbs. (Lincoln & Continental), 13-15 ft. lbs. (Thunderbird).

COIL SPRING REPLACEMENT: *See "Lower Control Arm" below.*

LOWER CONTROL ARM: Removal - Raise front of car and place stand under each frame side rail to rear of lower control arm. Remove wheel and brake drum as an assembly. Remove shock absorber (see above), and disconnect stabilizer bar from lower arm. Loosen lower ball joint to wheel spindle stud nut two turns and loosen ball joint *(see "Ball Joint Removal" below).* Place a jack under lower control arm and raise arm until rebound bumper on upper arm is clear of frame. Remove nut from lower ball joint stud and lift spindle up and off the stud. Lower jack until spring tension is relieved and spring

THUNDERBIRD, LINCOLN, CONTINENTAL FRONT SUSPENSION ASSEMBLY (TYPICAL)

can be removed. Remove spring, insulator and retainer ring (note location of these parts to insure correct reassembly). To remove lower control arm, take out bolts attaching arm to frame. Inspect bushings on inner end of each member and replace if necessary.

Bushing Replacement - Press bushings from control arms using an arbor press and the following tools: 3069, 3069-F, & 3069-J (Lincoln & Continental), T54P-3044-A13, & T54P-3044-A6 (Thunderbird). Install bushings in control arm with tools 3069 & 3069-A (Lincoln & Continental), T54P-3044-A6 & T54P-3044-A7 (Thunderbird). Press bushings into arm until shoulder ribs of bushings bottom on control arm. *(CAUTION* - Do not attempt to press bushings beyond edge of shoulder ribs or raised section of outer sleeve. Under no circumstances should only one bushing be replaced).

Installation: Install lower arm rear leg-to-frame crossmember and tighten attaching nut to 55-75 ft. lbs. (Lincoln & Continental), 40-46 ft. lbs. (Thunderbird). Add enough shims between forward arm and frame to fill the existing space, and tighten the nut finger tight *(NOTE - Shim pack at this point should not exceed ½").* Install bolt in forward arm and tighten nut finger tight, then loosen nut on rear bolt to a finger tight position. With arm in curb load position (approximately horizontal, with outer end slightly lower than inner), tighten nuts to 55-75 ft. lbs. (Lincoln & Continental), 40-46 ft. lbs. (Thunderbird). Place coil spring and upper rubber insulator in position, then place a jack under control arm and compress the spring, making sure that both upper and lower ends of spring are properly seated. Guide spindle boss over ball joint stud, install nut and tighten to 70-90 ft. lbs., continuing to tighten nut until cotter pin hole is lined up with slot in locknut. Remove jack from under control arm, and install shock absorber. Secure stabilizer to lower control arm. Install wheel and drum assembly and adjust front end alignment.

BALL JOINT (UPPER & LOWER): Removal - Ball joints are furnished as assemblies except for seals and related parts assembled on ball joint stud. Raise front of car with a jack placed under lower control arm, then place a support under frame side rail to rear of control arm. Remove front wheel and cotter pin in ball joint stud *(NOTE* - If both ball joints are to be removed, free the lower stud first). Loosen stud nut approximately two turns and install Tool 3006-A with the screw end resting against lower stud nut. Turn screw of tool and apply sufficient pressure to place ball joint under tension. Strike the spindle sharply at a point opposite the stud bore to pop it loose. Increase tension and strike again if necessary *(CAUTION - Spindle or tool may be damaged if pressure only is used to free stud).* Repeat this procedure with other stud if necessary. Remove ball joint from control arm by removing the attaching screws. Remove retainer, seal, and covers from stud. Inspect parts for damage and replace if necessary. If new rubber seals are being installed, make sure they are pushed down into retainer cup before cup is installed. Reassemble all seal parts in original position.

► *CAUTION: Do not wash ball joint assemblies with solvent which may remove lubricant.*

CONTINUED ON NEXT PAGE

THUNDERBIRD, LINCOLN & CONTINENTAL (C ntinu d)

Installati n: Reverse removal procedure and note the following: Tighten upper stud nut to 60-80 ft. lbs. and lower stud nut to 70-90 ft. lbs., then continue to tighten until cotter pin hole lines up with slot. Tighten ball joint assembly mounting bolts to 28-45 ft. lbs.

UPPER CONTROL ARM: Removal - Place jack under lower control arm near ball joint mounting and raise lower arm until some of the tension has been removed from upper control arm. Remove wheel and tire assembly. Wire spindle to frame to avoid damage to brake hose. Remove cotter pin from ball joint stud and loosen nut approximately two turns. Loosen ball joint stud *(see "Ball Joint Removal" above)*, then remove ball joint nut. Remove bolts securing inner shaft to frame *(NOTE* - Check and record amount of shims removed from between control arm mounting shaft and frame). Remove upper control arm.

Bushing Replacement (Lincoln & Continental) - Install Tool 3044-B on inner shaft and place Tool 3069 over bushing. Press bushing from arm. Remove mounting shaft and steel washer. To remove the opposite (double shoulder bushing), on rear upper arm, insert Tool 3069-F into flange of arm, then place Tool 3069 over bushing and into recess of Tool 3069-F. Center bushing over Tool 3069-G and press out *(NOTE* - Tool 3069-G will shear rubber until steel shell is contacted). To install double shouldered bushing in rear of upper arm, lubricate rubber portion of bushing for easier installation. Position Tool 3069 on inner side of rear arm. Install bushing in hole (entering it from outer side of arm), and position Tool 3068 over bushing. Press bushing into arm until shoulder stop is reached. Install long machined end of inner mounting shaft, with washer, into bushing. Install bushing in front arm, positioning it over end of shaft and pressing it into place with Tool 3068. With both bushings in place, install nut and washer on each end of shaft and tighten finger tight. Position shaft in suspension arm so that holes are parallel with shaft and tighten nuts to 55-75 ft. lbs. *CAUTION - Under no conditions should only one bushing be installed.*

Bushing Replacement (Thunderbird) - Install bushing remover Tools T54P-3044-A6 & T54P-3044-A5 in arbor press and press rear bushing out of arm. Install rear bushing with Tools T54P-3044-A6 & T54P-3044-A9. Bushing flange should be at outer side of arm. Insert end of mounting shaft in rear bushing, then press new front bushing into arm using Tool T54P-3044-A8. Install bolts and washers on both ends of shaft, but do not tighten bolts until upper arm is installed on the mounting bracket.

HUDSON, NASH, RAMBLER

Hudson, Nash, Rambl r (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*LOWER CONTROL ARM THROUGH BOLT TIGHTENING CAUTION:* The lower control arm through bolt which also acts as the front shock absorber lower anchor is a special heat treated bolt that must be properly tightened to 90-95 ft. lbs. *DO NOT REPLACE THIS BOLT WITH ONE THAT IS NOT HEAT TREATED.*

►*POWER STEERING TOE-IN ADJUSTMENT NOTE:* When adjusting toe-in on Power Steering cars, operate engine which will permit steering pump oil pressure to center valve spool in control valve

DESCRIPTION: Similar to design used on previous models. Upper and lower control arms are connected to steering knuckles by a trunnion assembly and coil springs are mounted between spring seat attached to top of steering knuckle and seat in wheelhouse panel. Shock absorbers are mounted between lower control arm and bracket on wheelhouse panel. Eccentric bolts are used at inner ends of lower control arm for camber and caster adjustment.

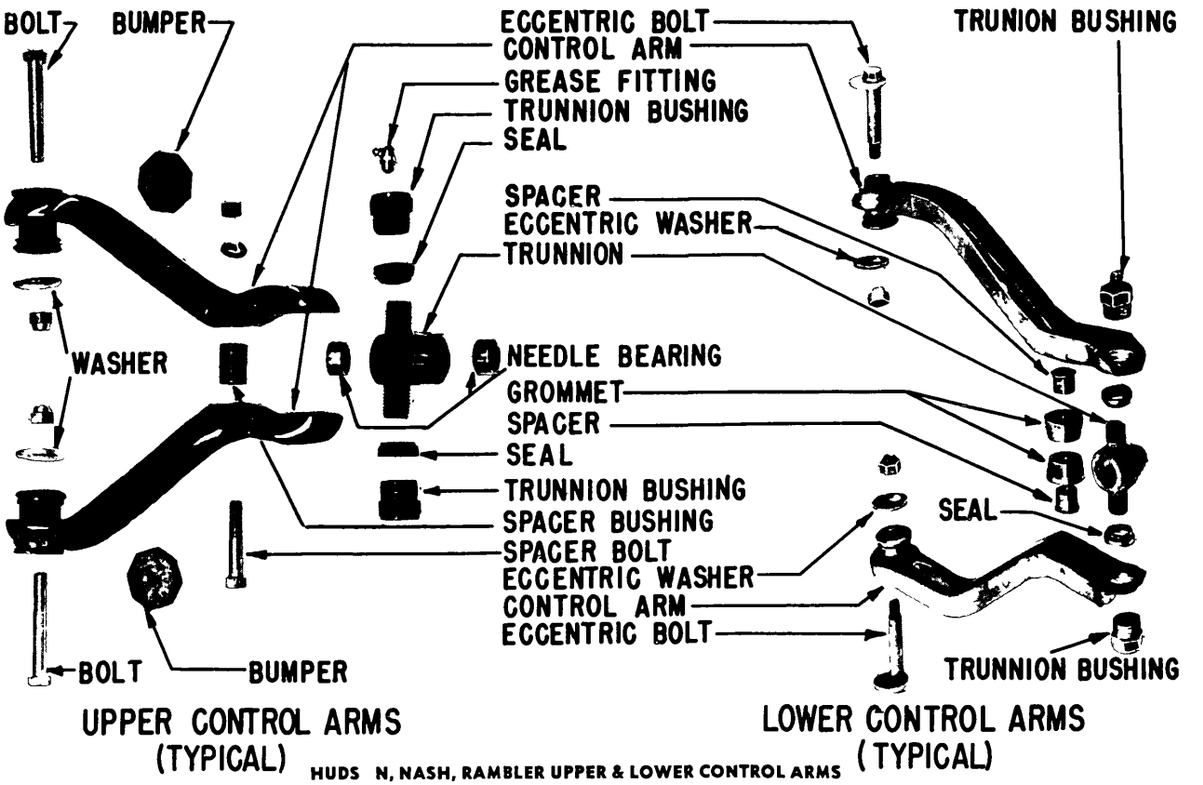
ADJUSTMENT

CHECKING & ADJUSTING: *ADJUSTMENT NOTE - Eccentric bolts used at inner ends of lower control arm for camber and caster adjustment on all models.*

Tir Inflati n: Hudson & Nash - 24 lbs. (front), 20 lbs. (rear). **Rambl r** - 24 lbs. (front & rear).

St ring Axis Inclinati n: 6½° (All Models). Not adjustable.

Cast r: (Exc. Pow r St ring) - 0° to Pos. ½° (Pos. ½° desired). **(Pow r St ring)** - Pos. ½° to Pos. 1° (Pos. 1° desired). *See "Camber & Caster Eccentric Bolt Adjustment" below.*



Camber: Neg. ¼° to Pos. ¼° (0° desired), all models. *Se "Caster & Camber Eccentric Bolt Adjustment" below.*

►*CASTER & CAMBER ECCENTRIC BOLT ADJUSTMENT:* Lower control arm attaching bolts are provided with eccentric washers, one being attached to bolt and the other keyed to threaded end of bolt. Loosening the attaching bolt nut will permit turning the bolts and eccentrics for adjustment of camber and caster. Adjust caster first, using one bolt as necessary, then adjust camber, turning both bolts equally as required.

Toe-In: 1/16" to 3/16". Loosen clamps and rotate adjusting tube on each front wheel tie-rod equally in opposite directions. To adjust steering wheel for correct spoke position after toe-in adjustment, rotate both tubes equally in the same direction.

►*TOE-IN ADJUSTING TUBE CLAMP POSITIONING FOR MAXIMUM CLEARANCE:* **(Series 10 & 20)** - Open end of clamp should be to front and bolt head up. **(Seri s 30)** - Open end of clamp should be down with bolt head

CONTINUED ON NEXT PAGE

HUDSON, NASH, RAMBLER UPPER & LOWER CONTROL ARMS

HUDSON, NASH, RAMBLER (Continued)

to front. **(Series 80)** - Open end of clamp should be to rear with bolt head up.

To -Out on Turns: (Rambler Series 10, 20, & 30). With inner wheel at 25°, outer wheel should be 22°. **(Hudson & Nash Series 80).** With inner wheel at 25°, outer wheel should be 21¾° (with power steering), 20¼° (without power steering). Not adjustable.

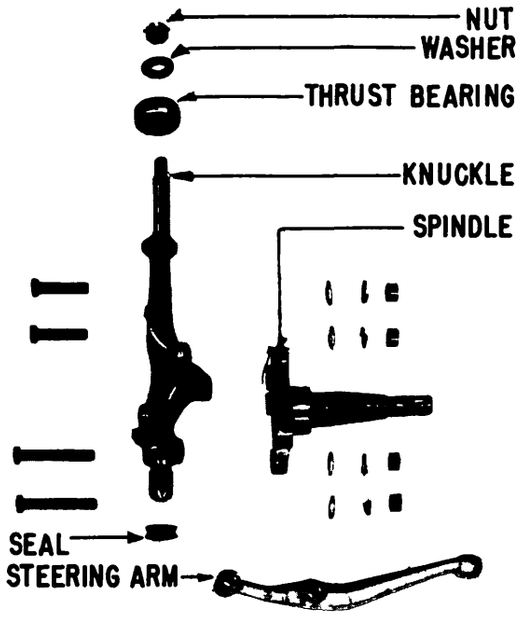
REMOVAL & INSTALLATION

FRONT COIL SPRING: *(NOTE* - Spring seats now have ears at opposite side into which special hooks, Tool No. 3200378 can be installed for spring removal and installation).

R moval: Raise rear of car on side opposite from which spring is to be removed and install hooks, Tool No. 3200378 in holes of ears on spring seats (if necessary, additional compression of spring can be obtained by leaning on front fender over spring). Lower rear of car, then raise front of car with a jack placed under frame at point that will allow wheel and suspension assembly to hang freely. Coil spring, upper and lower spring seats, and insulator can then be lifted out of spring support.

Installation: If original spring is to be installed, reverse removal procedure. If a new spring is to be installed, install upper and lower cushions and spring seats on spring. Align holes in ears on upper and lower spring seats and compress spring in an arbor press to a point where hooks can be installed. Install springs on spring support, lower front of car, then raise rear of car at side opposite spring being installed. Remove hooks from spring seats.

Front Coil Spring Application



M del	Part Nos. Right	Left
Series 10 (Std.)	3144874	3147585
Series 10 (Air Cond.)	3147585	3147585
Series 20 & 30 (Std.)	3150589	3150588
Series 20 & 30 (Air Cond.)	3150589	3150589
Series 80 (Synchro-mesh) ①	3150590	3150590
Series 80 (Hydra-Matic) ②	3150591	3150591

① - On Air Conditioned cars use No. 3150591.
② - On Air Conditioned cars use No. 3152622.

UPPER CONTROL ARM: Removal - Remove front coil spring, (see above). Disconnect inner ends of control arm assembly from wheelhouse bracket and remove control arm spacer bolt and spacer. Remove bushings from both sides of trunnion and remove control arms.

Installation: Reverse removal procedure, making sure that trunnion is centered between front and rear control arms.

LOWER CONTROL ARM: Removal - Remove front coil spring (if not previously removed). Disconnect inner ends of control arms by removing eccentric bolts and washers at wheelhouse bracket. Remove shock absorber mounting bolt at lower end and remove spacers and grommets. Remove both trunnion bushings, then remove control arms.

STEERING KNUCKLE ASSEMBLY

Installati n: Reverse removal procedure, making sure that trunnion is centered in lower control arm. Tighten shock absorber mounting bolts to 90-95 ft. lbs. *(CAUTION - The shock absorber mounting bolt is a special heat treated bolt and must not be replaced with a standard bolt).*

► *UPPER & LOWER CONTROL ARM RUBBER BUSHING REPLACEMENT NOTE:* These bushings are not furnished separately. If replacement is necessary, the complete assembly must be installed.

STEERING KNUCKLE: Rem val - Remove wheel and brake drum assembly, then remove brake backing plate. Remove front coil spring (see above). Remove spacer bolt from upper control arm and shock absorber mounting bolt, spacers, and grommets from lower control arm. Remove trunnion bushings from upper and lower trunnions. Remove steering knuckle assembly after disconnecting steering arm.

Disassembly: Remove nut and washer securing spring lower support from knuckle and remove support and thrust bearing. Unscrew lower trunnion from knuckle and remove trunnion seal.

Reassembly: Reverse disassembly procedures and note the following: Screw lower trunnion onto steering knuckle until there is approximately ¼" clearance between shoulder on knuckle and lower trunnion.

Installation: Reverse removal procedure.

OLDSMOBILE

Oldsmobile (1957)

DESCRIPTION: New "Pivot Poise" suspension having ball joints as the connection between upper and lower control arms and the steering knuckle. Front coil springs are mounted between spring seat on lower control arm and spring seat in frame crossmember. Direct acting shock absorbers are mounted within coil springs. Camber and caster adjustment is made by varying the shim pack located between upper control arm inner shaft and mounting bracket on frame crossmember.

ADJUSTMENT

CHECKING & ADJUSTING: Before checking or adjusting front wheel alignment, inflate tires to recommended pressure, check and adjust front wheel bearings, and check front wheel and tire assemblies for runout. Bounce front of car several times and allow it to come to its normal position. Check for erratic shock absorber action.

Tire Inflation: (With Air Conditioning) 24 lbs. (front), 20 lbs. (rear). (All Others) 22 lbs. (front), 20 lbs. (rear).

Steering Axis Inclination: 6° at 0° camber. Not adjustable.

Caster: 0° to Pos. ¾°. Maximum variation between wheels must not exceed ½°. *See "Shimming Procedure" below.*

Camber: Neg. ¾° to Pos. ¾°. Maximum variation between wheels must not exceed ½°. *See "Shimming Procedure" below.*

T -In: 1/16" to 1/8". To adjust, loosen clamp bolts at each end of steering tie rod adjustable sleeves. With steering wheel set in straight ahead position, rotate sleeves as necessary to obtain correct toe-in. Position tie rod-to-relay rod ball studs to bottom of slot in relay. Position inner clamps so edge of clamp is not adjacent to slot in adjusting sleeve.

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 23° ± ½°. Not adjustable.

Shimming Procedure: Caster and camber adjustments are made by adding or removing shims between upper control arm mounting shaft and frame mounting bracket. To change shims, raise car to remove weight from front wheels. Loosen top and rear fasteners on fender filler plate aprons to gain access to control arm shaft mounting bolts, then loosen the bolts. **Additi n** of shims at **front** bolt, or **removal** of shims at **r ar** bolt, will **incr as positive caster. Removal** of shims at **fr nt** bolt, or **addition** of shims at **rear** bolt, will **d cr as p sitiv caster.** To change camber, add or remove shims of equal thickness at both mounting bolts. **Additi n** of shims at **both** bolts will **increase camb r. R moval** of shims at **both** bolts will **decrease camb r.** See "Shim Selection" table below for approximate amount of change made by adding or removing shims. After shims have been installed or removed as necessary, tighten control arm inner shaft mounting bolts to 85-110 ft. lbs. Check adjustment.

Shim Selecti n Table

Shim Siz	Caster Change (Shim at front b lt)	Camb r Chang (Shim at both b lts)
.020"	3/8°	1/8°
.060"	1 1/8°	3/8°
.120"	2 1/4°	3/4°

(S-M) - Synchro-mesh Trans. **(H-M)** - Hydra-Matic.

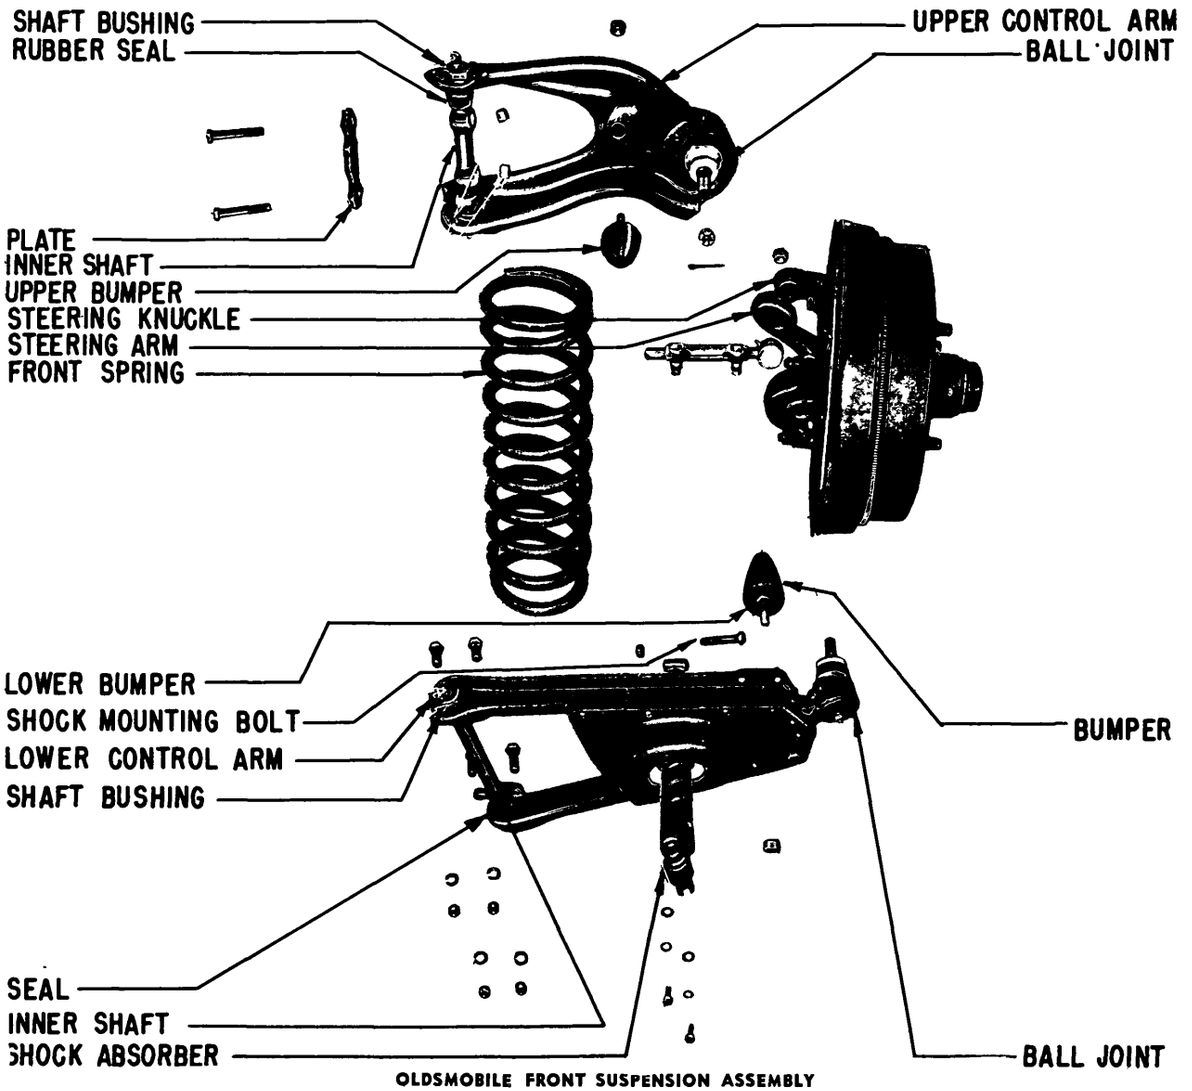
① - Without Air Conditioning.

② - Spring Color Code: No. 568862 (Brown & Blue). No. 568863 (Brown & Red). No. 568864 (Brown & Yellow). No. 568865 (Brown & Gray). No. 569994 (Brown & Green). No. 571096 (Brown & Brown). No. 571065 (Brown & Purple). No. 571067 (Brown & Orange).

► *COLOR CODE NOTE:* Low load range springs are identified by two daubs each color paint. High range are identified by one daub of each color.

► *SPRING REPLACEMENT CAUTION: Both sides of car must have low load range springs or both sides must have high load range springs.*

SHOCK ABSORBER: Upper and lower shock absorber mounting bushings are integral with the shock, and, if replacement is necessary, the complete shock absorber assembly must be replaced.



R m val: Remove pivot bolt from upper end of shock absorber, then remove capscrews and lockwashers attaching shock to lower control arm. Remove shock absorber out through lower control arm spring seat.

Installati n: Reverse removal procedure. Tighten pivot bolt to 60-70 ft. lbs. and capscrews at lower end to 15-25 ft. lbs.

STABILIZER: R m val - Disconnect each side of stabilizer linkage by removing nut from top of link bolt; pull out bolt from bottom of linkage, and remove retainer, grommets, and linkage. Remove stabilizer bracket-to-frame bolts and remove stabilizer bar, rubber bushings, and brackets.

Installati n: Reverse removal procedure and note the following: Rubber bushings should be positioned squarely in brackets. Tighten stabilizer link nut to 8-18 ft. lbs., and bracket bolts to 25-35 ft. lbs.

UPPER CONTROL ARM ASSEMBLY: Removal - Raise front of car and support lower control arm with jack stands, placing the stands between lower spring seats and ball joints. Remove front wheel and loosen upper control arm ball joint from steering knuckle *(see "Ball Joints" below).* Remove ball joint stud and pull stud free of knuckle. Support hub and drum assembly to prevent weight damaging brake hose *(NOTE* - If inner control arm shaft is to be removed, loosen shaft bushings at this time). Remove inner control arm shaft-to-frame attaching bolts, nut, lock plate, and wheel alignment shims (retain shim pack found at each bolt so it may be replaced in the same location). Remove arm assembly and inner shaft from car.

OLDSMOBILE FRONT SUSPENSION ASSEMBLY

Disass mbly: *(NOTE* - The ball joint assembly is riveted to control arm and should not be removed. If necessary to replace either the control arm or ball joint, the entire assembly should be replaced). Remove control arm inner shaft bushings and shaft from control arm.

R ass mbly: Apply chassis lubricant to threads of inner shaft and install rubber seals. Position inner shaft in control arm and, while holding shaft centered, start bushing on shaft and into arms. Tighten bushings until they are solidly seated. Rotate inner shaft so that shaft bolt holes are centralized in control arm (centerline of bolt hole should be approximately 1 11/16" from edge of boss on arm).

Installation: Install control arm inner shaft on frame and install attaching bolts, nuts, and lock plate with the original alignment shims installed between inner shaft and mounting bracket on frame. Tighten nuts to 100-110 ft. lbs. Remove temporary support from hub and drum assembly, then connect ball joint to steering knuckle.

CONTINUED ON NEXT PAGE

OLDSMOBILE (C nt.)

Tighten ball joint stud nut to 40 ft. lbs. (minimum) and install cotter pin (tighten nut further as necessary to install cotter pin). Install wheel and lower car. Check alignment and adjust if necessary.

LOWER CONTROL ARM ASSEMBLY: *(NOTE* - If ball joint is suspected of being worn, check by attempting to chuck top of wheel in and out with weight of car on wheels. Under other conditions the lower ball joint will appear to be worn regardless of its actual condition).

Removal: Raise front of car and support with floor stands. Remove wheel assembly and disconnect stabilizer bar from lower control arm. Remove shock absorber (see above). Install Tool 6509 in shock absorber mounting hole in spring seat. Raise floor jack until it supports lower control arm between spring seat and ball joint. Remove lower ball joint from control arm *(see "Ball Joints" below).* Slowly lower floor jack until spring is fully extended and remove spring. Remove control arm inner shaft-to-crossmember attaching bolts and remove assembly from car.

Disassembly: *(NOTE* - The ball joint assembly is riveted to control arm and should not be removed. If necessary to replace either the control arm or ball joint, the entire assembly should be replaced). Remove inner shaft bushings and shaft from control arm assembly.

R assembly: *(NOTE* - If a new lower control arm is to be installed, the bushings must cut their own thread in the new arm. To prevent arms from moving inward during bushing installation, Tool J-1052 must be installed between front and rear arms until distance between inner surfaces of inner ends of control arm assembly is 11½". If the old arm is to be installed it will not be necessary to use expander tool). Apply chassis lubricant to inner shaft threads and install rubber seals on shaft. Position inner shaft in control arm, and while holding shaft centered, start bushings on shaft and into arms. *(NOTE* - If threads are being cut in new control arm assembly, apply white lead to bushing). Tighten bushings until they are solidly seated against shoulder. If expander used, remove it from the assembly and rotate shaft so bolt holes are centralized in control arm (centerline of bolt holes should be approximately 1½" from edge of bushing boss on arm).

Installation: Connect control arm inner shaft to frame crossmember and tighten attaching bolts to 65-75 ft. lbs. *(CAUTION - Right and left coil springs are not interchangeable. See "Spring Application" above).* Tape spring rubber insulator to top of coil spring *(NOTE* - Top of spring is identified by a flat coil which will allow insulator to seat squarely). While holding spring and insulator against pilot in frame crossmember, tilt spring so it will pilot over Tool 6509 in lower control arm. Rotate spring so the end of bottom coil will index with edge of hole in control arm spring seat (the coil should not cover any portion of hole). Position floor jack between spring seat and ball joint. Chain upper control arm to base of jack. Raise lower control arm until ball joint is tight in steering knuckle. Install ball joint stud nut and tighten to 40 ft. lbs. (minimum) and install cotter pin (tighten nut further as necessary to install cotter pin). *(NOTE - A screwdriver slot is provided in ball joint stud to prevent stud turning when tightening nut).* Remove Tool 6509 and install shock absorber. Connect stabilizer to lower control arm and install wheel and tire. Check front end alignment.

BALL JOINTS: *(NOTE* - Ball joints are riveted to control arms and should not be removed).

Removal (From Steering Knuckle): Raise front of car and place jack stands under lower control arm at a point between spring seat and ball joints. Proceed as follows:

Upper Ball Joint - Loosen ball joint stud nut a few turns, then install Removing Tool 6446 with hollow end of tool positioned over lower ball joint stud nut. Rotate screw on tool and press ball joint loose from steering knuckle. Remove tool and ball joint stud nut.

Lower Ball Joint - Loosen ball joint stud nut a few turns, then proceed as for upper ball joint (above), reversing the tool position.

STEERING KNUCKLE: Removal - Raise front of car and place jack stands under lower control arm at a point between lower spring seat and ball joint. Remove wheel and drum assembly. Remove brake backing plate without disconnecting brake hose. Leave plain arm connected to tie rod end. *(NOTE* - Support backing plate to avoid damage to brake hose). Remove cotter pin from upper ball joint, then remove upper and lower ball joints *(see "Ball Joints" above).*

Installation: Connect lower ball joint to steering knuckle and tighten stud nut to 40 ft. lbs. minimum (tighten further as necessary to install cotter pin). Repeat this procedure with upper ball joint. Install brake backing plate and plain arm to steering knuckle and tighten bolts to 55-60 ft. lbs. Install wheel and drum assembly. Lower car to floor and check front end alignment.

STUDEBAKER & PACKARD

Studebaker, All Models (1957)
Packard Clipper (1957)
Golden Hawk (1957)

DESCRIPTION: Suspension design is the same as used on previous Studebaker models with the exception that front coil springs used on sedan models are the "variable rate" type having the coils closer together at upper end. Control arm outer pivot pin is eccentric and caster and camber adjustments are made at this point.

ADJUSTMENT

CHECKING & ADJUSTING: Before checking or adjusting front wheel alignment, inflate tires to correct pressure, check adjustment of front wheel bearings and check steering gear and linkage for excessive looseness. Make the necessary corrections.

Tire Inflation: (Exc. Sta. Wgn.) - 24 lbs. (front), 20 lbs. (rear). **(Station Wagon)** - 24 lbs. (front & rear).

Kingpin Inclination: 6° at 0° camber. Not adjustable.

Caster: Neg. 1° to Neg. 2½° with not more than ¾° variation between wheels. *(NOTE - Adjust caster before making camber adjustment).* To adjust caster, loosen king pin clamp bolt, then remove lubrication fitting from rear bushing at upper control arm outer pin. Insert an Allen Wrench into pin and turn it until proper caster is obtained (a full turn will change caster ½°).

Camber: 0° to Pos. 1° (½° greater camber is desired on left side). To adjust camber (after caster adjustment completed), turn outer pivot pin using an Allen Wrench to obtain desired setting. *(NOTE - ½ turn of the pin covers entire range of camber adjustment).* Tighten clamp bolt and install lubrication fitting.

Toe-In: 1/16" to 1/8". Adjust as follows: With steering gear cam lever shaft on high spot of cam (steering wheel spoke straight down) and left front wheel in straight ahead position (adjust left hand tie rod to bring wheel into straight ahead position if necessary), adjust **right hand** tie rod to obtain desired setting.

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 22½° to 23½°. Not adjustable.

REMOVAL & INSTALLATION

STABILIZER SHAFT: Removal - Remove capscrews holding shaft to lower control arms and pull down and outward to free shaft clips from slots in control arms. To remove shaft bushings and brackets, locate split in bushing, then spread and remove bushings and brackets from shaft.

Installation: Spread bushings and install them on stabilizer shaft. When installing stabilizer shaft, place shaft in position against control arms with bracket clips in slots in control arms. Using a pipe wrench, pull lower end of bracket under control arm, align hole in bracket with hole in lower control arm, install attaching screw, lockwasher, and nut. Install the remaining brackets in the same manner.

FRONT COIL SPRING: Removal - Raise car and support it with stands under frame just to rear of engine rear support crossmember (be sure car is high enough for lower control arm to clear floor when released). Place a roller jack under center of lower control arm inner shaft and raise jack so it just contacts shaft. Remove front shock absorber (see below), and disconnect stabilizer shaft from control arm. Remove the inner shaft-to-crossmember retaining bolts, then release jack slowly, and lower control arm until spring is unloaded. Remove jack and swing control arm outward, lifting spring off its seat on control arm. Remove lower rubber spring pad from control arm.

Installation: Place shock absorber mounting bolt in position on lower control arm, then place lower spring pad on spring seat. Position spring on upper spring seat, and while holding spring so that it remains seated, swing control arm inward, seating spring on control arm seat. Position roller jack under center of inner shaft and slowly lift jack to compress spring. Align holes in inner shaft and holes in crossmember flange with a drift pin, and continue to lift inner shaft until attaching bolts can be installed. Tighten bolts to 32-37 ft. lbs.

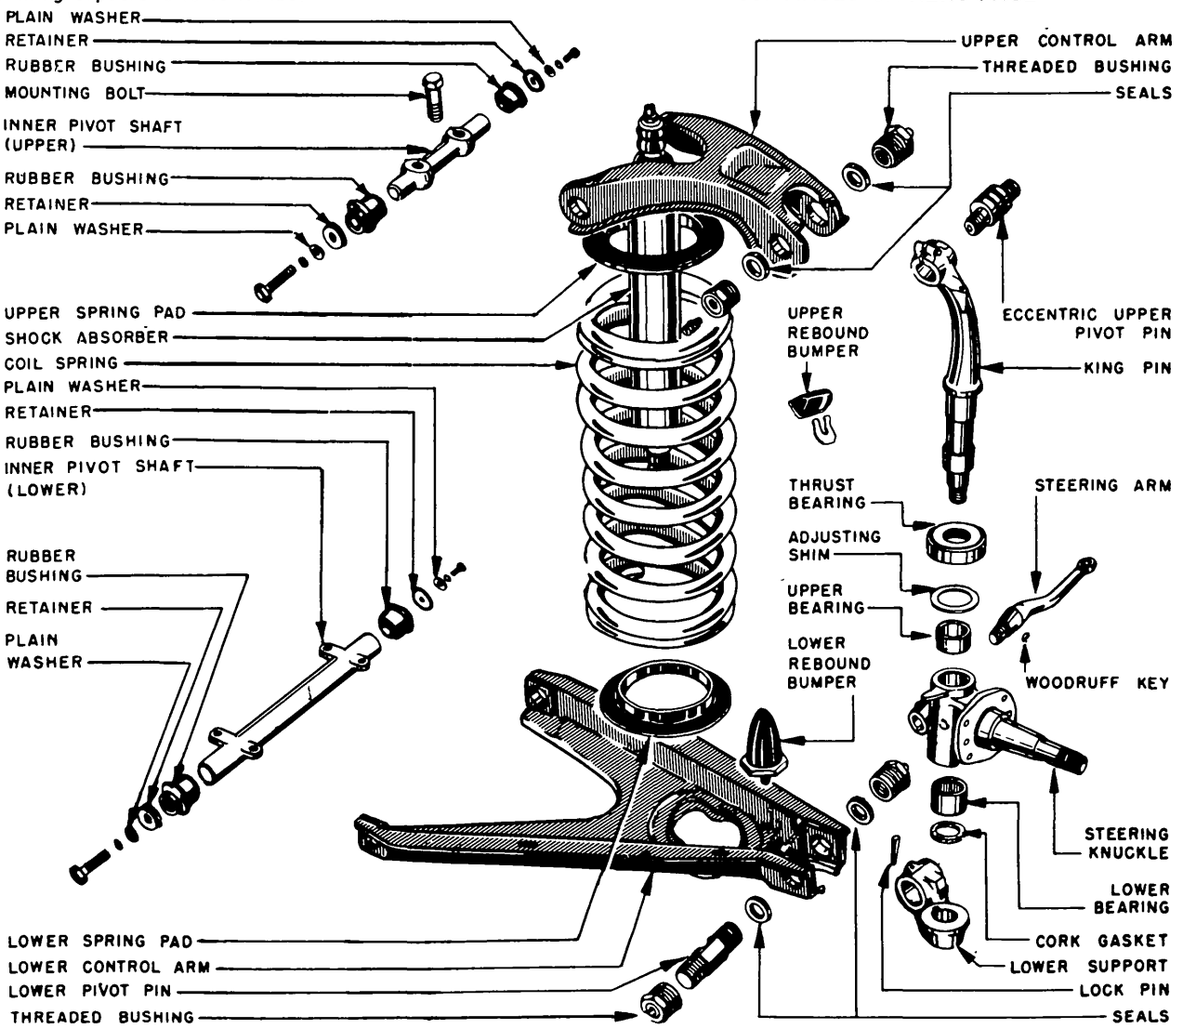
Model (Golden Hawk)	**Part No.**
Hard Top	1539501
Model (Packard Clipper)	**Part No.**
Sedan	1541867
Station Wagon	526130
Heavy Duty (Exc. Station Wagon)	526130

LOWER CONTROL ARM: Removal - Remove front coil spring (see above), and front wheel assembly. Remove threaded bushings from outer end of control arm and remove tapered lock pin through outer pin by driving it upward with a pin punch. Using a brass drift, drive outer pin out of steering knuckle support and remove control arm.

Disassembly: To remove rubber bushings from control arms, place Tool J-5472-4 over one insulator and screw the ½" x 2½" capscrew into other end of shaft. Turn inner shaft on control arm so that lugs on shaft contact outer shell of lower insulator, and install Tool J-5472-6 to prevent distortion of control arm. Using an arbor press, move inner shaft down so that lugs on shaft contact outer shell of lower insulator. Continue to press until outer shell is flush with flange on control arm. Place control arm in a vise, gripping near the partly removed insulator, and knock the insulator the rest of the way out with a hammer and blunt chisel. Remove capscrew from inner shaft and install it in other end of shaft, then using the same tools as for opposite end, remove second bushing in same manner.



Reassembly: Insert one end of inner shaft in one arm of lower control arm, then install opposite end in other arm. Place Tool J-5472-6 in position between ends of control arm. Start rubber bushings in holes at either end of control arm, then place Tool J-5472-1 in position on each bushing, and using an arbor press, force both bushings in place until shoulder on outer sleeve of bushing is seated against control arm *(CAUTION - Do not attempt to seat flange of bushing on control arm).* Install bushing caps, flat washers, lockwashers, and capscrews *(NOTE* - Tighten these capscrews to 65 ft. lbs. after control arm has been installed on car and weight of car is on springs).

Installation: *(NOTE - Outer ends of lower control arm must be spread .015" before installing outer pin and thread d bushings. Determine this dimension by adjusting calipers to fit over outer end of control arm adjacent to bushing holes with a .015" feeler gauge inserted between outside surface of control arm and one prong of calipers).* After setting calipers, position outer end of lower control arm at lower steering knuckle support and install the outer pin, with a grease seal on pin on each side of steering knuckle support. Using a screwdriver in slot provided in end of outer pin, turn pin and align slot at center of outer pin and hole of lower knuckle support and install lock pin. Install spreader Tool J-2044 between inner surfaces of outer ends and spread the outer ends until the outside dimension is equal to caliper setting. Centralize outer end of control arm on outer pin, then install bushings and tighten to 170 ft. lbs. minimum. Remove spreader tool and make sure control arm turns freely on outer pin. Complete installation by installing coil spring (see above). *NOTE - If new bushings have been installed on inner shaft, tighten retaining capscrews to 65 ft. lbs.*

UPPER CONTROL ARM: Rem val - Raise and support car at outer end of lower control arm. Remove front wheel assembly. Remove threaded bushings from upper control arm outer pin. Mark top front of inner shaft so that it can be installed in the same position *(CAUTION - Holes in control arm inner shaft are drilled off shaft centerline and turning the shaft over will change camber setting).* Remove bolts and nuts retaining inner shaft to frame bracket (be careful not to drop bolts or nuts into front crossmember). Shift upper control arm to one side, turn the arm and lift it off end of pin, then remove arm by slipping it off other end of pin.

Disassembly: Install Tool J-5472-25 on inner shaft and insert the two short capscrews through tool and inner shaft, then install the two nuts to hold tool in position. Insert Tool J-5472-5 between inner surfaces of control

CONTINUED ON NEXT PAGE

STUDEBAKER & PACKARD FRONT SUSPENSION ASSEMBLY

STUDEBAKER & PACKARD (C ntinu d)

arms adjacent to inner shaft holes. Thread a 3/8" x 2½" capscrew into end of inner shaft and install the complete assembly in an arbor press so one end of inner shaft rests on Tool J-5472-3. Press on capscrew in end of inner shaft until Tool J-5472-25 has pushed shell of bushing to a flush position. Invert control arm in press and put capscrew in other end of shaft, then press second bushing to a flush position. Remove control arm from press and knock the bushings out the rest of the way with a hammer and blunt chisel.

R assembly: Insert one end of inner shaft in one arm of lower control arm, then install opposite end in other arm. Place Tool J-5472-5 in position between ends of control arm. Start a rubber bushing in each hole at end of control arm, then place Tool J-5472-2 in position on each bushing, force bushing into place using an arbor press, until shoulder on outer sleeve of bushing is seated in control arm. Install bushing cap, washer, lockwasher, and capscrews. *(NOTE* - Tighten these capscrews to 32-37 ft. lbs. after control arm has been installed on car and weight of car is on springs).

Installation: Place one side of outer end of control arm over one end of outer pin and install opposite side of control arm on outer pin. With marked side of inner shaft up, align holes in inner shaft and holes in frame bracket, and install retaining bolts. washers, and nuts. *(NOTE - Outer ends of upper control arm must be spread .015" before installing outer pin and threaded bushings. Determine this dimension by adjusting a pair of calipers to fit over outer end of control arm adjacent to bushing hol s, with a .015" feeler gauge inserter between outside surface of control arm and one prong of calipers).* Install spreader Tool J-2044 and spread ends of control arm to setting of caliper. Start bushings on ends of outer pin, then center end of kingpin in control arm. With spreader still in place, start bushings and tighten to 170 ft. lbs. minimum. Remove spreader and install wheel assembly. Check and adjust front end alignment.

STEERING KNUCKLE: Removal - Raise car and support it at outer end of lower control arm. Remove wheel, hub, and drum assembly. Remove brake backing plate assembly from steering knuckle flange without disconnecting brake hose and suspend the assembly in an out of way place (do not allow assembly to hang on hose). Disconnect tie rod from steering knuckle arm. Remove cotter pin and kingpin retaining nut, then using a lead mallet, drive kingpin upward out of lower support. Remove upper control arm outer pin bushings and remove kingpin and steering knuckle assembly from outer pin.

Disassembly: Remove Woodruff key from kingpin, then remove steering knuckle, shim, and thrust bearing. Remove cork gasket from bottom end of knuckle. To remove steering knuckle bushing, invert steering knuckle and place Tool J-1294-9 on inner end of bushing. Insert Pilot Tool J-1294-4 in bearing end of knuckle, and using the arbor, Tool J-1294-A, press bushing out of knuckle. To remove needle bearing, place Tool J-1294-9 on inner end of bearing, and place Pilot Tool J-1294-4 in bushing end. Using the arbor, Tool J-1294-A, press needle bearing out of knuckle. *NOTE - To r mov kingpin lower support from lower control arm out r end, see "Lower Control Arm" above*

R ass mbly: To install bushing, place pilot, Tool J-1294-6, over the arbor with wide shoulder of pilot against shoulder of arbor. Place a new bushing on pilot, then insert pilot, Tool J-1294-4 in bearing end of knuckle. Press bushing in until pilot, Tool J-1294-6, stops against knuckle (bushing will be exposed approximately 1/16"). Remove arbor, reverse Tool J-1294-6, and press bushing in until pilot stops against knuckle. To install needle bearing in knuckle, place pilot, Tool J-1294-4, on arbor, Tool J-1294-A, so that wide shoulder of pilot is against shoulder of arbor. Place the bearing on pilot, Tool J-1294-4, so that lettered end of bearing is against shoulder of pilot, Insert pilot, Tool J-1294-6, in bushing bore. Insert the arbor in bearing end of knuckle and press bearing in until pilot, Tool J-1294-4, stops against knuckle. Bearing will then be recessed in knuckle leaving a space for the cork gasket.

Steering Knuckle Endplay Adjustment - Place kingpin in a vise and install steering knuckle on kingpin without the cork gasket (normally installed in bottom of knuckle). Install the thrust bearing and shims on kingpin, then insert a .003-.006" feeler gauge between shoulder of kingpin and steering knuckle. Place a straightedge across top surface of thrust bearing and lower shoulder of kingpin and press down on thrust bearing. If surface of the thrust bearing is not flush with shoulder of kingpin, remove or add shims as required.

Installation: Install upper control arm outer pin *(see "Upper Control Arm" above).* Place thrust bearing, shim, and steering knuckle on kingpin, making sure that shim is located between thrust bearing and steering knuckle. Install Woodruff key in kingpin, then start lower end of kingpin in through support far enough to allow installation of kingpin retaining nut, and tighten nut, drawing the kingpin through the support. Install cotter pin. Install brake backing plate assembly and wheel and drum assembly. Check and adjust front end alignment, then tighten kingpin upper retaining nut.

PONTIAC

Pontiac (1957)

DESCRIPTION: Same design as used on previous models. An eccentric bushing at outer end of upper control arm controls camber and caster adjustments.

ADJUSTMENTS & PARTS REPLACEMENT: *See 1954 Annual Data or later Manual edition and note:*

Kingpin Inclination: 1°20'. Not adjustable.

Caster: Neg. 1° ± ½°. *(NOTE - Adjust caster before camber adjustment is made).* Loosen eccentric bushing clamp in upper control arm and turn bushing with Camber & Caster Adjusting Wrench J-5343 to obtain correct caster. Tighten clamp bolt only enough to prevent setting from changing. *NOTE* - If camber was found to be within specifications, turn eccentric bushing in complete turns only so that camber setting will not be disturbed.

Camber: Pos. ½° ± ½°. Loosen clamp bolt and turn bushing, using the same wrench as used for caster adjustment, to obtain correct setting *(NOTE* - It is not necessary to turn bushing more than ½ turn to obtain maximum adjustment of camber). Tighten eccentric bushing clamp bolt to 30-45 ft. lbs.

Toe-In: 0-1/16" (measured 9" from floor). Adjust by turning tie rod tubes an equal amount (in opposite directions) to obtain correct setting. *(NOTE* - Steering gear must be on high point of worm when making adjustment to insure correct position of steering wheel. Adjust wheels for straight ahead position by turning both tie rod tubes equally in the same direction as necessary).

Toe-Out on Turns: With right wheel turned 20° to right, left wheel should be turned 18° to 19° Not adjustable.

SHOCK ABSORBER REPLACEMENT: Shocks are removed from above upper control arm. Raise car so weight is off front wheels, then remove nut from bottom stud on shock absorber (hold shock with a pair of water pump pliers inserted through coil spring, to prevent shock turning). Remove grommet and retainer and compress shock as far as possible by pushing lower section upward. Remove nuts holding shock bracket to frame (on left side of car, remove shock from bracket). Shock can be removed through frame above upper control arm. Reverse disassembly procedure to install shock.

COIL SPRING REPLACEMENT: Raise front of car until wheels are 10" off floor, then place jack stands under frame side rails at a point forward of front door hinge pillar. Place another jack stand under lower control arm of spring which is not being removed. Place a floor jack under lower control arm spring seat from which spring is to be removed and raise jack until it touches spring seat. Remove wheel, and then remove shock absorber (see above). Disconnect lower end of stabilizer link at lower control arm. Remove lower pivot pin from bushing, then slowly lower jack until coil spring is fully extended, then remove spring. To install spring, place jack under spring seat, then place coil spring in seat on lower control arm with end of coil at bottom of spring indexing with hole in spring seat *(NOTE* - Top of spring is identified by a flat surface on coil). Raise jack gradually until lower arm is in position. Complete installation by reversing removal procedure

FRONT TRIM HEIGHT: Check distance between top of lower control arm to underside of frame at a point directly in line with front of shock absorber. The measurement on both sides must be approximately the same.

1957 STEERING LINKAGE

MANUAL STEERING GEAR TYPE

STEERING LINKAGE & ADJUSTMENT: Special linkage and adjustment on cars and trucks as follows:

Buick: Linkage—Consists of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each wheel. Adjustable sleeves provided at end of each tie rod for toe-in adjustment.

Toe-In Adjustment—Turn steering wheel until lower spoke is vertical, with front wheels in straight-ahead position. Measure horizontal distance from near edge of front boss of lower control arm shaft to front edge of brake backing plate, on each side. Adjust tie rods, if necessary, to make measurements equal on both sides. To adjust toe-in, loosen clamp bolts and turn adjusting sleeves at tie rod ends as required. Decrease toe-in by turning left sleeve in same direction as wheel rotation when moving forward and turn right sleeve in opposite direction. To increase toe-in reverse direction of sleeve movement given above. *CAUTION*—Right and left sleeves must be turned equal amounts but in opposite directions when changing toe-in, in order not to disturb straight-ahead position of front wheels. Before tightening sleeve clamps, have slots in sleeve and clamps aligned.

Idler Lever & Support Adjustment—In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 2 21/32" to 2 3/4".

Intermediate Rod End Plug Adjustment—On idler lever end of rod, turn end plug up tight then back off 1/4-1/2 turn (1/2 turn preferred) and install cotter pin. On pitman arm end of rod, tighten end plug to 20-25 ft. lbs. torque, then back off 1 7/8—2 1/8 turns and install cotter pin.

Cadillac: Linkage—Consists of a drag link between steering gear pitman arm and idler arm mounted on right frame side rail, and individual tie rods between drag link and each wheel. Adjustable sleeves provided at outside ends of tie rods for toe-in adjustment.

Toe-In Adjustment—Loosen clamp screws on adjusting sleeves. Turning adjusting sleeves in direction of forward wheel rotation decreases toe-in. Turn sleeves equal amounts so that relation of steering gear high spot to straight-ahead position of front wheels will not be changed. When tightening clamp screws, be sure open side of clamp is over open side of adjusting sleeve.

Drag Link Adjustment—Place straight bar across two adjustable jacks, directly below drag link. Adjust height of jacks so that distance from top of bar to flat spot on frame is equal on both sides (Adjusting jacks to even number of inches will facilitate measurements). Measure distance from top of bar to bottom of drag link on both sides. Difference in measurement between 1st measurement (top of bar to flat spot on frame) and 2nd measurement (top of bar to bottom of drag link) should be 4½" and equal at both ends of drag link within 1/8" (DRAG LINK MUST BE PARALLEL TO FRAME WITHIN 1/8"). If idler arm end of drag link not within limits, remove idler arm support mounting screws on frame side bar, and screw idler arm in or out of bushing until correct height obtained. *(CAUTION*—When turning idler arm into bushing to raise drag link, be sure idler arm is at least 1/2 turn off base to prevent interference on turns. When turning idler arm out of bushing, do not unscrew more than 2 1/2 turns from base or excessive play will result). If proper height cannot be obtained with this adjustment, replace idler arm. If pitman arm end of drag link is not within limits, pitman arm must be removed and bent as required.

Drag Link Plug Adjustments—Install end plug in pitman arm end of drag link and adjust by turning down tight and backing plug off 1/4 to 1/2 turn. Install cotter pin. Install right end plug and adjust by turning down tight and backing off 1/4 to 1/2 turn. Install cotter pin.

Idler Arm Support Adjustment—Turn idler arm support with seal into idler arm bushing until it bottoms, and then back off 1/2 to 1 1/2 turns depending on position of bushing in idler arm.

Chevrolet Passenger Cars: Linkage—Consists of steering connecting rod between pitman arm and idler arm, bracketed on right frame side rail, and individual adjustable tie rods between steering connecting rod and each front wheel. Tie rods have adjusting sleeves at outer ends for making toe-in adjustment.

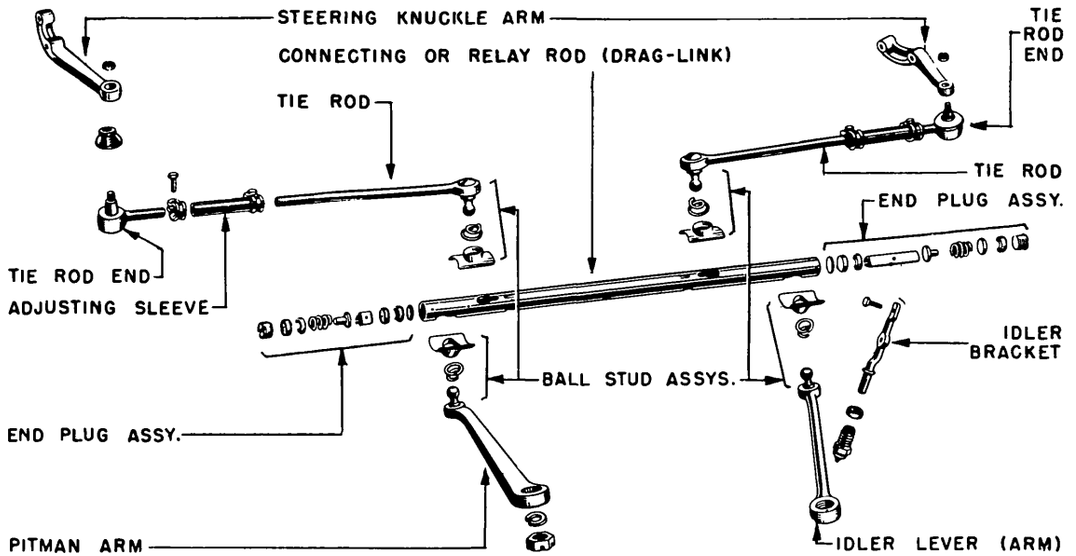
Toe-In Adjustment—Set steering gear on high point of worm, with mark on top end of steering mainshaft in

CONTINUED ON NEXT PAGE

MANUAL STEERING GEAR TYPE (C ntinu d)

vertical position and steering wheel positioned for straight ahead driving. Loosen clamp bolt at each end of each tie rod and adjust them individually for desired toe-in. Position tie rod clamp bosses below the tie rod to avoid frame interference, and tighten clamps securely.

Steering Connecting Rod Adjustment - If wheels not in straight-ahead position with steering gear on high point, set front wheels in straight-ahead position (can be checked by measuring distance between lubrication fitting on lower control arm shaft and the wheel fellow on each side). Remove ornamental cap or horn button and check position of mark on end of worm shaft designating gear high point (mark should be at top of shaft). If gear has been moved off high point when setting wheels in straight-ahead position, loosen adjusting sleeve clamps on both left and right hand tie rods, then turn each sleeve an equal amount in same direction to bring gear back to high point. *CAUTION* - Turning sleeves an unequal amount or in different directions will disturb toe-in.



Idler Arm Bushing Replacement - Remove relay rod from idler arm bracket. Press out old bushing, press in new bushing. Install idler arm over idler arm bracket and install nut but do not tighten. Install relay rod to idler arm and do not tighten. Place wheels in straight ahead position and steering gear on high point, then tighten idler arm nut and relay rod nut to 70 ft. lbs. Advance nuts to align castellations and insert pins.

Ch vr let Trucks: Linkage - Consists of three-piece tie rod (rod and two tie rod end assemblies) between front wheels. Tie rod end assemblies have right and left hand threads to facilitate toe-in adjustment. A connecting rod, between steering third arm (on left wheel) and pitman arm, has permanently installed studs in ends. Ends of studs are threaded and are attached to steering third arm and pitman arm with a nut and cotter pin.

T e-In Adjustment - Loosen clamp at each end of tie rod and turn tie rod to increase or decrease its length until proper toe-in is secured. Before locking clamps, be sure tie rod ends are in alignment with studs.

Chrysler, De Soto, Dodge, Plymouth (All): Linkage - Consists of idler arm bracketed to right frame side member and connected to right end of drag link. Pitman arm is connected to left end of drag link. Individual tie rods, connected to drag link near its center, have sleeve adjustment for toe-in at outside ends.

T -in Adjustment - Spin wheels and scribe thin line in center of each tire tread. Place wheels in straight ahead position. Measure distance at hub height between scribed line at both front and rear of tires. There should be less distance (See Toe-In Specifications) at front than at rear measurement. Adjust end of each tie rod an equal amount to correct toe-in and maintain wheels in straight ahead position when steering wheel is centered. With toe-in adjustment set correct, position ends of tie rods in the sockets so both studs are against either the front or back sides of sockets, then tighten clamp bolts to 10-15 ft. lbs. *NOTE* - Steering wheel hub, steering gear arm, steering tube, and steering gear sector shaft are machined with master serrations for a definate location. No attempt should be made to change relative positions of these parts by altering master serration. Improper positioning of steering wheel should be corrected only by adjustment of tie rods.

CADILLAC, CHEVROLET, OLDSMOBILE, PONTIAC STEERING LINKAGE—TYPICAL OF BUICK

Idler Arm Bushing Replacement - Idler arm with bushing is serviced only as an assembly. When bushing worn replace assembly. Opening in Idler Arm Bracket between Idler Arm Bushing positions or contact points should be 2¼". Bend bracket to correct.

Ford Passenger Cars: Linkage - Consists of steering arm-to-idler arm rod which transmits motion from steering gear through pitman arm, attached to left end of steering arm-to-idler arm rod, to front wheels through spindle connecting rods (tie rods). Spindle connecting rods have adjustable sleeves on outside ends for toe-in adjustment. Idler arm attached to right frame side rail and to right end of steering arm-to-idler arm rod.

Toe-In Adjustment - Drive car straight ahead to establish front wheel straight ahead position. Scribe chalk mark on steering wheel hub and steering column. Lower spoke of steering wheel should be pointed at bottom center. To correct toe-in when spoke is centered, loosen both clamp bolts on each tie rod and lengthen or shorten both tie rods an equal amount. If lower spoke is not at lower center position proceed as follows: **(1)** When spoke is left of bottom center, turn both tie rod sleeves upward, when toe-in is correct to correct center position of spoke, or lengthen left hand tie rod to increase toe-in or shorten right hand tie rod to decrease toe-in. **(2)** When spoke is to right of bottom center, turn both tie rod ends downward when toe-in is correct to correct spoke position or shorten left hand tie rod to decrease toe-in or lengthen right hand tie rod to increase toe-in.

Idler Arm & Bushing Replac m nt - Remove bracket from frame side member, then remove bracket and rear bushing from the idler arm. Remove idler arm from bushing in steering arm to idler arm rod, then remove seals from both ends of idler arm. Remove bushings from idler arm bracket and steering arm to idler arm rod. Replace bracket if cracked or bent. DO NOT STRAIGHTEN IDLER ARM BRACKET. Install new bushings in steering arm to idler arm rod and idler arm bracket and tighten bushings to 85-100 ft. lbs. Install new seals at both ends of idler arm, then thread arm into bushing in steering arm to idler arm rod until shoulder on arm is 19/32"±3/64" from top face of rod when arm is in straight ahead position. Thread idler arm bracket and bushing on the arm until shoulder on arm is 19/32"±3/64" below bottom side of bracket when bracket is parallel to frame side member. Install bracket on side member and torque mounting bolts to 28-43 ft. lbs.

Ford Trucks: Linkage - Consists of a connecting rod between front wheels. Rod has adjustable features at both ends. Spindle arm, attached to connecting rod at its left end, is in turn attached to a one-piece drag link with manual adjustment features at both ends. Rear of drag link is attached to sector shaft arm (pitman arm).

Toe-In Adjustment - Loosen clamp nut at each end of connecting rod, turn connecting rod to lengthen or shorten to obtain desired toe-in.

Drag Link Adjustment - Remove cotter pins from each end of drag link. Tighten each drag link plug until drag link ball springs are fully compressed. Back off each plug to first cotter pin hole, then install new cotter pins.

Lincoln & M rcury: Linkag - Consists of steering connecting link between steering gear arm (pitman arm) and idler arm, mounted on right frame side rail, and

CONTINUED ON NEXT PAGE

MANUAL STEERING GEAR TYPE (C ntinu d)

adjustable tie rods between connecting link and each front wheel. Adjustable sleeves provided at outside ends of tie rods for toe-in adjustment.

T -In Adjustment - Loosen clamp bolts on adjustable sleeves. Adjust sleeves equally until proper toe-in obtained.

C nn cting Link Plug Adjustment - Screw plug in left end of connecting link until it bottoms, back off 1½ turns, align cotter pin holes, install cotter pin.

M tr p litan, Huds n & Nash Models: Linkage - Consists of adjustable cross tube (for toe-in adjustment). Idler assembly is attached to body sill at right of car and has a double arm, with front arm attached to cross tube and rear arm attached to right tie rod. Steering gear pitman arm is double-levered, with front lever attached to left of cross tube and rear lever attached to left tie rod. Idler assembly is not adjustable.

T -In Adjustm nt - Loosen locknuts on ends of cross tube, lengthen or shorten cross tube until proper toe-in secured. Tighten locknuts.

Cr ss Tub Plug Adjustment - Remove cotter pin, lightly screw plug in as far as it will go, back off to first cotter pin hole in alignment with castellation.

Huds n, Nash & Rambl r (Exc. Metropolitan): Consists of steering linkage cross tube between steering arm and idler arm, bracketed on frame right side rail. Individual adjustable tie rods are attached to ends of cross tube. Adjusting tubes at outer ends of tie rods provide for toe-in adjustment.

T -In Adjustm nt - Loosen clamps on ends of tubes on tie rods. Turn tubes equally in opposite directions until desired toe-in obtained. Before tightening clamps on adjusting tubes, square ball joints on their studs to prevent excessive steering linkage friction or wear.

Oldsm bil : Linkag - Consists of steering relay rod between pitman arm and idler arm, bracketed to right frame side rail. Individual, adjustable tie rods are attached to center portion of steering relay rod and are provided with adjustable sleeves for toe-in adjustment.

T -In Adjustm nt - Loosen clamp bolts at each end of steering tie rod adjustable sleeves. With steering wheel in straight-ahead position turn tie rod adjusting sleeves to obtain proper toe-in adjustment. Insure that tie rod end ball seats are riding squarely in their seats, then position tie rod to relay rod ball studs to bottom of slot in relay rod. Position clamps on adjusting sleeves so that bolts are below upper surface of adjusting sleeves with edges of clamp **out of slot,** tighten clamp bolts.

R lay R d Plug Adjustment - Draw nut tight, then back off ¼-¾ turn, install cotter pin.

Idler Lever & Support Adjustment - Whenever idler arm is disassembled from idler arm support, reassemble so that there is a dimension of 23/32" between upper face of idler arm and shoulder on support.

Pontiac: Linkage - Consists of steering connecting rod between pitman arm and idler arm, bracketed on right frame side rail, and individual, adjustable tie rods between steering connecting rod and each front wheel. Tie rods have adjusting sleeves at outer ends for making toe-in adjustments.

T -In Adjustm nt - Remove horn button and set gear on high point of worm by turning steering wheel until mark on shaft is exactly at top. Loosen tie rod end clamp bolts and turn tie rod adjusting sleeves equally until desired toe-in is obtained. Turn right tie rod in direction of rotation of wheels to increase toe-in, turn left tie rod in opposite direction of increase toe-in. If front wheels not in straight-ahead position turn both tie rods in same direction (so as not to change toe-in) until error corrected. Tighten clamps on adjusting sleeves with slots in sleeve toward bolts in clamp.

Idler Lever & Support Adjustment - With lever and support off car, thread idle support into bushing until distance between upper face of lever and shoulder on support is approximately 11/16".

Steering Connecting Rod Plug Adjustment - Screw end plugs in until tight, then back off to nearest cotter pin hole alignment and insert new cotter pins.

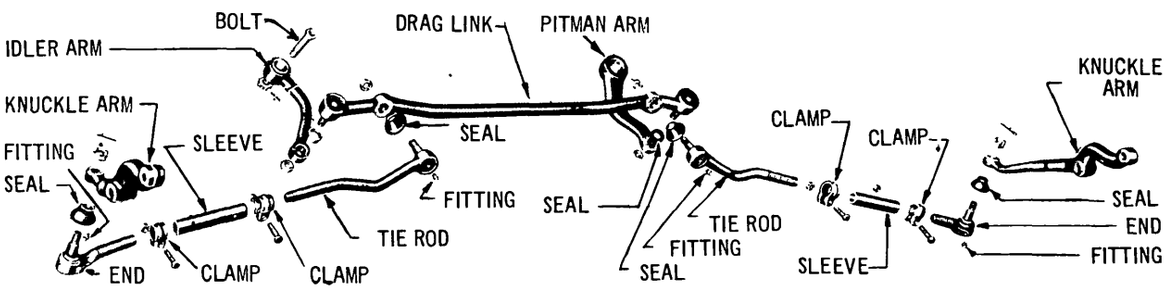
Studebaker & Packard Linkage; Consists of two adjustable tie rods attached to bellcrank mounted at center of frame crossmember. Bellcrank is attached to steering gear pitman arm by a reach rod (drag link).

Toe-In Adjustment - If tie rods disassembled, count number of turns when unscrewing tie rod ends from rod to facilitate reassembly. To adjust toe-in, adjust **right** tie rod (left tie rod on right-hand control cars). When tightened, inner tie rod bolts should be at bottom and horizontal.

Bellcrank Bearing Adjustment - Insert shims between lower thrust washer and shaft until there is no end play. Shaft should, however, turn freely in bearings. Lock nut securely with cotter pin.

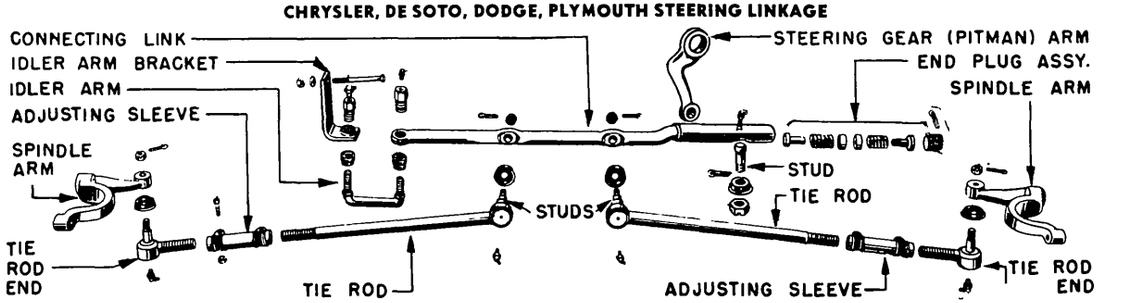
Willys Utility: Linkag - Bellcrank on frame cross member, linked to each front wheel by adjustable tie rods and to steering gear pitman arm by a steering connecting rod (drag link).

Toe-In Adjustment - Set tie rod end of steering bellcrank at right angles to front axle, place straightedge or line against left rear wheel and left front wheel to determine if wheels in straight-ahead position. If front wheel tire does not touch straightedge both at front and rear, adjust left tie rod by loosening clamps on each end and turning tie rod until tire touches straightedge. Check right side in same manner and adjust right tie rod. Adjust toe-in by shortening each tie rod ½ turn.



POWER STEERING TYPE

Steering linkage on cars equipped with power steering is essentially the same as for manual steering except as noted for "linkage" type below:



Bendix Linkage Type (Ford & Mercury): Steering pitman-to-idler arm rod has been revised to accomodate the power cylinder. One end of power cylinder is bracketed to right frame side rail and the other to the steering pitman-to-idler arm rod. Control valve is mounted on right end of steering pitman arm-to-idler arm rod. Rubber bushing assemblies are used at each pivot point.

Chevrolet Linkage Type (Pass. Cars): Power cylinder is connected to steering relay rod and piston rod is connected to bracket on right frame side rail.

Chevrolet Linkage Type (Trucks): Power cylinder is anchored to front axle and piston rod is attached to steering cross rod. Conventional drag link replaced by pitman arm ball stud and adapter rod which includes a control valve.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH STEERING LINKAGE

LINCOLN & MERCURY STEERING LINKAGE—TYPICAL OF FORD

CHRYSLER. DE SOTO, DODGE, PLYMOUTH "CO-AXIAL"

Chrysler. Imperial, De Soto, Dodge, Plymouth (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 CHRYSLER NOISY FAN BELT OPERATION CORRECTION:* This noisy condition may be caused by a stuck flow control valve in the power steering pump. Check pump pressure with engine operating at 1200 RPM. If pressure is greater than 950 lbs., replace the pump. DO NOT attempt to recondition the pump.

►*POWER STEERING PUMP APPLICATION: As follows:*
Chrysler, Imperial, & Plymouth V8 - *See "Thompson (Sleeve Type) Pump".*
DeSoto (Early) & Dodge - *See "Vickers (Three Housing) Pump".*
DeSoto (Late) - *See "Vickers (Two Housing) Pump".*
Plymouth 6 Cyl. - *See "Co-Axial Power Steering" in 1956 Annual Data.*

►*DODGE SELF-STEERING TO RIGHT CORRECTION* Adjust power steering gear control valve. If condition is not corrected, it may be caused by fluid leaking by the valve adjusting rod upper "O" ring seal or the reaction seal. See "Overhaul" below for correction.

►*1957 DESOTO POWER STEERING PUMP PRODUCTION CHANGE:* A new power steering pump, Part No. 182-6158, identified by the convex shape of the pulley, replaces Part No. 1730892, beginning with Car Serial Nos. S-25-55337661, S-26-50399739, S-27-58003300. The new pulley used with the later type pump is not interchangeable with the earlier pump. The later type pump will be furnished for service replacement.

►*PUMP PULLEY LOOSENESS CORRECTION:* If the pump pulley is loose and pulley attaching capscrew is tight, replace the washer with Part No. 567331.

DESCRIPTION: Design is similar to power steering gear used on 1956 models, however, changes have been made in the lower housing, power piston rings and in the worm shaft bearing assemblies. A new "vane type" pump is used on DeSoto & Dodge. and a new "sleeve type" pump used on Chrysler, Imperial, Plymouth V8.

ADJUSTMENT: *(NOTE - Three adjustments as follows, can be made without removing steering gear from the car. Make adjustments in the sequence indicated).* Remove steering wheel (see below), steering column jacket and tube. Remove tube coupling bolt and washer from center of coupling, then using Tool C-3392, remove coupling from worm shaft and remove worm housing seal. Remove steering drag link from steering gear arm. Back off gear lash adjusting screw until lash is maximum. Proceed as follows:

Worm Shaft Bearing Adjustment: Slide Tool C-3320A over adjusting nut, and Tool C-3319 on splines of worm shaft with sufficient space between tools to lift Tool C-3320A off the adjusting nut. Turn steering gear to full left and hold in this position with a ft. lb. torque wrench. Attach torque wrench C-3380 to Tool C-3320A in an "in-line" position *(NOTE - Tool C-3380 is a special inch-pound torque wrench having a special extension adapter).* While holding 5 ft. lbs. tension (toward left), loosen nut with small wrench and then adjust to exactly 5 inch-pounds on Tool C-3380. Remove tools with caution to prevent moving adjusting nut and crimp ring section of adjusting nut into keyway in worm shaft. Install worm housing seal.

Piston Valve Adjustment: Start engine and run at medium idle speed. Allow gear to reach normal operating temperature. Attach a small tap handle to flat on end of Tool C-3445, then insert tool through the worm shaft over end of piston valve rod. With a ft. lb. torque wrench on the steering arm nut, read tension while turning steering gear to full right and left. Wrench movement should be smooth. Turn piston valve in the direction necessary to obtain the same torque reading in both directions. Torque reading must be equal and under 40 ft. lbs. If torque reading is equal at less than 25 ft. lbs., a more accurate reading can be made using a 300 inch-pound torque wrench.

Gear Lash Adjustment: With engine running and steering gear at normal operating temperature, turn steering gear to straight ahead position. Using a very light finger tip touch at end of steering gear arm turn gear shaft adjusting screw clockwise until all gear lash has been eliminated. **Turn adjusting screw ¾ turn tighter (clockwise) and tighten locknut.** Stop engine and install worm housing oil seal (with lip of seal down). With gear still in the straight ahead position, install coupling on worm shaft with slot in an up-and-down position. Install drag link on steering gear arm, then install steering tube, steering wheel, etc.

Pump Drive Belt Adjustment: Adjust as follows:
Chrysler & Imperial (Early Cars) - Loosen pivot and adjusting slot bolts, then using a lever between pump and engine, tighten belts so that deflection on one of the belts is 3/8" with a 5 lb. force applied midway between fan and pump pulleys. Tighten pivot bolt first, then tighten adjusting slot bolt.
Chrysler & Imperial (Later Cars) - A square hole is provided in pump bracket to permit using a torque wrench for adjusting belt tension. Loosen pivot and adjusting slot bolts, then insert torque wrench in square hole and apply a 90 lb. torque. Tighten pivot bolt first, then tighten adjusting slot bolt.
DeSoto.- 3/16" belt deflection with a 5 lb. force applied midway between fan and pump pulleys.
Dodge - 1/8" (new belt), ¼" (used belt) deflection of belt measured midway between crankshaft and pump pulleys.
Plymouth V8 - A 20 ft. lb. torque should be required to slip pump pulley on belt with torque wrench applied to pump pullev attaching bolt.

LUBRICATION: Check fluid level in reservoir every 1000 miles or every 30 day. Maintain level of fluid to "Full" mark on reservoir using Automatic Transmission Fluid Type "A".

►*WORM HOUSING FLUID LEVEL NOTE:* It is not necessary to check fluid level in worm housing at regular intervals. When gear is removed for overhaul or for other reasons, fill worm housing to level of filler plug hole (with gear in normal installed position).

DRAINING HYDRAULIC SYSTEM: *(CAUTION–Extreme care should be taken to prevent dirt from entering reservoir while cover or filler cap is removed. To prevent damage to filter element, do not insert sharp objects into reversoir. Do not disturb filter element as periodic changes of this unit are not required).* Disconnect high pressure (small) hose at the gear housing and jack up front end of car sufficiently to raise wheels off floor. Place hose in suitable container. While holding hose in container start engine and allow to idle, turn steering wheel from one extreme to the other until all fluid is forced from unit. *(CAUTION–Do not run engine above idl speed. As soon as fluid starts to show great quantities of air bubbles, stop engine).* Reconnect high pressure nose and refill.

REFILLING HYDRAULIC SYSTEM: Bleed steering gear as follows: Fill reservoir slightly higher than normal. Start engine and run for a short time to circulate oil through hoses. With engine running at idle speed, turn steering wheel back and forth several times from extreme right to left to bleed any remaining air out of system. Check oil level in reservoir. Add oil to reach level mark. Capacity is approximately 2 quarts.

TROUBLE SHOOTING

HARD STEERING IN BOTH DIRECTIONS: 1) Leak in steering system, pump belt slipping or broken, fluid level low.
2) Steering gear linkage not lubricated, tire pressure too low, bind in steering column or gear, improper front end alignment.
3) Low pump pressure (see Hydraulic Pressure Test above) with particular attention to following: Relief and flow control valve, rotors (not turning or worn), pump body or cover worn.
4) Loss of pressure in power unit (see Hydraulic Pressure Test above).

SMALLER TURNING RADIUS IN ONE DIRECTION: 1) Wheel stops not adjusted properly.

HYDRAULIC LEAKS: 1) Check for leaks at hose adapters, pump body, between gear and worm housings, and gear shaft oil seal.

HARD STEERING IN ONE DIRECTION ONLY: 1) Tire pressure too low.
2) Control valve maladjusted.
3) Bind in steering column or gear, improper front end alignment.

VEHICLE ATTEMPTS TO TURN UNLESS FORCE APPLIED TO HOLD STEERING WHEEL: 1) Tire pressure uneven.
2) Control valve maladjusted.

POOR RECOVERY ON TURNS: 1) Tire pressure too low, improper front end alignment.
2) Gear shaft adjustment too tight, worm bearing adjustment too tight.
3) Balls in worm connector binding, fit too tight.
4) Bind in steering column or gear, bind in steering knuckles.

NOISE IN CHUCK ASSEMBLY: Check belt adjustment. Check for vibrating condition set up by control shaft rod. Remove unit and install a new valve rod adjusting disc.

HISSING NOISE (NO LOAD): Caused by low oil pressure or improper operation of back pressure valve.

CONTINUED ON NEXT PAGE

"CO-AXIAL" (C ntinu d)

HISSING NOISE (RIGHT TURN ONLY): Caused by oil leaking past lower piston rod gear housing seal.

HISSING NOISE & LOSS OF OIL THROUGH UPPER HOUSING VENT (LEFT TURN ONLY): Caused by oil leaking past upper piston rod housing head oil seal.

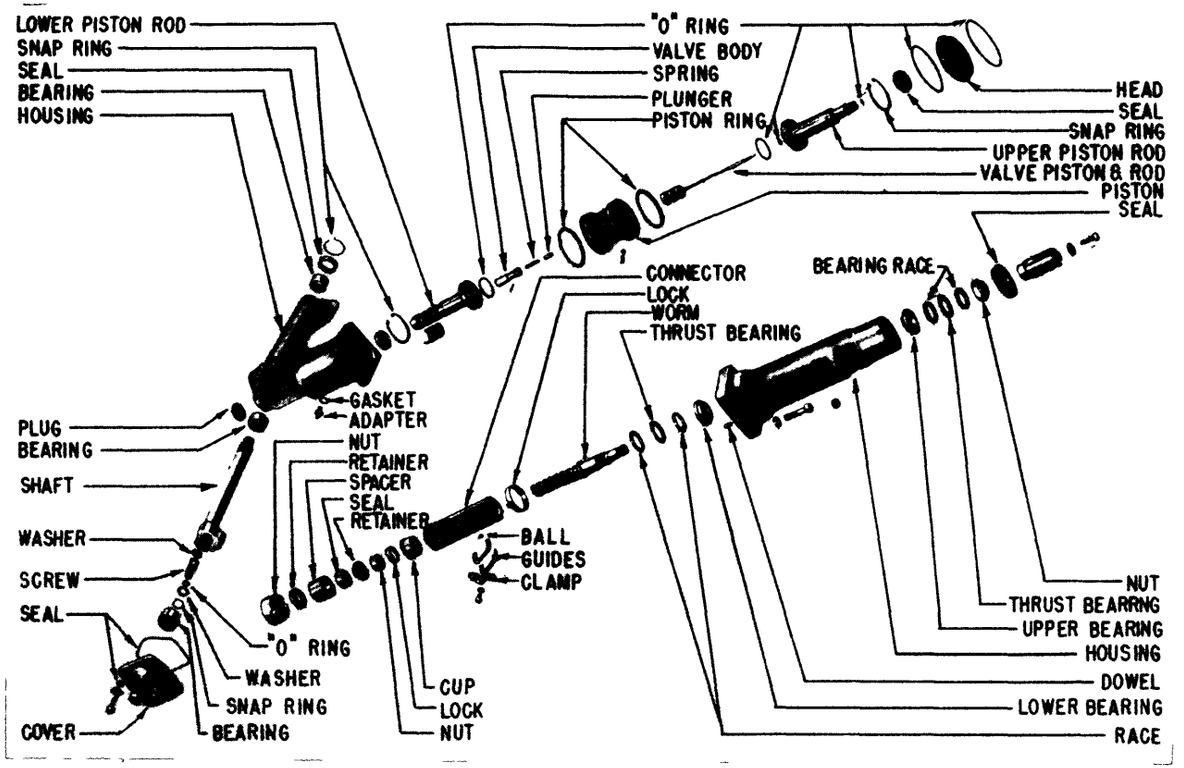
CREAKING NOISE ON TURNS: Check for loose gear-to-frame mounting bolts. If noise persists after tightening gear-to-frame bolts, install a new equal tooth sector or gear shaft.

SNAPPING NOISE: Tighten gear-to-frame mounting bolts. Check coupling screw for tightness. Check lower piston rod bushing dowel pin for being too high. Check bushing for seating properly. Check lower piston rod for tight fit at piston.

CHUCKLE NOISE: Check as follows: Steering arm nut loose on gearshaft. Loose front wheel bearing. Gearshaft adjustment too loose. Excessive kingpin endplay. Steering tube coupling screw loose. Worm bearing preload adjustment too loose. Excessive worm shaft endplay.

WANDER (STEERING WHEEL FREEPLAY): Check steering wheel freeplay which should not exceed 5/8". If freeplay excessive (without moving steering linkage), check in same manner as for "Chuckle" above, and also check steering linkage and front wheel alignment.

POOR RETURNABILITY (BOTH DIRECTIONS): Check torque required to turn gearshaft from one extreme to the other with torque wrench on steering gear arm nut (linkage disconnected from steering arm). Torque should not exceed 40 ft. lbs., ± 10 lbs. If torque reading not excessive, check wheel alignment and steering linkage. If torque excessive, check steering column jacket bearing. Check gearshaft adjustment. Check worm shaft bearing preload. Check wormshaft for binding in connector.



POOR RETURNABILITY (ONE DIRECTION ONLY): Check tire pressure. Center control valve (see Adjustment). Check gearshaft adjustment.

UNEQUAL STEERING EFFORT: Check control valve adjustment. Check for upper piston rod movement in piston. Check worm shaft connector nut for tightness. Check control valve rod for looseness in valve. Check upper piston rod nut for looseness. Check upper piston rod for being scored at reaction seal retainer. If the above fails to correct unequal steering effort, replace all reaction parts.

UNABLE TO MAINTAIN CONTROL VALVE ADJUSTMENT: This may be caused by reaction spacer being too short or too long, or by burrs or out of squareness. Check valve control rod for looseness in disc, or control valve looseness on rod. Upper piston rod nut may be loose, or upper piston rod may be loose in piston.

LACK OF ASSIST(ONE DIRECTION): Check for damaged neoprene piston ring. Check for damaged or improperly seated housing head oil seal. Valve rod lower "O" ring or piston rod "O" rings may be damaged.

LACK OF ASSIST (BOTH DIRECTIONS): Check the following: Low tire pressure. Drive belts slipping. Low oil pressure.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "CO-AXIAL" POWER STEERING GEAR

STEERING WHEEL & HORN BUTTON REMOVAL & INSTALLATION

HORN BUTTON REMOVAL & INSTALLATION: Chrysler - Disconnect battery. Turn horn blowing ring ornament counterclockwise and remove ornament. Disconnect wire from terminal. Remove three screws and three bushings and remove horn ring. Remove horn blowing contact ring switch from steering wheel hub. Reverse removal procedure to install.

Imperial: Remove two screws and washers from underside of steering wheel spokes and remove horn ring and cushion assembly. Disconnect horn wire. Remove four screws and bushings and remove horn blowing ring retainer and horn switch. Remove four screws and washers and remove ground plate from steering wheel. Reverse removal procedure to install.

DeSoto: Disconnect battery ground cable, then remove horn ring ornament by turning it counterclockwise. Disconnect horn wire at stationary plate and remove plate. Remove horn ring mounting base attaching screws and remove horn ring. Reverse removal procedure to install.

D dg : Remove two screws from horn ring ornament and remove ornament from steering wheel. Disconnect horn wire, then remove three horn ring screws and remove horn ring. Reverse removal procedure to install.

Plymouth: Disconnect battery, then remove the two screws on underside of medallion and remove medallion. Disconnect horn wire from terminal on travel plate and insulator, then remove horn ring, travel plate and insulator assembly, contact spring plate and ground plate. Reverse removal procedure to install.

STEERING WHEEL REMOVAL: Chrysler, Imperial, & DeSoto - Remove horn ring assembly (see above), then loosen steering wheel nut three full turns and attach Puller, Tool C-3428. Remove wheel from serrations, and remove tool, nut and steering wheel. To install steering wheel, place both front wheels in the straight ahead position, then install steering wheel and nut and tighten nut to 40 ft. lbs. *(NOTE* - Check to make sure cancelling dogs on steering wheel actuate the directional switch).

Dodge & Plymouth - Remove horn ring assembly (see above), then install Puller, Tool C-612 and remove steering wheel. When installing steering wheel make sure that master serrations are in alignment and that directional signal cancelling cam on bottom of wheel is inserted between switch levers (if so equipped).

STEERING GEAR REMOVAL & INSTALLATION

REMOVAL: Chrysler & Imperial - Remove horn ring assembly and steering wheel (see above). On Chrysler, remove two screws and bracket clamp securing steering column jacket at instrument panel. Disconnect directional indicator wires and horn wire at connectors

CONTINUED ON NEXT PAGE

"CO-AXIAL" (Continued)

below instrument panel. Loosen two screws and nuts at steering gear housing jacket at lower clamp. Remove column jacket by carefully turning assembly clockwise and pulling upward. On Imperial, remove cover plate, then remove turn signal and bracket. Remove shield, Loosen two clamp screws at lower clamp and loosen three gear housing to frame attaching bolts and remove jacket cover. On Chrysler & Imperial, remove pin and disconnect steering tube from coupling. Remove floor mat retaining plate, then remove dust pad and floor panel opening cover. Disengage drag link from steering gear arm and pull steering gear arm with Tool C-3402. Disconnect pressure and return hoses. Cap fittings at steering gear and raise hoses above oil level in reservoir to prevent oil loss. Cap ends of hoses. Disconnect stop light switch wires from brake master cylinder, then disconnect brake booster reservoir from fender side shield and move aside. Remove gear housing-to-frame attaching bolts and alignment wedge. Remove gear assembly by sliding unit forward and out of engine compartment.

Desoto, Dodge, & Plymouth-Remove horn ring assembly and steering wheel (see above), then remove front seat cushion. Raise front of car and remove pitman arm with Tool C-3402 and loosen steering gear housing to frame bolts. Remove jacket tube support bracket at dash panel. On DeSoto, disconnect shroud retaining spring from gear housing shroud and remove shroud and rubber shield at firewall. Remove floor opening panel, then remove jacket tube. On Dodge & Plymouth, remove shroud at upper end of steering column, then pull jacket from steering column shaft. Remove floor mat retaining plate, dust pad and access cover. Disconnect pressure and return hoses and cap ends of hoses and fittings on steering gear. Remove steering gear attaching bolts, then lift gear assembly up through opening in floor pan.

INSTALLATION: All Models - Reverse removal procedure and note the following: Tighten front upper and lower gear housing to frame attaching bolts to 20 ft. lbs. Install wedge over rear bolt between housing and frame, tapping lightly in place. Tighten the three attaching bolts to 50 ft. lbs. (Chrysler, Imperial, & DeSoto), 70 ft. lbs. (Dodge & Plymouth). Check alignment of steering column on DeSoto, Dodge, & Plymouth to make usre there is no bind at instrument panel bracket. If necessary, install shims between frame and gear housing to eliminate any binding condition.

OVERHAUL

▷ *1957 DODGE SELF-STEERING TO RIGHT SIDE CORRECTION:* If adjusting the control valve does not correct this condition, remove the valve adjusting cup to determine if fluid has leaked by the valve adjusting rod upper "0" ring seal or the reaction seal, correct by replacing the seals, then check to see if there is a port in the adjusting cup. If there is no hole, drill a 3/16" opening in disc midway between nylon inserted nut and rim of disc.

▷ *DISASSEMBLY & REASSEMBLY NOTE: Clean steering gear with solvent before disassembly. During disassembly, clean each part and dry with compressed air. Install all new "0" ring seals.*

DISASSEMBLY: (Worm Housing Removal) - Drain upper and lower housing, then attach holding fixture Tool C-3323 and install in a vise. Remove coupling attaching bolt and drive coupling from shaft with Tool C-3392. Gently pry worm housing seal from end of worm shaft, then pry locking collar portion of bearing adjusting nut out of keyway in worm shaft. Install Tool C-3320A on adjusting nut and Tool C-3319 over end of shaft, engaging the serrations. Hold worm shaft steady and loosen bearing adjusting nut. Remove tools and adjusting nut *(NOTE - A new nut must be used at reassembly).* Slide outer bearing race, thrust bearing inner race and spacer out of housing. Remove worm housing attaching bolts, then slide worm housing away from gear housing exposing the worm connector. Remove and discard "0" ring seals on housing head. Remove bearing assembly and spacer from worm housing *(NOTE - The spacer and bearing assembly is serviced as a unit).*

Inspection - Check bearing races and roller for pits or scratches. Spacers should fit flat against shoulders in housing and machined surfaces at each end of housing must be smooth and free of nicks or burrs. Replace all parts that show signs of wear.

Worm Connector & Valve Control: Pry worm connector locknut from openings in connector, then slide up on connector far enough to clear the unit. Using Tool C-3321 and Tool C-3326, remove worm connector nut, then slide connector assembly from upper piston rod. Remove valve adjusting cup from inside of worm connector. Pry retaining portion of piston rod nut lock from indents in nut and remove lock. *(CAUTION - Use care when removing lock so as not to damage control spacer).* Remove nut with Tool C-3328. Slide spacer, seal assembly and nut from valve rod and slide housing head off end of valve rod.

Inspection - Piston rod must be smooth on both ends and Nylon insert nut must be tight in valve adjusting cup. Flange inside connector nut should be smooth and housing head should be free from nicks and burrs. Inner bore of valve control rod should show little or no wear from retainers, and edges should be smooth and free from nicks or burrs. Use crocus cloth spread over a flat surface to remove burrs.

▷ *VALVE CONTROL SPACER NOTE:* Spacer is serviced in two different lengths, with a .001" differential. Spacer must be exactly the same length as space between piston rod nut and shoulder of piston rod. With nut tightened, spacer should roll freely in groove, barely holding its own weight.

Worm Connector: *(CAUTION - When disassembling the worm connector, be careful not to bottom worm shaft in either direction as the ball guides may be damaged causing either a tight or rough operating worm).* Remove ball guide clamp and carefully remove guide (with balls). *(CAUTION - If one or more of the balls are lost or damaged, replace the complete set of 40 balls. Balls are a selected fit and must not be replaced singly).* Hold connector upside down and remove remaining balls by turning connector in and out. Count balls that were removed so that same number may be installed at reassembly. Slide worm out of connector and remove nut lock.

Inspection - Guide rails on connector should be free of nicks or burrs and slide freely on guides in housing. Ball track on worm should be smooth without pitting or roughness. Check balls for pitting, brinelling or flaking. Check fit of adjusting cup and spacer in connector, if loose, install new spacer; adjusting cup, or both.

Gear Housing: Remove locknut from gear adjusting screw. Remove gear shaft oil seal snap ring, then using Tool C-3350, pull seal out of housing. Remove bolts and washers attaching gearshaft adjusting cover to housing (sealing washers are used on the two bolts that thread through to inside of housing). Discard sealing washers. To remove gearshaft cover, turn the adjusting screw into cover until flush, then spin cover off adjusting screw. Remove and discard cover "0" ring seal. Align gear on gearshaft to clear opening in housing, and using a fibre hammer, rap lightly on end of gearshaft. Slide gear and shaft out of housing. Remove adjusting screw retaining snap ring with pliers, Tool C-3229. Slide adjusting screw, "0" ring seal and retaining washer from end of gearshaft. Remove thrust washer from seat in end of shaft. Discard "0" ring seal.

Inspection - Gearshaft should be free of pits, scores, or signs of excessive wear in seal and bearing contact areas. Gear teeth should be smooth and show a good contact pattern. Needle bearings in cover should be smooth and rotate freely in race.

Piston & Rods: Place a suitable container under gear housing to catch trapped oil, remove piston assembly and rods from housing and disassemble as follows: Grasp upper piston rod firmly, twist slightly and pull piston and lower rod straight out of housing. *(CAUTION-Do not allow lower piston rod to touch piston bore).* Remove snap ring holding lower rod in piston, then carefully work lower rod out of piston to expose piston valve. Remove and discard "0" ring seal and slide piston valve out of piston, using care not to bend valve rod. Support piston assembly using a soft wood block and drive piston pin into upper rod using a ¼" round drift. Using snap ring pliers, remove upper rod retaining snap ring, then carefully work upper piston rod out of piston. Insert wire or paper clip down through piston pin, bend inserted end over through oil passage hole in rod and pull pin out of piston. Remove and discard "0" ring seal. Remove large "0" ring seal from base of upper rod, using a paper clip and remove valve rod "0" ring seals from each end of upper rod. Remove and discard piston rings from each end of piston. Using a 7/16"-14 (standard thread) bolt, remove restrictor valve from lower piston rod. Thread bolt into valve, finger tight. Clamp head of bolt in a vise and rap end of rod with a fibre hammer. Slide valve out of rod. Disassemble valve by inserting a stiff wire into pin hole and pushing out retaining pin. Remove plunger and spring.

Inspection - Restrictor valve plunger should slide freely in valve body and show no signs of sticking. Lower piston rod should be free of pits, burrs, or scratches. Upper rod should be unmarked in seal contact area. Valve port ring inside piston should have a bright polished surface with sharp edges, and the valve rod should slide freely through the "0" ring seals. Check

CONTINUED ON NEXT PAGE

"CO-AXIAL" (Continu d)

valve rod by inserting valve in piston until centered, then lay piston on flat surface and place Tool C-3333 under valve rod. Rotate piston slowly and check rod for straightness. If valve is loose, install a new assembly. Check adjusting cup to make sure it grips valve rod tightly by installing cup on valve rod, then, using a torque wrench (inch-pound) rotate cup which should require a minimum of 5 inch-pounds.

G ar Housing: Drive welch plug from bottom of gear housing (drive from cylinder side). Using a thin bladed screwdriver, pry out lower piston rod thrust pad from gear housing. Remove lower piston rod seal, using Tool C-3450 as follows. Insert disc end of tool through opening in end of housing, locating disc between seal and housing shoulder. Using offset (curved) section as a fulcrum, force disc between shoulder and seal until retainer screw almost contacts seal (viewed from opposite end). Drive seal out of housing.

Insp cti n - Inspect gearshaft needle bearings in housing *(NOTE - Do not remove unless they are damaged).* If lower piston thrust pad is scratched, replace it. Check piston walls for nicks or scratches. All machined surfaces of housing should be smooth and free from nicks and burrs.

REASSEMBLY: *NOTE - Clean all parts with solvent and blow dry with compressed air. Use all new "0" ring seals, coating them with Lubriplate at reassembly.*

G ar Housing: Remove garter ring from new piston rod seal and install seal on Driver, Tool C-3331 with lip of seal toward driver. Insert Pilot, Tool SP-1927 through seal and into driver until bottomed, then insert assembly into housing, keeping tool centered in bore. Drive seal into position, then very carefully work garter spring into seal with two long shank screwdrivers. *(NOTE* - If Tool C-3331-A is used, it will not be necessary to remove garter spring from seal). If gearshaft lower needle bearing was removed, drive bearing into position with Tool C-3333 (lettered end of bearing against driver). *(NOTE* - Outer end of bearing should be 1 1/16" from end of housing when properly seated). Install upper bearing in the same manner, with outer end of bearing flush with end of bore. Place lower piston rod thrust pad in position, align shoulder with recess in housing and press into position.

Pist n & R ds: Slide restrictor valve spring and plunger into valve body, secure with pin, then install assembly into lower piston rod bore. Check plunger for free operation in valve. Install two new valve rod "0" ring seals in each end of upper piston rod, making sure that rings are seated evenly in grooves. Coat a new "0" ring seal with Lubriplate and slide into position in groove on end of upper piston rod. Carefully slide rod into piston, aligning piston pin holes. Align new "0" ring seal over piston pin and insert into piston. Be sure pin is perfectly straight, then tap into piston, using a ¼" drift. *(NOTE* - Pin should be flush in piston). Install retaining snap ring with bevelled side out, **making sur that ends f snap ring do not bstruct an il passage** and that it is fully seated in groove. Slide valve and rod into piston and upper rod, carefully working past "0" ring seals previously installed. *(CAUTION - Be careful not to bend the rod).* Slide new "0" ring seal into position in groove on bottom of lower piston rod, then carefully slide rod into piston and down into position. Install retaining snap ring with bevelled side out, **making sure that ends of snap ring do not obstruct an oil passage.** Install new "0" ring seals on each end of piston, then locate Tool C-3344 on gear housing (around cylinder bore). Coat Tool C-3554 with Lubriplate and place over teeth of lower piston rod. Slide piston and rod assembly into cylinder bore, guiding Tool C-3554 out of lower housing as piston is being pushed into cylinder. As piston is installed, align teeth on lower rod for meshing with teeth on gearshaft.

Gear Shaft: Install adjusting screw thrust washer, screw and retaining washer, then install snap ring. Install "0" ring seal on adjusting screw, using Tool C-3401. Install sector gear in mesh with rack and seat shaft to mesh teeth. Check gear timing, using steering gear arm to rotate gearshaft. **Full piston travel must be 2".** *(CAUTION - Failure to obtain proper timing will result in a broken gear housing).* Check operation of gears by rotating gear shaft. Place a new shaft oil seal with lip down (coated with Lubriplate) on a piece of clean paper then carefully slide tapered end of sleeve, Tool C-3350 in seal and slide seal back about ¼" on sleeve. Slide sleeve and seal over shaft with lip of seal toward housing until seal contacts housing bore. Slide adapter over sleeve, followed by coupling nut. Install seal in housing by turning nut on shaft threads until shoulder of adapter touches housing. Remove nut and adapter. Wrap tape around sleeve to provide a firm grip, then slide sleeve off shaft using a twisting motion *(CAUTION - Do not use any tool to remove sleeve).* Install "0" ring seal on adjusting cover, place cover on screw and spin down as far as possible. Align cover with bolt holes, then move adjusting screw outward until cover is seated *(CAUTION - Do not force).* Install bolts and washers (with seals), in inside holes and tighten to 30 ft. lbs. Install adjusting screw locknut but do not tighten. Install a new welch plug in bottom of housing.

Valve Control Spacer: Remove garter spring from a new upper piston rod seal and position seal on Driver, Tool C-3331 with lip of seal toward driver. Install seal aligning pilot in end of driver *(NOTE* - If Tool C-3331-A is used it will not be necessary to remove garter spring). Place housing head on a flat surface with single flange side up and drive seal into head until seated, then install garter spring. Install "0" ring seal over shoulder on head, then slide head over piston and down against housing, making sure it is seated. Install connector nut over piston rod with threaded end out. Slide a new control spacer seal into spacer and install retainers. Place Seal Protector, Tool C-3329 over threads on upper rod and slide spacer assembly over tool and down against shoulder of upper rod. Remove tool. Install piston rod nut and tighten with a sharp rap of a hammer on Tool C-3328. Install new lock cap over nut and index with slots in rod. Using a suitable punch, drive outer diameter into recess in nut.

W rm Connect r & Valve Contr l: Install worm into connector and visually align upper portion of passages with ball guide holes. Insert 30 balls (no more), into lower hole by pushing them gently, using rubber end of pencil, and at the same time, oscillating worm. *(NOTE* - When 30 balls have been installed, they should be visible in the hole). Place remaining 10 balls in either half of ball guide, greasing the balls to keep them in place, then place other half of guide over balls. Insert ball and guide assembly into holes in connector and install clamp, lock washers and bolts. Check operation of worm, making sure that it is free to turn to maximum travel of worm shaft. *(NOTE* - Worm should rotate freely by its own weight in either direction). *(CAUTION - Do not allow worm to bottom at either end).* Install valve adjusting cup on end of valve rod. Slide worm connector nut lock over threaded end of connector with tang side facing threads. Slide worm connector over control spacer and screw nut onto connector by hand. Hold worm connector with Tool C-3321, then using Tool C-3326, tighten nut securely. Engage tang of lock with recess in nut, stake lock in hole in connector, then remove tools.

► *TESTING FOR LEAKS:* Align housing head to gear housing, then install Tool C-3555 over head. Install bolts and tighten securely. Install hose fittings, adaptors and test hoses from pump to unit. Fill pump reservoir with Automatic Transmission Fluid Type "A" and have additional fluid available. Install Tool C-3445 through worm shaft (forked end first) and engage valve rod. Remove wire from ignition coil and turn engine over, using the starting motor (this will prevent damaging steering gear unit should the valve be positioned to give excessively fast steering). As steering gear fills, it will self steer *(CAUTION - Be ready to turn the valve to stop the self steering before piston reaches limit of travel, turning valve to right if piston moves up, and to the left if piston moves down).* Fill reservoir. Replace engine ignition coil, start engine and allow steering gear to warm up to normal operating temperature, then check for leaks. *(NOTE - The above valve adjustment is only temporary. Make final adjustm nt after unit is completely assembled).* After leak test, stop engine and remove tools.

Worm Housing: Install "0" ring seal on smallest land of housing head, then slide bearing race over wormshaft, followed by a thrust bearing and race. Slide spacer and needle bearing assembly into housing past rail guides, then press shoulder of spacer into housing. Turn connector until ball guide is directly down and rails are aligned. Slide worm housing over connector with the vent on top side. *(CAUTION* - Be careful not to force "0" ring seal off housing head). Hold housing in alignment with connector rails, then seat against gear housing. *(NOTE* - Worm housing must meet gear housing with hand pressure only). Install attaching bolts and washers and tighten to 25-30 ft. lbs. Slide bearing spacer over worm shaft with shoulder towards worm, and seat in housing. Slide bearing race thrust bearing and race over worm and down against spacer. Install a new adjusting nut with locking flange up. Pour 14 ounces of Automatic Transmission Fluid Type "A" into upper housing and install filler plug.

► *ADJUSTMENT NOTE:* Make worm bearing adjustment, piston valve adjustment, and gear adjustment before installing steering gear. *S e "Adjustment" above .*

SAGINAW "IN LINE" POWER STEERING

Buick (1957)
Cadillac (1957)
Continental (1957)
Lincoln (1957)
Oldsmobile (1957)
Pontiac (1957)

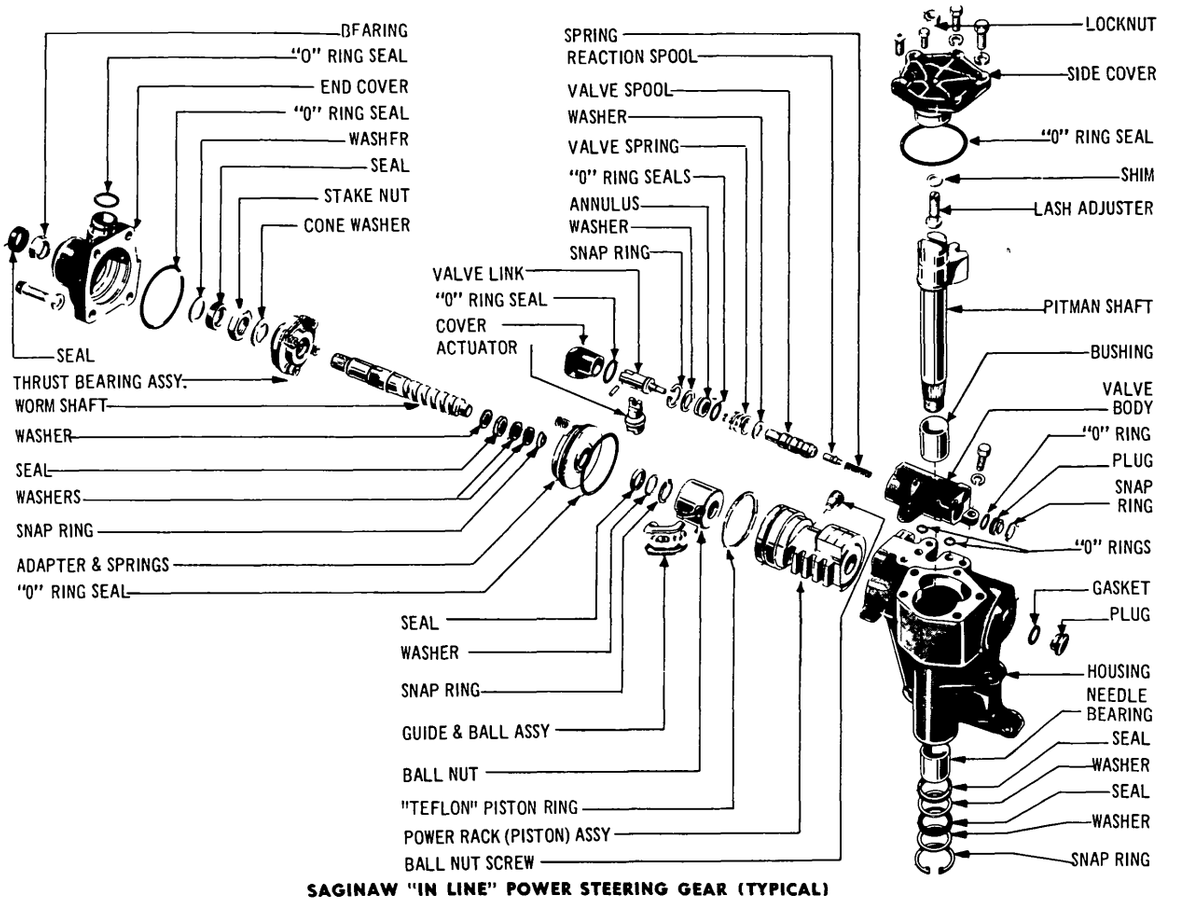
►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK POWER STEERING PUMP MANIFOLD BREAKAGE NOTE:* Excessive leakage at the cover attaching bolt accompanied by a heavy pump growl may be caused by a cracked or broken manifold in bottom of reservoir. This condition is caused by overtightening of the cover bolt.

►*1957 BALL NUT RETAINING SCREW PRODUCTION CHANGE:* A new screw having a hex head socket is now being used in production. Early and late type screws are not interchangeable. *See "Overhaul" below.*

►*1957 CADILLAC PITMAN ARM SHAFT RETAINING NUT TIGHTENING CHANGE:* Tightening specifications have been changed from 105-150 ft. lbs. to 100-125 ft. lbs.

►*1957 PONTIAC (EARLY) HIGH POINT MARK ON STEERING SHAFT CAUTION:* Some early cars had the "high point" mark on upper end of shaft positioned toward the bottom with wheels in straight ahead position (mark should have been at top). Determine correct "high point" by turning wheel to its mid position by counting the turns from stop-to-stop.



DESCRIPTION: Same design as used in 1956 models. *See "Saginaw (In-Line) Power Steering" in 1956 Annual Data.*

TESTING & TROUBLE SHOOTING: *See "Testing" and "Trouble Shooting" in 1956 Annual Data.*

CHECKING & ADJUSTMENTS (STEERING GEAR IN CAR)

PUMP BELT ADJUSTMENT: **Buick** - Adjust belt tension so belt will slip in pulley when 40-45 ft. lbs. (new belt), 30-35 ft. lbs. (old belt) is applied to pulley nut.
Cadillac - With Belt Tensioner Gauge J-6733 installed, adjust belt tension until red line on barrel of gauge is even with the shoulder.
Lincoln & Continental - ¼" belt deflection midway between pulleys with 5-7 lbs. of force applied.
Oldsmobile - Position Belt Tensioning Gauge No. 33-70 on belt. Loosen pump attaching clamp screws and move pump away from engine until pointers on gauge index with groove in gauge plunger. Tighten clamp screws.
Pontiac - Loosen pump to bracket bolts so pump falls of own weight. Using Tool J-5574 over head of hinge bolt, and torque wrench perpendicular to tool, tighten belt to 58-65 ft. lbs. (new belt), 51-53 lbs. (used belt).

STEERING GEAR CHECKING & ADJUSTING: Pitman Shaft Endplay Adjustment is the only adjustment that can be made with the steering gear installed in car. To determine correct Pitman Shaft Adjustment it is necessary that Thrust Bearing Preload and Ball Nut Preload first be checked. Disconnect pitman arm from pitman shaft or drag link, then proceed as follows.

SAGINAW "IN LINE" POWER STEERING GEAR (TYPICAL)

Thrust Bearing Preload Check: **Buick** - Disconnect pitman arm from intermediate tie rod. Attach Scale J-544-A to spoke of steering wheel at rim. While pulling at a 90° angle to spoke, pull required to turn steering wheel through range where lash normally exists (1/8 turn of wheel from either extreme position) should be ¼-½ lb.
Cadillac - Turn steering wheel two turns off center. Attach spring scale to spoke of wheel at rim. While pulling at 90° angle to spoke, pull required to turn wheel through a 1" arc should be 8-14 ounces.
Lincoln & Continental - Adjustments on car are not recommended, and should be performed when steering gear is removed for overhaul and during reassembly. *See "Overhaul" below.*
Oldsmobile - *(NOTE - Thrust Bearing Preload & Ball Nut Preload are checked in one operation as follows):* Remove pitman arm from shaft, then loosen pitman shaft adjusting screw locknut and thread adjusting screw out to limit of its travel. Attach Spring Scale J-544-A to spoke of wheel (at rim) and check and record pull required to move steering wheel through a 6" arc with steering gear on center position (2¼ turns from either end of steering wheel travel). *NOTE - This pull should be ¼-1¼ lbs.*
Pontiac - *(NOTE - Thrust Bearing Preload & Ball Nut Preload check not required).*

Ball Nut Preload Check: After Thrust Bearing Preload checked (see above), loosen pitman arm shaft adjusting screw locknut and turn adjusting screw a few turns to loosen it. With spring scale attached as for Thrust Bearing Preload Check, check Ball Nut Preload and record the pull.
Buick - Pull through "high point" (on center) should be ¼-¾ lb. higher than for thrust bearing preload.
Cadillac - With steering gear ½ to ¾ turn off center, the pull through an arc not exceeding 1" should be 2-9 ounces in excess of the Thrust Bearing Preload check.
Lincoln & Continental - Checking on car not recommended.
Oldsmobile - *See "Thrust Bearing Preload Check" above.*
Pontiac - Checking not required.

Pitman Shaft Endplay Adjustment: Adjust pitman shaft endplay adjusting screw so that pull required to move steering wheel through center (no lash) position is as follows:

CONTINUED ON NEXT PAGE

SAGINAW "IN LINE" (C ntinu d)

Buick - ½-1 lb. higher than for ball nut preload. Total reading should be 1¼-1¾ lbs.

Cadillac - 8-16 ounces higher than for ball nut preload reading, but should not exceed 28 ounces total.

Lincoln & Continental - Adjustment on car not recommended.

Oldsm bil - ½-¾ lb. in excess of thrust bearing & ball nut preload. Total overcenter preload must not exceed 1¾ lbs.

Pontiac - Overcenter preload should be 1¼-1¾ lbs.

LUBRICATION & BLEEDING

LUBRICATION: Buick, Cadillac, Oldsmobile, & Pontiac - Every 2000 miles remove cover on reservoir and add Automatic Transmission Fluid, Type "A" as required to bring level up to "Full" mark on side of reservoir. Tighten cover bolt to 7-9 ft. lbs. *CAUTION - Do not overtighten.*

Lincoln - Every 2000 miles, remove oil level indicator and add Automatic Transmission Fluid, Type "A" to bring level up to "Full" mark on indicator.

C ntinental - Every 2000 miles, remove star nut and vented breather washer, cover, and gasket. Fill reservoir to "Full" mark on side of reservoir. Replace cover using a new gasket. Tighten star nut securely.

BLEEDING: Buick, Cadillac, Oldsmobile, & Pontiac - *NOTE* - Any air trapped in system after overhaul may be expelled by running engine at fast idle for approximately 2 minutes and turning wheels from right to left (without hitting stops). Check fluid level and refill if necessary.

C ntinental - Fill reservoir to full mark, then replace star nut and washer (without cover). Loosen bleed screw in side cover and start engine. With wheels off the ground, turn steering wheel through its entire travel two or three times. Tighten bleed screw, recheck oil level and replace cover.

Lincoln - Fill reservoir to full mark on dipstick. Loosen bleed screw in side cover, then start engine. Turn steering wheel through its entire travel several times with wheels off ground. Tighten bleed screw, recheck oil level and replace dipstick.

STEERING WHEEL & HORN BUTTON REMOVAL & INSTALLATION

Buick: H rn Button Rem val (Series 40 Std.)—Pry cap out with thin bladed tool, then remove contact cup and other parts by removing attaching screws and insulating spacer bushings. To install, reverse removal procedure.

Horn Butt n & Ring Removal (DeLuxe Steering Wheel)—Pry out monogram which is held by prongs of a retain-contact plate and spring with insulators, remove operating ring with cushion and contact spacer. To install, reverse removal procedure. *NOTE*—When contact adjusting nut is being installed, turn it down until contact is made and horns blow, then back nut off ½ turn to provide proper clearance between contact plate and spacer.

Steering Wheel Removal—Remove horn button or operating ring (see above), then re-install steering wheel nut, leaving it backed off several turns. Set direction signal switch in "Off" position to avoid damage to switch operating mechanism. Apply puller J-3274 and pull wheel back to nut (*NOTE*—If wheel hub very tight on shaft, apply a moderate strain with puller then tap end of puller screw to break hub loose from shaft without distorting wheel hub). Remove puller, nut, and steering wheel.

Steering Wheel Installation - Install steering wheel with location marks on shaft and hub of wheel in line. With wheel properly located on shaft, install self-locking nut and tighten securely. Install horn button or operating ring and connect wire to horn cable connector.

Cadillac: Horn Ring Removal & Installation - Disconnect horn wire from terminal underneath instrument panel on steering column. Loosen Allen head screws on underside of horn ring (one on each side of directional signal carrier), and remove horn ring assembly. To install, reverse removal procedure.

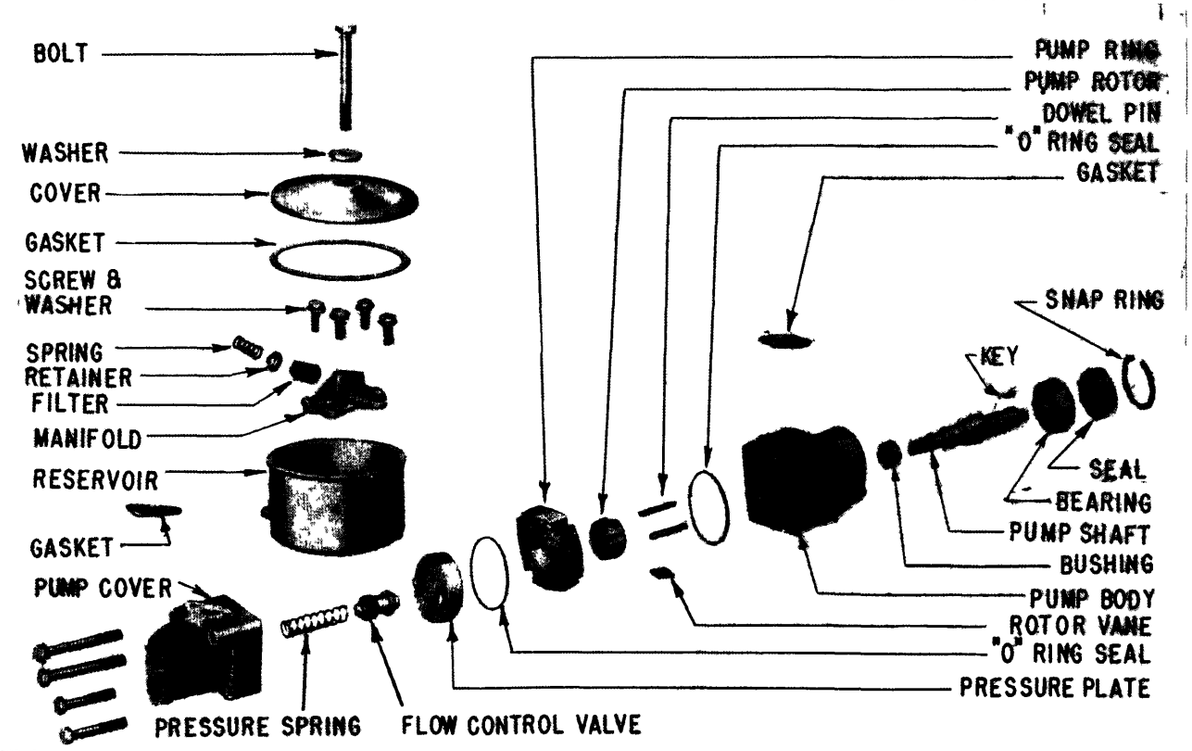
Steering Wheel Removal - Remove horn ring (see above), then remove steering wheel hub nut. Remove steering wheel using Steering Wheel Puller, Tool J-1859.

Steering Wheel Installation - Install steering wheel over splines on shaft so that punch marks line up. Install hub nut and tighten to 45-50 ft. lbs., then stake nut to steering wheel. Install horn ring.

Continental & Lincoln: Horn Ring Removal—After removal of steering wheel (see below) remove screws from underside of steering wheel and remove horn ring.

To install, reverse removal procedure.

Ste ring Wh l R moval—Pull cap and emblem outward from steering wheel hub. Remove steering wheel using Puller 3600-D (Lincoln), 3600-AA (Continental). To install, reverse removal procedure. Torque nut to 60-70 ft. lbs. (Lincoln), 40-50 ft. lbs. (Continental).



Oldsmobile: Horn Ring Removal & Installation - Disconnect horn wire. On standard steering wheel, remove horn cap by inserting a sharp instrument underneath edge of cap and prying upward. On deluxe steering wheels, horn ring cap is retained to hub by a screw. Remove steering wheel nut, then remove horn contact assembly. To install, reverse removal procedure.

Steering Wheel Removal & Installation - Remove horn ring (see above), then remove steering wheel using Puller, J-1262. To install, reverse removal procedure and tighten nut to 25 ft. lbs. (minimum) and stake.

Pontiac: Horn Ring Removal & Installation - On standard steering wheel, remove horn button by pressing down on one side and inserting a sharp instrument on opposite side. Pry button out. On deluxe wheel, remove four screws retaining covers to bottom of horn ring. Remove horn ring side plates, horn ring adapter bushing screws and associated parts. To install, reverse removal procedure.

Steering Wheel Removal & Installation - Remove horn ring or button (see above), then remove steering wheel shaft nut and washer. Remove steering wheel from

CONTINUED ON NEXT PAGE

SA INAW HYDRAULIC PUMP ASSEMBLY

SAGINAW "IN LINE" (Continued)

shaft using Tool J-3044. To install, reverse removal procedure, making sure that wheel is in the straight ahead position, then tighten nut to 25-30 ft. lbs.

REMOVAL & INSTALLATION

Buick: Disconnect pressure and return line hoses at steering gear and elevate ends to prevent oil draining from pump. Mark upper and lower steering shaft flanges for correct reassembly, then disconnect the flexible coupling. Raise front of car and remove pitman shaft nut and pitman arm. Remove steering gear to frame bolts and remove steering gear. To install gear, reverse removal procedure. Fill reservoir with oil, then start engine and operate pump, add additional oil until level remains constant. Rotate steering wheel through its entire range slowly a few times, then recheck oil level and replace cover on reservoir.

Cadillac: Remove reservoir cover, syphon all fluid from reservoir. Disconnect pressure and return line hoses at reservoir and pump, cap ends to prevent fluid drainage. Raise front of car and place stands near outer ends of lower suspension arms. Disconnect pitman arm from drag link. Remove upper flange-to-upper shaft retaining screw. Remove gear housing-to-frame side side bar screws, remove gear assembly. To install, reverse removal procedure. Torque upper flange-to-shaft retaining screw to 25-30 ft. lbs. *NOTE*–After installing gear, check flexible coupling for distortion. Coupling must rest in flat plane with no visible bend or twist. If distorted, remove lower steering column cover and lower clamp-to-jacket screw. Then loosen steering jacket clamp screws at instrument panel and slide complete steering jacket assembly up or down as required.

Continental: Disconnect battery cable, then remove steering column-to-dash panel upper and lower cover plates. Remove shift rod at shift arm. Remove steering wheel (see above). Remove dash panel trim pad, then remove trim panel. Disconnect turn signal wires at junction block and neutral switch and back-up wires at terminal block on steering column. Disconnect upper steering column tube from instrument panel and slide tube off shaft. Raise car and remove pitman arm from shaft with Tool 3590-AA. Lower car and remove air cleaner duct and air cleaner as an assembly. Remove exhaust manifold on left side of engine and take out the number 7 and 8 spark plugs. Remove as much fluid from power steering pump reservoir as is possible, using a suction gun. Disconnect hoses at steering gear and drain hoses. Drain steering gear by turning from stop to stop several times. Remove bolts holding gear to frame and note position of any shims found under bolts. *(CAUTION - Do not attempt to remove rolled pin out of steering gear shaft coupling at this time).* Rotate steering shaft so that coupling slot is in a vertical position, then tilt housing down and forward so sector shaft is facing up. Lift steering gear up between fender apron and engine and remove from engine compartment. To install, reverse removal procedure and tighten pitman shaft nut to 120-130 ft. lbs. Bleed hydraulic system after filling reservoir with Automatic Transmission Fluid Type "A". *(See "Bleeding" above).*

Lincoln: Disconnect battery cable from battery, then remove radio speaker assembly. Remove steering wheel (see above). Disconnect speedometer cable at speedometer head and accelerator rod at clevis pin connection. Roll carpet away from steering column opening in dash. Remove steering column supports and remove access covers in floor. Disconnect shift rod from shift arm at lower end of steering column. Disconnect turn signal wires at junction block and neutral switch and back-up light wires at terminal block on steering column. Remove steering column clamp and steering column-to-brake pedal support, then remove steering column from steering shaft. Remove rear exhaust manifold screw through hole in floor pan. Raise front of car and remove pitman arm from shaft using Tool 3590-AA. Disconnect exhaust pipe from muffler inlet pipe, then remove exhaust manifold. Remove No. 6, 7, & 8 spark plugs. Using a suction gun, remove as much fluid as possible from power steering reservoir. Disconnect hoses at power steering gear and drain gear by turning from stop to stop several times. Remove bolts securing steering gear to frame. Place steering shaft with coupling slot in a vertical position, then remove gear by tilting gear housing downward and rearward until shaft can be removed first. To install gear, reverse removal procedure and tighten pitman shaft nut to 120-130 ft. lbs. Fill pump reservoir and bleed system *(see "Bleeding" above).*

Oldsmobile: Scribe alignment marks on coupling flange and steering shaft flange. Disconnect hoses from power steering pump and cap pump and hose fittings. Raise car and remove engine filler plate. Remove pitman arm from shaft using Tool J-5504-B or similar tool. Remove gear housing-to-frame bolts, then remove gear assembly with hoses attached. To install, reverse removal procedure and tighten frame-to-gear bolts to 50-60 ft. lbs. Tighten pitman arm nut to 90-120 ft. lbs.

Pontiac: Scribe alignment marks on steering shaft and worm shaft flanges at coupling above steering gear, then disconnect coupling. Disconnect pressure and return hose assemblies from valve body. Remove pitman arm, then remove gear housing to frame bolts and remove steering gear. To install, reverse removal procedures, making sure that shims found between frame and gear are replaced in the original locations. Tighten pitman shaft nut to 130-135 ft. lbs.

OVERHAUL

OVERHAUL: *See "Saginaw (In-Line) Steering Gear" in 1956 Annual Data and note th following:*

1) A new needle bearing replaces the former bronze bushing in gear housing at outer end of pitman shaft.

2) A new "Teflon" piston ring replaces the two cast iron piston rings formerly used on power piston.

3) In later production cars, a new hex head screw is used to retain the ball nut assembly, replacing the former screwdriver slotted screw. The rack piston is slotted and hardened at the screw hole. Tighten the new screw to 30-35 ft. lbs. and stake in place, making sure that metal from screw head enters slots in piston. The hex head screw is not interchangeable with the earlier type screw.

► *1957 BUICK & PONTIAC PITMAN SHAFT SEAL REPLACEMENT NOTE:* This seal assembly may be replaced with the steering gear installed in car as follows: Disconnect pitman arm from shaft. Clean end of shaft and tape splines using one layer of tape. Remove pitman shaft seal retaining ring with Truarc pliers. Start engine and turn steering wheel to right until oil pressure forces seals from housing. Clean end of housing thoroughly, then lubricate new seal with petroleum jelly and install seals using Installer Tool J-6219 (place steel back-up washer between seal and tool to prevent damage to seal). Make sure that snap ring is fully seated in groove with beveled side outward. Fill reservoir and turn steering wheel from right to left several times. Check for oil leaks, then install pitman arm.

HYDRAULIC PUMP

HYDRAULIC PUMP: Buick, Cadillac, Oldsmobil & Pontiac - A Saginaw pump similar in design to 1956 pumps is used on these cars. *See "Saginaw (In-Line) Steering Gears" in 1956 Annual Data and note the following:* Pump drive shaft outer bearing and seal have been repositioned with the seal at outer end of shaft. The shaft inner bearing (needle) has been replaced with a bushing.

Continental & Lincoln - "Vickers Vane Type" used on Continental. "Eaton Rotor Type" used on Lincoln. *See "Eaton & Vickers Hydraulic Pow r Pumps" in 1955 Annual Data or later Manual editi n.*

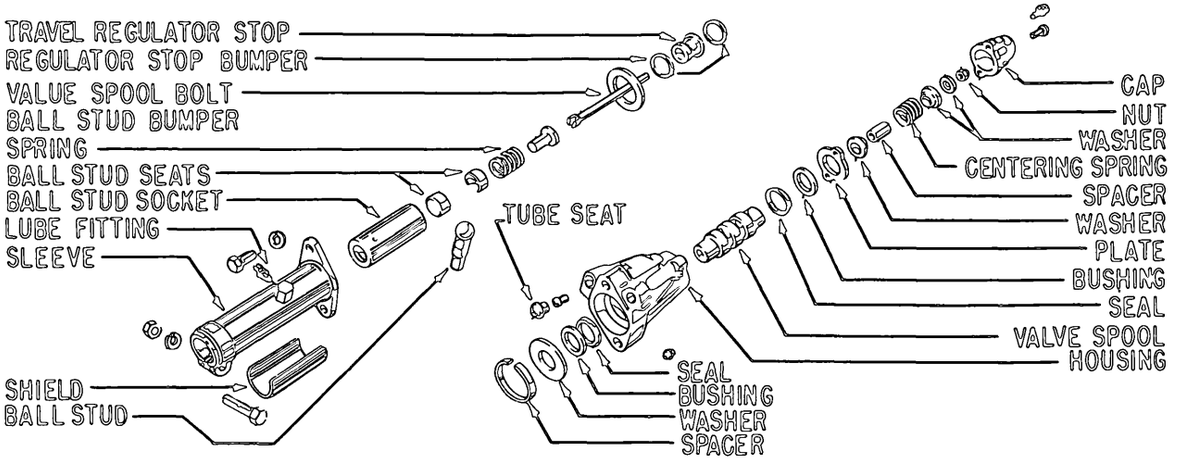
BENDIX LINKAGE TYPE (FORD & MERCURY)

Ford Pass. Cars (1957)
Mercury (1957)
Thunderbird (1957)

▷CHANGES, CAUTIONS, CORRECTIONS

▷*1957 MERCURY CONTROL VALVE CENTERING SPRING CHANGE (To provide heavier steering feel in center position):* A new heavier spring, Part No. MG-33704-B, replaces the earlier spring, Part No. MG-33704-A in production. On cars with 368" engine the later type spring must be used for service replacement. On cars with 312" engine, either spring may be used. For identification, the early spring is dyed a maroon color, and the later spring is dyed green.

▷*1957 MERCURY POWER STEERING NOISE CORRECTION:* A new power steering pressure line hose, Part No. MG-33589-A, having a relocated step-down orifice and revised dimensions for steel tubing at each end of hose to improve clearances in valve and pump areas.



DESCRIPTION: Linkage type similar in design to units used on previous models.

ADJUSTMENT: Pump Drive Belt - Place a heavy duty "C" clamp on pump bracket so pressure can be exerted on the movable adjusting bracket above the adjusting lock bolt. Loosen adjusting bolt enough to permit moving pump when "C" clamp is tightened, then tighten "C" clamp until pulley slips against belt friction when a torque of 14-16 ft. lbs. is applied to pump pulley bolt, using a torque wrench. *(NOTE* - Pull on wrench as if tightening bolt). Tighten belt adjusting bolt to 30-35 ft. lbs. and mounting bolt to 20-25 ft. lbs.

LUBRICATION: Check fluid level every 1000 miles. Start engine and turn steering wheel to full right and left a few times, then shut off engine. Add Automatic Transmission Fluid Type "A" to bring level up to "F" mark. (On "Eaton" pumps, mark is on dipstick. On "Vickers" pumps, mark is on reservoir).

TESTING: Turning Effort - With front wheel properly aligned and tire pressures correct, place car on dry concrete, set parking brakes, then proceed as follows: With engine running at normal idle speed, turn wheel to right and left several times to bring fluid to normal operating temperature. Hook a spring scale to rim of steering wheel and measure pull required to turn wheel at least one complete turn in both directions. The pull should be less than 12 lbs., and should be about equal in both directions.

Pump Pressure: Install pressure gauge, Tool T56L-33610-D (Ford), Tool 3500 (Mercury) in pressure line between hose and pump outlet. Open shutoff valve on tool, then run engine at idle speed for two minutes to bring oil temperature up to normal. Turn wheels fully to right, then to left, and note pressure reading on gauge when wheels are against stops. Normal pressure at both positions is 700-900 lbs., *(CAUTION - Do not hold wheels against stops for more than 30 seconds at a time).* If pressure was below 700 lbs., turn wheels off stops. Slowly close shutoff valve on gauge, and watch for an increase in pressure. *(CAUTION - Do not leave valve closed for more than 15 seconds).* If pressure, with valve fully closed is less than 700 lbs., the pump is causing the trouble. If pressure increases, but does not reach 700 lbs., the pump, control valve, and power cylinder should all be inspected. If pressure increases to 700-900 lbs., the trouble is in either the control valve or power cylinder.

FORD & MERCURY POWER STEERING CONTROL VALVE ASSEMBLY

TROUBLE SHOOTING: Binding or Poor Recovery - Check pitman arm ball stud in control valve sleeve which may be rubbing against the sleeve slot. If this is the case, the roll pin may be missing. Check idler arm bushings. Check all steering gear adjustments. Check operation of control valve and for interference between sector shaft arm and dust shield. Check control valve travel regulator stop adjustment. Check for damaged control valve sleeve and socket tube.

Hard Steering: Check to see that pump drive belt is properly tightened and that pump pressure is correct. If pump pressure is within specifications, check control valve spool centering spring adjustment. Check control valve spool for free movement and repair as necessary. *See "Binding or Poor Recovery" above.*

Excessive Free Play: Check steering gear worm and roller mesh adjustment. Check for excessive clearance between steering arm ball stud and ball stud seats. If ball stud is loose in seat, adjust control valve travel regulator stop. Check control valve centering spring adjustment.

Noisy Pump: Check pump belt tension. Noise may also result if correct hose is not used *(see "Changes, Cautions, Corrections" above).*

Steering Chatter: A loose pump belt can cause chatter against the wheel stops during an extremely sharp turn. Check belt tension. Check for looseness in idler arm connection, and check idler arm bushing. Check power cylinder piston rod insulators for looseness.

Loss of Power Assist: Check for damage or broken hoses. Check pump pressure (see above). Disconnect power cylinder piston rod from idler arm bracket and operate piston by hand to check for resistance to movement. If piston moves freely with little or no resistance, internal parts of power cylinder are damaged. Replace cylinder. Check adjustment of valve spool centering spring. Check operation of control valve check valve.

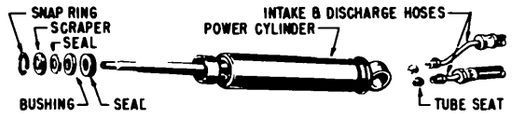
OVERHAUL

CONTROL VALVE: Removal - Disconnect hoses at control valve and drain fluid, turning wheels to right and left several times to force fluid from system. Loosen clamping nut and bolt at right hand end of sleeve, then pull roll pin out of steering arm-to-idler arm rod through slot in sleeve. Remove cotter pin from control valve ball stud nut, then loosen nut and back it off far enough to cover threads on end of ball stud. Hold a soft hammer against forward side of sector shaft arm to absorb the shock, then lightly tap ball stud with a hammer to loosen it from arm. *(CAUTION - Do not strike any part of valve body while loosening ball stud).* Remove nut from end of ball stud, then raise control valve high enough to remove ball stud from pitman arm. Turn front wheels fully to left and turn control valve counterclockwise to remove it from steering arm to idler arm rod.

Disassembly: Remove two centering spring cap bolts and cap from valve housing. *(CAUTION - When holding control valve in a soft jawed vise for disassembly, clamp valve only around the sleeve flange).* Remove nut from end of valve bolt, then remove washers, spacer, centering spring, adapter and bushing. Remove two bolts holding valve housing and sleeve together, then separate housing from sleeve. Remove lubrication fitting from sleeve and push valve spool out of centering spring end of housing. Remove seal from spool. Remove spacer, bushing and seal from sleeve end of valve housing. Drive stop pin out of travel regulator stop with a punch and hammer *(NOTE* - Pull head of valve spool bolt tightly against travel regulator stop before driving pin out of stop). Turn travel regulator stop counterclock-

CONTINUED ON NEXT PAGE

BENDIX LINKAGE TYPE FORD & MERCURY (Cont.)



wise in valve sleeve to remove stop from sleeve. Remove valve spool bolt spacer, and rubber washer, from travel regulator stop Remove dust shield from valve sleeve Slide bumper spring and ball seat out of sleeve, then remove ball stud socket

Inspection: Wash all parts in solvent and wipe with a lint free cloth. Inspect valve seals and bushings for wear, making sure that lips of seals are not nicked or scratched. Check bushings for nicks or scratches. Inspect valve housing for nicks and burrs. Use crocus cloth to remove burrs, being carefull not to round off sharp edges of spool *'NOTE* - If spool or inside of valve housing are badly scored, replace the assembly) Dry spool and housing thoroughly, and insert valve into housing. The spool should fall freely of its own weight in housing. *(NOTE* - Clearance between spool and housing should be .0002-.0009"). Inspect mating surfaces of ball stud socket and valve sleeve for wear or damage. Remove minor burrs and scores with crocus cloth. Check fit of socket in sleeve. Socket should slide freely in sleeve.

►*RELIEF VALVE & HOSE SEAT REPLACEMENT NOTE:* If replacement is necessary, proceed as follows Tap existing hole in hose seat, using a 3/8" starting tap for large hose seat and a 1/4" starting tap for small seats *(CAUTION - Remove all metal chips from seat ports after tapping).* Place a nut and large flat washer on a bolt of the same size as tapped hole. *(NOTE* - Washer must be large enough to cover hose seat port) Insert bolt in tapped hole, then use it as a puller to remove hose seat. If return line hose was removed, remove relief valve from port with a screwdriver, and install a new relief valve. Place a new hose seat in port, then thread a bolt of the same size as the port into the port. Tighten bolt enough to bottom seat in port.

R assembly: Coat all parts with Automatic Transmission Fluid Type "A". Insert one of the ball stud seats (flat end first) into ball stud socket, then insert threaded end of ball stud into socket. Place socket in control valve sleeve so threaded end of ball stud can be pulled out through slot in sleeve. Place other ball stud seat, spring, and bumper in the socket, then install and securely tighten travel regulator stop, Loosen stop just enough to align nearest hole in stop with slot in ball stud socket, then install stop pin in ball stud socket, travel regulator stop, and valve spool bolt. Install dust shield and lubrication fitting on sleeve. *(NOTE* - Make sure lubrication fitting is tight and does not bind on ball stud socket). Insert valve spool in housing so that large end of spool will be at centering spring end of housing and small end of spool will face sleeve end of housing. Rotate spool while inserting it in housing. Move spool toward centering spring end of housing, then place small seal, bushing, and spacer in sleeve end of housing. Press valve spool against inner lip of seal and, at the same time, guide lip of seal over spool with a small screwdriver. *(CAUTION - Do not nick or scratch seal or spool).* Place seal end of bushing on a flat surface so that seal, bushing, and spacer are at bottom end, then push down on valve spool until it stops. Carefully install spool seal and bushing in centering spring end of housing around large end of spool. Press spool against inner lip of seal and guide lip over spool with a small screwdriver. *(CAUTION - Do not nick or scratch seal or spool).* Slide spool back and forth in housing and check for free movement. Place valve sleeve on housing so that ball stud is on same side of housing as ports for the two power cylinder hoses, then install two bolts in sleeve. Tighten to 17-22 ft. lbs Place adapter on centering spring end of housing and install bushing, washers, spacers, and centering spring on the valve spool bolt Compress the spring, and install the nut. Tighten nut securely, then loosen it not more than 1/4 turn. Move ball stud back and forth in sleeve slot to check spool for free movement *(NOTE* - The spool should travel approximately .060" in each direction from center). Install centering spring cap on housing and tighten the two cap bolts to 4-6 1/2 ft. lbs Install nut on ball stud so that valve can be positioned in a vise with the vise clamping the nut and holding valve securely, then push forward on cap end of valve to check valve spool for free movement. Turn valve around in vise, and push forward and check for free movement.

Installation: Thread valve on steering arm-to-idler arm rod until about four threads are still visible on the rod. Position ball stud in sector arm, then measure the distance between center of ball stud in pitman arm and

FORD & MERCURY POWER CYLINDER

center of stud at inner end of left hand spindle connecting rod. *(CAUTION - Make sure the measurement is taken parallel to centerline of control valve).* The measurement should be as indicated in table below. If the measurement is not correct, disconnect ball stud from pitman arm and turn valve on steering arm-to-idler arm rod as necessary to obtain the correct measurement. With correct distance obtained and ball stud positioned in pitman arm, align hole in steering arm-to-idler arm rod with slot in end of valve sleeve. Install roll pin in rod hole to lock valve in position on rod. Tighten valve sleeve clamp bolt to 30-35 ft. lbs. Install nut on ball stud and tighten to 56-60 ft. lbs. Install cotter pin. Connect hoses to control valve and tighten all fittings securely. Fill reservoir to "F" mark on dipstick or reservoir with Automatic Transmission Fluid Type "A". Start engine and run at fast idle speed for two minutes, then turn steering wheel to right and left a few times and check for leaks.

Valve Installation Measurement

Model	Dimension
Ford (Exc. Thunderbird)	10 7/8"
Thunderbird	9 1/2"
Mercury (All Models)	11 1/4"

POWER CYLINDER: Except for cylinder seal and hose seat replacement, the power cylinder should be replaced as a complete assembly if faulty.

Removal: Disconnect hoses from power cylinder and fasten open ends of hoses in a raised position to prevent fluid draining out. Move front wheels to left and right several times to force all fluid from cylinder. Disconnect piston rod from idler arm bracket, but do not remove at this time. Remove locknut holding cylinder on mounting stud in steering arm-to-idler arm bracket and remove outer washer, bushing, and cylinder from stud. Remove inner bushing and washer from stud and pull inner insulator and washer from piston rod.

Inspection: Clean exterior of cylinder and piston rod. Inspect cylinder and rod for damage or wear and check for leakage. If parts are damaged or piston is leaking internally, replace the entire power assembly. Inspect mounting bushings and insulators for wear or damage and replace as necessary.

►*POWER CYLINDER SEAL REPLACEMENT NOTE:* Install all parts furnished in repair kit as follows· Clamp cylinder in vise and remove snap ring from end of cylinder, being careful not to distort or crack the cylinder. Pull piston rod out as far as it will go, then apply compressed air to other end of cylinder to blow seals out of cylinder. Lubricate new inner seal with Automatic Transmission Fluid Type "A", then place seal, bushing, outer seal, and scraper on piston rod. Push piston rod all the way in, then using a deep socket slightly smaller than cylinder opening, tap parts into cylinder and replace snap ring.

►*HOSE SEAT REPLACEMENT NOTE:* If either seat is damaged, both seats should be replaced as follows Tap the hole in power cylinder hose seat with a 3/8" starting tap. *(CAUTION - Remove all metal chips from hole after tapping).* Place a nut and large washer (enough to cover seat port) on a 3/8" bolt, then insert bolt in tapped hole and turn it to pull seat out of port. Position a new seat in port, and thread a 5/8"-18 bolt in the port until seat bottoms in port.

Installation: Install inner washer and bushing on mounting stud in steering arm-to-idler arm rod. Install inner insulator and washer on power cylinder piston rod, then install cylinder on mounting stud with piston rod in idler arm bracket. Install outer bushing, washer, and locknut on the mounting stud. If a new nut is installed, tighten it to 60-70 ft. lbs. If a used nut is installed, tighten it to 50-60 ft. lbs. Install outer insulator, washer, and nut on piston rod and tighten to 40-50 ft. lbs. Install locknut and tighten it to 40-50 ft lbs. (finger tight plus 1/3 turn). Connect hoses to cylinder and tighten fitting securely. Fill reservoir to "F" mark on dipstick, or to mark on reservoir with Automatic Transmission Fluid Type "A". Run engine and check for leaks.

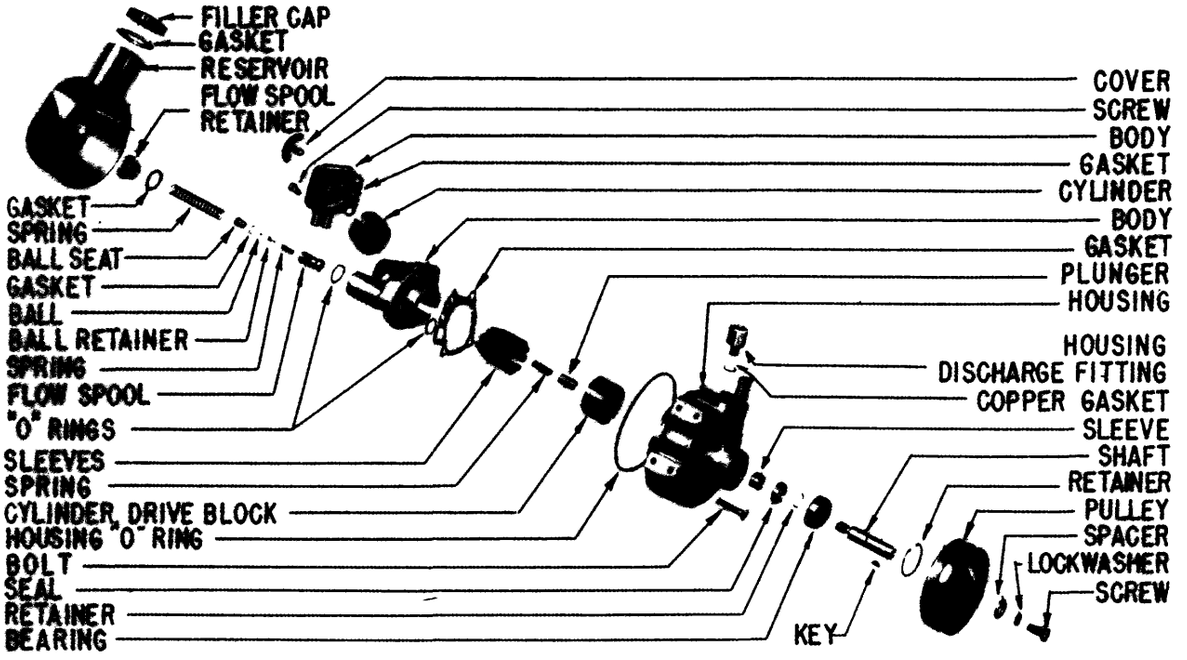
POWER STEERING PUMP· Different pumps used as follows

Ford - Eaton Rotor Type. *See "Power Steering Hydraulic Pumps".*

Mercury (312" Engine Exc Turnpike Cruiser & Air Conditioned Cars) - *Eaton Rotor Type. See "Power Steering Hydraulic Pumps".*

Mercury (368" Engine, Turnpike Cruiser & Air Conditioned Cars) - *Vickers Vane Type. See "Power Steering Hydraulic Pumps."*

THOMPSON SLEEVE TYPE



Chrysl r & Imperial (1957)
Plymouth V8 (1957)

DESCRIPTION: Sleeve type rotary reciprocating pump having nine cylinders operating in two cylinder blocks, one of which is diagonally offset in the pump body.

REMOVAL: Remove inlet and discharge hoses at pump and cap all openings to prevent entry of dirt or foreign matter. Loosen drive belt adjusting screw on pump bracket and remove belts. Remove pump from bracket.

DISASSEMBLY: Clean exterior of pump housing, then mount pump in a vise. Remove capscrew and reservoir and loosen the four capscrews at inlet end cap. Remove flow valve spring retainer *(CAUTION* - Flow and plunger springs are under pressure and caution should be used when removing cap and retainer to prevent spring and fitting from flying out). Remove flow valve and spring. Remove and disassemble both end caps from inlet cap body and pump housing. *(NOTE* - Plunger spring will tend to push cylinder blocks out of body, Use care when disassembling). Remove cylinder drive blocks and nine sleeves from body, as well as cylinder plunger spring. Remove ball bearing retainer ring from housing, using snap ring pliers, then remove shaft and bearing assembly. *(CAUTION - Bearing is pre-lubricated and must not be washed with solvent).* Inspect shaft for wear and ball bearing for roughness or noisy operation. If bearing must be replaced, remove shaft key and press bearing from shaft (away from splined or serrated end of shaft). Check retaining ring groove in housing. Replace bearing by supporting it on inner race, then press shaft through bearing until retainer ring stops against inner bearing race. *(NOTE* - The retaining ring must always be located between bearing and splined end of pump shaft).

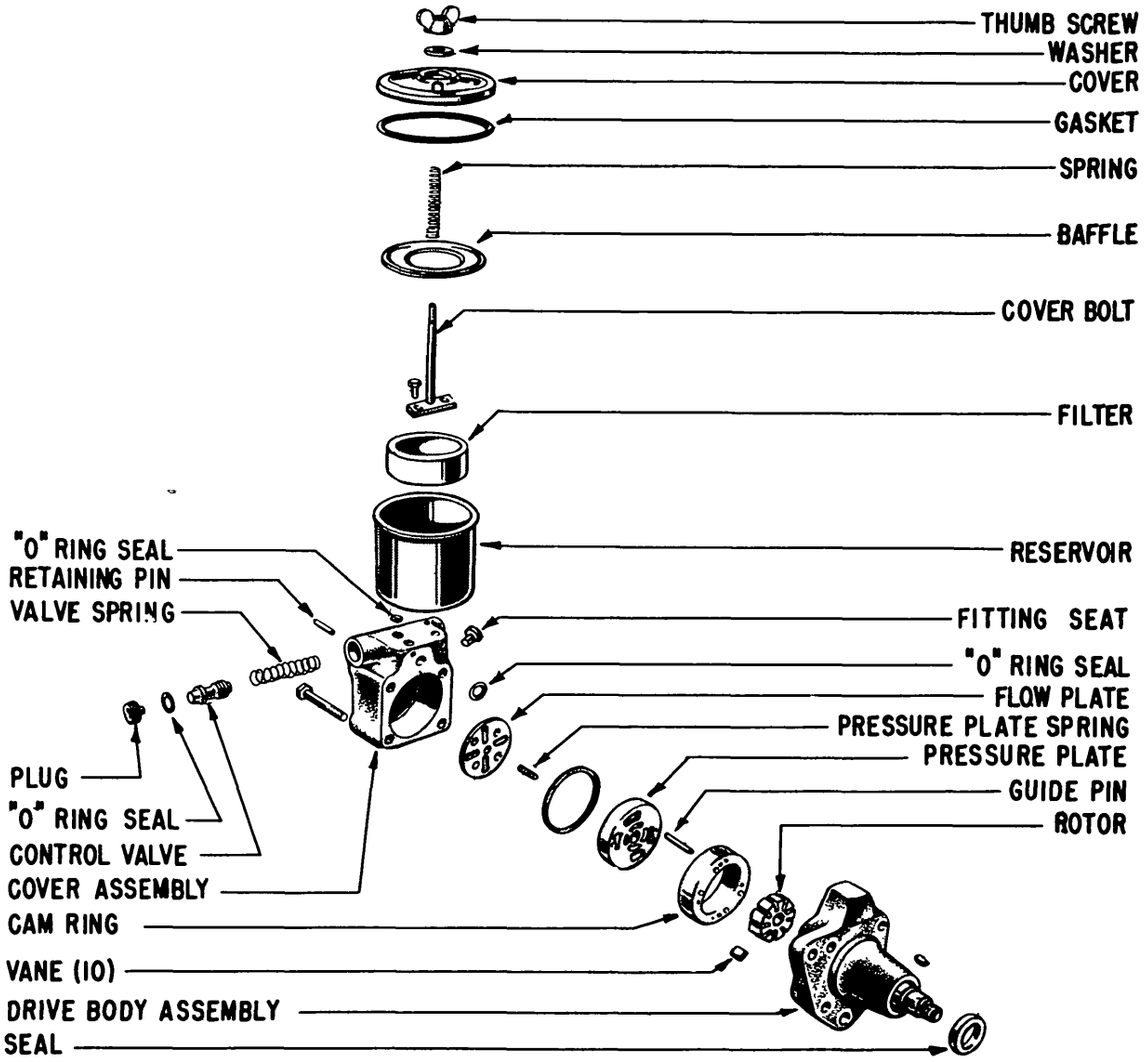
INSPECTION: Check fit of sleeves in cylinder block bores and make sure they slide freely. If cylinder block is heavily scored, it must be replaced. Hairline markings on sleeves are normal. Check flow valve spool and valve liner. Slight hairline scratches are permissable, Burrs or heavy scratches can be removed with a smooth stone. *(CAUTION - Do not break the sharp edges of spool or liner).* Insert flow valve in valve body and move spool back and forth, rotating slightly on each pass. The spool must slide freely in all positions. If spool sticks or drags, check for dirt, nicks, and burrs. Remove nicks or burrs with a smooth stone. Check shaft seal in bearing cap and replace if worn or damaged. If necessary to replace, align seal properly, then press it in until shoulder stops against cap casting, using an arbor press. Check pressure relief valve *(NOTE* - Valve must not leak at any pressure below 750 lbs. and must open completely at 900 lbs.) Evidence of leakage will be seen at small holes in side of flow spool. If valve leaks, disassemble check valve seat for nicks or dirt. Replace valve seat if nicked or damaged. *(NOTE* - If valve pressure is too low, a 1/32" washer may be placed between spring and ball retainer. If too high, place the washer between valve seat and flow valve spool body). Check pump body for wear or damage. Scratches or burrs can be removed with fine emery cloth. If body is scored or damaged, a new pump should be used.

THOMPSON SLEEVE TYPE HYDRAULIC PUMP

REASSEMBLY: Clean all parts thoroughly. Press drive shaft and bearing assembly into housing and check rotation of shaft to make sure shaft turns freely. Place cylinder driven block (without splines) on fixture C-3602 and insert plunger spring, plunger and seven sleeves into driven block. Place pump body, square end down, over cylinder drive block and fixture locating pins. Use a probe to align sleeves to a uniform spacing, then install the other two sleeves. Position cylinder drive (with splines) over the sleeves. Sighting thru bores in drive block for alignment, lower the cylinder drive block until it engages the two sleeves in forward position. Use a probe and align sleeves in the 5 and 7 o'clock positions at the same time guiding cylinder block downward. Continue this procedure with the other sleeve positions until all sleeves are aligned and engaged. Push block all the way in. *(CAUTION* - Do not force block into position). Remove body and cylinder block assembly from fixture, using care to see that blocks are not forced out of body by plunger spring. Assemble a new end cap gasket on pump body, then install end cap and tighten screws finger tight. Insert a new "0" ring seal in counterbore at flow valve liner in body. Install a new pump body-to-housing gasket and install housing. *(NOTE* - It may be necessary to apply hand pressure on housing to get drive block down into body after housing is seated). Tighten the five capscrews finger tight, then check pump shaft to make sure it is freely rotating. Tighten capscrews to 25 ft. lbs. and recheck pump shaft for free rotation. Mount pump in a vise and install flow valve spool with the 3/16" land down. Place flow valve spring on top of flow spool. Replace "0" ring seal on flow spring retainer, then compress flow spring with fitting and screw fitting into place. Tighten to 20 ft. lbs. Install and align a new reservoir "0" ring seal on housing, then align reservoir so that indentation on back will mate with angular boss on suction end cap. *(NOTE* - Sighting through 9/32" hole in back of reservoir will aid in alignment). Replace copper gasket under head of reservoir capscrew, replace screw and tighten to 15 ft. lbs. *(CAUTION* - Do not attempt to align reservoir in place with the capscrew). Install shaft key, pulley and tighten pulley bolt to 20 ft. lbs. Refill pump with Automatic Transmission Fluid Type "A".

VICKERS VANE TYPE (2 PIECE HOUSING)

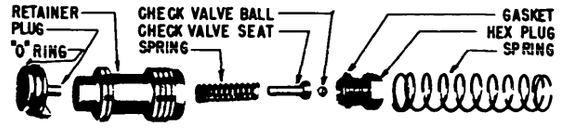
DeSoto (Late 1957). See Note below.
Mercury (Cars with 368" Eng., Turnpike Cruiser & Air Conditioned Cars) (1957)



►*1957 DESOTO (EARLY) NOTE:* A "Three Housing" Vickers Vane type pump is used on these models. *See "Vickers Three Housing Vane Type Pump."*

DESCRIPTION: This new pump consists of a two-piece housing (drive body & cover assembly). A new rotor cam ring is retained on pump drive body with two guide pins replacing the separate cam body on previous vane type pumps.

REMOVAL: Loosen pump drive belt adjusting screw and remove belt (or belts). Disconnect intake and discharge hoses and cap the openings. Remove pump from engine.



DISASSEMBLY: Drain pump and remove reservoir cover, baffle plate and filter. Remove reservoir retaining screws and remove reservoir and three "0" ring seals, Remove pump pulley, then remove screws attaching pump cover to drive body assembly and lift cover straight up from drive body. Drive retaining pin out of cover assembly and remove control valve assembly. *(CAUTION* - Control valve plug is spring loaded). Remove hex plug from end of control valve plunger and remove relief valve check ball, seat and spring. Remove flow plate and pressure plate spring from cover, then remove pressure plate, rotor cam ring, guide pins and rotor (with ten vanes) from drive body. Place pump body (with front end down) in end of a steel pipe which is large enough to clear forward end of drive body housing. Place drive body and pipe tool in an arbor press, and press at rear (splined) end of shaft to drive shaft, retainers, front bushing and seal out of housing. *(NOTE* - Some early pumps had a bronze retainer ring on shaft that may break when pressed out. If this happens, continue driving shaft completely out and then pry seal out with a screwdriver. Install new steel retaining rings at reassembly). Remove front bushing from body. *(CAUTION - Do not remove rear bushing. If bushing is damaged, replace complete drive body housing).* Check all parts for wear or damage and replace as necessary.

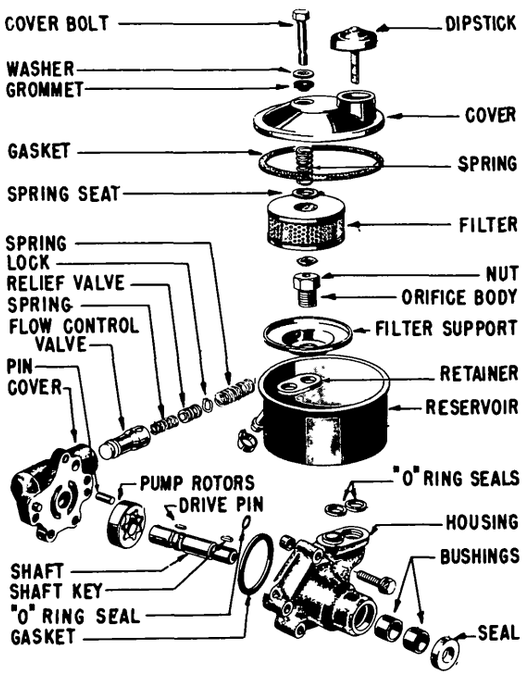
REASSEMBLY: Install new steel retainers around shoulder on pump shaft. Guide splined end of shaft through rear bushing and seat shaft and thrust washers against drive body casting. Slide a new front bushing over drive shaft and down against body casting. Be sure tapered end of bushing enters drive body evenly. Using a suitable tool (DeSoto C-3604) and an arbor press, press bushing into body until it seats against retainers. Be sure tool is in alignment with bushing to prevent damage to drive shaft shoulder. Coat a new seal with Lubriplate and install it over shaft and into position on drive body with lip of seal in and numbered side out. Drive seal into place using a suitable tool (DeSoto C-3603). Place drive body assembly in a vise and install rotor with ten vanes on splined end of shaft. *(NOTE - Vanes should be positioned in rotor with rounded end out).* Insert guide pins in drive body and seat cam ring over pins. *(CAUTION - Cam ring must be installed so that arrow on outside of ring points in a counterclockwise direction when viewing rotor end of shaft).* Slide pressure plate over pins against cam ring with spring recess hole up. Position flow plate at bottom of cover body with spring recess side out. Install new "0" rings in drive body and insert pressure plate spring in center recess hole in plate. Position cover body on drive body and install bracket and attaching screws and tighten to 25 ft. lbs. Install relief valve spring in control valve plunger, then install check ball seat and ball. Hold in place and install hex plug and gasket. Install control valve spring in cover assembly and install control valve plunger, plug (with new "0" ring seal), and then drive in the retaining pin. Install three "0" ring seals on cover body and install reservoir, filter, baffle plate, and reservoir cover. *(NOTE* - Install cover washer under thumb screw, with the groove upward).

VICKERS VANE TYPE HYDRAULIC PUMP (2 PIECE HOUSING)

INSTALLATION: Reverse removal procedure and tighten pump belt.

VICKERS CONTR L VALVE ASSY.

EATON ROTOR TYPE



Ford (1957)
Hudson & Nash (1957). S Note below.
M rcury (312" Eng. Exc. Turnpike Cruiser & Air Cond. Cars) (1957)
Lincoln (1957)
Rambler (1957). See N te b low.

►*1957 HUDSON, NASH, & RAMBLER NOTE:* Vickers (Three Housing) Vane Type pumps also used on these models. *See Vickers (Three Housing) Vane Type Pump.*

DESCRIPTION: Similar in design to previous models except that pump shaft is now carried on two bushings, replacing the former ball bearing. *See illustration.*

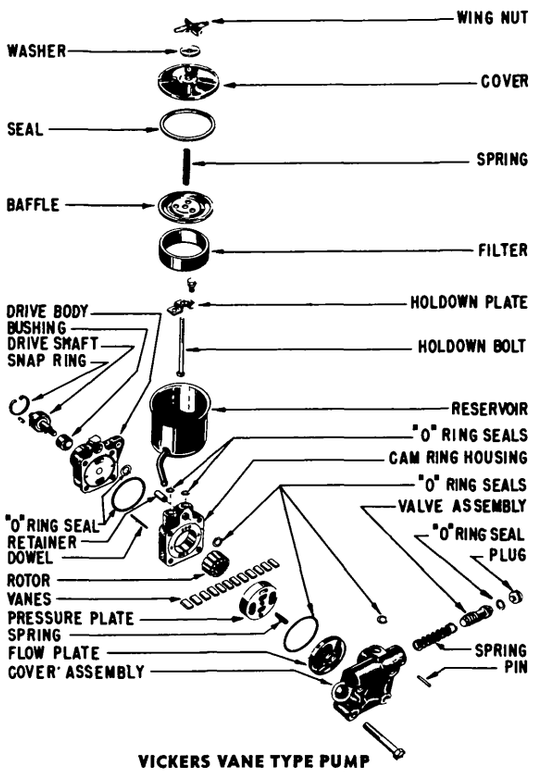
OVERHAUL: *See "Eaton & Vickers Hydraulic Power Pumps" in 1955 Annual Data or later Manual edition and note the following:*

Rotor Shaft Bushings: These bushings are integral with the housing and cannot be replaced. If bushings are scored or worn, replace the complete housing assembly.

EATON ROTOR TYPE PUMP

VICKERS VANE TYPE (3 PIECE HOUSING)

Continental (1957)
DeSoto (Early 1957). See Note below.
Dodge (1957)
Hudson & Nash (1957). See Note below.
Rambler (1957). See Note below.



►*1957 DESOTO (LATE) NOTE:* A "Two-Housing" Vickers Vane type pump is used on these models. *See Vickers (Two-Housing) Vane Type Pump.*

►*1957 HUDSON, NASH & RAMBLER NOTE:* Eaton Rotor Type pumps also used on these cars. *See "Eaton & Vickers Hydraulic Power Pumps" in 1955 Annual Data or later Manual edition.*

DESCRIPTION: Design is similar to previous pumps except that the pressure plate has been re-designed and a new "flow plate" has been added.

OVERHAUL: Same as for the previous vane type pump. *See "Eaton & Vickers Hydraulic Power Pumps" in 1956 Annual Data or later Manual edition and note the following:*

Flow Plate: This plate is installed in pump cover assembly, with the recess for pressure plate spring facing outward. Pressure plate must be installed with the spring recess facing the pump cover assembly. See illustration for positions of pump parts.

VICKERS VANE TYPE PUMP (3 PIECE HOUSING)

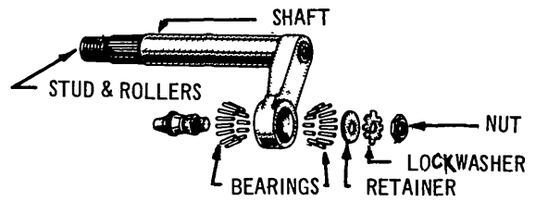
MANUAL STEERING GEARS

ROSS MODEL SL-54

Packard, Clipper (1957)
Studebaker, Comm., Pres., Golden Hawk (1957).

DESCRIPTION: Similar in design to Ross Cam & Twin Lever except for the single cam lever with tapered roller bearing mounted follower

Disassembly: Same as for the Cam & Twin Lever except as follows:



1) To remove follower from lever, bend down locking tang, remove the nut, lockwasher and plain washer. Then slip the bearings and follower out of the cam lever.

Reassembly: Same as for the Cam & Twin Lever except as follows:

1) To reassemble the cam lever, place lower set of bearings around the cam follower; hold them in place by means of heavy grease. Then carefully insert follower and bearings into the lever. Hold the follower in position and install the upper set of bearings. Install washer, lockwasher, and nut.

2) Adjust the cam follower bearing as follows: Hold cam follower and tighten the adjusting nut sufficiently so that cam follower can be turned by hand with a slight drag. This check should be done with the unit lubricated. Bend locking tang to hold adjusting nut securely in place.

Adjustment: The steering post and cam lever end play adjustments are made in the same manner as for the Cam & Twin Lever type.

CAM LEVER SHAFT ASSY.

BUICK - OLDSMOBILE - PONTIAC

Buick Series 40 (1957)
Oldsmobile Series 88 & Super 88 (1957)
Pontiac (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK & PONTIAC COUNTERGEAR THRUST WASHER CHANGE (To Reduce Transmission Case Wear):* A new thrust washer (Buick Part No. 1180482) is used in production and for service replacement at rear of countergear. A pin is embedded in the new thrust washer to index with the slot in transmission case to prevent thrust washer from rotating. *(NOTE* - On some early transmissions, it may be necessary to deepen the slot in transmission case). The other two thrust washers at rear of countergear are not affected by the above change.

DESCRIPTION: Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).

REMOVAL: *See "Synchro-mesh Transmission" on Car Mod l pag s.*

1957 SYNCHRO-MESH TRANSMISSIONS

OVERHAUL: Disassembly - *(CAUTION - Before opening case, clean exterior of transmission thoroughly).*

1) On Buick, remove speedometer driven gear assembly, then remove torque ball. Remove retaining bolt and washer, then pull universal joint from shaft using Puller J-682-A. Remove universal joint retaining ring from main shaft, then remove rear bearing retainer from transmission case. Remove speedometer drive gear. On Pontiac, remove transmission cover, gasket, selector lever, and shifter lever and yoke. Remove speedometer driven gear, then remove rear bearing retainer, gasket, and shift lever spring and yoke support from transmission case. On Oldsmobile, remove return spring, spring extension, spring clip and cover from transmission case. Remove universal joint companion flange bolt, then remove flange with Tools 6504, 6544 & 6295-01. Remove speedometer driven gear, rear bearing retainer and gasket.

2) On all models, remove rear bearing retainer and gasket (if not already done). Remove setscrews from the two shifter shafts using Tool J-2895 (or equivalent), then move the mainshaft rearward until rear bearing clears case. *(NOTE* - If fit between bearing and transmission case is tight, it may be necessary to tap on second speed gear with a block of wood). Disengage shifter yoke from synchronizer and lift front end of mainshaft enough to remove synchronizer from shaft. Remove snap ring holding second speed gear to mainshaft using snap ring pliers. Slide second speed gear off end of mainshaft (thrust washers will come off with gear), and note the wire spacer ring installed in bottom of snap ring groove. Slide low & reverse gear off mainshaft by pulling shaft through rear of transmission case.

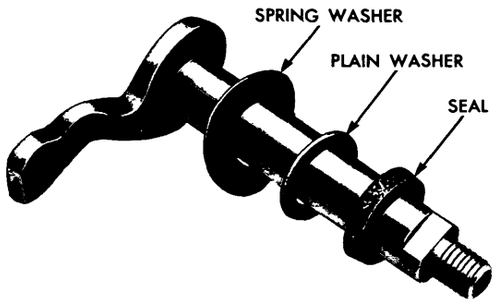
3) Remove shifter yokes and shafts, using care to prevent poppet balls from jumping out, then remove poppet balls and springs (poppet balls are under rear end of short shaft and under front end of long shaft). Move selector shaft so that interlock is clear of each shaft as it is removed. Remove setscrews from shift levers on selector shaft. Remove second and third speed in-

CONTINUED ON NEXT PAGE

BUICK-OLDSMOBILE-PONTIAC (C n.inued)

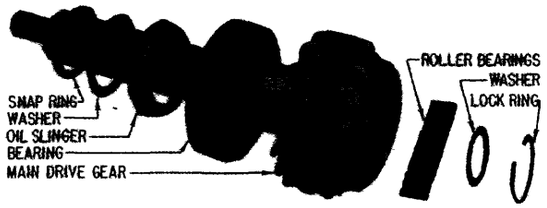
terlock retainer from groove in right end of selector shaft. Remove first and reverse interlock pin from case. Remove shift lever and lockwasher from left end of selector shaft, then drive shaft out through right side of case, using a soft hammer. *(NOTE* - The welch plug on right side of case will be driven out with the shaft. Do not let shifter levers and interlock drop into case). Remove selector lever and shaft, spring washer, flat washer and oil seal from transmission case.

4) Drive countergear shaft lock into the shaft, then drive shaft out through rear of case, using Bearing Loader, Tool J-1001, and a soft hammer. Make sure that bearing loader follows the shaft closely so that countergear bearings and thrust washers will be held in place. Allow countergear to rest on bottom of case. Remove snap ring from main drive gear bearing and tap main drive gear and bearing assembly toward rear of case to remove it. Carefully raise countergear out of case so that bearing loader and bearings will not fall out. Remove all thrust washers.



5) Drive reverse idler gear shaft lock into shaft, then remove shaft, idler gear and thrust washers.

Insp cti n: Clean all parts in solvent, then wipe dry with clean cloths. Carefully inspect all parts for evidence of damage (wear, scoring, pitting, chips, nicks, and burrs). Replace any part that is damaged or bent. Inspect all bearings for smoothness, and inspect all bearing seats and seal seats for roughness or burrs. Check cam surfaces of synchronizing drums which must be smooth. Conical surfaces of drums must be free of burrs or scores, and oil grooves must be clean *(CAUTION - Do not polish this surface or change the angle).*



R assembly: 1) Position reverse idler gear and bronze thrust washers into transmission case with oil hole to front of case. Install idler gear shaft until the front of shaft picks up the front thrust washers and just starts into inner support. Coat protruding end of shaft with Permatex No. 3, and complete installation of shaft, making sure that lock pin hole in shaft lines up with hole in case. *(NOTE* - Slot in end of shaft is used to line up shaft and hole). Install a new lock pin coated with sealing compound, driving it 1" below surface of boss on case.

2) Place spring washer, flat washer, and oil seal on selector lever shaft, with crowned side of spring washer against flat washer. Apply Lubriplate to shaft and assemble into transmission case. Install outer shaft lever.

3) Install countergear with bearings, Bearing Loader, Tool J-1001-A, retainer washers, and thrust washers into bottom of case. The small bronze washer is installed between the two steel washers at rear of case *(NOTE - See "Buick & Pontiac Countergear Thrust Washer Change" above).* Install large bronze thrust washer at front of case. Install main drive gear into front wall of transmission case and install snap ring on bearing. Mesh teeth of countergear with teeth of main drive gear and reverse idler gear. Drive countershaft into place with lock pin hole to rear, from rear of case, being careful that it closely follows Bearing Loader, Tool J-1001-A so that bearings and washers are held in proper position. When front end of shaft just enters bore in front wall of case, apply Permatex No. 3 to protruding end of shaft and bore in case, then complete installation of shaft, making sure that lock pin holes in shaft and case are in line. Install a new lock pin coated with sealing compound and drive pin flush with surface of case.

INNER SELECTOR LEVER & SHAFT

MAIN DRIVE GEAR & SHAFT

4) Replace poppet ball and spring, interlock pin, and low and reverse shifter shaft with yoke. Place low and reverse shifter shaft in neutral position. *(NOTE - Shifter shaft will be in neutral position when notch* for shifter lever is directly above shifter shaft bore in case). Install a new welch plug, coated with sealing compound, in right side of case. Raise low and reverse interlock pin into groove in shifter shaft, then from left side of transmission case, install selector shaft. Place low and reverse and second and high shifter levers on shaft, making sure that selector lever engages notch in bottom of shifter lever. Install second and high interlock on shaft, then install a new second and high interlock retainer. Replace poppet ball and spring, yoke, and second and high shifter shaft over and second and high interlock.

5) Insert main shaft assembly through bore in rear of case, slide low and reverse gear onto shaft and replace snap ring holding gear to shaft. Install second speed gear rear thrust washer on main shaft. *(NOTE - Two splines on main shaft are machined the entir length of the second speed gear. Both thrust washers must be installed with tang in the same spline. Th other spline is for lubrication).* Install second speed gear on main shaft. Install wire spacer ring in main shaft snap ring groove if removed. Install front thrust washer with tang in same spline as tang on rear thrust washer and install snap ring in groove.

6) Install synchronizer with counterbored end of clutch next to second speed gear, engage second and high shifter yoke with synchronizer and low and reverse yoke with low and reverse gear. Complete installation of main shaft assembly. Replace setscrews securing shifter levers and yokes to their respective shafts, using Tool J-2895.

7) Use a new gasket and install rear bearing retainer to transmission case, sealing capscrews with sealing compound. On Pontiac, install shifter lever spring yoke support under lower left capscrew, then install top cover gasket, and replace cover and spring clip. Install speedometer driven gear, selector lever, shifter lever, yoke and spring assembly.

8) On Oldsmobile, coat sealing lip of rear bearing retainer oil seal with special lubricant, Part No. 567196. Coat outer diameter with sealing compound, then install seal in rear bearing retainer, using Tool J-5154. Using Companion Flange Installer, Tool 6505, and Companion Flange Holder, Tool 6544, install companion flange. Install companion flange bolt and tighten to 27-36 ft. lbs. Position a new top cover gasket on case and install top cover, spring clip, attaching screws and lockwashers. Tighten screws to 10-12 ft. lbs. Install toggle spring and spring extension between spring clip and outer shaft lever. Install speedometer driven gear into rear bearing retainer and tighten to 6-8 ft. lbs.

9) On Buick, install selector lever and shifter lever. Install speedometer drive gear, then install rear bearing retainer. Install universal joint retainer ring on main shaft, then install universal joint and joint retaining bolt and washer. Install torque ball and speedometer driven gear.

CHRYSLER, DESOTO, DODGE & PLYMOUTH

Chrysler C-75-1 (Early 1957) Std. *See note below.*
Chrysler C-76-300 (1957) Optl.
DeSoto C-25 & C-27 (1957) Std.
Dodge, All Models (1957) Std.
Plymouth, All Models (1957) Std.

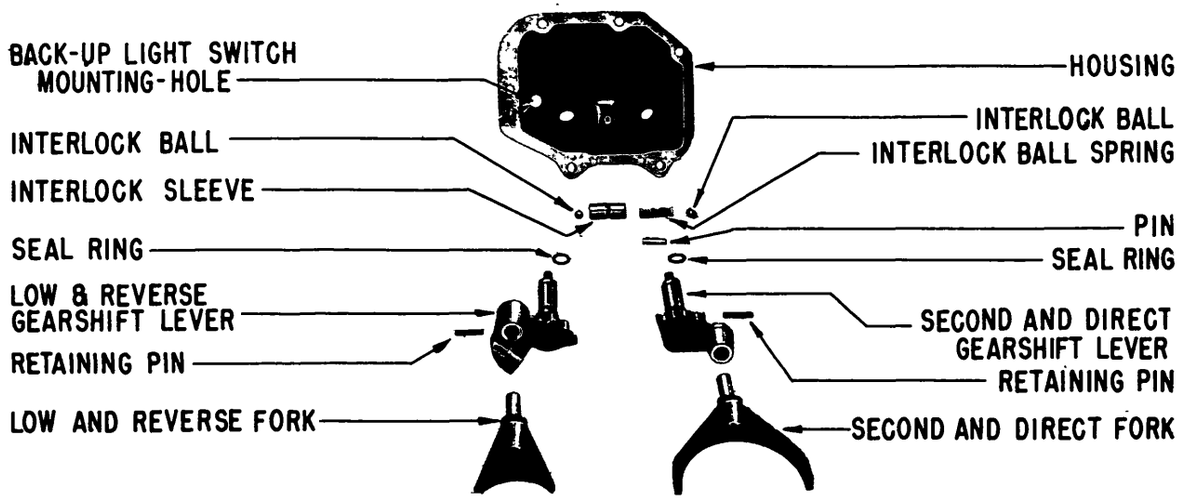
►CHANGES, CAUTIONS, CORRECTIONS

►*CHRYSLER C-75-1 NOTE:* Automatic transmission standard on later cars. Synchro-mesh transmission optional.

►*1957 PLYMOUTH HARD SHIFTING (REVERSE & LOW) CORRECTION:* On early cars, if a binding condition is encountered, remove the low-reverse gear and file a 45° chamfer approximately 1/16" long on end of each spline on front (large diameter) end of the gear. This chamfer has been added to gears in later production beginning approximately Dec. 1, 1957.

►*1957 PLYMOUTH HARD SHIFTING INTO REVERSE (OVERDRIVE CARS) CORRECTION:* This condition may be caused by a forging flash at the parting line on low and reverse gearshift lever cam. To correct, remove gearshift housing cover and grind off the flashing to provide sufficient clearance between cam and cover.

►*1957 PLYMOUTH SYNCHRONIZER SPRING PRODUCTION CHANGE (To Provide Easy Engagement of Gears When Shifting from First to Second and Second to Third):* A lighter synchronizer spring, Part No. 1823916 is used on transmissions stamped 3-21-57 and may be used on earlier transmissions for easier gear engagement.



►*1957 PLYMOUTH SECOND SPEED GEAR DISENGAGEMENT CORRECTION:* Adjust gear shift linkage to insure full engagement in all gear positions. Check and correct second speed gear endplay which must be .003-.008". Replace second speed gear or clutch gear (both if necessary), to eliminate parts with excessive tooth runout.

DESCRIPTION: **Own.** New design, three speed, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse). All helical gear type. Gear shift housing (transmission side cover) has two shift operating levers with separate shafts and shifting fork assemblies. A positive interlock between shifting assemblies prevents engagement in two gears at once.

REMOVAL OF TRANSMISSION: *See "Transmission" on car model pages.*

OVERHAUL

DISASSEMBLY: **Gearshift Housing** - Remove capscrews attaching housing to transmission case and remove housing. Remove shifting forks from transmission if they were not removed with gearshift housing. Remove operating levers from their shafts by driving out the spring pins from lever shafts. Then, slowly withdraw operating shaft from housing. *(CAUTION* - Do not lose interlock ball (spring loaded) located on inner side of shift housing). Remove interlock sleeve, spring, pin, ball, and remaining operating shaft. *NOTE* - Do not remove steel expansion plug from side of gearshift housing unless leakage is noted.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH SHIFT ASSEMBLY

Drive Pinion: Remove nut and bellville washer holding transmission brake drum and flange assembly. Remove main drive pinion bearing retainer and gasket (do not remove pinion at this time). Place transmission assembly in a fixture so forward end of transmission is upward. Remove drive pinion shaft assembly by lifting upward on shaft, tapping it lightly to aid removal. Remove main drive pinion bearing snap ring and bearing washer, then carefully press pinion shaft out of bearing. Remove oil slinger. Remove main drive pinion pilot bearing snap ring from cavity in end of shaft using a hook or flat blade. Remove washer and rollers.

Mainshaft: Remove extension housing-to-transmission case bolts and studs. Place a nut (½-5/8" thick) between synchronizer clutch gear sleeve and inner stop ring assembly *(NOTE* - The spacer nut (above) will minimize interference from synchronizer clutch gear sleeve when transmission case is removed from extension housing). Remove transmission case by lifting upward while guiding cluster gear second speed gear past synchronizer sleeve. Before further disassembly, check endplay of synchronizer clutch gear on mainshaft. Select a snap ring of proper thickness to eliminate all all endplay. Check endplay of second speed gear which should not exceed .008" (if greater, check for wear on thrust faces of second speed gear, clutch gear, and ends of mainshaft spiral splines). Check first and reverse sliding gear for free movement on mainshaft. *(NOTE* - Check spline backlash, and if found to be excessive, check shaft with a new gear before discarding old gear). Remove synchronizer clutch gear snap ring, using Tool C-484 or C-3301. Remove second speed gear and first and reverse sliding gear. Remove extension housing from fixture and remove brake drum and flange assembly, using Tool C-452. Remove oil seal with Tool C-748. Using a soft hammer, drive mainshaft out of extension housing by tapping rear end of shaft. Remove mainshaft rear bearing retainer snap ring with Tool C-760. Remove needle bearing by pressing bearing into extension housing. Drive ball bearing out of its bore with Tool C-3275, and remove needle bearing from rear of extension housing. *(NOTE* - Do not remove speedometer gear lubrication tube unless inspection indicates that it is necessary).

Reverse Idler: Using a brass drift, drive reverse idler gear shaft towards rear of transmission to expose key. Remove key, drive out shaft and remove reverse idler gear and bearing assembly.

Countershaft: Check endplay of countershaft which should be .004-.012". If greater, new thrust washers must be installed at reassembly. Using Tool C-578 (arbor), drive countershaft out rear of case. Remove shaft key, countershaft gear (with arbor installed), thrust washers, rollers, and spacer.

INSPECTION: Wash all parts and blow dry with air. Check bearings for looseness or noise and for fit on shafts and in housing bores. Inspect mainshaft splines for wear, galling, or scoring. Inspect bearing mounting surfaces and snap ring grooves. Slight nicks or burrs can be stoned smooth. Inspect gear teeth and threads on inner and outer synchronizer stop rings. Check gear teeth on clutch gear sleeve for chipped or excessively worn gear teeth. Make sure that synchronizer clutch sleeve slides freely on clutch gear. Check pins of inner and outer stop ring assembly for straightness and length (pins should be 1.570-1.580" long). If not within this specification, replace stop ring assemblies. Check all gears for broken, chipped, or worn teeth. Check rollers for chips and nicks and countershaft for wear. Replace worn thrust washers. Inspect mainshaft pilot rollers for

CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE & PLYMOUTH (Cont.)

play, pitting, or scoring. If roller bearings fall out during disassembly, they are too loose and should be replaced. Check gearshift housing and operating levers for wear, and replace worn or damaged rubber grommets. Check interlock sleeve for free movement in bores and where sleeve contacts operating lever shafts. Check operating shaft detents for wear, and replace shafts if necessary. Check shift shafts for free movement and wear.

REASSEMBLY: *NOTE - Before reassembly, lubricate each part with SAE 80 transmission fluid.*

Mainshaft: Drive mainshaft rear ball bearing into bore at rear of extension housing, using Tool C-3204 until bearing is seated against shoulder. Select and install a snap ring to eliminate all endplay at bearing (snap rings are available in two sizes), making sure snap ring is fully seated. Place needle bearing on extension and press on lettered side of bearing, using a suitable press, until bearing is flush with face of extension. Using Tool C-3105, install oil seal, driving until tool bottoms on extension housing. Position mainshaft into extension housing and tap forward end of mainshaft, using a soft hammer, until shoulder at rear of mainshaft seats firmly against inner race or rear ball bearing. Install brake drum and flange assembly on mainshaft, then place extension housing assembly on mounting fixture with forward end of mainshaft upward. Place first and reverse sliding gear on mainshaft with fork collar facing up. Install second speed gear, place spreader spring and then synchronizer inner stop ring on second speed gear (*NOTE* - Lightly grease threads on stop ring). Install synchronizer clutch gear on mainshaft and secure in place with snap ring to eliminate all endplay at clutch gear. Snap rings are available in the following thicknesses: .086-.088"; .089-.091"; .092-.094"; .095-.097". Properly seat snap ring. Place balance of synchronizer assembly on mainshaft. Lubricate outer snap ring.

Reverse Idler: Insert adapter arbor into reverse idler gear, then place 22 rollers into position in gear. (*NOTE* - A suitable adapter arbor can be made either of wood or metal by turning and cutting the stock to a length of 1.0625" and a diameter of .750"). Install thrust washer at each end of adapter arbor, retaining them in place with a small amount of grease. Place reverse idler assembly into transmission case (pointed end of teeth forward). Remove adapter arbor by driving reverse idler gear shaft through idler gear until key can be installed. Install key and continue to drive shaft into case until shaft is approximately 1/64" below mating surface on case.

Countershaft: Insert adapter arbor, Tool C-578 into countershaft gear. Place spacer over arbor and insert into cluster gear. After installing the 22 bearing rollers (on one end), place small thrust washer against end of rollers. Install remaining 22 rollers at opposite end of countershaft, and place small thrust washer at end of rollers. Add a small amount of grease to hold thrust washers in place (*NOTE* - Do not install large thrust washers at this time). Be sure transmission case is resting on a smooth surface, then position countershaft assembly into transmission, allowing adapter arbor to enter cluster gear shaft hole in rear of case. Install one of the large tabbed washers, making sure tab on washer engages groove in case (washers are available in two thicknesses, marked "A" & "B"). Select one to obtain .004-.012" total endplay of countershaft. Push adapter arbor into countershaft hole in front of transmission case, then turn transmission case so it rests on opposite end. Install remaining large thrust washer, making sure tab engages groove in case. Using the countershaft, push adapter arbor from cluster gear until shaft key can be inserted. Continue to drive shaft into case until it is approximately 1/64" below mating surface on rear of case. Lightly grease gasket surface of extension housing and install gasket. Install transmission case on extension housing. Place a nut between synchronizer clutch gear sleeve and inner stop ring assembly in same manner as used at disassembly. Install extension housing-to-case studs and bolts and tighten finger tight.

Drive Pinion: Place oil slinger (if removed) on pinion shaft, then press pinion shaft into ball bearing. (*CAUTION* - Make sure slinger does not hang up in bearing snap ring groove during pressing operation). Install keyed washer and secure with snap ring to eliminate all endplay (*NOTE* - Snap rings are furnished in the following thicknesses: .086-.088"; .089-.091"; .092-.094"; .095-.097"). Make sure snap ring is properly seated. If large snap ring on main drive pinion bearing was removed, replace at this time. Place shaft in vise equipped with soft jaws, and place 14 rollers in position in pilot pocket of drive pinion. Install washer against end of rollers and install snap ring. *Remove nut from synchronizer clutch gear sleeve and inner stop ring.* Guide drive pinion shaft through front of case, engaging synchronizer outer stop ring with clutch gear on drive pinion (*NOTE - Pinion shaft bearing is fully seated when snap ring makes full contact with front of transmission case).* Slide pinion bearing retainer over pinion shaft and against transmission case. While holding retainer with hand pressure against case, measure the clearance between retainer and case, using a feeler gauge. Select a gasket about .005" thicker than the clearance to eliminate endplay on front bearing (*NOTE* - Gaskets are furnished in various thicknesses). Install retainer and tighten bolts. Remove transmission assembly from mounting fixture, and tighten bearing retainer screws to 15 ft. lbs., and extension-to-case bolts to 30 ft. lbs. Install mainshaft washer (convex side toward nut), and draw nut up snug against washer. Install drain plug and tighten to 20 ft. lbs.

Gearshift Housing: Place gearshift housing in vise equipped with soft jaws. Place "O" ring seal on second and high gearshift lever shaft and install assembly in housing. Secure shaft in place with retaining pin. Install interlock sleeve in its bore, then place one of the interlock balls in sleeve, followed by spring and pin. Place "O" ring seal on low and reverse gearshift lever shaft, and install assembly part way into housing. Place second interlock ball on top of interlock spring, and while depressing ball with a suitable tool, seat shaft in bore while allowing interlock ball to seat in detent in lever. Secure shaft with retaining pin. (*NOTE - Lever shafts must be placed in position to allow clearance for tool).* Install gearshift operating levers and tighten retaining nuts to 20 ft. lbs. Shift transmission into neutral and place shift forks in position in transmission case. Place operating levers in neutral, install gasket, and then install housing, engaging fork ends with the respective shafts. Tighten housing bolts to 20 ft. lbs. Install new steel expansion plug (if removed). Install back-up light switch and speedometer drive pinion.

GEARSHIFT CONTROL ADJUSTMENTS

Crossover Adjustment: (*NOTE - Before making adjustments, gearshift lever shaft must be in its normal fully returned position in neutral).* Remove lubrication fitting from tube lever pin retainer and rotate retainer until gearshift cross pin is exposed. If a .040" round feeler gauge cannot be inserted between gearshift tube cross pin and bottom of slot in the second (high shift lever hub), an adjustment at gearshift tube lower support must be made as follows: Loosen gearshift tube lower support screws sufficiently to permit movement of support when it is tapped slightly with a plastic hammer. Adjust support up or down to obtain .040" clearance. Tighten support clamping screws to 150 inch pounds (90 inch pounds for power steering equipped cars). Rotate tube lever to its original position and install lubrication fitting. Tighten fitting to 70 inch pounds. Operate crossover to make sure it is free of any interference.

Control Rod Adjustment: With transmission in neutral, loosen and back off adjusting nuts at second-high gearshift control rod swivel. Place knob end section of manual control lever (in car) in a horizontal plane. Adjust nuts at swivel block to retain gearshift lever in a horizontal position. Tighten nuts to 70 ft. lbs., making sure the transmission remains in neutral. Loosen and back off adjusting nuts at low-reverse gearshift control rod swivel, then position low-reverse gearshift lever in direct alignment (through center of swivel block pin) with the second-high gearshift lever. Tighten adjusting nuts to 70 ft. lbs. Again check crossover operation for interference. *CAUTION* - Failure to make this adjustment correctly will result in insufficient manual lever-to-steering column clearance. Incomplete engagement of transmission may also result, causing damage to gears.

CHEVROLET (PASSENGER CARS) 4-SPEED SYNCHRO-MESH

Chevrolet Pass. Cars (1957) Optl.
Chevrolet Corvette (1957) Optl.

DESCRIPTION: New 4-speed "close ratio" helical gear type (except reverse), with constant mesh, synchro-mesh in all forward speeds. Sliding gear (reverse).

REMOVAL: *See "Transmission" on Car Model pages.*

OVERHAUL

SPEEDOMETER DRIVEN GEAR: *(NOTE - This gear may be removed with transmission in car).*

Removal: Disconnect speedometer cable, remove lock plate-to-housing bolt and lockwasher, then remove lock plate. Insert screwdriver in lock plate slot in fitting and pry fitting, gear and shaft from housing. Pry "O" ring from groove in fitting.

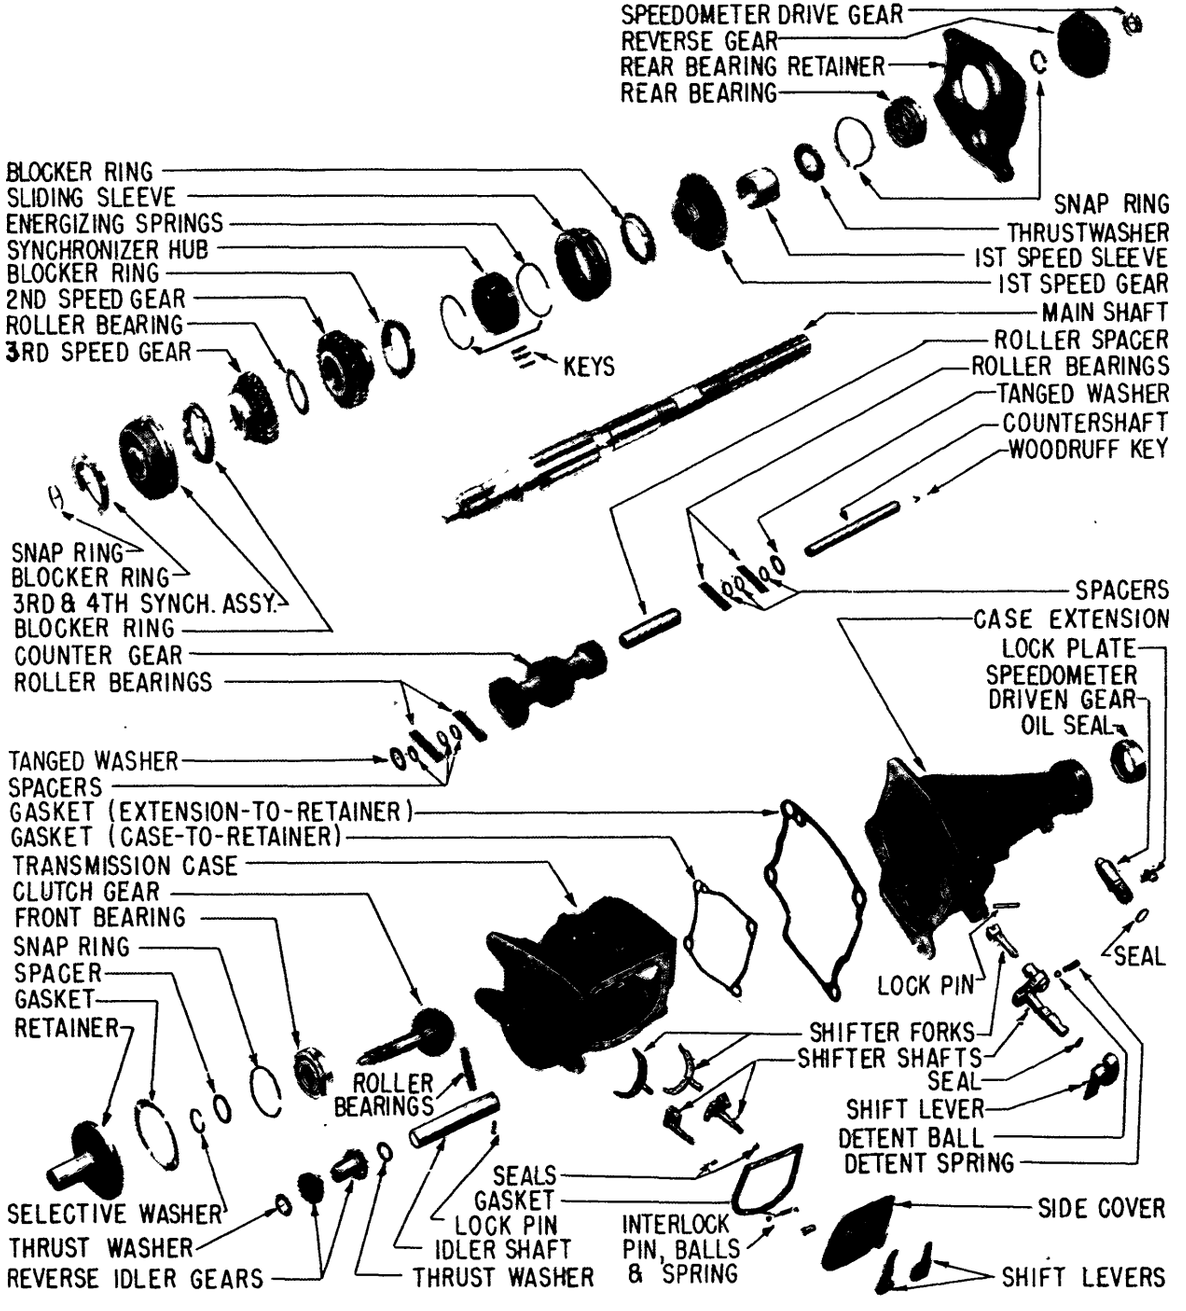
Installation: Install new "O" ring seal in groove in fitting and insert shaft. Hold assembly so slot in fitting is toward lock plate boss on housing and install in housing. Push fitting into housing until lock plate can be inserted into groove and attached to housing.

SIDE COVER: *(NOTE - Side cover can be removed with transmission in car after shift rods have been disconnected and transmission drained).*

Removal: Remove nine bolts from side cover and remove side cover, gasket, and shifter forks.

Disassembly: Remove outer shifter lever clamp bolts and pull levers from shaft. Carefully push shifter shafts into cover, allowing detent balls to fall free, then remove shifter shafts. Remove interlock sleeve, interlock pin, and poppet spring.

Reassembly: Install interlock sleeve and one shifter shaft. Place steel detent ball into sleeve followed by poppet spring and interlock pin. Start second shifter shaft into position and place second detent ball on poppet spring. Compress ball and spring with screwdriver and push shifter shaft fully in. With synchronizers in neutral and shifter forks in place, lower side cover into place. Install bolts (using sealer on lower right bolt), and tighten evenly.



MAINSHAFT OIL SEAL: *(NOTE - Seal may be removed with transmission in car).*

Removal: Remove nuts and bolts retaining rear universal joint trunnion bearings to drive flange. Lower rear end of propeller shaft and slide front flange off mainshaft. Use Tool J-5859 to remove mainshaft oil seal.

Installation: Press new seal into place in extension *(CAUTION - Do not force seal against seat in extension).* Install propeller shaft and connect rear universal joint.

TRANSMISSION CASE: Disassembly - Remove side cover (above), remove front bearing retainer bolts, remove retainer and gasket. Drive retainer pin from reverse shifter lever boss and pull shifter shaft out far enough to disengage shifter fork from reverse gear. Remove bolts attaching extension case to rear bearing retainer plate, then tap extension with a soft hammer, in a rearward direction. When reverse idler shaft is out as far as it will go, move extension to left so reverse fork clears reverse gear and remove extension case and gasket. Remove rear reverse idler gear and tanged thrust washer and front reverse idler gear and flat thrust washer. Remove speedometer gear, using a puller, and reverse gear. Remove self locking bolt attaching rear bearing retainer

CONTINUED ON NEXT PAGE

CHEVROLET 4-SPEED CLOSE-COUPLED TRANSMISSION ASSEMBLY

CHEVROLET (PASSENGER CARS) 4-SPEED (Continued)

to transmission case, then carefully remove entire mainshaft assembly. Unload needle bearings from clutch gear and remove fourth speed synchronizer blocker ring. Remove clutch gear retaining snap ring and spacer, then press clutch gear out of bearing toward inside of case. Tap front bearing and snap ring out of case from inside. From front of case, press out countershaft, then remove countergear and thrust washers. Remove the 80 rollers, 6.050" spacer, and roller spacers from countergear.

Cleaning & Inspection: Wash case inside and out with cleaning solvent and inspect for cracks. Inspect front face which fits against clutch housing for burrs. Remove any burrs with a fine cut mill file. Wash front and rear bearings in solvent and blow dry with air. Check for roughness, then oil them with light engine oil. Check clutch and countergear needle bearings and countershaft for wear.

EXTENSION CASE: Disassembly - Drive rear idler shaft lockpin into boss until it falls into clearance hole in shaft. Pry out extension plug at end of shaft and press shaft from extension. Remove shifter fork from shifter shaft, then drive shifter shaft into case, allowing ball detent to drop into case. Remove shaft and detent ball spring.

MAINSHAFT: Disassembly - Remove mainshaft front snap ring, third and fourth speed clutch synchronizer assembly, third speed gear and synchronizer blocker ring, second and third speed gear spacer (needle roller bearing), and second speed gear and blocker ring. Spread rear bearing snap ring and press off the retainer. Remove mainshaft rear snap ring. Support first and second speed synchronizer assembly and press on rear of mainshaft to remove rear bearing, first speed thrust washer, first speed gear and synchronizer blocker ring, second speed synchronizer assembly, and first speed gear sleeve.

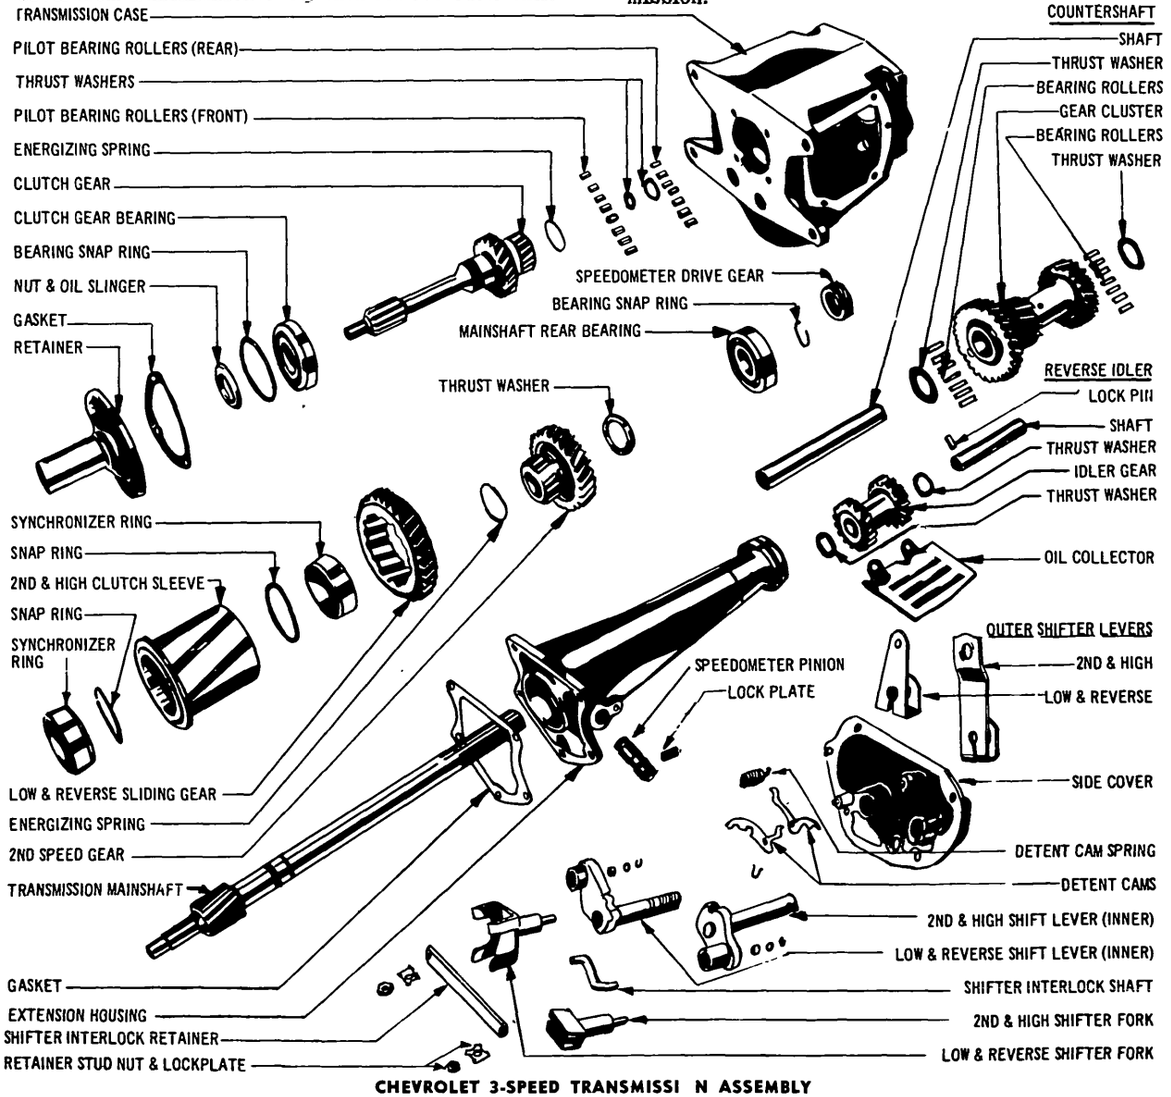
▷*SYNCHRONIZER ASSEMBLY CAUTION:* Synchronizer hubs and sliding sleeves are a selected assembly and should be kept together as originally assembled (the three keys and two energizing springs may be replaced if worn or broken). To remove keys and springs, push hub from sliding sleeve. The keys will fall out and the springs can be removed. Reinstall by placing the two energizing springs in position (one on each side of hub), so that tanged end of each spring falls into same keyway in hub. Place keys in position and hold them in place while sliding hub into sleeve.

Reassembly: From rear of mainshaft, assemble first and second gear synchronizer assembly on mainshaft (tapered end of clutch sleeve toward first speed gear), use Tool J-5746 to press first gear sleeve on shaft in an arbor press. Install first speed gear synchronizer blocker ring so that notches in ring correspond with keys in synchronizer hub. Install first speed gear (with hub toward front) and first speed gear thrust washer (grooves in washer must face toward gear). Press rear bearing on shaft (snap ring groove toward front of transmission) using Tool J-5746. Choose the correct selective fit snap ring and install it in groove behind rear bearing (*CAUTION - Always use new snap ring when reassembling transmission and do not expand ring further than is necessary for assembly*). From front of mainshaft, install second speed gear synchronizer blocker ring so that notches in ring correspond to keys in synchronizer hub. Install second speed gear with hub of gear toward back of transmission, and install the second and third speed gear spacer (needle bearing). Install third speed gear with hub to front of transmission, and the third speed gear synchronizer blocker ring (notches to front of transmission). Install third and fourth speed gear synchronizer assembly (hub and sliding clutch sleeve taper toward the front) making sure that keys in synchronizer blocker ring correspond to the notches in third speed gear synchronizer blocker ring. Install snap ring (.086-.088" thickness) in groove in front of the third and fourth speed synchronizer assembly (*NOTE* - With the correct size snap ring, the third speed gear will have correct amount of end play which will be .010-.015" maximum, with the third and fourth speed clutch hub forward against the snap ring). Install rear bearing retainer plate. Spread the selective snap ring (use largest ring which will fit in groove) on plate to allow it to drop around rear bearing, and press on end of mainshaft until snap ring engages groove in rear bearing. Install reverse gear with shift collar to rear. Press speedometer drive gear onto mainshaft using a suitable press plate. Position speedometer gear to get a measurement of 4½" from center of gear to flat surface of rear bearing retainer plate.

EXTENSION CASE: Reassembly - Place ball detent spring into detent spring hole and start reverse shift shaft into hole in boss. Place detent ball on spring and, holding ball down with a suitable tool, push shifter shaft into place and turn until the ball drops into place in detent on shifter shaft detent plate. Install shifter fork (*NOTE - Do not drive shifter shaft locking pin into place until extension case has been installed on transmission case*). Line up locking pin hole in rear idler shaft with hole in boss. Install idler shaft and lock in place with pin. Install new expansion plug behind idler shaft, using sealing compound on plug.

TRANSMISSION CASE: Reassembly - Install roller spacer (6.050" long) in countergear, then, using heavy grease to retain them, install 20 rollers in first gear end of countergear, two .050" spacers, 20 more rollers, and a .050" spacer on top of second race of rollers. Install the same amount of rollers and spacers in the same order in the other end of countergear. Rest transmission on its side with side cover opening upward. Place countergear tanged thrust washers in position, retaining them with heavy grease and making sure that tangs are resting in notches in case. Set countergear in place in bottom of case, making sure that tanged thrust washers are not moved out of position. Press front bearing onto clutch gear, with snap ring groove to front, using Tool J-5746. Install spacer washer and selective fit snap ring in groove on clutch gear ahead of front bearing. Install clutch gear and bearing assembly through side cover opening and into position in transmission front bore. Tap lightly into place with a plastic hammer. Place snap ring in groove in front bearing. Lift countergear, mating fourth speed gear of cluster with clutch gear, then install countershaft into position from rear of case (*NOTE* - Be sure thrust washers remain in place). Install woodruff key in end of countershaft and press shaft into place until shaft is flush with rear face of case. Attach a dial indicator to case so contact button of indicator rests against face of a gear on countergear cluster and check endplay of countergear which should not be in excess of .025". Install the fourteen pilot roller bearings into clutch gear, using heavy grease to retain them in place. Using heavy grease, place gasket into position on front face of rear bearing retainer. Install fourth speed synchronizer blocker ring on clutch gear with notches toward rear of transmission. With front face of transmission case facing down, install the mainshaft assembly into case, making certain that notches on fourth speed synchronizer blocker ring correspond to keys in synchronizer assembly. Install self locking bolt attaching rear bearing retainer to transmission case and tighten to 20-30 ft. lbs. Using heavy grease, install flat thrust washer onto rear face of rear idler thrust boss. Shift transmission into second gear and carefully install the small half of the reverse idler gear into place along side of thrust washer (notches toward rear). From rear of case, insert rear half of reverse idler gear, engaging notches of portion of gear within transmission case. Using heavy grease, place gasket into position on rear face of rear bearing retainer. Install remaining thrust washer into place on rear idler shaft, making sure that tang on thrust washer is in notch in idler thrust face of the extension. Retain thrust washer in place with heavy grease. With transmission facing downward, forward speed gears in neutral, and the reverse shifter shaft as far forward as possible, lower the extension case onto transmission case. Engage reverse shifter fork with the reverse gear flange and lower the extension case into position while moving reverse shifter shaft rearward. Install three extension and retainer-to-case attaching bolts and tighten to 35-45 ft. lbs. Install one extension-to-retainer bolt and tighten to 20-30 ft. lbs. Use a sealing compound on lower right hand attaching bolt. Move shifter shaft to line up groove in shaft with holes in boss and drive in the locking pin. Install shift lever. Install front bearing retainer, gasket and four attaching bolts, using sealing compound on bolts. Tighten to 15-20 ft. lbs. Install shifter fork in each synchronizer (first and second speed gear shifter fork must have its flat surface facing the reverse idler thrust boss). Place both synchronizers in neutral, then install side cover gasket and carefully lower side cover into place. Install attaching bolts and tighten evenly to avoid distortion of cover. *NOTE - Use a sealing compound on side cover lower right hand bolt.*

CHEVROLET (PASSENGER CARS) 3-SPEED SYNCHRO-MESH



Chevrolet Pass. Cars (1957)
Chevrolet Corvette (1957)

DESCRIPTION: Transmission design is the same as used on 1955-1956 models with the exception that the gearshift interlock assembly has been changed in the side cover. See illustration for details.

REMOVAL: *See "Transmission" on Car Model pages.*

OVERHAUL: Service procedures are the same as for 1955-1956 models. *See "Chevrolet Synchro-Mesh Transmission" in 1955 Annual Data and note the following:*

Side Cover Disassembly & Reassembly: Remove side cover from transmission case, then remove outer shifter lever clamp bolts and pull levers from shafts. Remove nuts and locks and remove shifter interlock retainer. This will allow removal of shifter shaft and fork assembly and cam assembly, or interlock from cover. Replace necessary parts and install shifter interlock retainer. Install outer shifter levers on shafts and install clamp bolts. With transmission gears in neutral and shifter forks in neutral, install cover to transmission, using a new gasket. Tighten retaining screws tightly. *(NOTE* - Hump on first and reverse shifter fork must be toward rear of transmission). Attach control rods to shifter levers, then refill transmission.

CHEVROLET 3-SPEED TRANSMISSI N ASSEMBLY

HUDSON NASH, RAMBLER

Hudson, Nash, Rambler Rebel (1957)

DESCRIPTION: **Warner.** Three speed, constant-mesh, all helical gear type. Synchro-mesh (second & high), sliding gear (low & reverse). Side cover plate contains shifting shafts and interlock assembly.

► *TRANSMISSION HOUSING NOTE:* The four units of the transmission housing (transmission case, adapter plate, rear housing & extension adapter) are similar in appearance to units used with overdrive transmissions, however, only the transmission case and extension adapter are interchangeable with overdrive transmissions.

TRANSMISSION REMOVAL: *S e "Transmission" on Car Model pages.*

OVERHAUL

► *OVERDRIVE TRANSMISSION DISASSEMBLY NOTE: See "Warner R10 Overdriv " f r ov rdriv disassembly, then proceed in same manner as for synchro-mesh transmission (without overdrive) b low.*

DISASSEMBLY: Drain transmission, place in holding stand, then proceed as follows:

Extension Adapter: Remove extension from transmission rear housing and remove oil seal from extension adapter, using Tool J-2626.

Rear Housing: Remove bolts attaching housing to adapter plate and remove housing. Remove both lock rings at speedometer gear and remove gear from shaft, then remove Woodruff key. Drive bearing from housing, using a brass drift.

Transmission Cover & Shift F rk Assembly: Remove screws attaching cover to transmission case and remove cover (including shift forks). Check interlock sleeve and clearance by placing one shaft "in gear" with the other in neutral and measure clearance between interlock sleeve and cam of the "in gear" shaft. Clearance should be .002-.008" (four different length sleeves are available in .005" variations for adjustment). Remove shift levers and forks by tapping shift shafts from cover *(CAUTION - Be car ful not to lose int rlock sleeve, balls, spring, or pin).*

Clutch Shaft Bearing: Remove bearing cap and gasket, then remove clutch shaft snap ring, spacer washer, and bearing lock ring. Using Bearing Puller J-6654 and Thrust Yoke J-6652, remove front bearing from clutch shaft *(NOTE - Clutch shaft cann t b rem v d from front of transmission case).*

Main Shaft: With front bearing removed from clutch shaft, pull shaft as far forward as possible. Separate main shaft and its components from clutch shaft, then slide main shaft assembly out through rear of transmission case. Remove clutch shaft through rear of case and remove the 14 needle bearings and oil baffle. Place mainshaft assembly on bench and remove synchro-clutch spacer washer and lock ring. Remove synchro-clutch, second speed gear, and first and reverse sliding gear from mainshaft. If the large bearing in the adapter plate requires replacement, remove snap ring in adapter and and tap mainshaft and bearing from adapter. Remove

CONTINUED ON NEXT PAGE

HUDSON, NASH, RAMBLER (C ntinued)

snap ring on mainshaft and press bearing off shaft.

Countershaft & Gears: Using a dummy shaft machined to .870" x 8 1/16", drive countershaft out rear of case. Remove countershaft gear, with dummy shaft in place, through rear of case as an assembly.

R v rs Idl 'r G ar & Shaft: Drive reverse idler gear shaft out through rear of case using a brass drift.

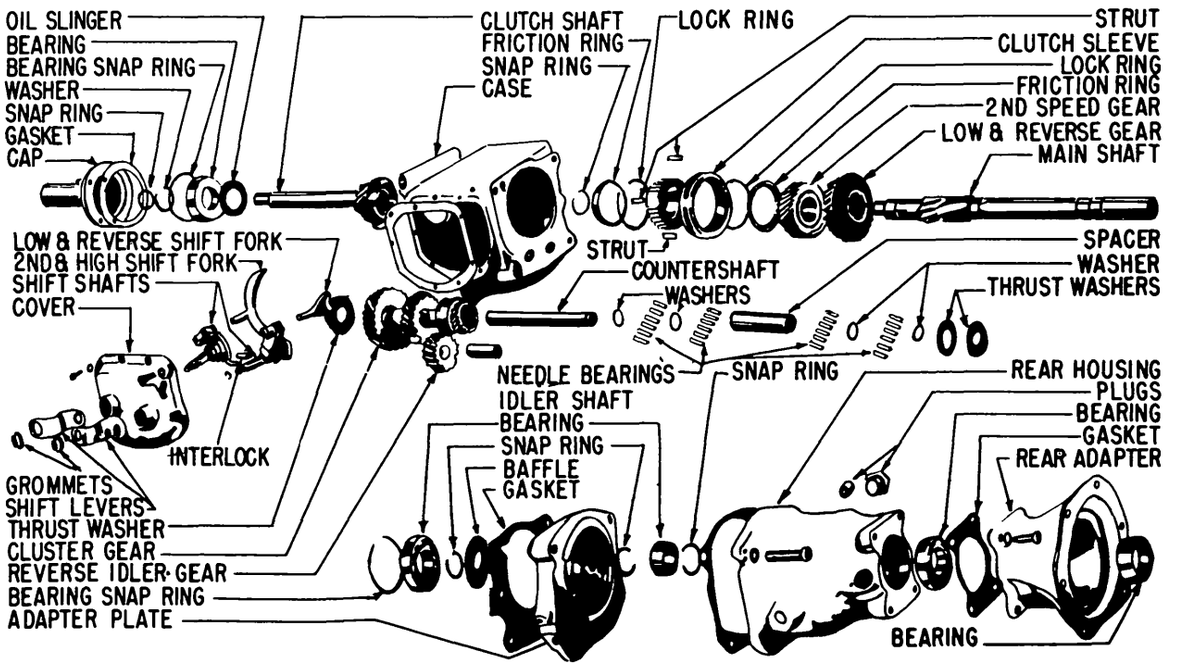
INSPECTION: Wash all parts in solvent and blow dry with air. Check all gears for worn or chipped teeth (check wear of gear bore by sliding gear onto a new shaft, replace if found to be loose). *(NOTE - If a transmission gear is replaced, the gear with which it meshes should also be replaced).* Check bearings for cracked races, worn or scored balls. Install gears on mainshaft and check for a smooth fit without excessive play between splines. Inspect synchro-clutch and friction rings. Check fit of taper on cones of second speed gear and clutch shaft by installing friction rings. Replace rings if there is excessive play. Check transmission case for wear and scoring of bearing recesses, cracks, or other defects. Check clutch housing for runout which should not exceed .005" (total). Total runout of clutch housing bore should not exceed .003".

REASSEMBLY: Use new gaskets and oil seals when reassembling transmission.

Countershaft & Gear: With bearings and spacers installed in countershaft gear, and dummy shaft in place, install the thrust washers, indexing the two small projections on face of bronze rear thrust washer with grooves in countershaft gear, and projections of front bronze thrust washer with transmission case. Position the large thrust washer and install assembly in bottom of case. Install Reverse Idler Gear (see below), then install countershaft as follows: Properly align countershaft gear and front and rear thrust washers with opening in case. Enter countershaft into hole in rear of case and carefully press it through bore in countershaft gear, pushing the dummy shaft forward and out of the gear. Before driving the shaft flush to rear of case, install and align the Woodruff key.

R v rs Idl r G ar & Shaft: Install reverse idler gear with chamfered side of teeth toward front of transmission case. Align gear and install idler shaft from rear of case driving it in sufficiently to install the Woodruff key, then continue driving until end of shaft is flush with rear of case.

Clutch Shaft: Insert fourteen clutch shaft needle bearings in pilot hole at rear of clutch shaft using a coating of heavy lubricant to retain them in place during assembly. Insert clutch shaft through rear of case and pull it as far forward as possible, letting it hang downward at front of case (to provide greatest possible amount of room for installation of the mainshaft).



Mainshaft: Install bearing on mainshaft using Tool J-2995, and install the snap ring *(NOTE* - This snap ring is available in the following sizes: .087", .090", .093", .096". Select the thickest ring which will fit into retaining groove). Place oil baffle into adapter plate with concave side facing forward, then tap mainshaft and center bearing assembly into adapter plate. Install the large snap ring in groove in adapter housing *(NOTE* - This snap ring is available in the following sizes: .088", .091", .094",. .097". Select the thickest ring which will fit into retaining groove). Install first and reverse sliding gear on mainshaft with shifting collar toward the front. Install second speed gear with tapered cone toward front. If synchro-clutch was disassembled, check for proper assembly (the hub section and outer ring of synchro-clutch assembly are lapped and matched and are marked accordingly. Etching marks must match when properly assembled). Install synchro-clutch and friction rings on mainshaft, then install lock ring and spacer washer. Insert mainshaft from rear of transmission case, tilting the rear portion of the assembly downward to provide clearance for synchro-clutch and second speed gear to pass over countershaft gear. When synchro-clutch just clears countershaft gear, place clutch shaft in horizontal position and slide it into mainshaft. *(CAUTION - Be sure roller bearings in end of clutch shaft are not moved out of position).* Place clutch shaft and mainshaft assembly in its proper position in transmission case. Check synchro-clutch rings for proper location and freeness.

Rear Housing: Install speedometer gear and Woodruff key, then install snap ring on each side of gear. Place rear housing in position and secure with attaching bolts. Install rear bearing on mainshaft and into position in rear housing.

Extension Adapter: Install seal in rear of housing and attach adapter to transmission rear housing

Clutch Shaft Bearing: Place oil slinger on clutch shaft with concave side toward rear. Install large snap ring on bearing and place bearing on clutch shaft. Using Tool J-2995 and Thrust Yoke J-6652, install bearing into transmission case. When bearing is properly seated, place a spacer washer against bearing race. Install clutch shaft bearing snap ring *(NOTE* - This ring is available in the following sizes: .087", .090", .093", .096", .099", .102". Select the thickest ring which will fit into retaining groove). Install clutch shaft bearing without a gasket and check clearance between bearing cap and case with a feeler gauge. Install the necessary gaskets (furnished in .010" & .015" thicknesses) to take up all clearance between bearing cap and case. Install bearing cap and secure in place with four bolts.

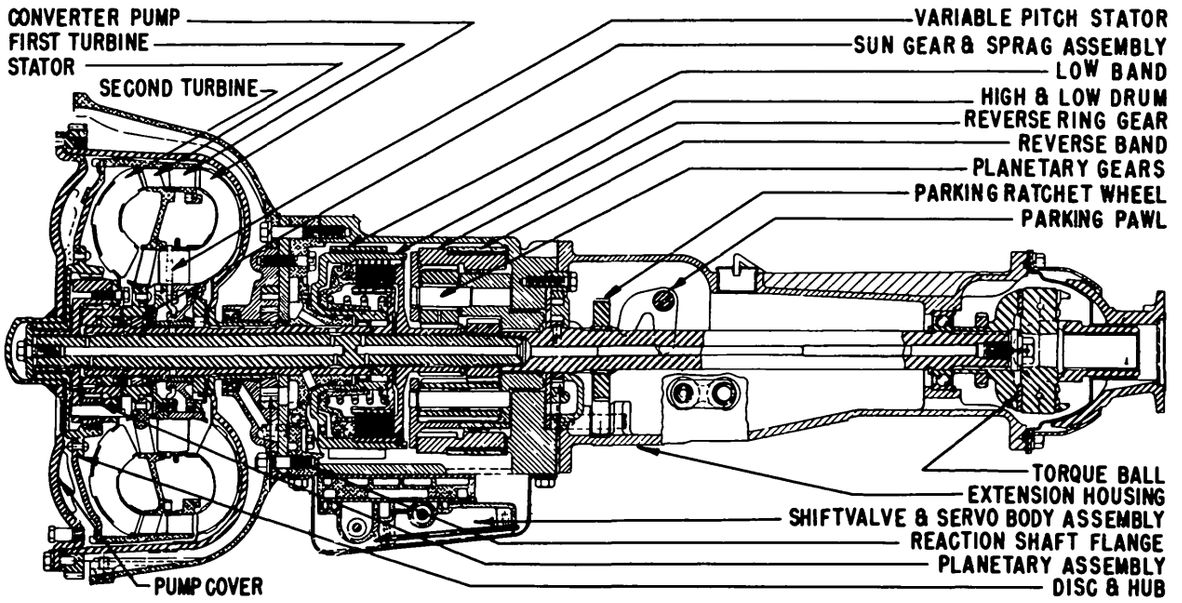
Transmission Cover & Shift Fork Assembly: Remove Thrust Yoke J-6652 from synchro-clutch. Place synchro-clutch and first & reverse sliding gear in neutral position. Place shift shafts and forks in neutral and install assembly on transmission case. Secure in position with attaching bolts.

HUDSON, NASH, RAMBLER TRANSMISSION ASSEMBLY

BUICK "VARIABLE PITCH" DYNAFLOW DRIVE

Buick, All Models (1957)

►CHANGES, CAUTIONS, CORRECTIONS



►*STARTING ENGINE BY PUSHING CAR:* Place shift control lever in "N" (Neutral) position until car reaches a speed of 15 MPH, then move control lever to "L" (Low) position and continue to increase speed until engine starts at approximately 25 MPH. After engine starts, return lever to "N" (Neutral) position for engine warm-up.

►*1957 (EARLY CARS) STATOR CONTROL VALVE STICKING CORRECTION:* Stator control valve may stick in the down position and allow stator blades to remain in high angle position at all times. If this condition exists, engine speed during part throttle in drive range will be abnormally high and there will be no evidence of increased engine RPM when accelerator is pressed to floor. Adjust stator control linkage (*see "Throttle Linkage Adjustment" on car model page).* If this does not correct the condition, check to see if there is a belleville type washer (dished washer) between valve operating lever and bearing nut. If one is found at this location, remove and discard it, leaving the flat washer. If stator control valve continues to stick, replace the valve assembly with Part No. 1179828. During reassembly of the high accumulator, adjust stator operating rod as follows: With crank against actuating valve and valve in extreme upper position, lever should be tight against stop pin when lock nut is tightened.

►*1957 VALVE BODY & VALVE PRODUCTION CHANGE:* The later valve body prevents oil being dumped above the screen as ports in the valve body have been changed. The later valve body is identified by absence of ports in valve boss. Valve is identified by a groove in valve land adjacent to actuating lever end. These parts are interchangeable; however, the adjusting procedure is different when later type valve body is used. *See "Valve & Servo Body Installation" under "Overhaul" below.*

►*1957 (EARLY CARS) TRANSMISSION OIL BYPASSING VALVE BODY SCREEN CORRECTION:* When oil pan is removed, check to see if there are openings between screen frame and valve body at the six corners of frame. If so, install an "0" ring, Part No. 1336936 (front pump "0" ring seal) by loosening oil screen screws and pressing the "0" ring under screen frame at all six corners. Tighten screws. Later type screen has been changed to eliminate the openings.

►*1957 LOOSE SHIFT CONTROL LEVER NOTE:* If the shift lever can be moved from "R" to "P" position without lifting lever, and no difinite stops are noticed at any point between these two positions, the stop pin at end of shift lever is worn or broken and the shift lever should be replaced. To install shift lever, proceed as follows: Remove shift lever to housing pin retainer and drive out pin. Pull lever out toward steering wheel and remove lever (*CAUTION - When removing lev r, take care to keep lever return spring from flying loose).* Position lever return spring on lever with closed end of spring engaged in groove of lever and open ends of spring pointing downward. Insert a Phillips screwdriver through spring coils and hole in lever, then insert lever into housing. Using needle-nosed pliers, rotate each end of return spring into lever housing. When spring is in housing, push lever inward until screwdriver makes contact with housing, then remove screwdriver and push lever in until lever retaining pin can be driven into position. Install pin retainer by rotating it on lever housing to lock it in position.

BUICK VARIABLE PITCH DYNAFLOW DRIVE (SECTIONAL VIEW)

►*1957 SHIFT LINKAGE RATTLE CORRECTION:* Install an anti-rattle spring washer, Part No. 1180307, between clevis and control shaft lever at bottom of steering column.

►*1957 DYNAFLOW OIL PAN BOLT TIGHTENING CHANGE:* To prevent overtightening of oil pan bolts and damage to oil pan gasket, resulting in oil pan leakage, tighten the bolts to 10-12 ft. lbs. This supersedes previous specifications of 15-18 ft. lbs.

►*1957 DYNAFLOW VALVE BODY PRODUCTION CHANGE & SERVICE NOTE:* To prevent the possibility of air being drawn into the hydraulic system during cornering, the valve body vent hole has been relocated to a position in the rear pump suction passage. Whenever the oil pan is removed on early 1957 cars, the control valve should also be removed and the original 1/8" vent hole should be plugged with a self tapping screw. A new hole should be drilled in the rear oil pump passage . *See "Overhaul" below.*

►*1957 DYNAFLOW FRONT PUMP OIL SEAL PRODUCTION CHANGE* A new silicone-rubber seal is being used in production and for service replacement. When installing the new seal, care must be taken to prevent tearing or damage. The retaining spring around sealing element must be in toward pump when installed.

DESCRIPTION

"Variable Pitch" twin-turbine torque converter and a hydraulically operated planetary transmission similar to 1955-56 models. *See "Buick Dynaflow Drive" in 1955 Annual Data or later Manual editions.*

LUBRICATION

►*1957 DYNAFLOW OIL CAPACITY INCREASE AND DIPSTICK PRODUCTION CHANGE:* The transmission oil capacity has been increased on all 1957 Dynaflow Transmissions by 1 pint. New dipsticks have been released for production and service replacement having the FULL mark located to indicate the additional fluid capacity. The later type dipsticks can be identified by the handle being bent at right angles to the dipstick. Earlier rods had a "looped" handle.

Check oil level at 1000 miles intervals and add oil as required. Drain and refill at 25,000 mile intervals.

►*CAUTION: Oil must be warm and engine must be idling when checking oil level. Warm up engine before draining.*

Checking Oil Level: With oil warm and engine idling with control lever in "P" (Parking) position, check oil level as indicated on dipstick in filler tube in engine compartment (on right side between battery and engine). If level is more than 1" below FULL mark on rod, add recommended oil to bring level up to FULL mark (CAU-

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (C nt.)

TION - Do not fill abov FULL mark). Distance between ADD OIL and FULL marks on dipstick is equal to approximately 1 pint of oil.

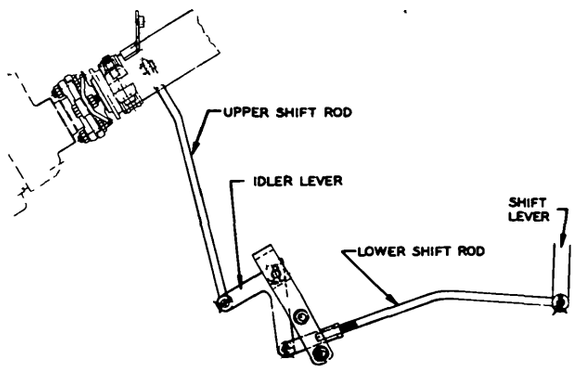
► *CAUTION: If oil l v l is consistently low when check- d (indicating loss of 1 pint or more per 1000 miles), ch ck transmission thoroughly for oil leaks.*

Draining & R filling: With oil warm, drain transmission case by removing drain plug in oil pan, drain torque converter, after removing bellhousing cover for access to drain plug, by loosening one plug and turning converter until second plug is downward, and removing this plug. Re-install and tighten all drain plugs. Install three quarts of recommended oil through filler opening in case. Start engine and allow it to idle with control lever in "P" (Parking) position, add additional oil to bring level up to point 1 3/4" below FULL mark on dipstick. Recheck oil level after transmission warmed up. Oil level should be at FULL mark on rod. *NOTE* - Transmissions with steel torque converter require 1 pint more fluid than transmissions with aluminum converter. See Production Change above.

► *CAUTION: DO NOT FLUSH transmission when changing oil.*

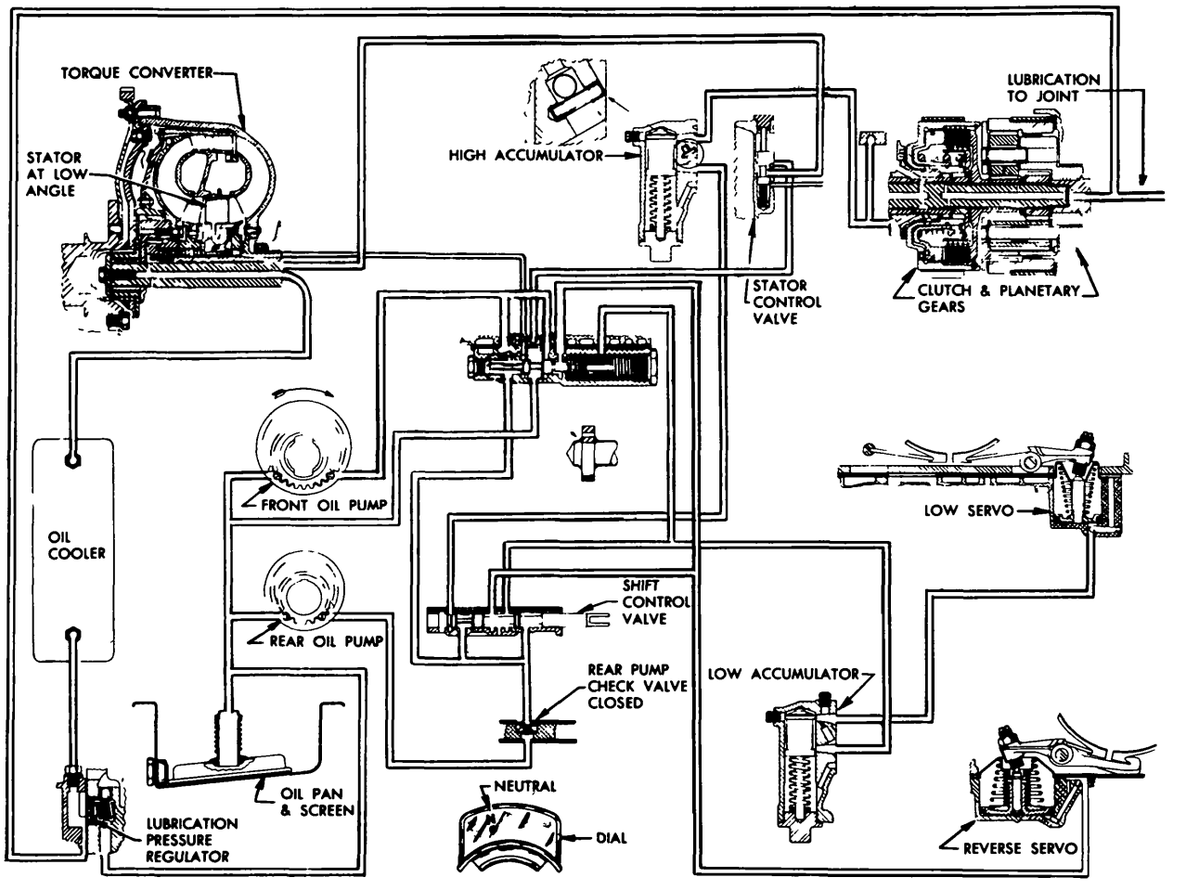
► *DIPSTICK NOTE: S e "Oil Capacity & Dipstick Producti n Chang " abov .*

Capacity (Cars With Early "Looped Handle" Dipstick) - Approx. 11 quarts (refilling after draining). Install an additional 1¾ quarts (after overhaul).



Capacity (Cars With Lat r "Right Angle Handle" Dipstick) - Approximately 11½ quarts(refilling after draining). Install an additional 1¾ quarts (after overhaul).

R c mm nd d Oil - Use only "Special Buick Oil for Dynaflow Drive" or Automatic Transmission Fluid, Type "A", with AQ-ATF number embossed on can.



LINKAGE ADJUSTMENT

Thr ttl Linkage & Stat r Control Linkage Adjustment: See *CARBURETOR n Car Model pages.*

Manual Shift Control Linkage Adjustment: 1) Move manual control lever carefully until transmission is shifted into its "D" (Drive) detent position (manual lever will seem to catch). Now move manual control lever toward "N" (Neutral), without lifting toward steering wheel, and notice how far it moves before contacting stop.

DYNAFL W MANUAL LINKAGE

VARIABLE PITCH DYNAFLOW HYDRAULIC CIRCUITS

2) Move manual control lever until transmission is in "L" (Low) detent position. Then move manual control lever toward "R" (Reverse) and notice how far it moves before it contacts stop.

3) If movement from "D" detent to stop is the same as movement from "L" detent to stop, shift control linkage is correctly adjusted. If the above check indicates linkage to be incorrectly adjusted, adjust linkage as follows:

4) With manual control lever in "D", raise car and loosen adjusting clevis locknut on lower shift rod. Remove clevis pin, cotter key and spring washer. Make sure transmission is in "D" detent (center position of five possible detents).

5) Move idler lever so that upper shaft rod is forced upward as far as possible. Then turn clevis until clevis pin will just slip in place without moving transmission shift lever. Shorten lower shift rod by turning clevis **four complete turns,** Install clevis pin spring washer and cotter key.

6) Lower car and check adjustment at manual control lever as indicated above. If movement of lever is not correct, readjust lower shift rod clevis slightly until movement is even.

7) Park car on a ramp or other grade with control lever in "P" (Park) position to determine whether parking lock holds securely. Then let car roll with control lever in "N" (Neutral) position and listen for a clicking or ratchet sound which indicates that parking lock pawl is contacting parking lock ratchet wheel.

8) If parking lock fails to hold or ratchet noise exists, jack car up so a wheel may be turned to rotate propeller shaft. Loosen linkage adjusting lever lock bolt on side of transmission rear bearing retainer. With transmission in "N" (Neutral), tap rear end of lever upward until a slight ratchet noise is heard when propeller shaft is

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (C nt.)

turned, then tap lever down just enough to eliminate the noise.

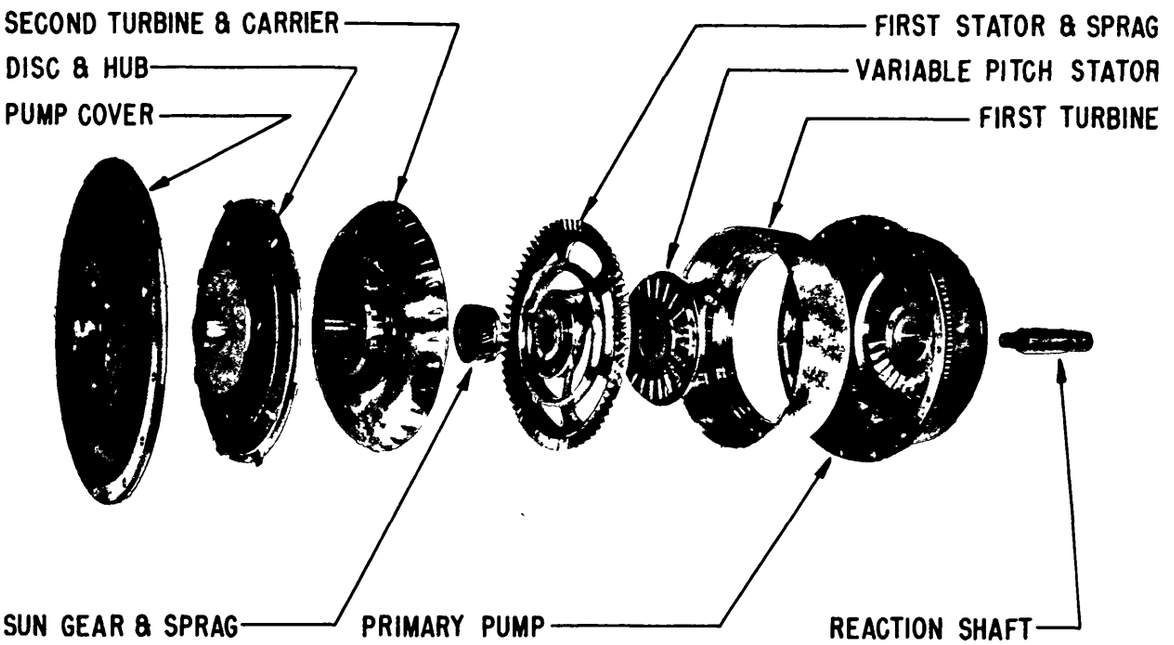
9) With transmission warmed up and engine idling at approximately 600 RPM, slowly move control lever from "N" to "D" position. The clutch should engage, as indicated by an immediate decrease in engine speed when center of dial pointer is midway between "N" and "D" on speed ratio dial. Slowly move control lever from "D" to "N" position. Clutch should disengage, as indicated by an immediate increase in engine RPM, when center of speed ratio pointer is midway between "D" and "N" on speed ratio dial.

10) If points of clutch engagement and disengagement are not as specified, and all preceding linkage adjustments have been correctly made, it will be necessary to remove transmission oil pan and adjust position of shift control valve. *See "Valve & Servo Body Installation" und r "Overhaul" below.*

11) After adjusting shift control linkage, make sure that dial pointer lines up with letters on face of dial. If necessary, adjust as follows:

C ntrol Dial Pointer Position Adjustment: Place manual control lever in "N" position. Remove dial by prying between dial and housing until dial snaps out. Loosen nut holding pointer to transmission shaft. Correct pointer alignment leaving 3/16" to 1/4" between pointer and back plate. Tighten nut. Snap dial back in place and recheck pointer alignment.

Neutral Safety Switch Adjustment: Check and adjust shift control linkage. Place shift control lever in "N" (Neutral) position. Insert a 3/32" drill through gauging hole in operating lever and through gauging hole in switch body *(CAUTION - Be careful not to move shift control lev r out of neutral position).* If gauging drill is now parallel with centerline of steering column jacket, switch timing is correct. If gauging drill will not go through holes or is not parallel, loosen two switch mounting screws and move switch sideways until gauge is parallel. Tighten screws. To check adjustment, turn on ignition switch, place shift control lever in "R" (Reverse) position, and make sure back-up lights are lit. Then set parking brake, place shift lever in "N" (Neutral) and make sure engine will start.



BAND ADJUSTMENT

► *BAND ADJUSTMENT CAUTION: Bands cannot be adjusted with transmission in car and adjustment ordinarily required only when transmission overhauled. BANDS MUST BE CORRECTLY ADJUSTED BEFORE TRANSMISSION INSTALLED IN CAR. See "Band Adjustment" in 1955 Annual Data or later Manual edition.*

TESTING

If performance not satisfactory, make following tests **with transmission thoroughly warmed up and at operating t mperature:**

Oil Lev l: Check oil level, add fluid as necessary to bring level up to FULL mark on dipstick, recheck performance with correct oil level. If car has been losing oil at rate of 1 pint or more each 1000 miles, make thorough check for oil leaks.

BUICK VARIABLE PITCH DYNAFLOW DRIVE TORQUE CONVERTER & BELL HOUSIN

Manual Control Linkage: Check and adjust manual control linkage. See Linkage Adjustment.

Hydraulic Control System Pressures: Use Transmission Oil Pressure Gauge J-2575. Support rear end of car solidly with wheels off floor so that transmission can be operated. Remove transmission cover in floor pan for access to pressure take-off points.

Connect gauge and make tests as follows:

Front Oil Pump - Connect pressure gauge at pipe plug opening on left side of transmission case. Run engine at 500 RPM, check pressure with selector lever in **Low, Drive, and Reverse ranges.** Repeat tests at 1000 RPM, and at 1800 RPM **in Low and Reverse only.** See table below for correct pressures. Low or erratic pump pressures indicate air leaks in suction lines, improper pressure regulator valve action. or excessive pump clearances.

Front Oil Pump Pressures

Selector Lever–	Low	Drive	Reverse
500 RPM	120 lbs.	90 lbs.	120 lbs.
1000 RPM	180 lbs.	90 lbs.	
1800 RPM	180 lbs.	90 lbs.	

Rear Oil Pump - Connect pressure gauge at pipe plug opening in lower flange at front end of rear bearing retainer. Run engine at 500 RPM, check pressure with selector lever in **Low & Drive Range.** Repeat test 1000 RPM and 1800 RPM. See table below for correct pressures. Low or erratic pump pressures indicate air leaks in suction line (this will affect both pumps), improper pressure regulator valve action, excessive pump clearances or leaks in valve and servo body passages between pump and regulator valve.

Rear Oil Pump Pr ssur s

Selector Lever–	L w	Driv
500 RPM	90 lbs.	90 lbs.
1000 RPM	180 lbs.	90 lbs.
1800 RPM	180 lbs.	90 lbs.

High & Low Accumulator - Connect pressure gauge at pipe plug opening on top of accumulator body (**High**–left side of car); (**Low**–right side of car). Place selector lever in **Drive Range** (High Accumulator Test); **L w Range** (Low Accumulator Test). Run engine and check pressures at speeds indicated in tables below. Low accumulator pressure may be caused by leakage past accumulator body gasket. If accumulator pressure more than 10 lbs. lower than front pump pressure, check for leakage between accumulator and multiple disc clutch and for restricted or plugged metering orifice in accumulator dump valve.

Accumulator Pr ssur s

Selector Lever–	L w	Driv
500 RPM	115 lbs.	80 lbs.
1000 RPM	175 lbs.	85 lbs.
1800 RPM	175 lbs.	85 lbs.

Stator - Connect pressure gauge at pipe plug opening on left end of reaction shaft flange. Test pressure in **Drive Range** at 500 RPM, 1000 RPM, and 1800 RPM.

Stator Pressur s

Sel ct r Lev r -	Driv
500 RPM	10 lbs.
1000 RPM	70 lbs.
1800 RPM	75 lbs.

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)
TROUBLE SHOOTING

▷*EXCESSIVE DYNAFLOW WHINE CORRECTION: (This condition is usually the result of excessive clearance between input shaft and bearing in the reaction shaft).* If transmission is to be disassembled to correct whine, perform the following:

1) Remove converter cover, twin turbine assembly, and sun gear, then mount dial indicator on end of input shaft with indicator button contacting reaction shaft. Position indicator button 90° to left of top center (facing end of shaft) then move input shaft away from and toward indicator while noting the gauge reading. Repeat this check at 45° to left of top center. If dial reading exceeds .005", excessive clearance exists between input shaft and bearing in reaction flange.
2) Before replacing bearing, remove reaction flange assembly and input shaft and observe the following: (a) Inspect bearing surface on input shaft. If surface appears abnormally rough or scored, replace input shaft; if not, polish journal area with crocus cloth. (b) Inspect the two oil seal rings toward rear of input shaft and the mating surface in the reaction shaft for scoring or other damage. If reaction shaft or input shaft shows evidence of scoring or other damage, replace worn or damaged parts.
3) If inspection reveals that condition of reaction shaft and input shaft are satisfactory, replace only the input shaft bearing (see Overhaul data).
4) If input shaft, reaction flange, or the bearing requires replacement, it will be necessary to replace the converter sun gear and planet pinions. *NOTE*—When installing reaction flange service bushing, be sure the assembly is supported on rear end of reaction shaft to prevent distortion of aluminum reaction flange.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With selector in any Range (rear wheels free). If car will not move for 1-8 minutes after standing over night—Check front pump oil pressure (see Testing) after allowing car to stand for several hours. If zero pressure noted, check pump for excessive clearances allowing pump to lose its prime. Check alignment of bell housing and converter primary pump hub.

▷*CAUTION—If this condition found, inspect Clutch and Bands for excessive wear due to slippage caused by low oil pressure.*

If car will not move after extended operation in Reverse—Check for air leaks in pump suction line (at rear oil pump gaskets), or excessive clearance in front pump (at pump gears and covers). Check alignment of bell housing and converter primary pump hub.

2) With selector in any Range (rear wheels locked). Parking lock engaged. Broken parts in transmission or rear axle. Parking brake applied.
3) With selector in Drive Range. Check front oil pump pressure and High Accumulator pressure. If OK, check for sticking Low Band Anchor Piston, remove and inspect Clutch for worn or sticking clutch plates, leaking clutch seal rings. If High Accumulator pressure low, also check rear pump Check Valve for correct installation and proper seating, check for leaks at accumulator body gasket, reaction flange gasket, clutch piston outer seal and clutch ball check valve, and leaks at sealing rings on reaction shaft flange and low drum.
4) With selector in Reverse Range. Check reverse band for displaced operating strut caused by too loose adjustment, improper installation, or broken band anchor (indicated by free up and down movement of band operating lever). If band assembly OK (no free movement of lever), check servo operation by running engine and shifting into Reverse. Remove Valve & Servo Body and check for reverse servo piston seal leaks.

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, or poor acceleration).

1) In all Speed Ranges. Low oil level. Incorrect manual control linkage adjustment. Air leak in oil pump suction pipe at oil screen sealing ring. Low front oil pump pressure caused by wear or excessive clearances in pump. Leaks at front pump cover or reaction shaft flange, pressure regulator valve, Valve & Servo Body gasket. Pressure regulator valve defective.
2) In Drive Range. Incorrect manual control linkage adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, check for leaking clutch sealing rings, sticking clutch piston, worn or sticking clutch plates.
3) In Low Range. Incorrect manual control linkage adjustment. Incorrect low band adjustment. Low band and drum worn or scored. If Low Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, remove Valve & Servo Body and check for gasket leaks or leaks at low servo piston seal.
4) In Reverse Range. Incorrect manual control linkage adjustment. Reverse band out of adjustment, strut out of place, or anchor broken. If front oil pump pressure low, remove Valve & Servo Body and check for gasket leaks and leaking reverse servo piston seal.

CAR CREEPS (Forward or Backward).

1) Creeps forward with selector in Neutral. Incorrect manual control linkage adjustment. Sticking low servo piston (check by removing low band adjustment cover). Sticking clutch caused by warped, binding, or incorrectly assembled clutch plates (not stacked properly with "dish" in same direction).
If Car Creeps only when engine accelerated to 2500 RPM—Check clutch vent ball checks in clutch piston and reaction shaft flange.
2) Creeps forward with selector in Reverse or backward with selector in Low. Incorrect manual control linkage adjustment.

SHIFTS ARE ROUGH.

1) Low-to-Drive Shift. Incorrect Low Band adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket and for dump valve or accumulator piston sticking down (top land of piston should be visible through top port in body). Sticking low band anchor piston (remove Valve & Servo Body to check), or incorrect piston location (see piston shimming data in Valve & Servo Body Reassembly). Valve & Servo Body gasket leaks. Clutch plates worn or binding.

EXCESSIVE CHATTER OR CLUNK ON STARTING

▷*CAUTION—Slight "clunk" when shifting into Low or Reverse is normal, and slight chatter when car starting to move in reverse (disappearing as soon as car in motion) is also normal.*

1) In Low & Reverse Range. Incorrect Low or Reverse Band adjustment. Engine and transmission mountings loose or incorrectly adjusted, thrust pad at transmission mounting broken (see Engine Mountings in Buick Special Data). Clutch plates warped, sticking, or incorrectly assembled (not stacked properly with "dish" in same direction). Reverse ring gear bushing worn. Planet pinion needle bearing rough.

NOISE IN TRANSMISSION.

▷*CAUTION—Hum or low whine in Neutral or Parking is normal (due to free rotation of all planetary gears) and slight hum in Low and Reverse may be expected.*

1) Buzzing Noise. Low oil level. Front pump check valve hanging up on edge of gasket between valve and servo bodies. If noise noticed in Parking or Neutral, pressure regulator valve clearance in body may be excessive or orifice in valve land oversize (correct by replacing valve and body).
2) Clicking Noise. If noticed in all ranges, may be caused by foreign material in converter. If noticed only when car in motion, may be caused by parking lock pawl contacting ratchet wheel due to incorrect manual control linkage adjustment.
3) Abnormal Hum or Whine (see Caution above). If noted in all ranges, may be caused by worn parts or excessive front pump clearances (front pump noise will increase in Low and decrease at car speeds above 45 MPH. in Direct Drive). Check front pump for excessive clearances by testing for low pump pressure. If noise noted in all ranges except Direct Drive, may be caused by trouble in planetary gears (gears locked out in Direct Drive).
4) Squealing or Screeching following installation of Front Oil Pump. Pump driving gear installed backward.

▷*CAUTION—Above condition must be corrected WITHOUT FURTHER OPERATION OF TRANSMISSION or severe damage will result.*

REMOVAL FROM CAR

Transmission and torque converter are removed as an assembly as follows:

▷*TRANSMISSION REMOVAL & INSTALLATION CAUTION:* Before removing transmission or disconnecting it from engine disconnect exhaust pipes from manifolds and loosen front muffler joints. After transmission is installed reassemble the exhaust system making sure that pipes are centered in frame member holes and that system is free from binds.

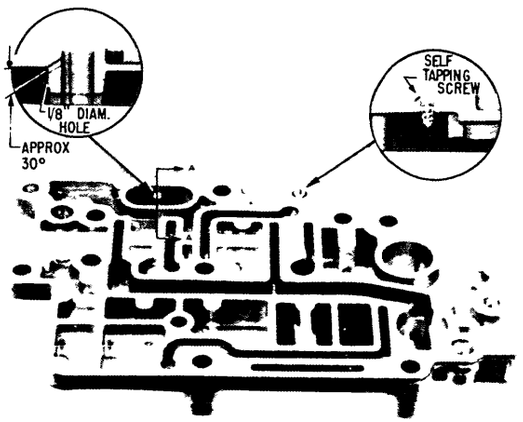
1) Raise car so that frame side rail is at least 20" off floor and place stands at front and rear to support car.
2) Disconnect torque tube from torque ball and move rear axle back to disengage propeller shaft from universal joint. Remove converter housing cover. Turn flywheel until one converter drain plug can be loosened sufficiently to provide an air vent, then turn flywheel until opposite drain plug is straight down. Remove plug and drain oil from converter. Drain oil from transmission.
3) Remove bolts attaching converter to flywheel. Disconnect and remove oil cooler lines. Disconnect speedometer cable, shift rod from shift lever, and stator operating control rod from lever on high accumulator.
4) Place transmission jack or hoist in position and ad-

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (C nt.)

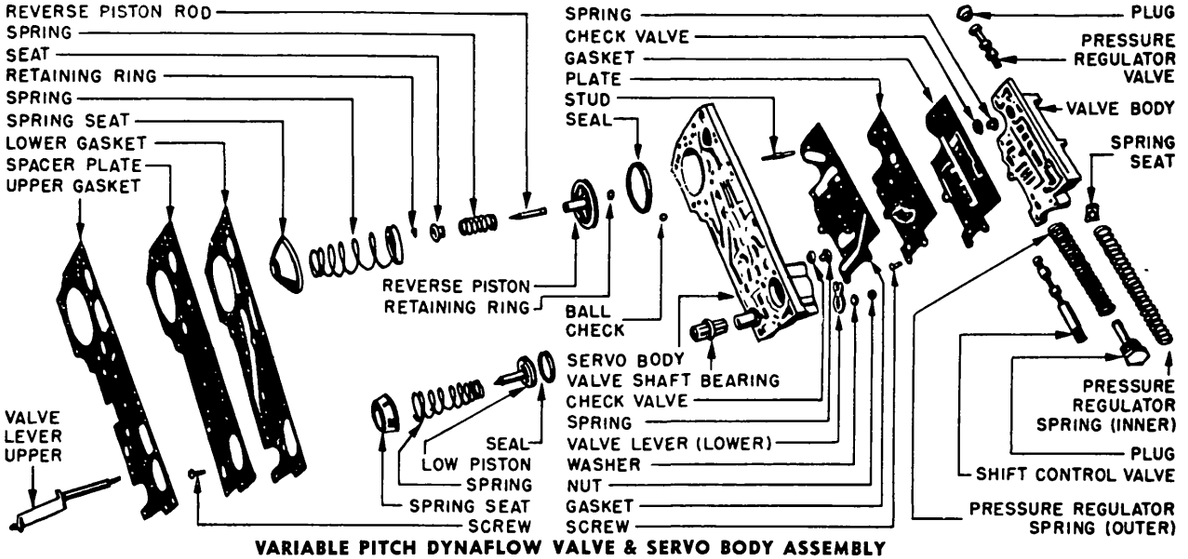
just it to securely support transmission. Remove four bolts that attach thrust plate to rear bearing retainer, then remove two nuts and plate which attach mounting pad to transmission support.

5) Raise engine and transmission just enough to relieve load on transmission support, remove bolts attaching each end of support to frame, then remove support and thrust plate as an assembly *(CAUTION - Shims may or may not be used to fill space between transmission support and frame. If shims are present note the number and location of shims so they can be installed in their original positions).*



6) Place suitable jack under rear end of engine lower crankcase so engine will be safely supported while transmission is removed. *(CAUTION - Do not use bar or hooks placed over frame side rails as brake pipes on top of left side rail will be damaged).* Lower transmission just enough so that converter housing bolts can be reached.

7) With engine and transmission supported by separate jacks, disconnect converter housing from engine crankcase. Move transmission rearward to disengage hub of converter pump from crankshaft, lower transmission and remove from car.



TRANSMISSION OVERHAUL

►*1957 VALVE BODY PRODUCTION CHANGE:* The later valve body prevents oil being dumped above the screen as ports in the valve body have been changed. The later valve body is identified by absence of ports in valve boss. Valve is identified by a groove in valve land adjacent to actuating lever end. These parts are interchangeable; however, the adjusting procedure is different when later type valve body is used. *See "Valve & Servo Bodies" below.*

►*1957 VALVE BODY PRODUCTION CHANGE & SERVICE NOTE:* To prevent the possibility of air being drawn into hydraulic system during cornering, the valve body vent hole has been relocated to a position in the rear pump suction passage. Whenever oil pan is removed on 1957 cars (early), the control valve should be removed and the original 1/8" vent hole should be plugged with a self-tapping screw. A new hole should be drilled in the rear oil pump passage as shown in the illustration.

VALVE BODY CHANGE

VARIABLE PITCH DYNAFLOW VALVE & SERVO BODY ASSEMBLY

►***EXCESSIVE DYNAFLOW WHINE CORRECTION:*** ***(This condition is usually the result of excessive clearance between input shaft and bearing in the reaction flange). See "Trouble Shooting" above.***

►*1957 DYNAFLOW SPRAG CLUTCH PRODUCTION CHANGE:* A new sprag clutch, Part No. 1179222, having two bronze drag strips on inner diameter to provide a bearing surface that rides on reaction shaft when freewheeling, is used in production and for service replacement. This later assembly is interchangeable with the assembly used in 1956 & early 1957 models.

►*1957 THRUST WASHER (BETWEEN PLANET CARRIER & CASE) NOTE:* There is no thrust washer (front or rear) at this location. DO NOT ATTEMPT TO INSTALL THEM.

Converter Twin Turbine & Sun Gear: Disassembly - Pry retaining ring out of groove in first turbine, insert screwdriver in hole in disc and lift disc and hub assembly out of first turbine. Lift second turbine and carrier assembly out of first turbine. Remove tanged thrust washer (this washer may remain in carrier or be found on top of sun gear). Slide sun gear assembly off the first turbine being careful to hold sun gear bearing in place. Lift first stator assembly out of first turbine. Remove bronze thrust washer and sprag from sun gear. Lay first turbine on bench with narrow edge of vanes up. Pry off cupped thrust washer, then remove first stator bearing and sprag assembly. Using a brass drift, carefully tap first stator bearing to remove bearing and cupped thrust washer.

C nv rt r Variabl Pitch Stat r: Disassembly - Remove stator thrust washer and selective spacers from rear side of stator, remove Tool J-5806 (installed on input shaft when converter removed from transmission), then remove free wheel rollers and springs from cam. Pry retaining ring from groove in stator blade rear carrier, and remove free wheel cam and three driving keys. Use screwdriver, Tool J-5826 to remove stator blade front carrier screws and lockwashers, then remove front carrier which is also held to rear carrier by two dowels. Tilt three or four blades toward the low angle position and slide the crank pin ends clockwise around stator piston grooves. The next blade and all succeeding blades will then have enough clearance to be removed.

Inspection (All Converter Parts)—Wash all parts in clean solvent and dry thoroughly. Inspect converter pump hub for scores and for wear caused by front pump seal. (If pump is suspected of leaking oil, it may be tested as described below). Inspect converter pump and turbines for cracked or damaged vanes. Inspect turbine carrier, planetary gear teeth, thrust washers, bushings and related bearing surfaces for wear, scoring or damage. Inspect stator free wheel rollers and cam for nicks or burrs, which should be removed with an Arkansas stone, and polished with crocus cloth. Discard any roller springs that are damaged or distorted. Inspect stator blades for distortion, cracks, loose on cranks, or other damage. Inspect piston oil seal ring and bore of blade carrier for scoring or wear. If bushings of carrier are worn, they should be replaced, using installer tool J-5913. If second turbine or the carrier must be replaced, use care in separating them to avoid damage to the good part. With second turbine suitably supported, tap carrier free of counter-bore in turbine, using a hammer and a hardwood dowel or other soft punch. ***CAUTION—Do not drive against surface of thrust boss in carrier.***

Testing Converter Pump for Leakage: *(NOTE*—Prepare a special stopper to close opening in converter pump for testing, as follows: Using ¼" steel plate, cut a disc 3¼" in diameter and drill a ¼" hole in the center. Install a ¼" x 2¾" bolt thru hole and braze head of bolt to plate to seal bolt hole. From

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)

a piece of 1/8" rubber, make a gasket 3 1/4" O.D. x 1 7/8" I.D. and cement this gasket to side of disc from which the bolt protrudes. Drill a 1/4" hole in a piece of plate 1/4" x 1" x 2" and install this on bolt, retaining it in place with a nut). To test pump, install the plate (with rubber washer) over inside surface of pump hub, securing it in place with the 1/4" x 1" x 2" plate against outside surface of pump hub. Tighten clamp nut sufficiently to make stopper air tight. Install pump cover with seal and tighten all bolts to 25-30 ft. lbs., in same sequence as used for installation of torque converter (see Reassembly of Transmission below). Install one drain plug, and install a Barrett fitting No. 365 in other drain hole. Tighten parts securely. Attach air hose to Barrett fitting and fill pump with compressed air at 80 to 100 lbs. per sq. in. Submerge pump in water tank and check for leaks. *CAUTION—After pump cover seal is used for this test, it should not be used when rebuilding the transmission.*

Variable Pitch Stator: Reassembly - *NOTE - A special fixture which can be made locally is required for reassembly of the stator. See Stator Fixture Note below.*

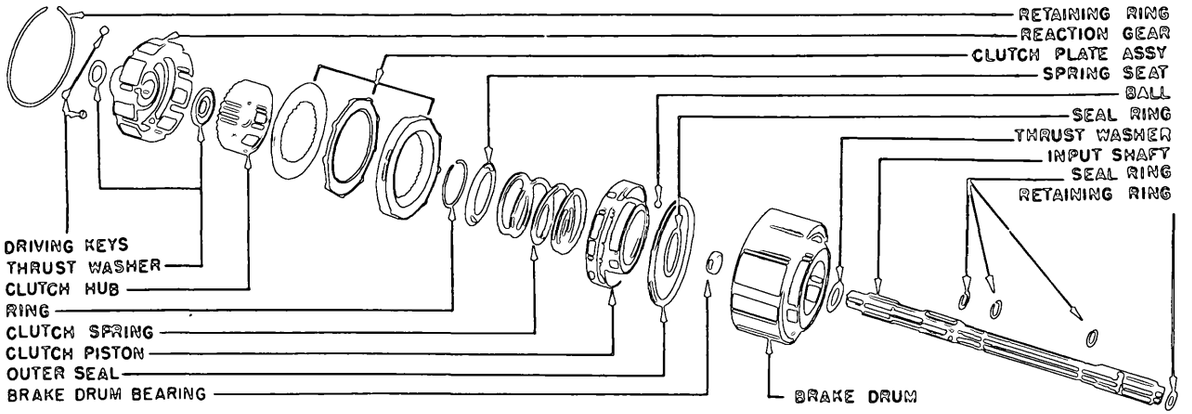
1) Insert stator piston and oil seal in rear carrier and push it to the extreme forward position. Place rear carrier on center block of fixture to hold piston in position.

2) Place stator outer ring on two outer blocks of fixture. with crank pin up. Holding the blade in the approximate "low pitch" position insert the crank pin in the outer ring. Then rotate the blade to bring the crank throw into the piston groove. Hold the piston, blades, and outer ring together while installing the blades

3) Install the remainder of the blades, working in a clockwise direction. To insert the last blade it will be necessary to tilt the adjacent three blades.

4) Install the front carrier and bolt into place. Be sure that blades operate freely in carrier. Complete the assembly of stator as indicated for first type stator (above).

▷Stator Fixture Note—The fixture is composed of four blocks of wood as follows: One piece 3/4" x 3 1/2" x 11" (base piece). One piece 3/4" x 3" x 2" (center piece). Two pieces 1 1/8" x 3 1/2" x 2 1/4" (end pieces). Place base piece on bench and position center piece in center of base piece so that each end of center piece is 1/4" from edge of base. Position the two end pieces on extreme ends of base piece so they lay lengthwise across base piece flush with end and sides. Stator hub will rest on center piece and ring will rest on the two end pieces for installation of the blades.



Converter Twin Turbine & Sun Gear: Reassembly - 1) Install sprag in bore of sun gear with shouldered end toward outside then carefully press bearing into place. Check operation of sun gear sprag clutch by sliding sun gear assembly on reaction shaft with gear end toward front of transmission. When viewed from front of transmission sun gear must rotate freely clockwise and lock in a counterclockwise direction.

2) Lay first stator on bench with thin edges up. Place first stator sprag in hub of first stator with shoulder down. Install one bronze bearing and cupped thrust washer on each side of sprag. Check operation of first stator sprag clutch by sliding the first stator on reaction shaft with thin edges of blades toward front of transmission. The first stator must turn freely clockwise and lock in a counterclockwise direction when viewed from front of transmission.

3) If second turbine was separated from carrier, make certain that counterbored recess in turbine and mating surfaces of carrier are clean and free of burrs, and apply a film of oil to these surfaces. Support carrier on suitable blocks, install several pinion pins to serve as pilots, then place turbine in position so that carrier is squarely started into recess in turbine. Use a hammer and hardwood dowel to tap turbine down over the carrier. Avoid distortion of turbine by using light blows applied midway between holes and alternated from side to side to keep parts square with each other. *(CAUTION - If turbine cannot be assembled on carrier with moderate force, remove it and check for burrs in counterbored recess).* With turbine and carrier supported on wood blocks, hub side down, assemble and install the four pinions as follows:

4) Place planet pinion on a thrust washer, install 22 needle bearings in pinion and place a thrust washer on top of pinion. *(NOTE* - A loading tool can be made locally from a piece of 3/8" steel rod, 11/16" long which will simplify loading and installation of pinion). Place assembled pinion in carrier and install a pinion pin with notched end up. After loading tool is pushed out of carrier, slide a block under pinion to hold it in place. Turn all pins so that notches face center of carrier. Install pinion lock plate so that it enters notch in all pins, then install four turbine-to-carrier bolts with lockwashers.

5) Place first stator in first turbine with thin edge of blades up. Place sun gear assembly on first stator with gear end up. Place thrust washers (with tangs) in planet carrier. Use chassis lube to prevent washer from shifting during assembly. Place second turbine and carrier assembly in first turbine, making sure pinions mesh with sun gear. Place thrust washer on carrier, then install first turbine disc and hub assembly over second turbine. Rotate disc until ring gear meshes with carrier pinions, then align driving lugs on disc with notches in first turbine and the assembly all the way down into turbine.

VARIABLE PITCH DYNAFLOW DIRECT DRIVE CLUTCH ASSEMBLY

6) Note that turbine disc retaining ring is "dished". Place ring in position with the "dish" upward so that inner edge will bear firmly against the disc when ring is engaged in groove of first turbine. Start one end of ring into groove in turbine, then twist ring upward in order to lay ring flat on the disc so that it can be progressively entered into groove all the way around. Make certain that ring is fully seated in groove and that inner edge bears against turbine disc. Tap inner edge down against disc if it has raised up.

Valve & Servo Bodies: Disassembly—Remove safety nuts and washers from body studs, lift off valve body and gasket, examine gasket for evidence of oil leakage. Remove shift control valve from valve body and rear pump delivery check valve and spring from servo body. Remove large pressure regulator valve plug from valve body *(CAUTION*—hold plug to prevent it flying off due to heavy spring pressure), remove springs and spring seat. Remove small valve plug and lift out pressure regulator valve. Remove valve body plate and gasket, examine gasket for evidence of oil leakage. Lift out front pump delivery check valve and spring. Take off nut and lockwasher attaching upper and lower valve operating levers in servo body and remove levers. Use wooden block placed across low and reverse servo spring seats to hold them in place with springs compressed while taking out spacer plate attaching screws, carefully relieve spring pressure *(CAUTION*—use care not to spring spacer plate or allow servo springs to fly out), lift off spacer plate and gasket, examine gasket for evidence of oil leakage. Lift out low and reverse servo spring seats, springs and pistons. Remove check valve from reverse servo feed channel.

Inspection—Wash valve and servo bodies and parts with clean solvent, blow out all passages and dry parts with air. Inspect bodies for cracks, damaged gasket surfaces, and scored piston and valve cylinders. Inspect valves and pistons for nicks, scores, scratches, or rounded shoulders (edges must be sharp to keep out foreign material which might cause sticking). Replace worn or damaged piston seals.

▷Piston Seal Installation Caution—Lip on seal must fit over SMALLER diameter land on piston.

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)

Reassembly—Install low and reverse servo pistons in servo body (CAUTION—use care not to damage seals), check to see that pistons move freely in body. Install piston springs and spring seats (small end of low servo spring in groove in piston, large end of both reverse servo springs in grooves in piston). Place check ball in reverse servo feed channel. Use new spacer plate gasket, compress servo springs and tighten all spacer plate attaching screws uniformly. Install both upper and lower operating levers with lower lever pointing to low servo cylinder and upper lever to reverse piston spring seat, tighten lever shaft nut to 15-20 ft. lbs. torque. Install front pump delivery check valve spring (large end down), and valve (ridged side up), then install valve body plate using new gasket and making sure that valve seats against plate (must not hang on gasket). Install pressure regulator spring seat, inner and outer springs, and valve plug in valve body, tighten plug to 20-25 ft. lbs. torque. Install pressure regulator valve (see that oil orifice in end land is clear and place this land outward), tighten valve plug to 20-25 ft. lbs. torque. Install shift control valve with slotted end of valve pointing toward large pressure regulator plug. Install rear pump delivery check valve (ridged face inward), and spring (large end upward). Install valve body on servo body using new gasket *(CAUTION—see that pump delivery check valve spring below gasket)*, tighten all stud nuts to 11-15 ft. lbs. torque.

▷Front Pump Tightening Sequence—Tighten nuts in following order: Top, Bottom, Right Center, Left Upper Center, Right Lower Center, Left Lower Center, Right Upper Center.

High & Low Accumulators: Disassembly—Remove retaining pin and check ball from high accumulator body (low accumulator does not have the check ball). Remove the pipe plug, cap, gasket, spring (2 in low accumulator) and piston from accumulator body. *(NOTE—Keep parts separated so same parts will be installed in same body)*. On high accumulator body only, remove clamp bolt, lever, bearing with seal, gasket, thrust washer and control valve crank, then remove valve stop with gasket, control valve and spring.

Inspection—Clean all parts with solvent, blow out all passages and dry with air. Check parts for excessive wear, scoring, nicks, burrs, and other damage. Remove nicks and burrs from pistons and valves by stoning but do not round off sharp edges of pistons and valves (edges must be sharp to keep out foreign material which might cause sticking). Check mounting face of accumulator body for flatness with a straightedge (face can be trued up by using emery cloth on a surface plate but all traces of emery must be removed). Replace accumulator assembly if body, or piston worn (these parts not furnished separately). Check piston for wear by placing it in cylinder (all parts clean and dry). Piston should slide freely as body is tilted back and forth.

Reassembly—Lubricate each piston and install it in the accumulator body from which it was removed. *(CAUTION—Start piston squarely into body, do not tap or force it)*. Install proper piston springs in each body. The high accumulator uses one heavy spring approximately 4 5/16". The low accumulator uses one shorter heavy spring and one inner spring. Install caps with new gaskets (do not tighten caps at this time). On high accumulator only, install spring, control valve and stop, then install crank with thrust washer, bearing with new gasket and seal (grooved side inward), operating lever and clamp bolt. Adjust operating lever on crank so that lever contacts its stop and the crank contacts the valve without depressing the spring, then tighten clamp bolt. Install pipe plugs in both accumulators and install check ball and retaining pin in high accumulator body. *NOTE—Accumulator body caps will be tightened at time transmission is reassembled.*

Reaction Shaft Flange & Oil Pump: Disassembly—Remove high and low accumulators from reaction shaft flange, using care to prevent the retaining pin and check ball from dropping out of high accumulator and being lost. Check gaskets for indications of oil leakage. Inspect input shaft bearing in front end of reaction shaft (see Production Change above). If bearing is damaged or excessively worn, remove outer bearing ring and then remove bearing, using Remover J-5822 installed on Remover J-1436 *(NOTE—Both types of bearings are removed in the same manner)*. Oil pump must be in place to support the reaction flange during bearing removal. If inner retainer ring remained in place in shaft make sure it is firmly seated in its groove, otherwise replace it. Check front oil pump bolts to make sure they are tight (loose bolts would be the cause of oil leakage around pump). Remove front oil pump body and gears, tapping body lightly with a mallet to free it. Remove front oil pump cover and gasket from reaction shaft flange, and check gasket for evidence of oil leakage. If the check ball located in clutch feed passage is free to drop out, remove ball to avoid loss in handling parts. Do not remove if securely retained by peened edge of hole.

Oil Pump Inspection & Repair—Clean pump parts with solvent and dry with air. Check pump gears and mounting faces of body and cover for excessive wear. Check front pump bushing for excessive wear or looseness which will require replacement of pump assembly *(NOTE—Check flywheel and primary pump hub run-out and bell housing misalignment if bushing worn or loose)*. Check front oil pump seal and replace if damaged or any evidence of leakage noted. Drive out old seal, coat outside of new seal with Permatex #3, start seal in place with deep groove in retainer outward, tap seal into place with wood block and mallet. Check following clearances and replace pump parts if excessive:

Pump Gear Side Clearance—Place straightedge across face of pump body and gears. Clearance between face of gears and straightedge should be .001-.0025" (front pump), .001-.002" (rear pump).

Pump Gear Clearances—Check pump gears with feeler gauge between gear teeth and crescent while pressing gear away from crescent. Clearance should be .005-.009" (front pump driven gear), .0045-.007" (rear pump driven gear), .010-.016" (front pump driving gear), .006-.012" (rear pump driving gear).

Pump Cover Gear Wear—Replace cover if gear bearing area scored or worn to depth of more than .001".

Reaction Shaft Flange Inspection—Wash flange in clean solvent and blow out all passages with air. Inspect surfaces of reaction shaft flange and transmission case for nicks or burrs and remove with a mill file. Inspect race for clutch drum roller bearings on rear end of reaction shaft. If this bearing is worn excessively or scored, replace reaction shaft flange *(NOTE—If reaction shaft flange is replaced, stamp transmission identification number in lower edge of new part in same place as on original flange)*. Check all studs for tightness and replace any with damaged threads. If stud threads are stripped in reaction shaft flange, it will be necessary to tap out the hole for installation of step studs which are available for service replacement. *(The 5/16"—18 step studs have a 3/8"—16 thread on flange end)*. Inspect the oil seal rings on hub of reaction shaft flange and replace if damaged in any way.

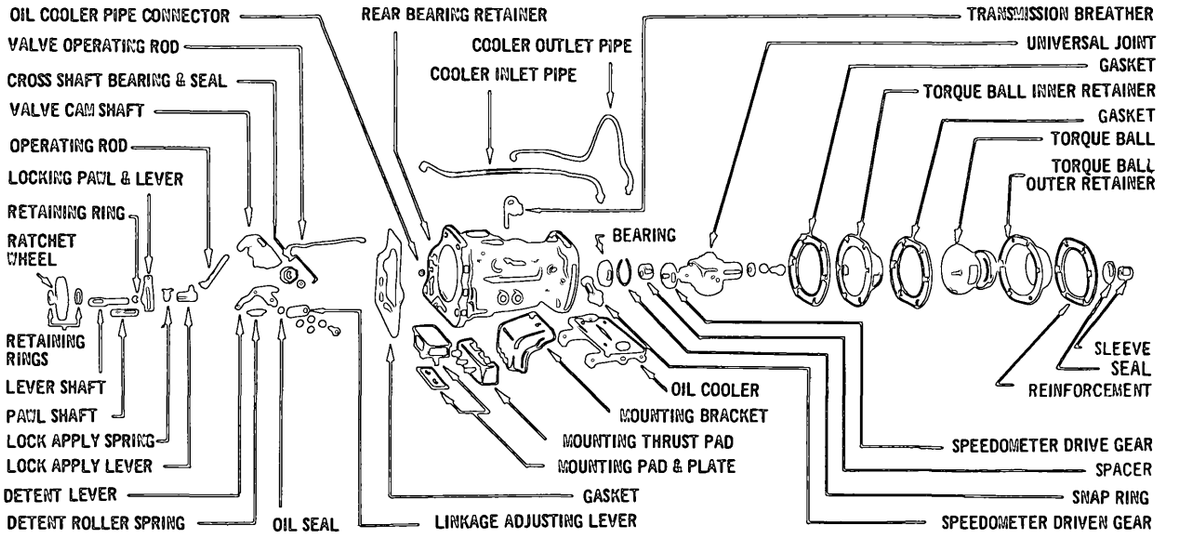
Reaction Shaft Flange & Oil Pump: Reassembly - If old input shaft was removed, first make sure that inner retaining ring is firmly seated in groove in reaction shaft, then install a new bearing, using Installer J-5816. Support shaft on wooden block to avoid damage and drive bearing into place with a light hammer until shoulder on tool contacts reaction shaft. Install outer retaining ring. Install check ball in clutch feed passage if ball was removed, then install a new gasket and pump cover on reaction shaft flange. Lubricate and install gears in front pump body. *(NOTE - Driving gear must be installed with beveled side outward so this side will be against cover when pump is installed. Reversing this gear will result in severe damage to transmission)*. Install oil pump on cover so the two dowel pins and the bolt holes match holes in cover, then install bolts and lockwashers. Tighten bolts to approximately 5 ft. lbs. in the sequence shown in illustration, and then tighten in same sequence to 25-30 ft. lbs.

Multiple Disc Clutch & Input Shaft: Disassembly - Remove reaction gear flange retainer ring and remove the flange driving keys with a pointed tool. Remove low range reaction gear, thrust washer, clutch hub and 12 clutch plates from drum. Install Clutch Spring Compressor J-2590 in clutch drum, placing slot in compressor ring over ends of spring seat retaining ring. Compress clutch spring sufficiently to remove retainer ring. Release pressure on clutch spring, making sure that spring seat does not engage retaining ring groove in drum, then remove spring compressor, spring seat and spring. Remove piston from drum *(NOTE - It may be necessary to rap open end of drum against a block of wood to remove piston)*.

Inspection—Wash parts in solvent and dry with air *(CAUTION—use only gasoline or kerosene on clutch bands and plates—do not use chemical degreasers or commercial solvents)*. Inspect and replace all clutch plates which are worn, scored, burred, or warped *(CAUTION—new plates must slide freely on clutch hub—tight plates will prevent full disengagement)*. Inspect oil seal ring on clutch hub and replace if damaged (ring has interlocked ends and is released by compressing ring and depressing one end while raising the other). Replace clutch piston outer seal if hardened, broken, or with turned lip (install new seal with lip extending over smaller diameter piston land). Inspect Low Range Band and replace if worn smooth without visible

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)



grooves. Inspect oil seal ring and replace if damaged (same type ring with interlocked ends as used on clutch hub). Check to make sure retaining ring in place in shaft groove. See that small bleed hole in piston is open and that check ball is staked in place (*CAUTION*—ball must be free to move in recess) If needle bearing in drum is excessively worn or scored, carefully remove it and install a new one, using tool J-5191. This tool will locate bearing flush with shoulder drum. Place numbered end of bearing, which is hardened, toward shoulder of tool to avoid distortion of cage.

Reassembly—Lubricate piston seal and inner surface of drum with light oil, install piston using extreme care not to distort or turn lip of seal. Top of piston should be approximately even with shoulder in drum when installed. Install clutch spring, use Compressor J-2590 to compress spring, install spring retaining ring in groove in drum, remove compressor. Place reaction gear on bench with flange upward and install all clutch parts in following order: Clutch Hub Thrustwasher, Clutch Hub (open end upward), and all clutch plates (see Clutch Plate Caution below). Bottom clutch plate should be internally splined (faced) type and top clutch plate externally splined (plain steel) type with the two types alternating in the assembly. Install drum and clutch piston assembly over reaction gear and clutch assembly with driving key recesses in drum and gear flange aligned. After drum pressed evenly in place, fully align driving key recesses by tapping reaction gear flange, install three driving keys and flange retainer ring.

▷Clutch Plate Caution—Externally splined (plain steel) clutch plates are concave or "dished" and these plates must be installed with "dished" face in same direction (either up or down). Check each plate with straightedge and stack plates with dished faces in same direction before beginning installation. *NOTE*—Internally splined clutch plates are flat and can be installed in either direction.

Rear Bearing Retainer: Disassembly—Remove spring from detent roller lever and support inside rear bearing retainer, remove adjusting lever on outside of retainer, then remove lever and support assembly. Disconnect parking lock operating rod from cross shaft by unscrewing rod end from cross shaft lever. Push clip from valve operating rod to remove clip and rod from cross shaft. Screw a ¼"—20 bolt into parking lock operating lever shaft and the lock pawl shaft and pull these parts from bearing retainer, then remove lock pawl and lever assembly. Remove cross shaft bearing, using a box wrench (a socket that does not fully engage bearing, or an end wrench will distort the bearing) remove cross shaft.

Rear Bearing Retainer Inspection—Wash parts in solvent and dry with air. Check parking brake pawl, pawl locking link, and ratchet wheel for worn teeth, cracks, or other damage preventing positive locking. Check valve operating cross-shaft and bearing for wear, remove and discard rubber seal in

VARIABLE PITCH DYNAFLOW REAR BEARING RETAINER & TORQUE BALL ASSY.

bearing. Inspect output shaft bushing in retainer for wear scoring, check clearance by inserting output shaft in bushing. Clearance should be .001-.006". Replace bushing with Bushing Remover & Replacer Tool J-2997 (not necessary to ream new bushing).

Universal Joint Inspection—Check for wear and excessive play between spider pins and bushings (should be .002-.004"). Check yokes for wear on shaft splines. Front yoke must be tight fit on output shaft (play will allow "snap" between forward and reverse), rear yoke backlash on propeller shaft should be .0005-.0045". Rear yoke clearance in torque ball bushing should be .004-.006" and bearing surfaces must not be scored.

Torque Ball Inspection—Replace torque ball and retainers if bearing surfaces scored or pitted. Inspect oil seal and replace if worn (use seal which has been soaked in neatsfoot oil), press seal squarely into place until flush with torque ball flange and with feather edge of seal pointing into torque ball. Check universal rear yoke for excessive wear at point where seal bears.

Reassembly—Install valve operating cross shaft, and cross shaft bearing. Install a new seal in bearing, with grooved side facing inward. Install parking lock pawl and lever assembly in rear bearing retainer, then install lock pawl shaft and operating lever shaft with tapped ends outward. Attach valve operating rod with retainer clip to cross shaft lever and snap clip into place over rod. Connect parking lock operating rod to cross shaft lever, using a lockwasher on threaded end of rod. Install detent lever and support assembly with a new seal in groove of shaft, then install linkage adjusting lever on shaft with nut and lockwasher. Attach adjusting lever to bearing retainer with bolt, plain washer and lockwasher, but do not tighten until the following detent adjustment is made.

Parking Pawl Adjustment—Temporarily install shift lever on cross shaft and shift parking pawl into parking position. Shift linkage adjusting lever at slotted end until pawl lock contacts the parking pawl, then tighten adjusting lever lock bolt, being certain to maintain contact between lock and pawl. Move shift lever back and forth to check detent adjustment. Parking lock must contact parking pawl when detent roller in deepest portion of parking notch of detent lever and should break contact at same instant that detent roller starts to move toward neutral position.

Planetary Gear Set: Disassembly—Take out three planet carrier screws and special lockwashers (use 7/32"Allen wrench), separate front and rear halves of planet carrier (hold carrier by output shaft, tap down on flange on front end). Lift out sun gear rear thrustwasher and reverse sun gear. Remove all planet pinion assemblies (three long low pinions, three short reverse pinions) by tapping shaft out of front half of carrier using care not to lose steel ball imbedded in end of each shaft to prevent shaft rotating in carrier. Disassemble pinion assemblies by removing thrustwashers and shafts from pinions and then taking out bearing rollers (long pinions have two sets of rollers separated by spacer, short pinions have one set of rollers).

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (C nt.)

Inspection: Wash all parts in solvent and dry with air. Inspect planet pinion shaft and rollers, replace if worn. Inspect all gear teeth for wear, remove all nicks and burrs by stoning. Replace bushing in rear end of planet carrier if worn or scored (use Bushing Remover J-3197, Bushing Replacer J-2996—new bushing may be installed either end first and need not be reamed). Inspect reverse band anchor for cracks. Replace reverse band if cracked or the lining worn smooth.

Reassembly—Assemble each planet pinion with its bearing rollers, thrust washers, and shaft (24 rollers in each reverse pinion, 20 rollers at each end of low pinion and separated by a spacer). Make certain that thrustwasher installed at each end of each pinion (lower washer against retaining ring on shaft, upper washer on outer end of shaft). Install planet pinion assemblies in carrier making certain that **steel ball imbedded in lower end of each shaft** (necessary to prevent shafts turning). Install reverse sun gear with bronze thrustwasher on top of gear, align assembly marks on both planet carrier halves when installing upper half (numbers stamped on dividing line during production), make certain that special lockwasher used on each carrier screw, tighten screws evenly to 25-30 ft. lbs. torque. Install reverse ring gear thrustwasher.

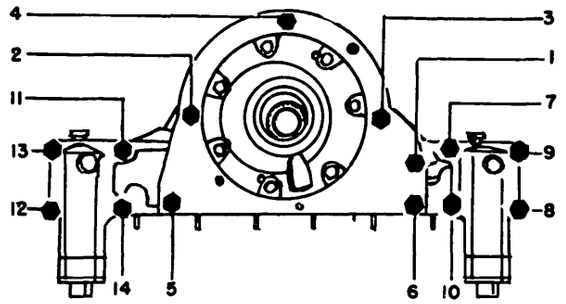
Transmission Case (Cleaning & Inspection): Wash case and blow out all passages. Inspect for cracks, and stripped bolt threads. Check machined surfaces for nicks and burrs and clean these up with a mill file. Check bushing in case for wear by inserting planet carrier in bushing and checking clearance with a feeler gauge. Clearance should be .002-.004". Replace bushing if clearance excessive or if scored.

Bushing Replacement—To remove old bushing, support case with rear end down, drive bushing out with tool J-3175-1 (part of replacer set). To install new bushing, place pilot J-3175-2 (part of replacer set) in rear oil pump recess in case, slip bushing over J-3175-1 and drive bushing into case from front side until bushing is flush with front surface of case wall which supports the bushing. **Bushing must be installed with wide deep ends of oil grooves toward rear of case.**

Flywheel & Primary Pump Run-out and Bell Housing Alignment Check: ***Make this check if front oil pump noisy, bushing and oil seal worn, or if oil leakage noted at Converter or Front Oil Pump Body.***

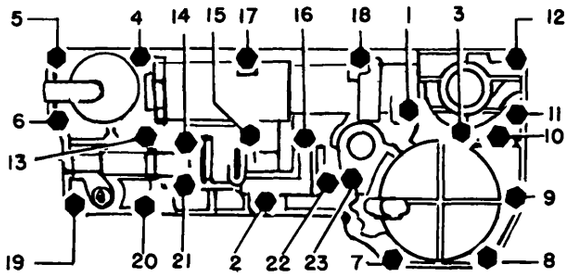
Flywheel Run-out—Remove all burrs from around drilled holes in face of flywheel, mount dial indicator on flywheel housing with strip of .005" shim stock between dial indicator and face of flywheel (clamp shim stock under a flywheel housing bolt so that it covers bolt holes and provides smooth surface for dial indicator pick-up). Turn flywheel **holding end thrust in one direction.** Run-out should not exceed .008". If excessive run-out cannot be corrected by tapping high side with mallet or by removing flywheel and cleaning up burrs at crankshaft flange mounting holes, install new flywheel and re-check run-out.

Primary Pump Hub Run- ut—With converter primary pump and bell housing installed, mount dial indicator on bell housing so that it bears against primary pump hub. If run-out exceeds .012" when flywheel turned, mark flywheel and primary pump, remove and re-install pump at point 180° from first position. If pump run-out still exceeds .012", install new primary pump and recheck run-out. When position found where run-out is less than .012", mark flywheel and pump with paint and **align these marks when transmission is finally reinstalled.**



Bell Housing Alignment—Mount dial indicator on oil pump driving lug on rear end of converter primary pump hub ***(CAUTION***—do not clamp indicator on bearing surface) so that it bears against rear face of bell housing at 3¾"" radius. Rotate flywheel **holding end thrust in one direction.** Run-out should not exceed .005". If run-out of bell housing face exceeds .005", cement paper shims of proper thickness to rear face of crankcase to bring run-out to .005" or less, with all bolts securely tightened.

Pilot Hole Run-out—Mount dial indicator and Hole Attachment KMO-30-F to bear against inner edge of pilot hole in bell housing. Run-out of pilot hole should not exceed .004". If run-out greater, remove bell housing and remove the two dowels, and reinstall bell housing, leaving bolts just loose enough to permit shifting housing by tapping with a lead hammer. Set up dial indicator as indicated above and bring pilot hole of bell housing within .004" run-out by tapping in required direction with a lead hammer. If it is not possible to move housing far enough, remove housing and drill bolt holes with a ½" drill. When bell housing is placed so that run-out is .004" or less, tighten all bolts securely. Ream the two dowel holes through housing and crankcase using Reamer J-2548-3 (17/32"), until this reamer bottoms in hole, then finish with bottoming Reamer J-4710-6 to provide full size to bottom of hole. Remove bell housing and install oversize dowels J-808-5 in crankcase.



REASSEMBLY

After overhaul of Major Components, make certain that all parts absolutely clean, oil moving parts with 10-W engine oil before installation, use ALL NEW GASKETS & SEALS. Tighten all parts evenly to specified torque and in correct sequence (see illustrations). Proceed in reverse order of disassembly directions and note all of following points:

Planetary Gear Set Installation: After reverse ring gear thrustwasher and reverse band installed in case (with Installing Clip J-2595 on band), rotate band 45° toward servo opening, insert anchor and engage hooked end of band, then rotate assembly back into position. Position band operating lever in place with strut shoulder toward inside of case, install anchor shaft **with tapped end outward.** If installation correctly made, adjustment screw will be centered in servo opening (lever has offset end). See that planet carrier front (steel) thrustwasher installed on carrier with three tangs engaging holes in carrier, install rear (bronze) thrustwasher in case with three tangs engaging holes in case, then install planet carrier. If correctly installed, chamfer on output shaft journal will be flush with rear end of transmission case bushing.

REACTION SHAFT FLANGE & ACCUMULATOR BOLT TIGHTENING SEQUENCE

VALVE & SERVO BODY BOLT TIGHTENING SEQUENCE

Rear Oil Pump & Lubrication Oil Pressure Regulator Valve Installation: Install rear gasket (gasket with LARGER hole—do not confuse with cover gasket) and plate on transmission case with bolt holes aligned, install drive key cushion and key in output shaft, then install driving gear to engage key (old gear should face in same direction as before, new gear with either face in). Tighten attaching bolts to 5 ft. lbs. torque in following sequence: Top, Bottom, Right, Left; then retighten bolts to 25-30 ft. lbs. torque in same sequence. Check pump for free operation by rotating output shaft. Install lubrication oil check valve assembly in case.

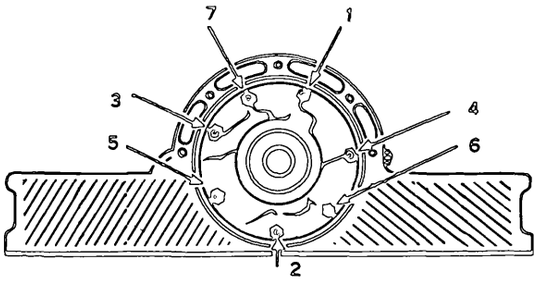
Parking Lock Ratchet Wheel & Rear Bearing Retainer: Make certain that retaining ring installed on each side of ratchet wheel on output shaft, insert valve operating rod through square hole in front face of bearing retainer and connect rod to cross-shaft lever, then install rear bearing retainer and gasket, tighten attaching bolts evenly to 35-40 ft. lbs.

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)

Low Brake Band, Clutch, & Input Shaft Installation: Install low band operating lever and anchor lever with strut shoulders of levers toward inside of case and tapped ends of shaft outward (operating lever on side of case having large servo opening, anchor lever on opposite side). Install low band struts in ends of levers with notched ends together using two wooden blocks (1" x 2" x 3½") to support struts and band while assembling. Install low band with J-2595 band installing clip holding band compressed (*CAUTION*—used band must be installed in original position with point of heavier wear at anchor end, (new band can be installed either way). With struts engaging ends of band (notches on struts must straddle pins on band), apply operating lever and remove clip. Place bronze reaction gear thrustwasher on sun gear, install clutch assembly (use wire hook to lift low band if clutch does not go down fully), place bronze thrustwasher on front face of clutch hub. Install input shaft (make certain that oil seal ring ends properly locked and that retaining ring installed in shaft groove). If shaft does not go down into place, make certain all four thrustwashers are properly centered.

Reaction Shaft Flange, Front Oil Pump & Accumulator Installation: Install 5/16" guide pin in accumulator bolt hole at each end of flange on transmission case, then proceed as follows:



1) Place reaction shaft flange gasket in position on case so all holes in gasket are aligned with holes in case. Install tanged bronze high clutch thrust washer on reaction flange, using chassis lubricant to hold in position. Make certain that oil seal rings are on flange hub, then install flange assembly on case using care to avoid damage to oil seal rings.

2) Install three special bolts (3/8"-16 x 2") with plain washers in positions marked 2, 3, 4 in "bolt tightening sequence" illustration. (*NOTE* - These bolts are for assembly purposes only). Install regular pump bolts and lockwashers at positions marked 1, 5, 6. Coat threads of No. 5 bolt with Permatex No. 3. Tighten bolts marked 1, through 4 to 35-40 ft. lbs. and bolt No. 5 to 20-25 ft. lbs. in numerical sequence.

3) Thread Endplay Gauge J-5804 into rear end of output shaft and thread Extension Rod J-5808 into a bolt hole in rear bearing retainer. Tighten both tools firmly. Use Clamp KMO-30-G and Sleeve KMO-30-K to mount dial indicator KMO-30-B and Extension J-5339 so that extension bears squarely against end of Gauge J-5804. Push Gauge J-5804 as far forward as possible, set dial indicator at zero, then pull gauge rearward toward indicator with sufficient force to remove all endplay from output shaft. Note indicator reading which will be between .015" and .035", if output shaft endplay is within limits. If endplay is not within limits, remove reaction shaft flange, clutch assembly, and the thrust washer located between reaction gear and reverse sun gear.

4) Measure thickness of removed thrust washer and substitute another one of proper thickness to bring output shaft endplay within the above limits. (*NOTE* - If endplay is less than .015" select a thinner washer. If more than .035" select a thicker washer). Reinstall parts and recheck for correct endplay. Place accumulator gaskets in position so holes match holes in reaction shaft flange. Install low accumulator on same side as low band operating lever and install high accumulator on opposite side of flange, first making sure that check ball and retaining pin are in place in high accumulator body.

5) Coat accumulator bolt threads with Permatex No. 3 and install bolts and stud nuts with lockwashers, but do not tighten. Tighten all bolts and nuts (1 through 14) to 5 ft. lbs. (see illustration), in numerical sequence. Following the same sequence again, tighten bolts (1 through 4) to 35-40 ft. lbs., and the remaining bolts and nuts to 20-25 ft. lbs. Remove the three special bolts (2, 3, 4) and tighten accumulator body caps to 40-50 ft. lbs. *NOTE* - If edges of flange gasket protrude beyond bottom surface of transmission case, carefully trim it flush with a sharp knife.

FRONT OIL PUMP TIGHTENING SEQUENCE

▷Guide Pin Note—These 5/16" guide pins can be made up from 5/16" round stock, 2½" long, with 5/16"-18 thread ½" long on one end and screwdriver slot on opposite end (chamfer this end slightly).

▷*SHIFT CONTROL VALVE ADJUSTMENT CHANGE:* The previous valve adjustment procedures included a clearance check between the shift control valve and stop pin which have been superseded by the instructions outlined below. The following adjustment applies whether the adjustment is made with the transmission in the car or during transmission assembly.

Valve & Servo Body Installation: (*NOTE* - Valve body and shift control valve have been changed in production and the adjustment procedure is different for the later type valve assembly. *See "1957 Valve Body & Valve Production Change" above for identification of the later type parts).*

1) With transmission lying bottom side up, raise reverse band operating lever and insert strut between shoulders on lever and end of band, with rounded ends against levers and band. *CAUTION - Do not lift the lever during following steps because strut will fall into transmission.*

2) Install two 5/16" guide pins into case to guide each end of servo body and install servo body spacer plate gasket over guide pins. Push shift control valve and lower operating lever inward to align upper level with opening in case and install valve and servo body on case. Engage pin in control valve with slot in operating lever.

3) Install various length bolts with lockwashers according to depth of holes through valve and servo bodies (*NOTE - Use copper washer on bolt No. 16. See tightening sequence illustration).* Tighten all bolts to 5 ft. lbs. in the numerical sequence indicated in tightening sequence illustration. Repeating the same sequence, tighten all ¼" bolts and nuts to 11-15 ft. lbs., and all 5/8" bolts to 15-20 ft. lbs. While tightening bolts and nuts adjacent to shift control valve, operate the valve to make sure it is not binding (*NOTE* - It may be necessary to tighten some bolts to low limit of torque to prevent valve binding).

4) Using Linkage Hook-Up Finger J-2591, position the socket of valve operating rod under ball of valve upper operating lever and pull upward until ball snaps into socket. Temporarily install shift lever on cross shaft and operate valve linkage to make sure it works freely. Move lever toward front of transmission to engage parking lock pawl in ratchet wheel. Turn output shaft to make certain it is locked.

▷*LATE 1957 SHIFT CONTROL VALVE & BODY PRODUCTION CHANGE NOTE & ADJUSTMENT CAUTION:* The service procedure for adjusting the shift control valve is different than for the early type since the land on the new valve is no longer visible through the discharge port. To facilitate adjustment, the later valve has a locating groove which is to be positioned flush against boss on casting with the shift lever in "Drive" position. Either type valve can be used, but the adjustments are different as indicated below. The later shift control valve can be used in an old type valve body, in which case the valve may be adjusted by using the procedure for early type assemblies. If an old valve (without locating groove) is to be used with a new valve body, first locate the replacement valve in drive position in an old valve body, then mark on the old valve so that the mark may be used as a reference point to adjust the old type valve in the same manner as the later type valve in "Drive" position.

5) On the early type shift control valve and valve body, temporarily install shift lever on cross shaft and operate valve to make sure it works freely. Move lever to engage middle detent "Drive" position. If inner end of valve is not flush with edge of port in valve body, loosen lockbolt and move adjusting lever as necessary

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)

to align edge of valve with edge of port (flush), then retighten lockbolt, making certain that adjustment does not change.

6) On later type valve and valve body, position groove in flush against boss on casting with shift lever in "Drive" position. See note above for adjusting old type shift control valve in a later type valve body.

7) On both old and new assemblies, move shift lever into "Park" position, making certain that pawl engages ratchet wheel (by attempting to turn output shaft), then check for clearance between outside end of shaft and stop pin. If valve does not clear stop pin, loosen valve body attaching bolts. If valve and pin still touch, check lever for distortion and replace if necessary.

8) Install a 5/16" guide pin at each end of transmission case and install a new oil pan gasket over guide pins. Install oil screen, Install oil pan with bolts and stud nuts provided with lockwashers. Tighten all bolts and nuts to 10-12 ft. lbs.

Oil Pan Installation: Coat area on transmission case (where case is cut away under oil pan gasket) thinly with Permatex No. 3. Install 5/16" guide pin at each end (same pin as used for reaction shaft flange), then install a new gasket over pins. Install oil pan (use heavy duty internal tooth lockwashers on bolts and stud nuts), tighten all bolts and nuts evenly to 10-12 ft. lbs. *NOTE* - This tightening torque supersedes previous specification of 15-18 ft. lbs.

Universal Joint Installation: Make certain that joint retaining ring fully seated in groove in output shaft before installing universal joint. Install universal joint using Replacer Tool J-855 to draw universal joint snug against retaining ring. Install plain washer, lockwasher, and bolt and tighten bolt to 30-35 ft. lbs. *(CAUTION—Make certain that oil passage in gear is clear).* Install speedometer driven gear and sleeve assembly in rear bearing retainer.

Bell Housing & Torque Converter Assembly Installation: 1) Install front oil pump seal ring around pump body against pump cover. Install bell housing, using lockwashers on bolts and stud. Sparingly coat threads of lower right side bolt with Permatex No. 3 (because bolt hole opens into transmission case). Tighten bolts and stud nut evenly to 35-40 ft. lbs.

2) Support converter pump firmly on blocks and carefully place stator in proper position, with original selective spacers and the thrust washer between stator and pump hub. *CAUTION—Do not use grease to hold spacers in place.*

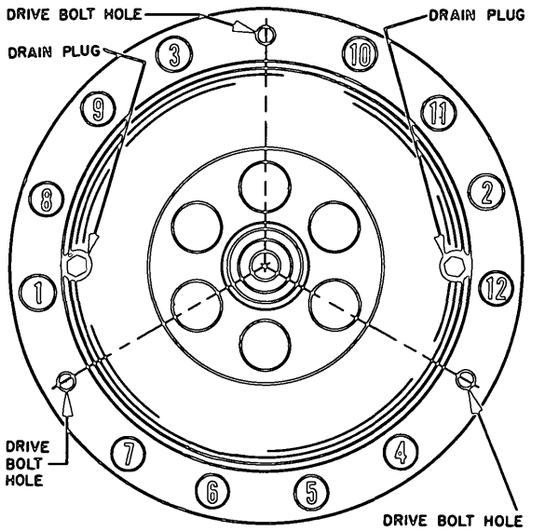
3) Place sun gear on stator with tanged thrust washer up, then carefully lower twin turbine assembly into place, making sure that planet pinions enter and mesh properly with sun gear. Install Converter Gauge J-5899 on converter pump flange, making sure that indicator post does not contact turbine. Loosen wing screw, firmly press gauge plunger down against first turbine hub and tighten wing screw.

4) Support converter pump cover firmly on blocks with inner side up and place bronze thrust washer in its recess. Remove Gauge J-5899 from pump, invert it, and center it on cover so that it rests squarely on the gasket surface.

5) Use Sleeve KMO-30-K to mount dial indicator KMO-30-B on the adjustable post of clearance gauge so that indicator button bears squarely against upper end of clearance gauge plunger. Set dial at zero.

6) Loosen plunger wing screw, firmly press plunger down against the thrust washer and note dial reading. The dial reading is clearance that will exist between turbine pump and pump cover when parts are installed, and should be .004-.017". If dial reading not within specified limits, change the total thickness of selective spacers located under the stator. *Increasing* spacer thickness will *decrease* clearance at cover and *decreasing* spacer thickness will *increase* the clearance.

Part No.	Spacers	Thickness
1167710		.013-.010"
1167711		.023-.020"
1167712		.033-.030"



7) Install converter pump on reaction shaft, turning it until lugs on pump hub enter slots in front pump driving gear. Coat selective spacers and thrust washers with petroleum jelly so they will adhere to stator during installation. Make sure that all rollers and springs are in place and held in stator with tool J-5806.

8) While holding thrust washers and spacers to rear side of stator, slide stator off of installing tool onto the reaction shaft. Make certain that washer and spacers remain in place as stator is pushed back against converter pump. Install converter sun gear with the tanged thrust washer outward. If sprag is properly installed, the sun gear may be turned on reaction shaft in clockwise direction only.

9) Make sure that retaining ring is seated in groove of input shaft, then install the twin turbine assembly, turning it as required to mesh planet pinions with sun gear. Install selective thrust washer, retaining washer and bolt, with external tooth lockwasher on front end of input shaft. Shift into "P" (parking) and pry up on reverse band operating lever with a screwdriver to lock input shaft, then tighten bolt to 30-35 ft. lbs.

10) Check clearance between selective thrust washer and first turbine hub, using feeler gauges. Clearance should be .002-.009". If clearance not correct, substitute another thrust washer of proper size. Two sizes furnished for selective fitting (Part No. 1166113, .063-.060". Part No. 1166112, .070-.067").

11) Looking at front face of converter pump cover, select the three bolt holes used for pump to flywheel drive bolts (see illustration). Install a new "O" ring seal on pump cover, making sure that surfaces are clean and that seal has even tension all around and is not twisted.

CONVERTER PUMP COVER TIGHTENING SEQUENCE

▷ *CONVERTER COVER INSTALLATION NOTE:* Tightening sequence and installation procedures have been changed and are not the same as previous models. Proceed as follows: Looking at front face, turn converter cover so that drain plugs are horizontally aligned with seven bolt holes above a line through the plugs and eight below (see illustration). In this position the top center hole is a driving bolt hole as is the fifth hole from top in either direction. Mark these holes for later installation of flywheel-to-pump driving bolts.

(NOTE - With converter in the above position, the triangular flywheel must be turned so that wide flange is down and horizontal, to match converter driving bolt holes and clear drain plugs). Install a new "O" ring seal on pump cover, making sure that seal has even tension, is not twisted, and that all surfaces are clean. Grease selected thrust washer so it will adhere and place it in recess in cover, then install cover on pump. Install bolts with lockwashers in all but the three driving bolt holes, insert shank of 11/32" drill through one bolt hole to align all holes, then tighten bolts to approximately 5 ft. lbs. in numerical sequence (see illustration). Finally tighten bolts in same sequence to 25-30 ft. lbs.

INSTALLATION IN CAR

1) Turn flywheel so that one hole for converter attaching bolt is straight up and wide flange is down. Raise transmission into place with same equipment used for removal. Align converter attaching bolt holes with holes

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (C nt.)

in flywheel before moving transmission forward against cylinder crankcase. Then with converter pump cover in correct position (*s e "Converter Cover Installation" above*), adjust lifting equipment so converter housing meets engine crankcase squarely and engages the two dowels. Install all converter housing bolts with lockwashers and tighten to 45-55 ft. lbs.

2) Raise transmission just enough to install transmission support and thrust plate, installing shims in their original positions between support and frame. Attach mounting pad to support with plate and nuts, and attach thrust plate to bearing retainer with four bolts and lockwashers.

3) Remove transmission hoist and engine support jack. Check converter drain plugs for tightness, then install converter housing cover. Attach oil filler pipe to oil pan and install oil cooler pipes. Connect torque tube to torque ball (tighten bolts after car is on floor).

4) Connect speedometer cable to driven gear sleeve and connect shift rod to shift lever on transmission, Connect stator operating rod to lever on high accumulator. Wipe all oil from outside of transmission and lower car to floor. Tighten torque ball bolts to 30-35 ft. lbs.

5) Fill transmission to proper level (*see "Draining & Refilling" above*). Check adjustment of control linkage (*see "Linkage Adjustment" above*). Check adjustment of stator operating controls and throttle linkage (*see CARBURETOR on car model page*). Road test car and check for oil leaks.

ENGINE BALANCING

►***IF VIBRATION NOTED AFTER INSTALLATION OF CRANKSHAFT, FLYWHEEL, AND OTHER ROTATING PARTS, CORRECT THIS UNBALANCED CONDITION AS FOLLOWS:***

►*CAUTION:* Procedure below will correct minor unbalance caused by replacement of individually balanced parts. Extreme vibration caused by parts abnormally out of balance, or different in weight from corresponding parts, should be corrected by replacement of these parts.

Critical Speed of Vibration—Determine speed at which vibration is most evident (use tachometer) and operate engine at this speed to check results from the following corrective procedures.

1) Remove bell housing cover and install one balance weight (.060" thick) under head of two converter pump cover bolts, and tighten bolts to 25-30 ft. lbs. (*CAUTION - Do not place a weight at a flywheel-to-converter driving bolt as these bolts are not long enough for addition of weights).*

2) Run engine at critical speed and carefully compare vibration with that obtained without the weight, then stop engine. Mark location of balance weight on converter pump, remove weight and tighten bolt to 25-30 ft. lbs. Install the weight at other converter pump cover bolts and compare vibration produced at critical speed.

3) At the point where valance weight produced greatest improvement in vibration, install weights of proper thickness to eliminate objectionable vibration. Balance weights are furnished in the following thicknesses:

Balance Weight Part Nos.

Thickness	Part No.
.009"	1178106
.018"	1178107
.0345"	1178108
.060"	1178109
.120"	1178110

►*NOTE: When factory balancing of converter pump is changed to balance an engine, the pump cannot be used with any other engine.*

CHEVROLET POWERGLIDE

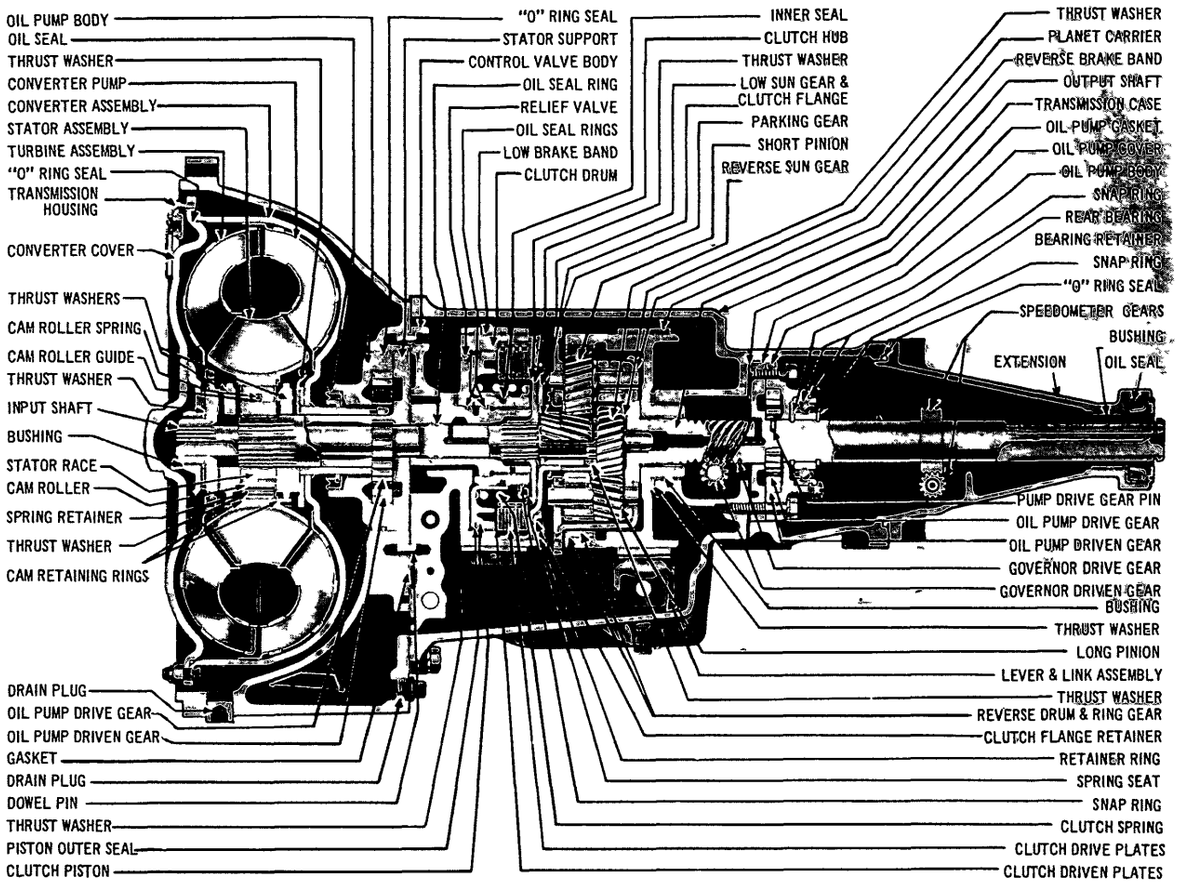
Chevrolet Pass. Cars (1957)
Chevrolet Corvette (1957)

►CHANGES, CAUTIONS, CORRECTIONS

► *STARTING ENGINE BY PUSHING CAR (Pushing recommended rather than towing):* Place selector lever in Neutral "N" position. When car reaches speed of approximately 16 MPH. (20 MPH if road wet or icy with resultant poor traction), move selector lever to Low "L" position to crank engine. After engine is started, move lever to "N" for engine warm-up.

DESCRIPTION

The 1956 Powerglide Transmission is similar to 1955 design, consisting of a torque converter and a hydraulically operated planetary transmission.



OPERATION

Operation of the Torque Converter and Transmission is similar to the previous type except for automatic shifting in "Drive Range" as follows:

Starting in Drive Range—With the selector lever in Drive "D" position, the manual valve is positioned to direct oil pressure to apply side of the Low Servo and to the Low Drive Valve Body so that the car starts out in low range (torque converter plus planetary gear) providing an equivalent gear reduction of 2.2-1 (torque converter) plus 1.82-1 (gears). Depressing the accelerator pedal applies throttle valve pressure behind the shifter valve in the low drive valve body which assists the spring in keeping the shifter valve closed and the transmission in low range. As soon as the car begins to move, the rear pump begins to operate and to supply oil pressure to the governor which controls the upshift as follows:

Normal Upshift—When the rear pump pressure balances the force of the centrifugal weights in the governor, the governor valve directs oil pressure to the Shifter Valve in the low drive valve body and moves the valve to the drive position. This directs main line pressure to the clutch assembly and to the release side of the low servo piston (balancing of low servo pressures allows spring to release band). Application of the clutch and release of the band places the transmission in Drive Range (converter drops out independently when reversal of pressure on stator vanes causes stator to "free-wheel" so that torque converter acts merely as a fluid coupling). Upshift can be delayed by greater throttle opening as follows:

Delayed Upshift—The shift from Low to Drive Range is dependent on the extent to which the accelerator pedal is depressed and will occur at a higher car speed with greater throttle opening. In addition, if the accelerator pedal is depressed beyond the "detent point" (this point reached just before throttle is wide open and will be noted as a definite resistance to further movement of the accelerator pedal), this movement of the pedal compresses the detent spring in the low drive valve body and moves the Detent Valve which then directs throttle valve pressure to the large plunger which assists in holding the shifter valve in the low range position (see Forced Downshift operation below). This delays the upshift to drive range until the car speed reaches 42 MPH. when the governor pressure becomes great enough to move the shifter valve to the high position regardless of the accelerator pedal position (governor pressure increases with car speed until it equals main line pressure).

POWERGLIDE TRANSMISSION SECTIONAL VIEW

Normal Downshift—With closed throttle, transmission remains in drive range until car speed drops to approximately 9 MPH. and shifts down to low range at this point. However, transmission can be downshifted at will at higher car speeds to provide greater torque for rapid acceleration as follows:

Forced Downshift—At car speeds below 37 MPH., the transmission can be downshifted from drive to low range for rapid acceleration by depressing the accelerator pedal. The amount of pedal movement required, and the resulting action of the transmission control depends on car speed.

LUBRICATION

Check oil level at 1000 mile intervals, drain and refill transmission at 25,000 mile intervals.

► *CONVERTER DRAIN NOTE:* There is no drain plug on converter unit. Oil trapped in converter need only be replaced when transmission disassembled for overhaul.

Recommended Oil - Use only Automatic Transmission Fluid Type "A" (as furnished in containers bearing "AQ-ATF" number).

Capacity - Approximately 5 qts. (refill after transmission case drained), 11 qts. (after overhaul with transmission and converter dry).

►**Warming Up Transmission (For Checking or Draining)**—Drive car approximately 5 miles with frequent starts and stops OR warm up transmission in shop as follows: Run engine for 15 minutes at 750 RPM with selector lever in "Dr" position. ***CAUTION*** —Set hand brake tightly to prevent car moving.

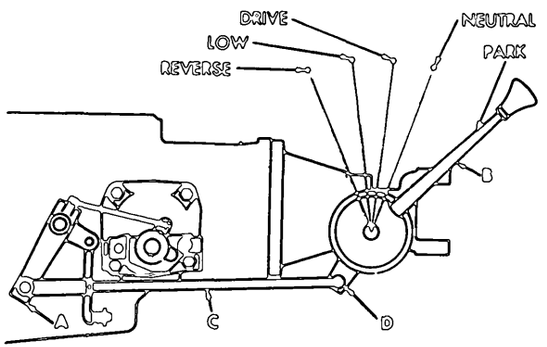
Checking Oil Level—Check only with transmission warm and engine idling with selector lever in Neutral "N" position. Remove dipstick from filler tube in engine compartment on right side. Add oil only if level down to "ADD ONE QUART" mark on stick, fill only to "FULL" mark on stick. ***CAUTION—High oil level (above "FULL" mark) will cause foaming and loss of fluid.***

CONTINUED ON NEXT PAGE

POWERGLIDE (Continued)

▷*OIL FILLER NOTE*—Use of Oil Filler Tube & Funnel No. J-4264 recommended to facilitate filling. This assembly is vented (transmission not vented and may blow-back causing oil spillage if vented filler not used).

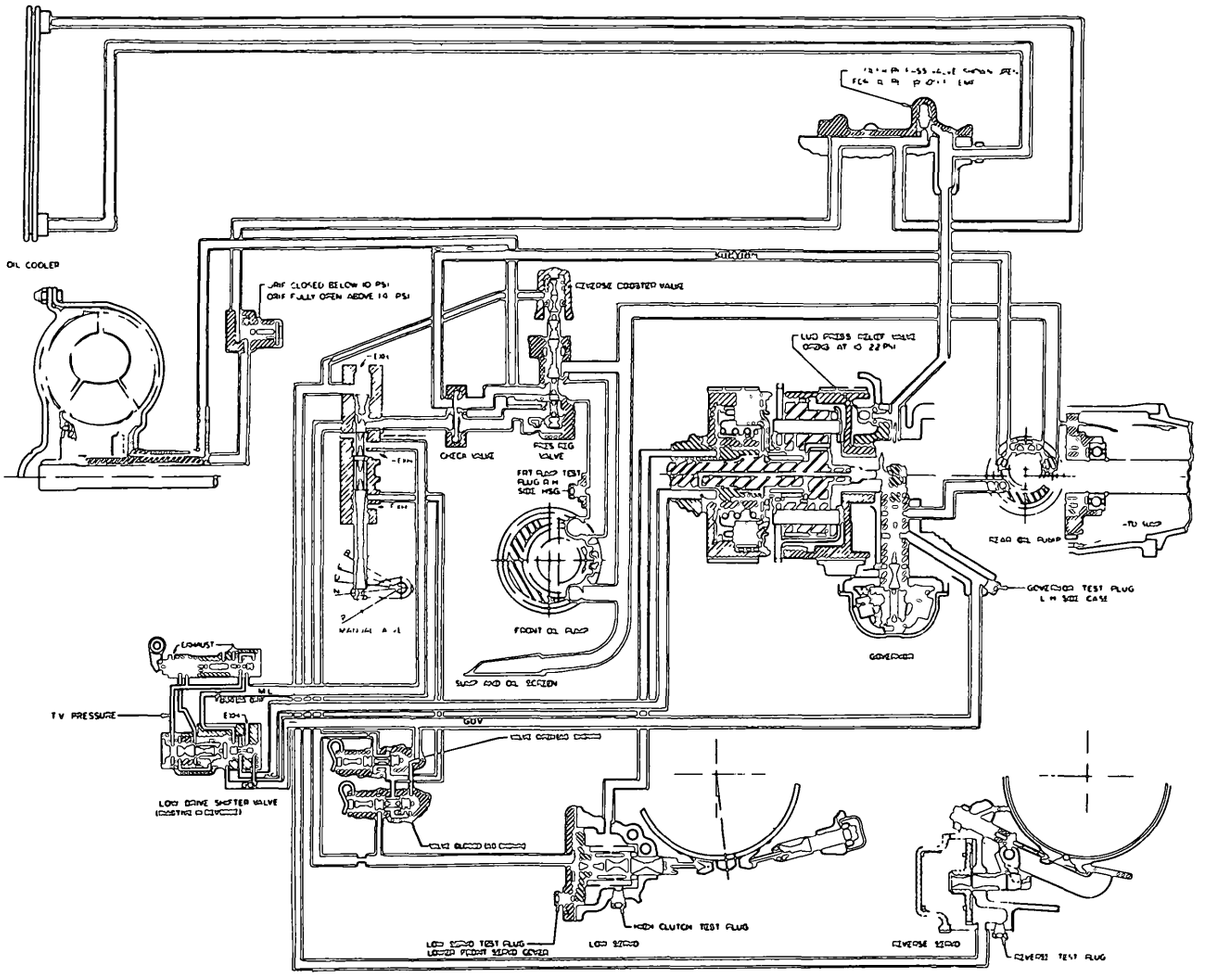
▷*LOW OIL LEVEL CAUTION—If oil level in transmission found consistently low, check for internal and external oil leaks. See "OIL LEAKAGE OR HIGH OIL CONSUMPTION" in TROUBLE SHOOTING.*



Draining & Refilling—Transmission must be warm. Remove drain plug in rear face of transmission housing under the case to drain the transmission. *NOTE*—It is not necessary to drain converter. Replace and tighten drain plug. Install 5 qts. of new fluid through filler tube on right side of engine (see Oil Filler Notes above). Idle engine with selector lever in "N" until transmission warm, check fluid level and add additional fluid, as required, to bring level up to "Full" mark on dipstick. *CAUTION—Do not overfill (will cause foaming).*

Filling (After Overhaul)—Install 3 qts. of fluid through filler tube, start engine and allow it to idle with selector lever in "N", install additional 8 qts. of fluid. Run engine until transmission warm and check fluid level.

LINKAGE ADJUSTMENT



▷*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR on car model pages.*

Manual Control Linkage (Except Corvette): Loosen shifter tube lever clamp nut sufficiently to allow upper control rod to move freely in the swivel. Push control rod bellcrank (on left side of transmission case) toward front of car as far as it will go, placing transmission in "Park" position. Place shift control lever on steering column in "P" (Park) position. With both the control rod bellcrank and selector lever held in the "P" (Park) position, tighten shifter tube lever clamp nut securely.

CORVETTE MANUAL CONTROL LINKAGE

Manual Control Linkage (Corvette): Set control rod bell crank (A) on transmission to reverse position (extreme rearward position). Place transmission selector lever (B) in reverse position (extreme forward position). Adjust rod (C) connecting lower end of selector lever with control rod bell crank so that rod will enter hole in lower end of selector lever (D) freely.

POWERGLIDE TRANSMISSION HYDRAULIC CIRCUITS

Neutral Safety Switch: Mounted on steering column mast jacket back of instrument panel. To adjust, loosen mounting screws, and place selector lever in "N" (Neutral). Install cotter pins into both holes on switch (each side of pointer) and rotate switch to pointer between holes. Tighten screws securely. *(NOTE* - Slot in switch must be set on center line of tang on shifter tube). If starter will not operate with selector lever in "N", rotate switch as necessary. *Check to make sure starter will operate only when selector lever is in "P" or "N" positions.*

BAND ADJUSTMENT

▷*BAND ADJUSTING NOTE: Band adjustment not ordinarily required in service (bands adjusted when reassembling transmission). Reverse band adjustment requires removal of Servo Cover Assembly (see Disassembly data).*

Low Servo Band - Adjusting screw located on left side of transmission case (under cover). To adjust band, remove adjusting screw cover. Use Tool J-4277 (see "Tool Modification Note" below), loosen adjusting screw locknut and tighten low band adjusting screw to 5-7 ft. lbs. *(NOTE - This procedure is now and supersedes the previous instructions which required that the screw be tightened firmly).* Back screw out four complete turns, and tighten locknut, taking care not to allow screw to turn. Replace adjusting cover.

▷Tool J-4277 Modification (for Low Servo Band Adjustment)—Adjusting screw has recessed head for ¼" Allen wrench. To use tool, remove screwdriver

CONTINUED ON NEXT PAGE

POWERGLIDE (C ntinu d)

retainer and special screwdriver from tool, use ¼" Allen Wrench in place of the screwdriver in the tool.

Reverse Servo Band—Adjusting screw located on right side of case under servo cover. With servo cover removed, install tool J-4277 on adjusting screw, loosen locknut. Rotate reverse drum to center it in the reverse band. Tighten adjusting screw until all endplay between linkage and band is removed without compressing the band. The reverse drum must be free to rotate after this adjustment. If reverse drum is not free to rotate, back the adjusting screw ¼ turn at a time until drum is free to rotate. ***(CAUTION—This is a sensitive adjustment and must be done carefully).*** Tighten locknut taking care not to allow adjusting screw to turn.

TROUBLE SHOOTING

SEVERE CLOSED THROTTLE DOWNSHIFT "CLUNK": May be caused by a broken closed throttle cushion valve spring retainer. Check this condition by removing right hand side cover and inspecting retainer. *See "Closed & Forced Throttle Valve Spring Retainer Production Change" above.*

MOMENTARY RUN AWAY IN LOW UP TO 30 MPH (WIDE OPEN THROTTLE ACCELERATION): May be caused by a broken forced throttle cushion valve spring retainer. Check mainline pressure which will be lower just prior to shift, and the stall pressure will be low if the faulty transmission operation is caused by a broken retainer. *See "Closed & Forced Throttle Valve Spring Retainer Production Change" above.*

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, poor acceleration, or engine runs away on turns).

1) In all Speed Ranges—Low oil level. Incorrect control linkage adjustment. Air leak in oil pump suction pipe. Low front oil pump pressure.

2) In Drive Range—Incorrect control linkage adjustment. Damaged or leaking clutch piston seal (worn or burned clutch plates resulting from partially engaged clutch).

3) In Low Range—Incorrect control linkage adjustment. Low Band out of adjustment. Sticking accumulator valve, modulator lever, or modulator valve. Damaged or worn Low Servo Piston Ring resulting in poor band application or excessive oil leakage into clutch apply circuit causing partial clutch application and possibly burned clutch plates (check by connecting pressure gauges to Low Servo Apply and to High Clutch test points—there should be no pressure indicated at High Clutch point with selector lever in "L").

CAR CREEPS (Forward or Backward).

1) With Control Lever in Neutral—Incorrect control linkage adjustment. Clutch piston vent valve stuck closed. Clutch plates sticking or incorrectly assembled (not "stacked" in correct order).

2) Creeps forward with Control Lever in Reverse or backward with Lever in Low—Incorrect control linkage adjustment.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With Control Lever in any range (rear wheels free). If this occurs at other times than after reversing car, see causes listed under EXCESSIVE SLIPPAGE above. If this occurs only after reversing car (indicating loss of front pump pressure) check: Rear pump air leakage into front pump suction line (causing front pump to lose its prime). Rear pump gasket leakage. Front pump clearance excessive.

2) With Control Lever in any range (rear wheels locked). Parking pawl lock engaged. Broken parts in transmission. Parking brake applied.

3) With Control Lever in Drive Range (rear wheels free). If engine runs away and transmission is hot, check for: Low radiator water level, clogged oil cooler, sticking thermostatic valve, or dragging Low Range Band (causing over-expansion of clutch parts due to excessive heat).

SHIFTS ARE ROUGH.

1) Low-to-Drive Shift (car in motion). Incorrect Low Band adjustment. Clutch plates worn or binding. Modulator control lever or piston sticking (will cause excessive pressures). Accumulator dump valve orifice plugged.

If engine speeds up during this shift—Check for incorrect low band adjustment and worn or binding clutch plates.

2) Drive-to-Low Shift. Incorrect Low Band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

3) Neutral-to-Reverse. Incorrect reverse band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

CHATTERS WHEN STARTING.

1) In Low Range. Incorrect Low Band adjustment. Worn or rough band, scored drum. Clutch not disengaging properly due to distorted or binding plates, sticking clutch piston, sticking piston vent valve, or damaged or worn Low Servo Piston Ring allowing oil leakage into clutch apply circuit and causing partial clutch application (see tests for Excessive Slippage in Low Range above).

2) In Drive Range. Incorrect Low Band or Reverse Band Adjustment. Bands worn or rough, drums scored.

3) In Reverse Range. Incorrect Reverse Band adjustment. Worn or rough band, scored drum. Reverse ring gear and drum bushing worn or damaged.

REVERSE OPERATION JERKY OR DRAGGING.

1) Clutch plates are incorrectly assembled (not "stacked" properly) or sticking. Clutch piston vent valve stuck closed.

REVERSE CAN NOT BE ENGAGED WITH ENGINE RUNNING: If reverse can only be engaged when engine not running, check for accumulator snap ring being out of place (allowing accumulator valve and body to be forced against clamp nut on parking lock lever shaft and apply spring assembly, blocking shift into reverse). *NOTE*—Above condition will not prevent shift into Low Range).

DRIVE-TO-LOW or LOW-TO-DRIVE SHIFT DIFFICULT: May be caused by improperly drilled high clutch feed orifice in valve body resulting in slow clutch application in Drive Range and slow clutch release when shifting from Drive to Low (restricted orifice will cause slow oil flow). Check by connecting pressure gauges to Low Servo Apply and to High Clutch (low servo release side) and noting pressures as follows:

1) Move selector from Neutral to Drive with engine idling. If pressure builds up much more rapidly on Low Servo Apply gauge than on High Clutch gauge, a restriction in the passage (undersized orifice) is indicated.

2) Move selector from Drive to Low. Pressure in High Clutch gauge drops slowly, oil drainage from clutch is restricted. NOTE—This will result in slow Low Band application and clutch drag (may cause burned clutch plates).

HIGH CLUTCH PLATES BURNED OR CLUTCH FAIL

►***CAUTION—When High Clutch failure noted, following tests should be made before transmission removed, and transmission should also be carefully examined after removal and disassembly.***

1) Connect pressure gauges to Low Servo Apply, High Clutch (low servo release side), and to Reverse Servo points. Operate engine to supply oil pressure.

2) Place selector lever in Drive position and note pressure build-up in High Clutch gauge. Slow build-up indicates restriction in high clutch apply orifice resulting in clutch slippage and burned plates.

3) Place selector lever in Low position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage past Low Servo Piston Ring resulting in partial clutch application and burned clutch plates.

4) Place selector lever in Reverse position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage between the converter "out" and low servo "release" channels in valve body or damaged Housing-to-Valve Body gasket. This condition will cause partial clutch application and burned clutch plates.

NOISE IN TRANSMISSION.

1) Buzzing Noise (All Ranges). Low oil level. Pump gear interference with crescent in pump. Pump check valve not seating.

2) Ringing Noise in Converter. Low oil level. Air leak in pump suction line (pump not seated properly) resulting in low oil level in converter. Pressure regulator valve stuck (closing converter inlet port). Leakage in oil line between front pump and regulator valve.

3) Clicking Noise. Incorrect manual linkage adjustment (causing interference between parking lock pawl and gear).

4) Whining Noise. Transmission gear teeth worn. Pump gear clearance excessive or pump gear bushings worn.

FUEL CONSUMPTION EXCESSIVE.

1) Transmission Causes. Converter stator freewheeling cams and roller incorrectly assembled. Clutch piston vent valve stuck open.

CONTINUED ON NEXT PAGE

POWERGLIDE (C ntinued)

TRANSMISSION OIL BEING FORCED OUT OF FILLER PIPE: Caused by aeration and foaming of the oil due to one or more of the following:

NOTE—This condition may also cause Loss of Power and Lower Stall Speed (due to converter turbulence and lower pressures in control circuits).

1) Oil level too high allowing planet carrier to revolve in oil and aerate it. Correct by lowering oil level to correct point (see LUBRICATION) and driving car for 5 miles to work out air bubbles.

2) Oil suction pipe split, seal damaged, bore for suction pipe in housing too deep, or suction pipe retainer ears bent (preventing proper compression of the seal) resulting in air leaks in oil suction line.

3) Sand hole in suction bore of transmission case or housing or in suction cavity in valve body resulting in air leaks in oil suction line.

TESTING

►***TESTING CAUTION***—Transmission oil level must be checked and corrected (see LUBBRICATION) and ***transmission must be warmed up before tests made.***

Warming Up Transmission: Transmission must be warmed up by road driving or in the shop exactly as follows before checking for oil leaks or trouble.

Road Warm-Up—Drive car for approximately 5 miles with frequent starts and stops to approximate heavy-traffic conditions.

Shop Warm-Up—Set hand brake tight to hold car, place selector lever in "D" range, start engine and run for 15 minutes at 750 RPM. At end of 15 minutes, transmission will be warmed up suffcientl y for testing regardless of initial temperature.

►***CAUTION—Recheck oil level after warm-up and before making following tests.***

ROAD TEST: Road test car when endeavoring to determine the reasons for the following difficulties:

Clutch Slippage: Connect gauges to the test points of the low servo apply and high clutch (release side of low servo). Position selector lever in "D" range and when car starts to move on acceleration, carefully check the pressure readings. Before the upshift takes place, the gauge connected to the low servo apply test point should record between 85 and 95 lbs. After a normal upshift takes place and the high clutch has time to become fully engaged, both gauges should record 85-95 lbs. If on this type of shift, the gauge on the high clutch (release side of low servo) test point records 85-95 lbs., and the clutch slips or does not fully engage, it indicates a mechanical fault in the clutch. If the gauges do not record between 50-60 lbs with engine idling at 425 RPM, or from 85 to 95 lbs upon acceleration, the following items will require checking as it indicates leakage in the oil circuits. (a) Pressure regulator valve stuck, (b) Leak at low servo piston ring (between bore and ring), (c) Leak at low servo piston rod (between bore and rod), (d) Leak at valve body to case gasket, (e) Leak between valve body and housing, (f) Front pump clearances not correct, (g) Leak at low drive valve body (check gaskets and shifter valve), (h) Check passages in transmission housing for porosity, (i) Loose suction screen connection.

Closed Throttle Downshift "Clunk": High engine idle speed, or Closed Throttle Downshift Cushion Valve stuck.

Harsh Abrupt Upshift Above 25 MPH: Forced downshift cushion valve stuck closed

Improper Upshifts and Downshifts: Refer to "Shift Patterns" below. Connect gauges to throttle valve and governor test points *(NOTE—See "Governor Pressure Test Plug Production Change" above).* Throttle valve pressure ranges from 0 to 62 lbs, depending to what extent the accelerator is depressed. Governor pressure is governed by road speed. If difficulty is experienced with the "Shift Patterns" it is recommended that the governor pressure be checked first to determine whether the pressure is within proper range, for if not, it will effect the "Shift Patterns" and the governor assembly is the first thing that should receive attention. Throttle valve pressure is another thing that effects "Shift Patterns" and if governor pressure is correct it is indicative that trouble is in the low drive valve body, provided the positive linkage and throttle valve linkage is in proper adjustment.

SHIFT PATTERNS
Drive Range—Automatic

Throttle Position	①Upshift	②Downshift
Light Throttle③	12-14 MPH	④10-13 MPH
To Detent	30-45 MPH	14-18 MPH
Through Detent	48-53 MPH	45-50 MPH

①—From Low to Drive Range.
②—From Drive to Low Range.
③—Light Throttle on Upshift
④—Closed Throttle on Downshift.

STALL TEST: Check coolant level in radiator as a safety precaution. With tachometer connected to engine and service brakes securely locked, open throttle wide, with transmission in "D" (Drive) range, then in "L" (Low) range, and then in "R" (Reverse) range. Note maximum speed attained in each range and record. Speed should be almost identical in all ranges and be between 1560 and 1610 (6 Cyl.), 1600 and 1700 (V8). ***(CAUTION—Do not maintain stall condition longer than 10 seconds at one time to avoid overheating transmission fluid).*** If engine fails to attain minimum stall speed by several hundred RPM, it is likely that the stator is not locking up on the stator hub. If stall speed varies much between ranges or exceeds the maximum in all ranges, there is slippage which may be due to insufficient oil pressure or to a mechanical fault of clutch or bands.

PRESSURE TESTS: Connect pressure gauges at the following points and make the tests listed below.

►***TEST GAUGE NOTE:*** Five gauges are required. The four-gauge panel, No. J-4872, can be modified for use by installing an additional gauge furnished in conversion package No. J-5491 (reverse original gauges on panel, drilling additional hole to mount new gauge on lower edge of panel).

Gauge Connections—Connect gauge at each of the following points:

1) Low Servo Apply Pressure—Plug on lower front of servo cover on right side of transmission. ***CAUTION—Do not confuse this plug with Modulator Pivot Pin Retaining Plug which is slightly to rear of this Low Servo Apply Plug.***

2) Clutch Apply Pressure (Low Servo Release)—On bottom of transmission case at center and adjacent to servo mounting flange.

3) Reverse Servo Apply Pressure—On bottom of transmission case at rear and adjacent to servo mounting flange.

4) Throttle Valve Pressure—At hex-head plug in center of Low and Drive Valve Body Cover on left side of converter housing.

5) Governor Pressure—At plug on side or at upper end of channel in Low and Drive Valve Body Cover on left side of converter housing (upper plug is between second and third top cover screws (counting from top front corner of cover).

6) Main Line Pressure—At plug on upper end of channel in Low and Drive Valve Body Cover on left side of converter housing (plug is between third and fourth top cover screws (counting from top front corner of cover).

7) Clutch Apply or Main Line Pressure—At plug at outer end of channel in Low and Drive Valve Body Cover on left side of converter housing (this plug is at lower rear corner of cover).

Test Pressures—***CAUTION—Representative pressures listed below may vary 5% (higher or lower).***

FRONT PUMP PRESSURE

	Pressure
Idle (425 RPM)	50-60 lbs
Above Idle	85-95 lbs
Reverse (Idle 425 RPM)	50-60 lbs.
Reverse (Above Idle)	165-195 lbs

DRIVE (AUTOMATIC)
Transmission in Low Range

	Light Throttle (10 MPH)	Through Detent (45 MPH)
Low Apply	85-95 lbs	85-95 lbs.
Clutch Apply	0 lbs.	0 lbs.
Governor	8-13 lbs.	72½-76½ lbs
Throttle Valve	①	①

Transmission in High Range

	Light Throttle (30 MPH)	To Detent (45 MPH)
Low Apply	85-95 lbs.	85-95 lbs
Clutch Apply	85-95 lbs.	85-95 lbs
Governor	52-56 lbs.	72½-76½ lbs
Throttle Valve	①	①

①—Throttle valve pressure will vary from 0 to 62 lbs., depending on throttle position. At wide open throttle (through detent) pressure should read 61 to 63 lbs., on acceleration

CONTINUED ON NEXT PAGE

POWERGLIDE (C ntinu d)

REMOVAL FROM CAR (EXCEPT CORVETTE)

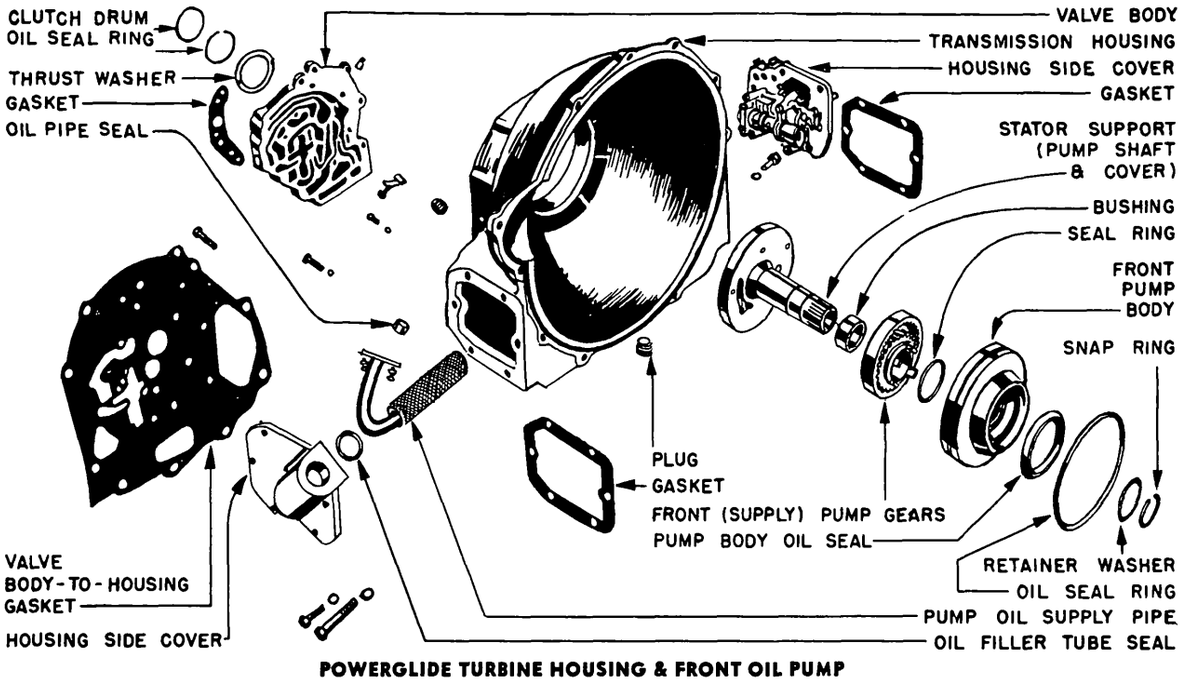
Transmission & Torque Converter are removed as an assembly *CAUTION—Torque converter is not retained in housing as on previous transmission and special holding tool must be used to prevent converter falling out when transmission assembly removed.*

TRANSMISSION ASSEMBLY REMOVAL (1) Raise car and install jack stands front and rear Turn back floor mat and remove toe pan plate

2) Remove spark plug wires on all models Disconnect ground strap from battery and wires from starting motor solenoid on eight cyl models only Disconnect oil cooler lines retaining clip bolt from right side cover and disengage lines from retaining clip on engine Move lines away from transmission and tie to right frame side rail

3) Disconnect throttle valve control rod from throttle valve control outer lever and manual shift control rod (long rod) from bellcrank Split rear universal joint Then remove propeller shaft and front universal joint as an assembly by sliding it rearward until front joint is free of transmission output shaft

4) Remove drain plug from rear of converter housing and drain transmission Clean dirt from around filler tube, dipstick and transmission cover and remove side cover bolt retaining filler tube in position Remove filler tube and dipstick *(CAUTION—Use masking tape or rubber stopper to cover filler tube opening*



5) On V8 cars only, remove starter, and disconnect exhaust pipe from crossover pipe On 6 Cyl cars disconnect exhaust pipe from exhaust manifold

6) Disconnect muffler from muffler support bracket and move the exhaust pipe and bracket as an assembly to the left and tie it to left frame side member

7) Remove flywheel inspection hole cover and remove the three flywheel to converter attaching bolts through the opening that is adjacent to the starting motor, (opening on six cylinder cars is on left side of engine)

8) Remove all converter housing to flywheel housing attaching bolts except the top three Install engine support bar or cradle to support engine Position jack under transmission (using a suitable transmission handling device) Remove both rear engine mountings making sure that engine is properly supported before removing mountings

9) Remove the three upper converter housing to flywheel housing attaching bolts through opening in toe pan Move transmission to rear slightly and install converter holding tool J-5384 Lower transmission on jack and remove from under car

POWERGLIDE TURBINE HOUSING & FRONT OIL PUMP

TRANSMISSION OVERHAUL

OVERHAUL: Service procedures are the same as for 1956 models *See "Powerglide Transmission" in 1956 Annual Data and note the following*

Front Pump Oil Seal Installation (Revised): Remove transmission from car and remove torque converter from transmission Thread the new oil seal removing tool J-6793 into oil seal and attach sliding hammer to tool. Drive seal out of housing. Position a new type seal, Part No 3737894 in front pump and drive into place with Tool J-6839.

► *LOW BAND ANCHOR STRUT INSTALLATION CAUTION:* The guide stamping of the anchor strut assembly must be installed **toward** the band.

► *1957 POWERGLIDE LOW SUN GEAR THRUST WASHER PRODUCTION CHANGE* The "roller type" thrust washer (078" thick) used in production at this location has been changed to a bronze thrust washer (095" thick) When servicing all 1957 Powerglide clutch assemblies installed in 1953-1957 cars where either the low sun gear thrust washer ("roller type or bronze type"), or the clutch drum thrust washer requires replacement it will be necessary to replace the washer at both of these locations The service replacement clutch drum thrust washer (untanged) Part No 3745897 is 061" thick Replacement low sun gear thrust washers are furnished in the following thicknesses for selective fitting Part No 3719296 (095"), 3719297 (120"), 3719298 (145") *See "Transmission Endplay Check & Adjustment Change" below*

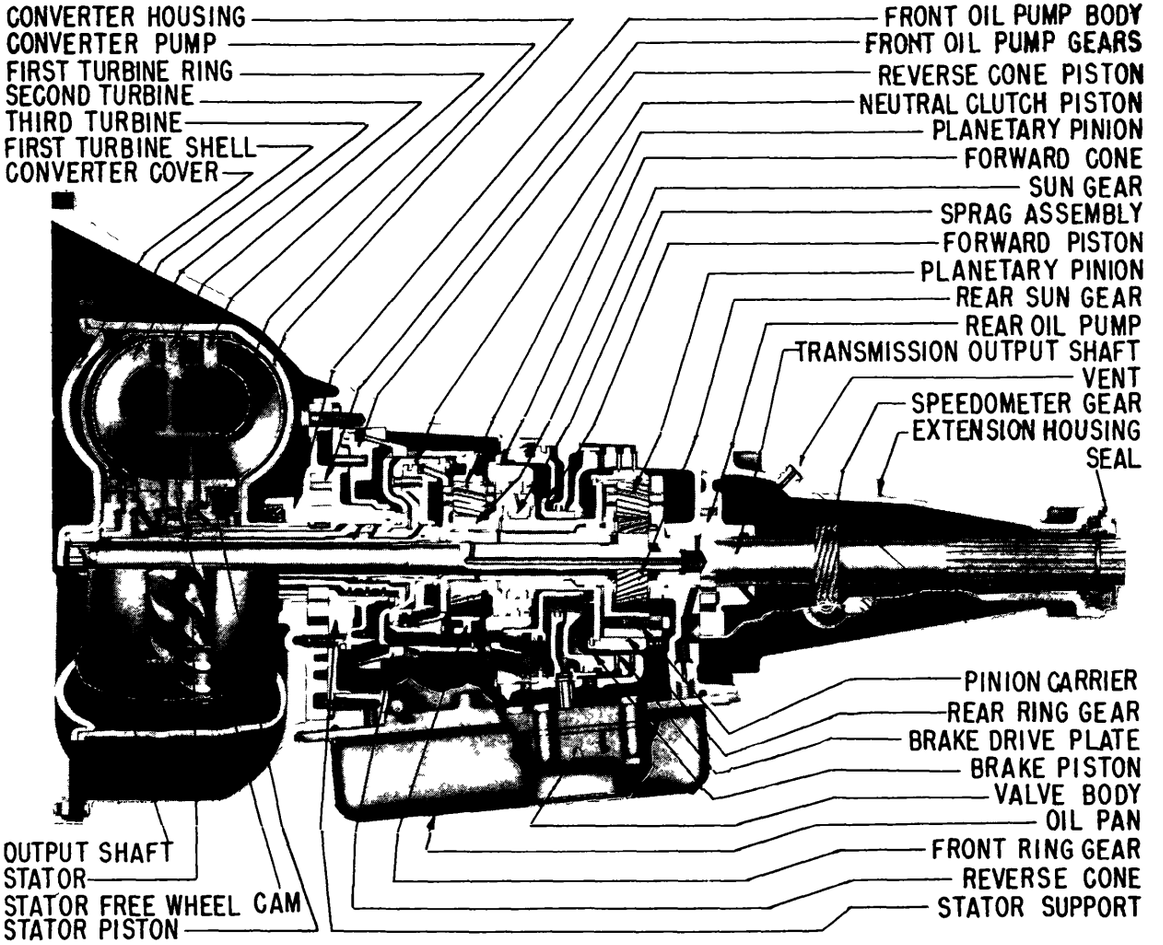
► *1957 POWERGLIDE TRANSMISSION ENDPLAY CHECK & ADJUSTMENT CHANGE* The procedure for selecting and installing the service thrust washers in all transmissions using the 1957 clutch will be the same as for previous (1953 & later) transmissions except that the low sun gear-to-reverse gear clearance will be 025-050" *See "1957 Powerglide Low Sun Gear Thrust Washer Production Change" above for correct thrust washers to use*

CHEVROLET TURBOGLIDE TRANSMISSION

Ch vrol t (1957) Optl. with 283" V8 Engine

►CHANGES, CAUTIONS, CORRECTIONS

►*TURBOGLIDE TRANSMISSION PRODUCTION CHANGE NOTE:* A number of transmission parts have been changed in production and are covered in OVERHAUL below.



►*TRANSMISSION SELECTOR LEVER INDICATOR CHANGE:* Indicator lettering on face of speedometer has been changed from "HR" (Hill-Retarder) to "GR" (Grade-Retarder) to prevent misinterpreting "HR" position as "High-Range".

►*THERMAL BY-PASS VALVE PRODUCTION CHANGE:* In later transmissions, the thermal by-pass valve has been eliminated and replaced by a new plug which acts as a relief valve in the event oil cooler becomes plugged.

►*VACUUM MODULATOR PRODUCTION CHANGE:* A new vacuum modulator, Part No. 3745607, identified by a stripe of orange paint, replaces all previous vacuum modulators.

►*STARTING ENGINE BY PUSHING CAR:* Place control lever in "N" (Neutral) range until car reaches 25-30 MPH. Turn key on and move control lever to "HR" (Hill Retarder) position. After engine starts, move control lever to "N" (Neutral) for engine warm-up. Towing is is not recommended to start car.

►*TOWING TURBOGLIDE CARS:* Cars must not be towed with rear wheels on the ground except with transmission in "N" (Neutral) position and should not be towed in excess of 30 MPH. If car is to be towed a long distance, drive shaft should be removed. *NOTE* – If car has been damaged and transmission cannot be placed in "N" with selector lever, disconnect long rod from idler lever on left side below mast jacket, then pull lever on transmission toward front of car as far as it will go. Move lever toward rear of car from the forward position to the third detent which is "N" (Neutral) position.

CHEVROLET TURBOGLIDE TRANSMISSION (SECTIONAL VIEW)

DESCRIPTION

The new Turboglide transmission is a non-shifting, hydraulically controlled, planetary type transmission with a five unit torque converter having three turbines which are connected through two planetary units to the output shaft. Band or clutch engagement or disengagement (from standstill to top speed) is eliminated. In addition to the two planetary units, three cone clutches are provided for Neutral, Drive, and Reverse operation. A disc type clutch is used for control of Hill Retarder. A parking lock pawl engages a gear which is integral with the output shaft when selector lever is placed in "P" (Parking) position. Transmission clutches and torque converter variable pitch stator are hydraulically controlled by oil pressure supplied by front and rear oil pumps. A valve body mounted on the bottom of the transmission and enclosed in oil contains units to regulate oil pressure, control operation of clutches and provide manual selection of the operating ranges. When transmission is in "D" (Drive) position, torque multiplication is provided by the "first turbine" for starting and low speed power requirements. The "second turbine" is used for intermediate speeds and acceleration purposes and comes into operation at approximately 30 MPH (at full throttle operation). The "third turbine" is used for cruising and high speed operation and comes into operation at approximately 60 MPH (at full throttle). The actual point at which each turbine provides torque to the output shaft is dependent on car speed, engine speed, and throttle position. Oil pressure in the transmission is regulated and controlled in relation to engine torque by means of a diaphragm operated valve which is exposed to engine vacuum and maintains a pressure no higher than is required to hold clutches stationary. Oil temperature is controlled by a thermostatic valve which receives oil leaving the converter. When oil temperature reaches 180°F. the valve completely closes and directs oil through the heat exchanger installed in bottom of car radiator.

OPERATION

NEUTRAL (Selector Lever in "N"); All clutches are released and no drive is transmitted to transmission output shaft. Engine can be started with transmission in "N".

PARK (Selector Lever in "P"): All clutches are released (as in Neutral). The parking lock pawl is engaged with a gear on output shaft which prevents output shaft from rotating. Engine can be started with transmission in "P".

DRIVE (S l ct r L v r in "D"): Reverse clutch and hill retarder clutch are released. Neutral clutch and forward clutch are applied. Power transmission is through planetary units and output shaft as indicated below. As each

CONTINUED ON NEXT PAGE

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

of the three turbines are directly connected to a component of the two planetary units, power transmission varies in relation to turbine or turbines in operation depending on engine speed, car speed, and throttle position.

P wer Range: As accelerator pressed to set car in motion, the engine drive pump starts, increasing with engine speed, and delivers nearly all of its output to first turbine. Motion of first turbine is transmitted to sun gear of rear planetary gear set, causing transmission shaft to be driven at a reduced rate as the rear planetary gears are forced to "walk" around their ring gear. The ring gear cannot rotate backwards because of its one way clutch. In this phase of operation, greatest transmission torque multiplication is obtained. Transmission gear reduction is 2.67-1, and with torque converter reduction (stator in normal low angle position), the maximum reduction is 3.8-1 at 1700 engine RPM. With stator in high angle, maximum reduction is 4.3-1 at 2700 engine RPM.

Acc leration Range: As car speed increases, angle of oil pumped by converter pump changes due to engine RPM and, because of the angle of first turbine blades, the oil starts to drive the second and third turbine in a progressive and overlapping action while output of first turbine diminishes. Output of second turbine is transmitted to output shaft through the front planetary sun gear at a 1.63-1 ratio. Reduction in the front gear set is obtained by turning the ring gear which causes planet gears to "walk" around sun gears and transmit their speed to the output shaft. The sun gear is prevented from turning backwards by a one way clutch. When second turbine reaches maximum torque, the first turbine is released and freewheels in converter pump oil stream. Like the first turbine declining action, as engine speed continues to increase, less oil pressure plays on the second turbine vanes but more reacts on the third turbine. Because of its direct connection to transmission output shaft, the third turbine is more favorable for high speed acceleration.

Cruising Range: When fluid coupling point of the torque converter is reached, the transmission is in cruising range. At this stage, work of the second turbine is completed and it is released by a clutch to freewheel in converter housing with the first turbine. All output is now from third turbine which is connected mechanically to output shaft at a 1 to 1 ratio.

Variable Pitch Stator: At speeds below 60 MPH, additional torque multiplication is available by depressing accelerator through its detent beyond full throttle position. Stator blades are changed to their high angle, which provides a greater redirection of oil entering the pump, to increase torque multiplication and permits engine speed to increase for greater power output to converter. Above speeds of 60 MPH, at full throttle, the stator freewheels regardless of blade angle, and converter ceases to multiply torque.

Hill Retarder: Hill Retarder clutch is applied and all other clutches are released. The hill retarder may be applied up to 40 MPH to control car forward speed when descending grades. When hill retarder position is applied, the multiple disc clutch on rear planetary gear set ring gear is engaged and all other clutches are released. This drives the first turbine at 2.67 times output shaft speed, while the second and third turbines freewheel. The pumping action of the first turbine creates a turbulence in the converter which effectively brakes the car by increasing engine speed and by transferring energy into heat in the converter oil. The heat is then dissipated by the engine cooling system.

REVERSE: Reverse cone clutch holds ring gear of front planetary gear set and the second turbine stationary and the drive range cone clutch connecting the third turbine to output shaft is also applied. Starting from a standstill in reverse, the reaction within the torque converter is same as for drive range. Inertia of the car tends to hold rear planetary carrier stationary. This causes the planet gears to drive ring gear in reverse. The rear ring gear then turns front planetary sun gear which forces front planetary gears to "walk" around locked ring gear and drive planet carrier and output shaft in reverse.

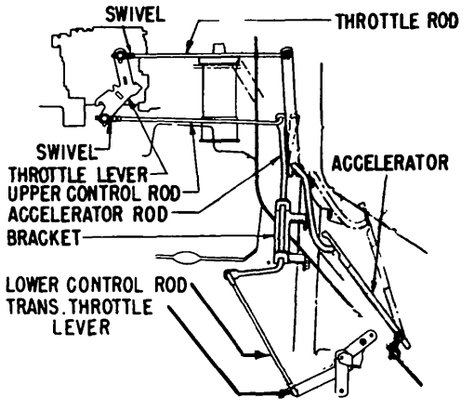
LUBRICATION

Check oil level at 1000 mile intervals, drain and refill every 25,000 miles.

Capacity – Approx. 3½ qts. (refill), 6½ qts. (after overhaul).

Recommended Oil – Use only Automatic Transmission Fluid Type A (as furnished in containers bearing "AQ-ATF" number).

Checking Fluid Level (Exc. Air Conditioned Cars): With transmission at normal operating temperature, transmission selector lever in "D" (Drive) position, and engine idling. Remove gauge rod located under right side of hood. Wipe with a clean cloth and check oil level. Add sufficient oil to bring level in transmission to the "Full" mark. *CAUTION - Do not overfill.*



Checking Fluid Level (Air Conditioned Cars): With transmission at normal operating temperature, transmission selector lever in "N" (Neutral) position, raise car on a hoist. Remove cap from oil level tube located at rear of transmission oil pan. Add oil to bring level in transmission to top of tube, as follows: Remove speedometer fitting and speedometer drive gear. Add Automatic Transmission Fluid Type "A" through speedometer gear hole.

Draining & Refilling: With engine and transmission at normal operating temperature, stop the engine and remove transmission oil pan drain plug. *(CAUTION – Do not run engine while draining transmission).* After completing draining, replace drain plug and install 3½ quarts of Automatic Transmission Fluid Type A, through the oil dipstick tube (use Funnel J-4264). Start engine and allow to run a few minutes as idle speed, then check oil level. If necessary, add oil to bring level up to "FULL" mark on dipstick.

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR n car mod l pag s.*

Manual C ntr l Linkag : Loosen shifter tube lever clamp nut sufficiently to allow upper control rod to move freely in the swivel. Move parking lock and range selector lever on left side of transmission case toward front of car to the "N" (Neutral) detent (3rd position forward). Place shift control lever on steering column in "N" (Neutral) position. With the parking lock and range selector lever and the shift tube lever held in the "N" (Neutral) position, tighten the shifter tube lever swivel clamp nut securely. Check linkage operation to insure the "R" and "D" stops of the transmission control selector plate (mast jacket gate) do not prevent positioning of the selector *(CAUTION – L v r position must be established by transmissi n N utral d t nt and not by the "R" and "D" stops of th control selector plate on the mast jacket).* If necessary, reposition control selector plate to permit normal operation in "R" and "N". *CAUTION*—Improper adjustment of linkage will result in partial pressures on the cone clutches resulting in slippage and ultimate failure of the transmission.

CHEVROLET TRANSMISSION THROTTLE LINKAGE

Neutral Safety Switch: Loosen switch assembly mounting screws. Place selector lever in "N" (Neutral) position. Install cotter pin or similar aligning pin in each of the two holes in switch (one on each side of pointer). Rotate switch to place pointer between holes. Tighten screws securely and remove pins *(NOTE* – Slot in neutral safety switch must be set on center line of tang on shifter tube). If engine will not turn over, loosen screws and rotate switch in the direction necessary until it does. Make sure selector lever is in "N" (Neutral) position when changing switch position.

TROUBLE SHOOTING

NO DRIVE IN ANY SELECTOR POSITION: Front pump is assembled backwards.

NO DRIVE EXCEPT IN HILL RETARD: Both overrun clutches assembled backwards.

NO DRIVE EXCEPT IN HILL RETARD AND REVERSE: Outer overrun clutch assembled backwards. Forward and neutral clutch not applied due to severe leakage in forward clutch hydraulic circuit.

DRIVE POOR AT LOW SPEEDS (NO REVERSE, HILL RETARD NORMAL: Inner overrun clutch assembled backwards.

CONTINUED ON NEXT PAGE

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

CAR DRIVE VERY SLIGHTLY IN NEUTRAL (REVERSE NORMAL): Neutral clutch not released.

CAR DRIVES NORMAL IN NEUTRAL AND DRIVE AT LOW SPEEDS (NO REVERSE): Forward clutch not released.

TRANSMISSION WILL NOT SHIFT TO HIGH STATOR ANGLE: Stator control linkage out of adjustment. Converter charging pressure low for one of the following reasons: (a) Leakage which will reduce line pressure enough to cause pressure regulator valve to shut off converter in line. (b) Leakage in converter circuit. (c) Stator control pressure leaking to converter out across front oil seal ring or second oil seal ring on second turbine shaft.

UNABLE TO PUSH START: Rear oil pump drive pin broken or missing.

CLUTCH SLIPPAGE ON WIDE OPEN THROTTLE STARTS: Low oil pressure due to leakage (especially check forward pressure tube "O" ring). Mechanical interference which will prevent forward or neutral piston to fully apply. Neutral or forward clutch facing bond failure.

SECOND TURBINE SEAL RING LANDS INTERFERING WITH I.D. OF STATOR SHAFT: Case locating dowels on engine or dowel holes in case misaligned. Check by indicating front pump bore in case from crankshaft.

HILL RETARD SLOW TO APPLY: Control linkage out of adjustment preventing manual valve getting into hill retard position. Leakage to hill retard clutch (Check pressure tube "O" ring seal and other sources). Mechanical interference of hill retard piston. Glazed hill retard plates (check neutral clutch for release). If neutral clutch does not disengage, during hill retard, hill retard plate can be destroyed.

NO DRIVE, REVERSE NORMAL, NO HILL RETARD: Reverse clutch not disengaged.

HILL RETARD BRAKES VIOLENTLY, STATOR PRESSURE READS HIGH ON CHECKING: Vacuum hose disconnected.

SHIFTS FROM STANDSTILL VERY SLOW: Check linkage to ascertain that shift lever is positioned by transmission detents. Accumulator control valve stuck closed. Leakage in hydraulic system (Check pressure tube "O" rings and other seals and gaskets).

SHIFTS FROM STANDSTILL VERY FAST AND HARSH: Accumulator control valve spring too strong or valve stuck open.

TESTING

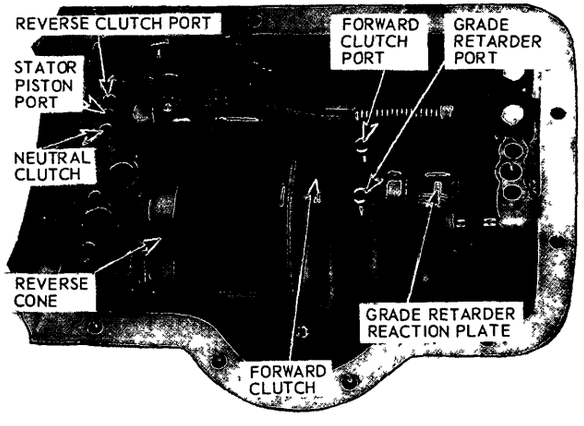
►*TESTING CAUTION: Do not stall test this transmission at wide open throttle.*

►*TESTING CAUTION: Before testing transmission, check oil lev l and bring it to the "FULL" mark on dipstick (See LUBRICATION above). Warm transmission to normal operating temperature as outlined below. Adjust engine idle speed to 425 RPM with transmission selector lever in "D" (Drive) range. Adjust throttle linkage (see CARBURETOR on car model pages).*

TRANSMISSION WARM-UP: (In Shop) – Connect tachometer to engine, set parking brake and start engine. Place selector lever in "D" (Drive) range and adjust carburetor idle speed to approximately 750 RPM. Operate engine at this speed for 15 minutes, then readjust engine idle speed to 425 RPM with transmission selector lever in "D" (Drive) range.

On Road – Drive car for approximately 5 minutes with frequent starts and stops. Make sure engine idle speed is 425 RPM with transmission selector lever in "D" (Drive) range. Check fluid level (see LUBRICATION above). *CAUTION* – If fluid level too high, lower the level to "FULL" mark, then drive car five minutes to work bubbles out of fluid.

PRESSURE TEST: Shop – Connect pressure gauge to test point on left side of transmission adjacent to torque converter housing.



Drive Range: Adjust engine idle speed to 425 RPM, selector lever in drive range. Check idle stator pressure, which should be 45-60 lbs.

Reverse Range: With selector lever in "R" Range, stator pressure should be 45-60 lbs.

Hill Retard Range: With selector lever in "HR", and foot on brake, accelerate engine to 700-900 RPM, stator pressure should be 80-90 lbs.

Park Range: With selector lever in "P" range, accelerate engine to 800-1000 RPM, stator pressure should be 80-90 lbs.

Neutral Range: Test in same manner as for "P" range.

TRANSMISSION AIR TEST POINTS

PRESSURE TEST: Road – Disconnect stator control from throttle. Connect pressure gauge to test point on left side of transmission adjacent to torque converter housing. Connect vacuum gauge to engine.

1) With selector lever in "D" range, pressure should be 45-60 lbs.

2) With selector lever in "D" range and at a car speed of approximately 30 MPH depress accelerator to wide open position, throttle pressure will rise to 135-145 lbs. at 0" of vacuum. At any speed, with foot off throttle, stator pressure should be 50-65 lbs., with engine vacuum reading of 16-25" of vacuum.

3) Stator Operation – Reconnect stator control rod to the throttle, place selector lever in "D" range and drive car at 20 MPH. Open throttle quickly, going through detent. Pressure will then drop to 0 lbs., and engine speed will rise when stator is working correctly. *(NOTE – At wide open throttle, stator pressure should read 0 lbs. at any car speed).*

4) With selector lever in "D" range, traveling at 40 MPH, and foot off the throttle, stator pressure should read 50-65 lbs. With selector lever in "HR" range at 40 MPH, and foot off throttle, stator pressure should rise to 85-95 ft. lbs.

►*NOTE:* If engine tachometer is being used, the engine speed will drop (during manual shift from "D" to "HR") and then when hill retarder pressure reaches 85-95 lbs., the clutch will set down and engine speed will increase.

►*CAUTION: Make sure vacuum hose is properly connected to transmission vacuum diaphragm.*

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Drain oil from transmission and remove converter cover pan, transmission oil pan, and main valve body. Install oil pressure tubes in Forward Clutch and Grade Retarder apply ports (see illustration). Use Tool J-4353-1 and an air source of 100 lbs. pressure. Proceed as follows for the five air pressure checks:

Reverse Clutch: Apply pressure to reverse clutch port (see illustration) and visually check that reverse cone moves rearward. Listen for air leaks. If reverse cone does not move, determine whether front pump-to-transmission case gasket is incorrectly installed and blocking oil passages, or if reverse piston is cocked or bound. If air leaks are heard, check for damaged front pump-to-transmission case gasket or for damaged seals in reverse piston.

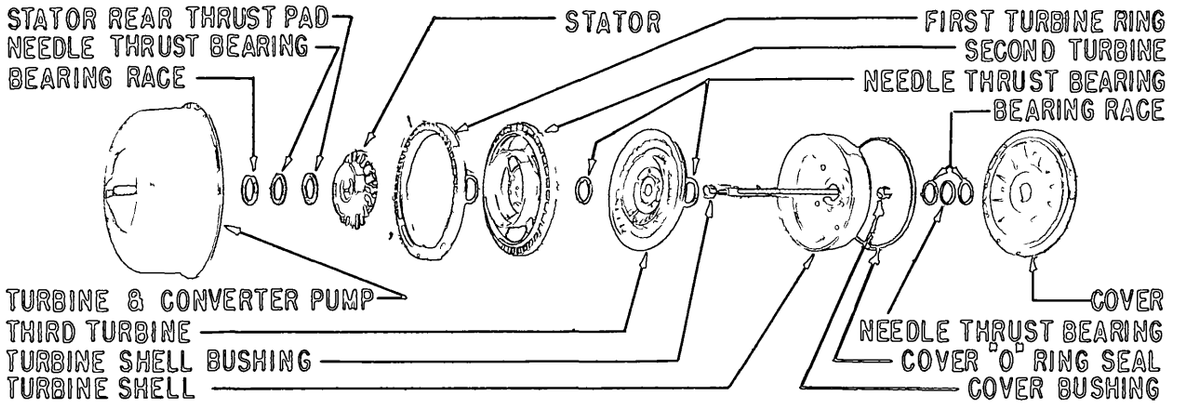
Stator Piston: Apply air to stator piston port (see illustration), and listen for air leaks. If air leaks are detected, check for a mispositioned or damaged front pump-to-transmission case gasket, broken or warped seal rings on second turbine shaft, defective stator piston seal, or damaged or worn brass seal in the inside diameter of stator support. Should it be determined that stator support brass seal is at fault, the stator support must be replaced as brass seal cannot be replaced separately.

Neutral Clutch: With air applied to neutral clutch port (see illustration), listen for application of clutch and air leaks. If no clutch application is heard, determine if the front pump-to-transmission case gasket is incorrectly positioned and blocking oil passages; otherwise disassemble neutral clutch and check for a locked-up or binding condition. If air leaks are heard, possible causes are a torn or distorted front pump-to-transmission case gasket, warped or broken oil seal rings on second or third turbine shafts, defective brass seal in the inside diameter of second turbine shaft. If brass seal is faulty, replace front ring gear hub and shaft assembly.

Forward Clutch: With oil transfer tube installed, apply air pressure to tube and observe that forward clutch applies. Listen for air leaks. Failure of clutch to apply can be the result of a wedged forward piston or Grade Retarder piston, probably caused by cocked piston "O" rings. A blockage of oil feed orifice in forward and brake piston support could also prevent clutch application. The first place to check if air leaks are found is

CONTINUED ON NEXT PAGE

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)



the "0" ring seals on oil pressure tube in forward clutch port; otherwise, check forward piston-to-support seals.

Grade Retarder Piston: Apply air to grade retarder piston port with oil pressure tube installed (see illustration). Check Grade Retarder application by watching for movement of grade retarder reaction plate which will occur as the brake plates are forced against it by piston moving backward. If grade retarder piston does not move, check for cocked "0" ring seals in both the grade retarder and forward pistons or check for blocked orifice in piston support. Leakage could only occur at either the oil pressure tube "0" ring seal or brake piston "0" ring seal.

TRANSMISSION REMOVAL & INSTALLATION

REMOVAL: Place car on jack stands, and remove toe pan plate (under floor mat). Remove spark plugs and disconnect battery ground strap from battery. Disconnect wires from starting motor solenoid and remove starter. Remove underpan mounting bolt retaining oil filler tube clamp and remove filler pipe. *(NOTE - Use masking tape to cover opening in transmission).* On early cars with a thermal by-pass valve, disconnect oil cooler lines and vacuum hose at thermal valve on transmission case. On later cars, disconnect oil cooler lines at plug (replaces vacuum manifold valve). Move lines away from transmission and tie to right frame side rail. Disconnect manual and throttle control rods at transmission levers. Split rear universal joint, then remove propeller shaft and front universal joint as an assembly by sliding complete assembly rearward until free of transmission output shaft. Drain transmission. Disconnect exhaust pipe from crossover pipe and muffler from muffler support bracket. Move exhaust pipe and muffler as an assembly to left and tie to frame member. Remove converter underpan. Install engine support bar or cradle to support engine. Remove the six converter-to-flywheel bolts and nuts. Position hydraulic jack under transmission and attach handling equipment. Remove rear engine mounts from transmission *(CAUTION - Be sure engine is properly supported before removing mounts).* Remove all transmission-to-engine block attaching bolts, then lift accelerator bracket assembly toward front onto the block. Move transmission to rear slightly and install converter holding Tool J-5384. Move transmission to rear off of dowels on engine block and lower transmission from under car.

INSTALLATION: Raise transmission with proper handling equipment until converter housing is in line with flywheel housing. Remove converter assembly Tool J-5384 from converter housing, then carefully align the "X" mark on converter cover with "X" mark on flywheel *(CAUTION - After removing converter holding tool, be careful that converter does not move forward causing disengagement of the pump hub drive slots from lugs of front pump drive gear).* *(NOTE - "X" marks must be aligned. These marks are not visible after assembly has been completed).* Align bolt holes in flywheel and converter, then enter transmission case into dowels on engine and assemble one bolt on right side of center near the top. Assemble throttle bellcrank bracket on left side of case and assemble two bolts holding case and bracket to engine. Install transmission case-to-engine bolts and tighten to 25-30 ft. lbs. Install converter-to-flywheel bolts and nuts and tighten to 15-20 ft. lbs. Install underpan on case. Install rear engine mountings (both sides) and remove engine support bar or cradle. Complete the installation by reversing removal procedure (above).

TURBOGLIDE TORQUE CONVERTER ASSEMBLY

TRANSMISSION DISASSEMBLY

▷ *TRANSMISSION OVERHAUL CAUTION: Before disassembling transmission, clean outside of case thoroughly to prevent dirt getting into transmission parts. As each part is removed, clean it with cleaning solvent and blow dry with air. DO NOT USE WIPING CLOTH (which may leave lint on parts).*

DISASSEMBLY (Into Major Units): 1) Remove converter assembly from transmission *(CAUTION - Prevent damage to converter output shaft during removal as the output shaft bushing may be misaligned which would make replacement of torus shell and shaft assembly necessary).* Remove oil pan and gasket. Remove capscrew and retaining clip holding speedometer gear housing in extension and remove housing. Remove extension housing from transmission, noting the square type seal ring on rear pump body.

2) Remove speedometer drive gear from output shaft, using Puller J-5814. Remove rear oil pump body and seal ring, then remove driven gear. Remove drive gear and pin from output shaft *(CAUTION - Drive pin can fall out if hole on bottom of shaft).* Remove parking pawl spring with needle nose pliers. Remove four bolts retaining valve body assembly to transmission case. *(NOTE - All three units of valve body will come off as an assembly. Bolts are two different sizes. Rear bolt is hollow to permit oil pressure to valve body).*

3) Remove oil pressure tubes between valve body assembly and case *(NOTE - Tubes are interchangeable and the "O" ring seals are the same).* Remove front and rear gasket on valve body.

4) Place transmission with input shaft facing upward, then remove front oil pump cap screws, pump, stator support and reverse piston assembly *(NOTE - Install Puller J-6585 in threaded holes of front pump housing to remove this assembly).* Remove reverse cone and spring from case and place transmission horizontally on bench.

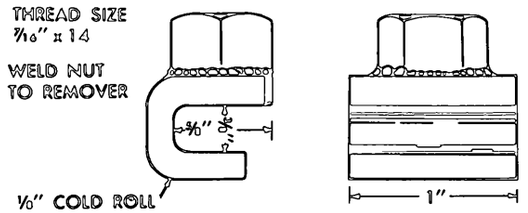
5) Remove neutral clutch and front ring gear assembly, which includes turbine shaft assembly, neutral shaft, and neutral clutch piston. Remove reverse cone ring (tanged to case), with soft drift and hammer. Remove front planet carrier. Remove front sun gear and freewheel assembly (gear section forward). Remove forward cone retaining ring which holds forward cone in place. Remove forward cone ring and forward cone *(NOTE - By exerting slight pressure on output shaft, both ring and cone can readily be removed).* Remove forward and brake pistons and support as an assembly.

6) Remove rear unit ring gear and output shaft and rear planet carrier as a unit. Also remove both brake clutch plates and aluminum separator. Disassemble rear ring gear from rear planet carrier by removing retaining ring, and remove two races and needle bearings from extension of carrier. Remove caged needle bearing assembly from output shaft.

7) Remove hairpin clip and remove detent control lever which is splined to shaft *(NOTE - Do not lose the seat and washer from shaft).* Remove manual selector lever. Remove parking brake bracket from case (two bolts), then remove parking lock actuator assembly. Remove parking brake pawl, pin, and "0" ring. Pin must be removed by driving on front of pin. On early cars with a thermal by-pass valve, remove valve and square seal ring *(CAUTION - Thermal by-pass valve cover is under spring tension).* Remove vacuum diaphragm by holding valve body and removing retainer nut from inside transmission case (valve strut will come off with retaining nut). On later cars, remove the plug which replaces thermal by-pass valve.

▷ *DISASSEMBLY NOTE: For disassembly of the above units, see OVERHAUL following.*

CONTINUED ON NEXT PAGE



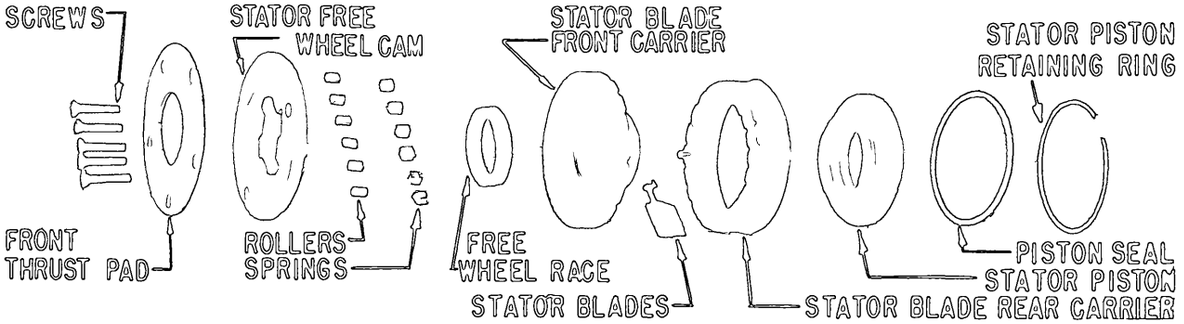
CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

TRANSMISSION OVERHAUL

▷ *OVERHAUL NOTE: After removal from case, overhaul sub-assemblies or units as follows:*

TORQUE CONVERTER (Disassembly): Mount converter in a support to avoid damage to turbine output shaft. *(CAUTION - Scribe a mark on converter housing and cover for alignment and balance).* Remove bolts from cover, then remove cover from converter pump. Remove square seal from cover. Remove first, second, and third turbines as an assembly. Remove stator assembly. Remove stator rear thrust pad, needle thrust bearing and thrust bearing race.

Turbine - Place converter turbine assembly on bench and drive out three drive pins enough to remove first turbine from turbine shell (a small punch should be used to drive pins through the inside of first turbine shell to protrude from first turbine ring). Remove first turbine ring from turbine shell with Tool J-6585, and first turbine ring remover (see illustration). *(NOTE - First turbine ring remover must be fabricated locally).* Remove second and third turbine from turbine shell.



FIRST TURBINE RING REMOVER TOOL

Stator - Remove clutch head retaining screws and front thrust pad, then remove stator freewheel cam, rollers and springs. Remove stator freewheel race, then remove stator blade front carrier by pushing on rear extension of front carrier. Two dowel pins hold the front carrier from turning. Remove 20 stator blades, stator piston and retaining ring, then remove stator piston from blade rear carrier and remove ring from piston *(CAUTION - Be careful not to break cast iron seal ring on stator piston).*

Inspection: Wash all parts in cleaning solvent and blow dry with air *(CAUTION - Do not use rags to dry parts).* Inspect converter pump hub outer surface, and pump thrust washers for galling or scoring. Check converter pump vanes and turbine vanes for looseness or damage. Inspect turbine hubs, turbine thrust washers, stator race and cam rollers for galling or scoring. Inspect converter cover bushing for galling, scoring, or excessive wear. Inspect cam springs for distortion. Inspect stator for galling or scoring and for loose vanes or damage. Inspect loose needle thrust bearing assembly and races for damage.

Converter Cover Bushing Replacement: Use precision type converter cover bushing, Part No. 3737261 for field service replacement (this bushing does not require reaming). Install bushing as follows: Remove thrust washer, needle thrust bearing assembly with a sharp instrument. Remove bushing with a chisel or sharpened tool, taking care not to damage thrust surfaces in bottom of bushing hole. Place new bushing on pilot end of converter cover bushing replacer, Tool J-6583, and press bushing into place. Replace thrust washer and needle thrust bearing assembly.

VARIABLE STATOR ASSEMBLY

First Turbine Hub Bushing Replacement: Remove needle bearing assembly, then remove bushing with a sharp chisel, being careful not to strike turbine hub. Using Tool J-6561, place pilot bushing, Part No. 3732200 (which requires no reaming), on end of tool and press into hub of first turbine. Install new needle bearing assembly with Tool J-6561.

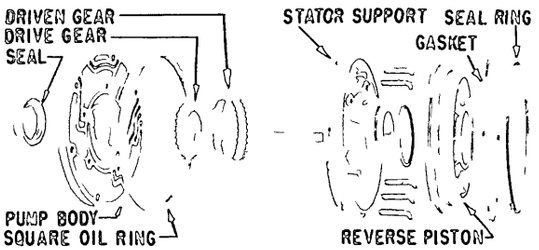
Reassembly: Stator - Install cast iron seal ring in stator piston and install stator piston in rear blade carrier, being careful not to break cast iron seal ring. Install stator piston retaining ring and install the 20 stator blades. *(NOTE - Trailing or sharp edge of blades should point downward after installation in stator. Neck of stator piston must be pushed fully through rear carrier to install stator blades).* Install stator front blade carrier, indexing the dowel pins in holes in rear blade carrier. Install stator freewheel cam in stator front blade carrier, aligning holes for retaining screws. Install freewheel race, springs and cam rollers with springs in large end of ramp slots of freewheel cam. Install front thrust pad and retain with five screws. Tighten screws to no more than 3-4 ft. lbs.

Turbine - Install needle thrust bearings with Tool J-6561, in the three turbines (needle thrust bearing assembly is the same for each of the three turbines). Support third turbine with suitable bushing while installing thrust bearing *(CAUTION - Do not strike or drive needle bearing on thrust surface. The needle bearing should be installed only by applying force to outer edge of bearing).* Install third turbine in turbine shell with vanes up. Install second turbine in turbine shell with flange upward. Align balance marks, then install first turbine inner ring with inner flat surface facing up in turbine shell. Locating three drive pins in shell with their respective holes in the inner ring can be accomplished with a small drift having the diameter of the pin. Complete installation by seating pins in place with a small "C" clamp.

Converter - Install steel spring ring into thrust bearing opening in pump and invert pump and converter assembly on stand and install needle bearing race (thinner washer) in pump. Install needle bearing assembly in pump, then install stator rear thrust pad (heavier of two washers). Install stator assembly into pump with bolts on stator facing up. Mount pump on stand face up, and index converter turbine shaft through pump and stator assembly. Install new square ring seal on converter cover. Place thrust washer, needle bearing, and another thrust washer on face of hub. Install converter cover and align balance marks on converter cover and pump. Install bolts on each side of scribe mark, omitting each fourth bolt, then tighten nuts finger tight. Tighten converter bolts as follows: Tighten every third bolt to 8-12 ft. lbs., (in rotation). Tighten remaining bolts to 8-12 ft. lbs., (in rotation), then tighten all bolts to 13-18 ft. lbs., (in rotation).

PLANETARY UNITS (FRONT & REAR): Front and rear units are similar and service procedures are nearly identical. Front unit does not have a sun gear or sun gear thrust washers.

▷ *FRONT PLANETARY UNIT PRODUCTION CHANGE:* Early units had four planetary gears. Later units have only three. On later units, planet pinion shafts are held in place with a lock plate, and are not held in place by staking as on the earlier units.



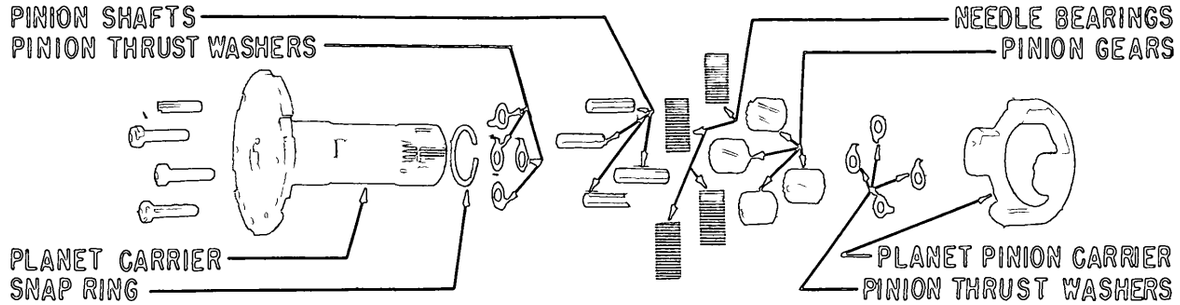
▷ *REAR PLANETARY UNIT PRODUCTION CHANGE:* Rear planet carrier pinion pins are held in place on later units with a lock plate identical to the one used on later front planetary units. On transmissions disassembled for service in which the old pressed-in type pins are found, the pins should be removed and discarded. Carefully file out staking burrs in pinion shaft holes in carrier and output shaft. Reassemble, using a new pinion shaft, Part No. 3746468, and lock plate, Part No. 3746470.

Disassembly: Place planet carrier in a vise (having protected jaws), then mark gear and output shaft for identification and alignment at reassembly. Remove three hex head lock bolts from bottom of carrier (rear unit); four Allen head bolts (three on later units) from top of carrier (front unit), and install Tool J-6559 to top of assembly, retaining it in place with the lock bolts. Install assembly in an arbor press with the output shaft down-

CONTINUED ON NEXT PAGE

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

ward, then install a suitable drift in hole in carrier and press on sun gear (rear unit), flange of output shaft (front unit) until output shaft is away from carrier and planetary gear shafts are freed from carrier *(NOTE - On later transmissions, the pinion shaft lock plates must be removed).* When carrier is separated from output shaft, all parts of the assembly can be removed. Be careful to keep planet pinions on pinion shafts so as not to lose pinion needle bearings *(CAUTION - On early cars with pinion shafts staked in carrier and output shaft, do not attempt to remove pinion shafts by breaking the four way stake. Pinion shafts must be removed by disassembly of planet carrier only).* Remove Tool J-6559 from carrier. Install the part containing pinion shafts into a vise and remove needle thrust bearing assembly, thrust bearing retainer, needle bearing race, and on rear unit, remove sun gear and sun gear thrust washer. Place a dummy shaft (old pinion shaft or a wooden dowel the same size as pinion shaft) to end of pinion shaft and slide a knife blade between lower thrust washer and



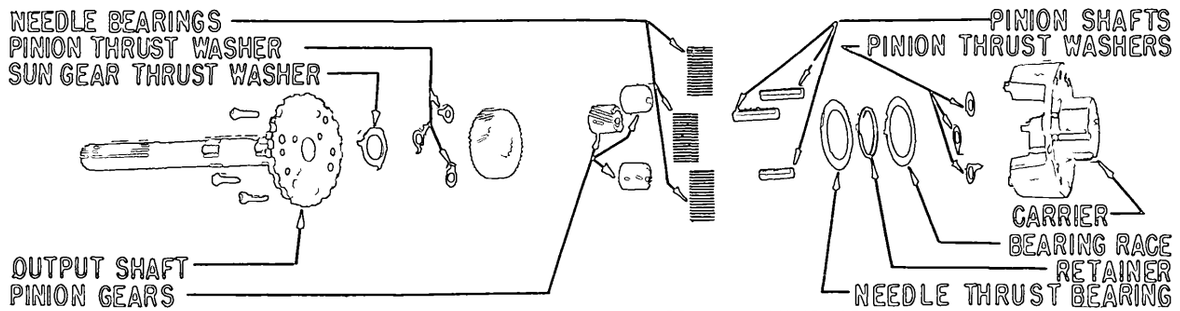
FRONT PUMP & REVERSE PISTON ASSEMBLY

pinion shaft holder. Lift up on knife and slide lower bearing thrust washer onto dummy shaft. Remove other two (three on early type front units) pinion assemblies in the same manner. On units with early type front and rear units, pinion shafts may be removed by knocking shaft out of holder (carrier or output shaft) with a drift no larger than the inner circle formed by staking marks *(CAUTION - Damaging the staking marks will ruin retaining quality of carrier or output shaft and necessitate replacement of these parts).*

Inspection: Wash all parts in solvent and blow dry with air. Check planetary pinion gears and sun gear for nicks or other tooth damage. Check thrust washers for wear or scoring and replace all worn or damaged parts. *(NOTE - The output shaft bushing is precision bored in place during assembly, and is not replaceable).* Inspect planetary needle bearings closely and if excessive wear shows, replace all the bearings in that pinion. Check pinion shafts and replace if worn (install new pinion shafts in output shaft half of the assembly).

Reassembly: *(NOTE -* If pinion shafts have been installed in output shaft, install output shaft in vise, if pinion shafts are not removed, install carrier in vise for installation of pinion gears). Using a dummy shaft, assemble

FRONT PLANET CARRIER ASSEMBLY NOTE—THREE PLANET PINIONS USED IN LATER PRODUCTION



needle bearings, and spacer (17 in each end), in one of the planet pinion gears (use cup grease sparingly to aid in assembling and holding needle bearings in place). Install pinion thrust washer over pinion shaft with tang indexed to small lock hole in output shaft (or carrier). Index dummy shaft with pinion gear assembly, to pinion gear shaft, and slide pinion gear assembly over shaft. Repeat operation for other pinion assemblies. Install sun gear rear thrust washer into output shaft with tang of thrust washer down and into lock hole in output shaft. Install sun gear. Install thrust bearing retainer in rear planet carrier. Install sun gear needle bearing race and needle thrust bearing assembly in rear planet carrier (use a slight amount of lubricant to retain in position). Install pinion thrust washers with tangs up. *(CAUTION - Make sure that no metal is shaved from pinion shafts during assembly as false clearance readings will be obtained).* Align alignment marks on carrier to alignment marks on output shaft and insert dowels of carrier into their respective holes in output shaft *(CAUTION -* While installing carrier to output shaft, align tangs of thrust washers to lock holes in carrier). To accomplish mating of carrier and output shaft, install assembly in arbor press in same manner as that used for disassembly, and press into position. Install the lock bolts and tighten to 18-22 ft. lbs. Check clearance of planet gears between washer and pinion (do not check between washer and carrier), this clearance should be .006-.030".

FRONT OIL PUMP & REVERSE PISTON: Disassembly - Remove gasket and the square oil seal ring. Remove reverse cone piston by using air pressure and applying nozzle approximately ½" from reverse port in stator support. Remove square seal ring from outer diameter of reverse piston, and square seal from stator support hub. Remove five hex bolts holding stator support to front oil pump body and remove oil pump body from stator support. Remove oil pump drive gear and driven gear. *(NOTE -* Lug on drive gear is installed to front of pump body. This lug mates with slot in converter housing hub).

Inspection: Wash all parts in solvent and blow out all oil passages *(CAUTION - Do not use rags to wip parts).* Inspect all parts for nicks or scores. Inspect seals for wear, hardness, damage, or evidence of oil leakage. If pump body oil seal is damaged, pry out and install new seal using Tool J-6584. Inspect splines on stator shaft for wear, and check both ends of shaft inner diameter for wear. Inspect facing material on reverse piston and ring for cracks or flaking and replace if found questionable. Inspect reverse cone and replace if excessive heat indicated. Inspect pump body bushing for galling or scoring. Check clearance between pump body bushing and converter pump hub. Maximum clearance should be .005". With parts clean and dry, install pump gears and check clearance between O.D. of driven gear and body. This clearance should be .0025-.0055". Check clearance between internal gear and crescent. This clearance should be .003-.009". With scale and feeler gauge, check gear end clearance by placing scale across gears and housing. Clearance between scale and gears should be .0005-.0015".

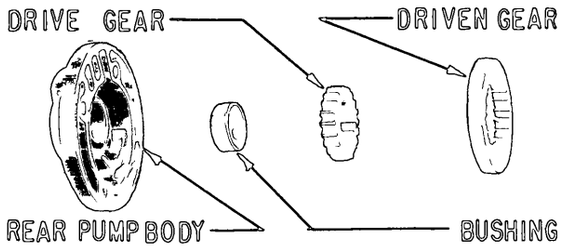
Reassembly: Remove gears from pump after checking and lubricate with automatic transmission fluid, then reinstall gears in pump body *(NOTE -* Drive gear is installed in pump body with lug toward body. Lug mates with

CONTINUED ON NEXT PAGE

REAR PLANETARY CARRIER & OUTPUT SHAFT ASSEMBLY (FIRST TYPE

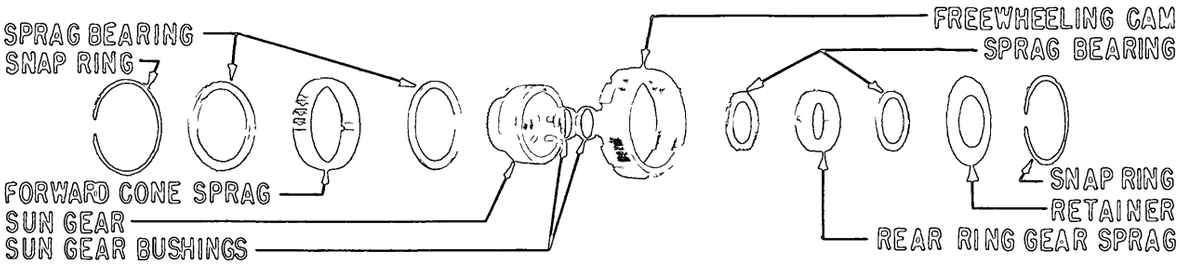
CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

slot in converter housing. If drive gear is installed improperly, pump will not operate). Assemble stator support through drive gear and align attaching bolt holes. Install the five lock bolts but do not tighten. Install Concentricity Gauge J-6560 over front extension of stator support to align stator support to pump body, then tighten the five lock bolts to 18-22 ft. lbs., and remove gauge. Install square seal to stator support hub (lubricate seal with automatic transmission fluid), install outer square seal ring. Guide piston over dowels and press with fingers to seat in place (dowels are off center to facilitate correct mating of parts). Install square seal to outer edge of support. Install gasket on oil pump housing *(NOTE - Reverse cone spring is not installed at this time due to operation for selection of correct size thrust washer, during which spring is removed).*



REAR PUMP: Disassembly - Remove pump gears and wash parts with solvent. Blow out all oil passages and check parts for visible damage. Install gears and check all clearances which are the same as for the front pump (see above). *NOTE* - Use output shaft in place of converter to make check for clearance between output shaft and pump bushing.

Rear Pump Body Bushing - Use precision bushing, Part No. 3727490, which requires no reaming, for service replacement. Cut bushing with a chisel and remove from pump body. Press new bushing into pump body with Tool J-6582. Bushing should be flush with neck of pump body on the inside, and flush to .010" below front surface of pump body.



Reassembly: Lubricate all parts with automatic transmission fluid. Reverse the disassembly procedure.

FRONT SUN GEAR FREE WHEEL ASSEMBLY: Disassembly - Remove needle thrust bearing assembly in opening in the rear of sun gear. Remove snap ring in outer cam from rear of assembly with a screwdriver. Remove forward cone freewheel sprag assembly, and outer bearing from sun gear (sun gear may have to be rotated clockwise to freewheel out of cam). Remove sprag assembly from outer cam *(NOTE* - The sprag assembly should not be disassembled. An arrow stamped on outer cage of sprag assembly designates front of transmission). Remove sheet metal retainer from sun gear, using pliers and bending retainer at staking points. Remove ring gear freewheel sprag assembly and bearings.

Inspection: Wash all parts in solvent and blow dry with air *(CAUTION - Do not use rags to wipe parts).* Inspect

REAR PUMP ASSEMBLY

SUN GEAR FREEWHEELING ASSEMBLY

inner race (sprag bearing surface) of cam for excessive scoring or burning. Also check lugs on outer perimeter of cam for nicks or burrs. Check bushings in sun gear for looseness or bushing scoring. Replace if necessary. *(NOTE* - Bushings must be replaced in pairs with sun gear removed from freewheel unit). Inspect front sun gear teeth for nicks and burrs and for fit of sun gear into front planetary unit. Inspect internal and external races (sprag bearing surfaces) of sun gear for excessive scoring or burning. Inspect sprag bearing for excessive wear. Check sprag assemblies and if wear is indicated, replace the assembly.

Front Sun Gear Bushing Replacement - Use precision bushings, Part No. 3727244, which require no reaming, for service replacement. *(CAUTION - Do not attempt replacement of these bushings with freewheel unit assembled).* Remove old bushings with Tool J-6581, using removal end of tool. *(CAUTION - Before installing bushings, note position of oil grooves in bushings. These grooves must point outward to maintain oil reservoir in sun gear).* Using Tool J-6581, mount sun gear in press and press bushings into place.

Reassembly: Install front retainer, then large sprag front bearing (brass) into cam. Install sprag into cam *(NOTE - Stamped arrow on outer cage of sprag assembly indicates front of transmission),* compress unit into cam with fingers (do not force). Install large sprag rear bearing (brass) into cam, then set aside for further assembly. Install front bearing (brass) into rear of sun gear. Install sprag, then install rear bearing (brass) into sun gear. Index tang of new seal retainer into hole in rear of sun gear and clamp in vise, using a steel block and wood block, and stake retainer into place using a staking tool which must be sharp and give a "fingernail" impression *(CAUTION - Shield retainer must be held snug to rear of sun gear while staking operation is performed. Be very careful not to bend shield).* Index sun gear into forward cone sprag, twisting counterclockwise to enable sprag cams to twist, allowing sun gear race to seat under sprags while twisting. Install rear bearing into cam. *(NOTE - Sprags are assembled correctly if units will slip while holding outer cam stationary and turning sun gear clockwise as viewed from front).*

NEUTRAL CLUTCH & FRONT RING GEAR: *NOTE - These assemblies have been changed in production and the service procedures have been revised as noted below.*

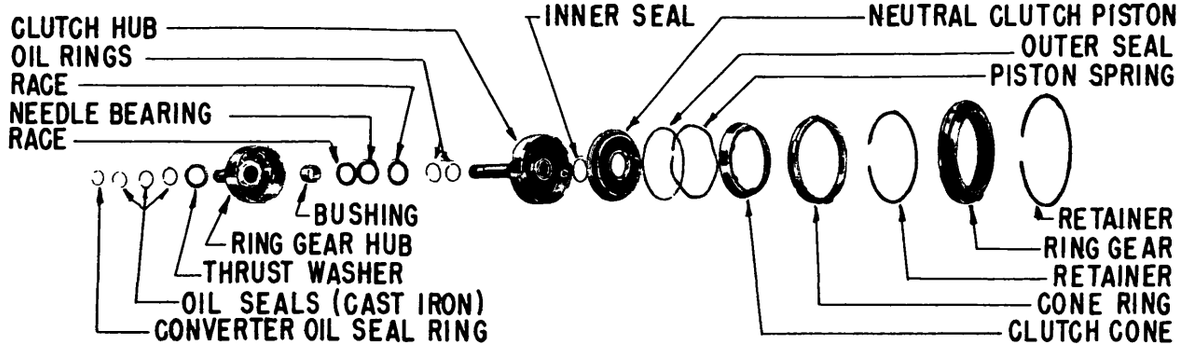
▷ *NEUTRAL CLUTCH PISTON & SPRING PRODUCTION CHANGE:* A new piston is being used in production and two release springs are being used in place of the former single spring. These springs are the same as the single original spring but must always be replaced in pairs from the same source and have the same die mark to assure proper nesting. Matched springs are furnished in service package, Part No. 3746425. When installing springs, the ends should be toward piston and the gaps of both springs must line up.

▷ *NEUTRAL CLUTCH CONE RING PRODUCTION CHANGE:* Transmissions bearing a date of Feb. 1, 1957 or later have a new clutch cone ring to which a .045-.035" step has been added to rear face. Slots in clutch hub have been increased .040" in depth to permit removal and installation of the ring retainer. Special procedures are required for disassembly and reassembly of unit using the new rings, as follows: In order to fully depress cone ring, install a small "C" clamp on each side of clutch hub assembly so that the adjustable foot of clamp is seated partly on step of cone ring and partly on clutch cone. Cone ring retainer can then be either removed or installed.

NEUTRAL CLUTCH & FRONT RING GEAR: Disassembly - Remove converter turbine shaft oil seal ring from front of ring gear hub shaft. Remove three turbine shaft oil seal rings and lift converter turbine shaft ring gear thrust washer off shaft *(NOTE* - This washer is a selective fit for proper clearances within transmission). Remove front planet ring gear retainer ring with a sharp instrument and remove ring gear from hub. Remove hub from turbine shaft and neutral clutch assembly. Remove oil seal rings from turbine shaft. Remove race, needle thrust bearing assembly and rear race from turbine shaft. Remove neutral cone ring retainer ring from neutral clutch assembly *(See "Neutral Cone Ring Production Change" above),* then remove cone ring, cone and cone piston return springs (or spring). Remove neutral clutch piston by putting air pressure into ball check hole in hub (Piston is doweled to hub and will not rotate independently of hub). Remove neutral cone piston outer square seal ring, and stator support square seal ring from stator support hub. *NOTE* - Ball check in hub is not removable.

Inspection: Wash all parts in solvent and blow dry with air. *(CAUTION - Do not use rags to wipe parts).* Inspect splines in hubs for nicks or burrs and check hub for fit into third turbine. Inspect ball check for looseness. If leakage is suspected, hub may be checked by filling cavity with oil and noting any leakage at ball check. Inspect inner race of hub for excessive scoring or bur-

CONTINUED ON NEXT PAGE



CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

ring (surface on which piston moves must be micro-smooth to eliminate possibility of oil ring breakage). Check all ring lands for nicks or burrs which may restrict ring movement. Check bushing in center of hub. If bushing is scored or loose, or inner race is damaged, replace hub and shaft assembly. Check neutral cone piston for burred or nicked groove for piston outer seal, or inner race being scored or pitted. Any surface roughness in contact with rubber seals will cause seal failure. Inspect neutral cone inner and outer facings for cracks or flaking. If questionable, replace as necessary. Check all tangs and keyways for proper engagement (the smallest burr or tang will hamper assembly). Inspect neutral cone surface and if excessive heat is indicated, replace the part.

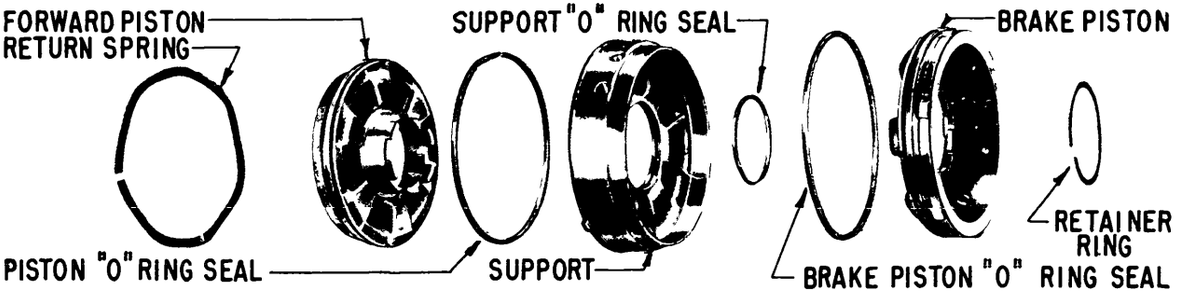
Front Ring Gear Hub Bushing Replacement - Use precision bushing, Part No. 3727301, which requires no reaming, for service replacement. Mount hub in vise (with jaws protected). Remove bushing with chisel *(CAUTION - Do not strike hub of ring gear)*. Mount hub in arbor press and using Tool J-6643, pilot bushing on end of tool and press into hub of ring gear.

R assembly: *(NOTE - Lubricate rubber seals with automatic transmission fluid before assembling)*. Install neutral cone piston inner square seal ring to center raised portion of hub. Install neutral piston outer square seal ring on piston. Install neutral clutch piston into hub, indexing hole in piston to fit dowel in hub. Apply hand pressure evenly around piston to facilitate installation. Install neutral cone piston return spring, neutral cone and cone ring, indexing lugs to keyways in hub. Install neutral cone ring retainer ring in groove in hub, seating it fully in groove. Place unit on bench with turbine shaft up and install needle thrust bearing race, needle bearing assembly and front race over turbine shaft of neutral cone hub. Install two piston hub oil seal rings (cast iron) on turbine shaft. Install front ring gear hub over neutral piston and turbine shaft assembly *(CAUTION - Be careful not to break oil seal rings during installation)*. Lift the assembly, keeping units together, and mount in vise. Key front planet ring gear to ring gear hub with large tapered portion of ring gear upward, or retainer cannot be installed. Install front ring gear retainer ring in hub and make sure it seats in bottom of groove. *NOTE - Oil seal rings and selective thrust washers are not installed at this time as it would b necessary to remove them for selecting proper thrust washer during reassembly.*

FORWARD PISTON, BRAKE PISTON & SUPPORT: Disassembly - Remove return spring from forward piston, making sure that facing material is not chipped from piston cone surface. Remove retainer holding brake piston to forward piston. Mount assembly into Holding Fixture J-6580-1 indexing tang of support to keyway in holding fixture, then place in arbor press. Index Tool J-6580 into spline of hub of forward piston and press piston out of support and brake piston. Remove support from holding fixture and remove forward piston. Reverse support and install with brake piston down into holding fixture, then press out brake piston in the same manner as for forward piston. Remove parts from holding fixture and remove "0" rings from support, and square seal rings from forward and brake pistons.

NEUTRAL CLUTCH & RING GEAR ASSEMBLY (FIRST TYPE)

Inspection: Wash all parts in cleaning solvent and blow dry with air. Inspect splines of hub for nicks or burrs and check hub of brake piston for fit into hub of forward piston. Inspect all surfaces contacting oil seal ring surfaces for scoring or burning, and check seal rings for damage. Inspect forward cone ring and piston for cracks or flaking in facing material. If condition of material is questionable, replace the necessary parts. Inspect forward cone surface and replace if excessive heating is indicated. Inspect hill retarder composition plates and replace if damaged.

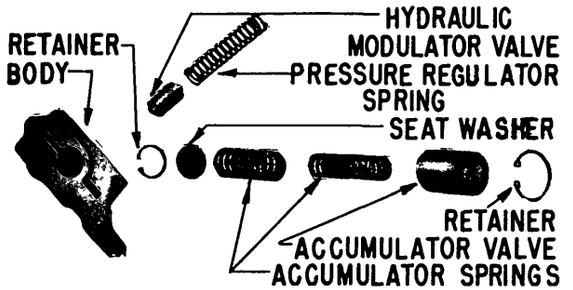


Reassembly: Install new "0" ring in support and square seal rings on brake and forward piston (lightly lubricate with automatic transmission fluid). Place forward piston on bench with splines facing up. Index support over hub of forward piston and hand press together, noting position of raised ribs of piston to mate with cavities in support. Key the splines of hub on hill retarder piston to splines of forward piston and align tang with hill retarder piston between pressure tube holes in support, then press together evenly to avoid damage to seals (rear piston must be down far enough to enable retainer to be installed and fully seated). Install return spring to forward piston taking care not to chip off facing material. *(CAUTION* - Make sure spring is indexed properly with notches in forward cone ring). Install forward cone ring and align tang of ring to tang of support.

TRANSMISSION CASE REAR BUSHING REPLACEMENT: The case rear bushing, Part No. 3732210 is a precision type and requires no reaming after installation. Place transmission case on bench with rear portion facing up, then cut bushing with a cape chisel and remove from case. *(CAUTION - Be car ful not to damage the aluminum transmission case)*. Install bushing into case using Tool J-6582, from inside of case.

► *CONTROL VALVE BODY PRODUCTION CHANGES:* A new main valve body, Part No. 3746447, including the hydraulic modulator valve assembly is being used in production to increase line pressure from 60-170 lbs., to 90-200 lbs. The valve body transfer plate has been replaced by a new plate, Part No. 3745601, which has the .13" x .50" orifice for stator feed oil reduced in size to .062". Two ditch plate straps, Part No. 3747241, and 3747242 are used to prevent oil leakage with the increased oil pressure. New bolts with a torque specification of 8-12 ft. lbs. are being used. The stator detent spring and the manual detent spring have also been changed.

CONTROL VALVE BODY: Disassembly - Remove both oil pressure tubes (if they did not stay on support). Remove valve body screen and manual valve. Remove both gaskets between valve body and transmission case. Remove vacuum modulator valve body and gasket. Remove

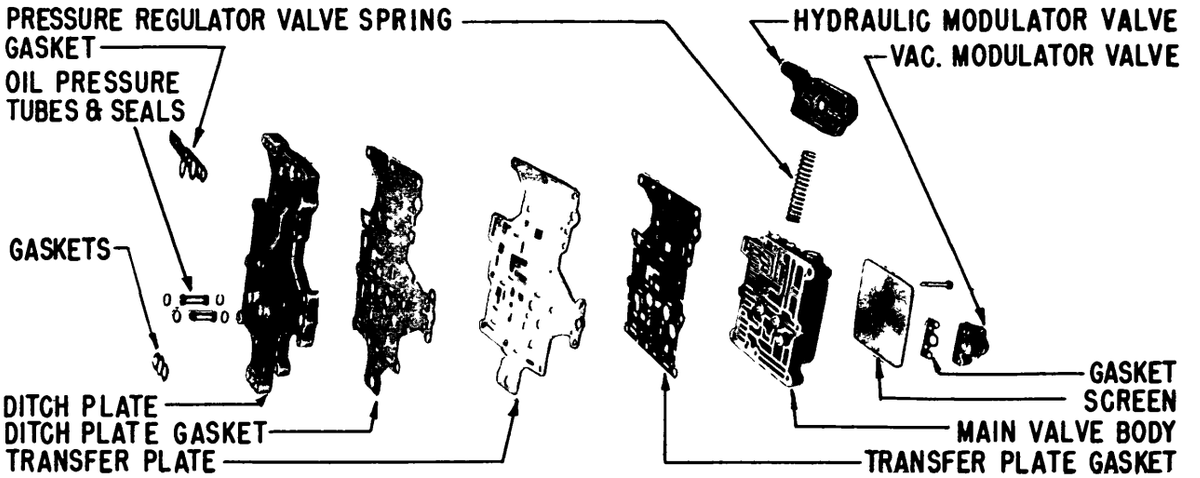


CONTINUED ON NEXT PAGE

FORWARD & BRAKE PISTON & SUPP RT ASSEMBLY

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

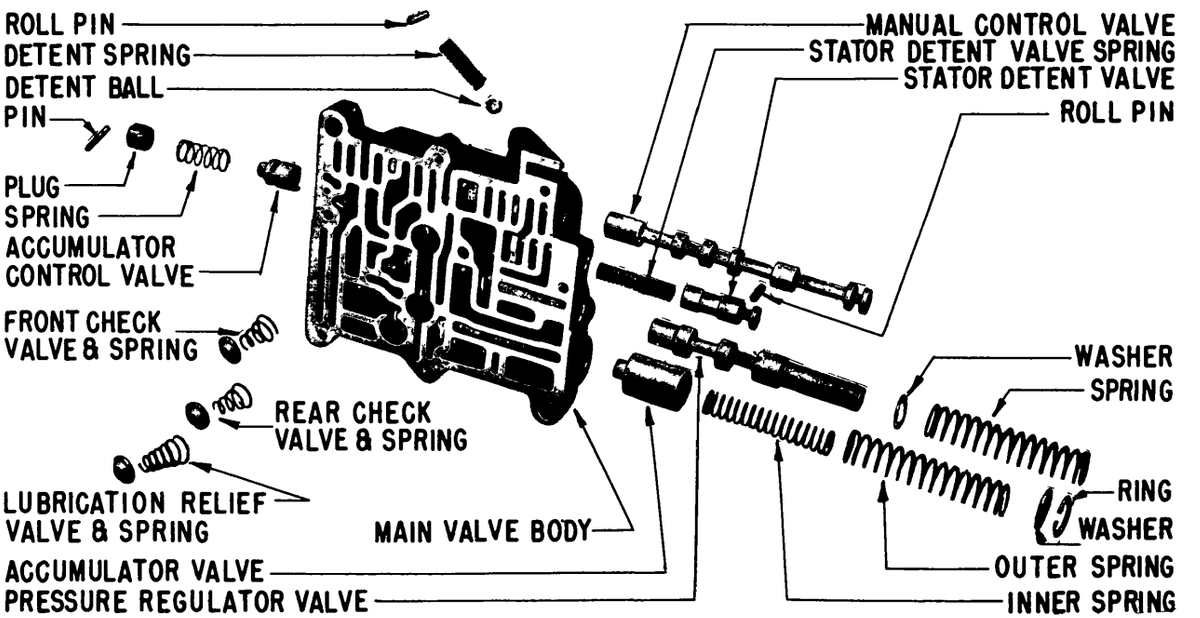
modulator valve body (*NOTE* - Hold valve body securely while removing bolts as this unit is spring loaded by pressure regulator valve spring). Remove accumulator valve by installing hydraulic modulator valve body in a vise (or use a "C" clamp) to depress the accumulator valve while the accumulator valve snap ring is being removed (*CAUTION* - This valve is under about 90 lbs. pressure). Then remove seat and inner and outer springs and accumulator piston. Remove hydraulic modulator valve from body. Remove pressure regulator spring, valve, and spring seat washer. Remove main valve by removing screw retaining parking pawl spring strut, then remove other valve body locating screw holding valve body to ditch plate. Reverse valve body and remove seven bolts holding ditch plate to valve body. Separate ditch plate (aluminum) from transfer plate (steel)



HYDRAULIC M DULATOR VALVE ASSEMBLY

and valve body. Remove gasket between ditch plate and transfer plate, remove transfer plate, then remove gasket between transfer plate and valve body. Remove front and rear pump check and lubrication relief valve and springs (*NOTE* - Front and rear check valve springs are interchangeable. Lubrication relief valve spring is different and is not interchangeable. The three valves are interchangeable). Remove accumulator check valve from ditch plate, then remove accumulator control valve plug roll pin, plug, valve and spring. Remove accumulator valve snap ring (in end of valve body), spring seat, inner and outer springs and accumulator piston. Remove the seven socket head pipe plugs from valve body. Remove detent roll pin, spring, and detent ball.

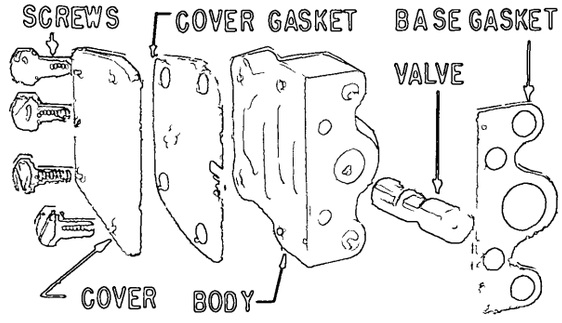
Inspection: Wash all parts in solvent and blow dry with air (*CAUTION - Do not us rags to wipe parts*). Inspect all springs for distortion or damage and all valves for nicks, burrs, galling, or scoring. Check valves and pistons for free operation in their respective bores. Inspect lands of manual valve for wear or scratches. Inspect valve bodies for cracks, scoring, or galling. Clean sump screen and inspect rubber by-pass valve.



Reass mbly: Install the seven pipe plugs in valve body. Install detent ball and spring, then install new roll pin to retain detent ball and spring. Install inner and outer springs into accumulator piston and install this assembly into valve body (*NOTE - This is not th accumulator 'valv locat d in hydraulic modulator body*). Hold

CONTROL VALVE BODY ASSEMBLY (FIRST TYPE)

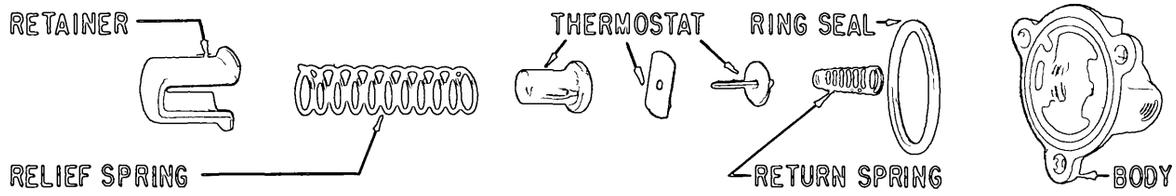
spring seat over springs and compress, then install retaining snap ring into groove in bore (*CAUTION - Do not confuse pressure regulator spring with accumulator outer spring. The pressure regulator spring is heavier with a free length of 3¼"*). Install stator detent valve spring in valve body, then install detent valve with hollow end indexing over spring. Hold valve in and press roll pin to engage in groove in end of valve. Do not install pin too deep (end of spring should not touch bottom of groove). Check freedom of the assembly. Install accumulator control valve with tangs of valve inward, then install spring and plug. Compress spring by pushing in on plug, then install retaining pin. Install accumulator check valve spring onto accumulator check valve, then install assembly into respective hole in aluminum ditch plate (set aside for further assembly). (*NOTE* - Accumulator check valve spring is lightest spring in the valve assembly, and check valve has a hole in the center. Valve and spring are not interchangeable with other valves or springs in valve assembly). Install large hollow bolt through rear hole in ditch plate to aid in alignment of gaskets and parts. Install gasket on ditch plate,



CONTINUED ON NEXT PAGE

C NTROL VALVE MAIN BODY ASSEMBLY (FIRST TYPE)

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)



then install transfer plate. Invert valve body and install front and rear pump check valve, lubrication relief check valve and springs. Install gasket on valve body. Install transfer plate and ditch plate assembly on valve body, indexing holes in transfer plate with valves in valve body *(CAUTION - Make sure that valve seats and gaskets are not damaged).* Hold ditch plate down and start three bolts to hold plate to valve body *(NOTE* - On later valve bodies with ditch plate straps, install straps). Turn bolts completely down to overcome tension of valve springs. Install shortest bolt in center hole of valve body (this hole is used for the bottom bolt and for the screw retaining sump screen). *(NOTE* - Installation of wrong length bolt in this hole will prevent sump retaining screw installation). Install and tighten remaining bolts to 8-12 ft. lbs. Reverse valve body and install pressure regulator valve, washer, and spring into valve body. Install accumulator valve into hydraulic modulator valve body with piston boss facing down. Install both springs, then install spring cover with raised portion of cover away from spring, and compress (using a vise or "C" clamp) sufficiently to install snap ring *(CAUTION - Approximately 90 lbs. pressure is exerted by accumulator springs and care must be taken to prevent damage to parts during valve installation).* Install modulator valve into hydraulic modulator valve body (valve can be installed either way). Place regulator valve spring into counterbore of modulator valve in modulator valve body, compress spring and install bolts. Install long bolt through valve body to ditch plate. Install vacuum modulator valve and gasket to valve body assembly and tighten screws. Install manual valve and sump screen. Install parking brake spring clip and bolt and tighten to 8-12 ft. lbs.

VACUUM MODULATOR VALVE ASSEMBLY

REAR EXTENSION HOUSING REAR OIL SEAL REPLACEMENT: Place extension housing on a wooden surface and remove oil seal using a cape chisel or punch *(CAUTION - Be careful not t damage aluminum case).* Using Installing Tool J-5154, install seal in extension housing.

▷ *EXTENSION HOUSING BUSHING NOTE: This bushing is precision bored in position and is not replaceable.*

THERMAL BYPASS VALVE (EARLY CARS)

TRANSMISSION REASSEMBLY

REASSEMBLY: 1) Install parking pawl and parking pawl shaft with "O" ring in transmission case. Index manual control lever into manual control rod and park lock pawl rod (bullet type), and secure with bolt and nut *(NOTE* - Shaft is serrated to permit installation in one position only). Install stator lever through control lever and install detent control lever plate, then install hairpin clip *(NOTE* - Stator lever is serrated to permit installation in one position only). Install parking lever bracket and tighten bolts to 7-9 ft. lbs.

2) Install rear race, needle bearing assembly, and front race on front of output shaft carrier. Install caged needle thrust bearing assembly on rear of output shaft (hold in place with lubricant). Install rear ring gear onto rear planet carrier and output shaft, using grease sparingly, to hold bearing in place. Install output shaft and rear ring gear assembly into case from the front. Install brake drive plate (composition) by indexing rear ring gear, then index brake reaction plate (aluminum) to case. Finally, index the other brake drive plate (composition) to rear ring gear.

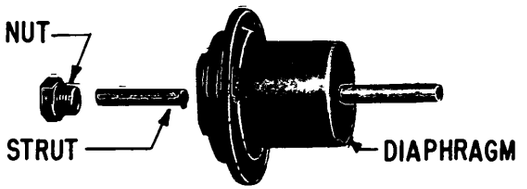
3) Install forward cone on forward piston, then install forward cone ring over spring on forward piston, making sure that notches of ring fully engage outer tangs on edge of spring *(CAUTION* - Be careful when placing spring on forward piston so that the indexing is proper for installation of ring to case and indexing of ring to the return spring).

4) Install forward and brake pistons and support in case (outer forward cone ring may have to be tapped gently to compress spring in forward piston to provide enough space to install retainer. *(NOTE - Retainer must be seated in groove in transmission case or failure may result, causing serious damage to transmission).*

5) Install needle thrust bearing race over extension of front planet carrier, then install needle thrust bearing assembly over race. Install tanged washer on front end of planetary (use a small amount of lubricant to retain in position during assembly). Hold the neutral clutch assembly in one hand with the shaft pointing upward, then lift front planetary, with tanged washer installed, and index keyways on front planetary housing to cone lugs in neutral clutch assembly. *(CAUTION - Improper mating of these parts will prevent transmission being assembled).* After planetary assembly is installed, rest shaft of neutral clutch on bench and install freewheel sprag assembly over rear extension of planetary. Twist sprag assembly to mate sun gear to planetary gears. Install needle thrust bearing over extension of front planetary gear extending through freewheel unit.

▷ *REVERSE CONE RING SELECTION (For Proper Running Clearance During Forward Drive Range Operation and Contact Area for Positive H lding in Reverse):* (1) Before installing the neutral clutch and freewheel units in the transmission case, temporarily install the reverse cone ring, cone, spring, and front pump and reverse piston assembly (be sure that cone is seated evenly in reverse cone ring). Secure front pump with at least four bolts. (2) Clamp a dial indicator onto side of transmission case, using an indicator tip 1¼" long, so that tip of indicator is against reverse piston (set tip on a flat area of piston to prevent slippage during piston travel). Set dial indicator at zero, then turn front end of transmission case downward, and, while watching dial indicator, apply air pressure to reverse piston passage in control valve mounting boss (second hole in boss, from control lever side of transmission case). If cone ring is within limits, indicator reading will be between .059-.085". If piston travel is over the high limit, repeat the test using a new green cone ring, Part No. 3740892, or a blue cone ring, Part No. 3740891, in that order. If travel is below the limits, repeat test, starting with the green cone first, then the yellow cone ring, Part No. 3740893.

6) Install neutral clutch and freewheel sprag assembly into case, twisting shaft to engage lugs of freewheeling assembly outer cam to forward clutch assembly mounted in transmission case (forward cam is loose and can be turned to align with lugs of freewheeling cam).



7) Turn transmission so input shaft is facing up and install reverse cone ring in case (tapered portion forward with tang fitted into case and oil return groove at bottom). Check for correct selective washer thickness as follows: With gasket installed on front pump assembly, install dial indicator on Tool J-6557 with indicator set at zero and touching contact arm on tool. Mount gauge and tool assembly to rear hub of front pump so that contact arm is resting on mounting flange of pump. Gauge several points around mounting flange and record the highest reading obtained. Remove gauge and dial indi-

CONTINUED ON NEXT PAGE

CHEVROLET TURBOGLIDE TRANSMISSION (Cont.)

cator assembly and mount in transmission case over input shaft so that gauge arm contacts thrust washer pad of neutral clutch and front ring gear assembly. Record highest reading obtained at this point, then subtract reading from the reading taken on front pump assembly. The difference will indicate correct thrust washer thickness. Thrust washers are available in the following three sizes: .068" (Part No. 3727319), .085" (3727321), & .103" (3727320). Select the thrust washer which will provide a clearance of .008-.028".

8) Install four oil seal rings to extension on front ring gear hub. Install reverse cone into case, meshing tangs with slots in neutral clutch and front ring gear assembly. Install reverse cone spring into case. Install two guide studs, J-3361-10 in case to guide the pump assembly and avoid damage to oil seal rings. Install stator support gasket to case, then install square type seal ring on outer lip of stator support. Align tang of oil pump drive gear to bottom of pump housing. With front end of transmission case facing upward, index front pump on guide studs and carefully guide pump over oil seal rings on front ring gear hub shaft (tap housing lightly to fully seat in case). Remove guide studs and install capscrews retaining pump to case, and tighten to 15-18 ft. lbs.

VACUUM DIAPHRAGM

9) Install converter assembly (driving lug of pump to mate with keyway of front pump drive gear) rotating converter as necessary to complete mating of splines.

► *CHECKING CAUTION: A minimum distance of ¾" from front of transmission case to front of converter at flange, measured with a straightedge assures that all parts are properly engaged. If this distance is less, check transmission for improper assembly.*

10) Install Torus Holding Tool J-5384 in position and place transmission in a horizontal position. Turn output shaft to locate drive pin holes to top of transmission, and install drive pins (*CAUTION* - Make sure that drive pins do not fall out of transmission during assembly). Position rear pump output shaft indexing drive gear to drive pin. Install bolts through pump into rear of case and tighten to 7-9 ft. lbs. Install square seal ring over pump.

11) Install thermal by-pass and tighten to 7-9 ft. lbs., and install vacuum diaphragm outside of case along with vacuum modulator strut and attaching nut. Install "O" rings in support and then install "O" rings on oil pressure tubes in support (tapered end of support) through case, making sure that seal rings are seated. Install valve body gaskets, using a small amount of lubricant to retain gaskets in position for assembly.

12) Place stator control or detent lever in "down" position and install valve body in case, guiding detent plate into groove, manual lever to manual valve detent valve, and carefully pick up manual valve, oil pressure tubes and vacuum modulator strut. Install special drilled bolt at rear of valve body to rear case (hole in bolt carries lube pressure to drilled passage in case to output shaft, from valve body). Tighten hollow bolt to 18 ft. lbs. Install remaining bolt in valve body and tighten to 8-10 ft. lbs.

13) Index spring in parking pawl lock, then index into clip on rear bolt of valve body. Install speedometer gear on output shaft with Tool J-5814. Install in extension housing and install extension housing on transmission case. Tighten bolts to 23-26 ft. lbs.

► *EXTENSION HOUSING INSTALLATION NOTE:* After tightening extension housing bolts, install universal joint yoke on output shaft and rotate freely. If yoke is tight, remove rear extension and tap rear oil pump body with plastic hammer to center output shaft with rear extension bushing and seal.

14) Install driven speedometer gear in extension housing and install transmission oil pan gasket and oil pan.

POWERFLITE
(DE SOTO, DODGE, PLYMOUTH)

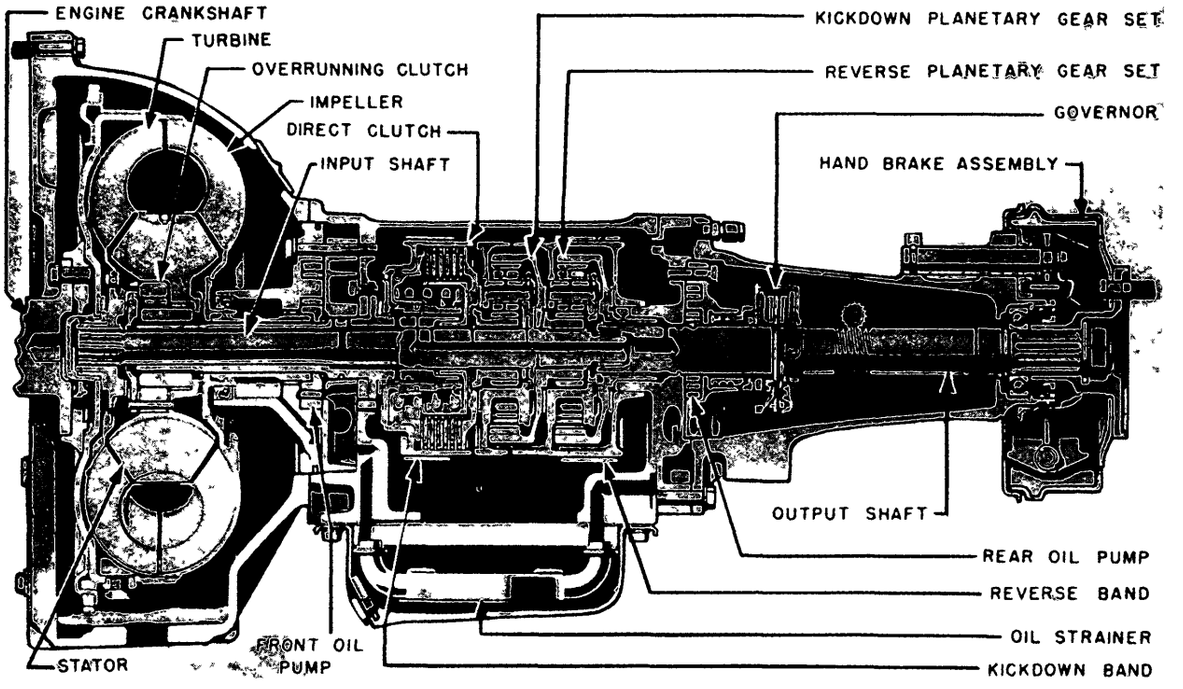
DeSoto S-25 & S-27 (1957)
Dodge 6, D-72 (1957)
Dodge V8, D-66 (1957)
Plymouth 6, P-30 (1957)
Plymouth V8, P-31 (1957), Except Fury.

►CHANGES, CAUTIONS, CORRECTIONS

►*PUSHING CAR TO START ENGINE:* Pushing is recommended rather than towing. With the "N" (Neutral) button pushed in, turn the key to "ON" position. When car reaches a speed of approximately 25 MPH, push in the "L" (Low) button. This will allow the transmission to crank the engine.

►*TOWING POWERFLITE CARS:* Following procedure recommended.

Transmission Inoperative – Disconnect propeller shaft or tow car with rear end raised.



Transmission Operating – The car may be safely towed at moderate speeds with the "N" (Neutral) button pushed in. For long distance towing (over 100 miles), the propeller shaft should be removed.

►*1957 POWERFLITE REVERSE SERVO PISTON PRODUCTION CHANGE:* All transmissions code dated C-5-57 and with the letter "B" preceding the part number will have a new reverse servo which incorporates a spring cushion instead of the hydraulic cushion previously used. New reverse band adjustment specifications are also used with the later type servo. *See "Reverse Band Adjustment Production Change" below.*

►*1957 REVERSE BAND ADJUSTMENT CHANGE (TRANSMISSIONS WITH LATER TYPE REVERSE SERVO PISTON ASSEMBLY):* See production change above. On transmissions having a code date of C-5-57 and with the letter "B" preceding the part number, adjust the reverse band as follows: Loosen locknut and tighten adjusting screw to 20-25 inch-pounds, then back off the adjusting screw **exactly 12 turns** (previous adjustment was 10 turns) Hold adjusting screw and tighten locknut to 30-35 ft. lbs.

►*1957 POWERFLITE REAR OIL PUMP PRODUCTION CHANGE:* A plastic rear oil pump gear and a revised oil pump housing are now being used in production. Transmissions having a code date L-19-56 and the letter "A" preceding the transmission part number stamped on lower side of case will have the later type pump assembly. The new pump parts (Gear, Part No. 1672315 & Housing Assembly, Part No. 1823666) are interchangeable with the previous parts if both the pump gear and housing are replaced together. The new plastic gear cannot be used in the old housing, and the old steel gear cannot be used with the later type housing.

►*1957 PLYMOUTH POWERFLITE TORQUE CONVERTER IDENTIFICATION:* Torque converters used on the 6 cyl. engine have a smooth surface at rear of converter (side nearest transmission) The V8 engine converter is identified by a 1 8" wide groove cut on the rear "donut"

POWERFLITE TRANSMISSION (SECTIONAL VIEW)

►*1957 POWERFLITE RUNNING AWAY DURING PART THROTTLE DOWNSHIFT CORRECTION:* If this condition cannot be corrected by correct throttle linkage and kickdown band adjustment, remove main control valve assembly and examine throttle pressure lever for endplay between spherical surface of adjusting screw and positioning tab on throttle lever. If there is clearance at this point, bend tab against spherical surface of screw to eliminate all clearance *(CAUTION* - Be sure that lever moves freely on screw after bending tab). Examine servo restrictor valve (in valve body transfer plate), and replace if bent. Check servo restrictor valve plug for free movement.

DESCRIPTION

DESCRIPTION: PowerFlite transmission consists of a torque converter and two-speed hydraulically operated planetary gear type automatic transmission of the same design as used on 1956 models.

LUBRICATION

►*TRANSMISSION FLUID LEVEL & CHECKING PROCEDURE CHANGE:* To avoid overfilling and trouble under high speed and high temperature operating conditions, it is recommended that the following checking procedure be used and that the recommended fluid level not be exceeded. *This supersedes previous recommendations.*

►*NOTE:* It is recommended that the fluid level be checked with transmission "Cold" (after being parked for a considerable time and before being driven several miles). If necessary to check transmission "Hot" (after car driven for several miles), observe the special hot fluid level given below.

Checking Fluid Level (Cold Transmissi n) - Run engine at idling speed with parking brake applied. Operate all push buttons in turn (leave in each position momentarily), then check fluid level with "N" (Neutral) button pushed in. Note level indicated on dipstick, add or remove oil as follows: **Level betw en "L" mark and ½" below "L" mark** - Do not add oil - this level is satisfactory. **Level below ½" below "L" mark** - Add oil to bring level up to between "L" mark and ½" below "L" mark. **Level above "L" mark** - Remove oil until level has been lowered to between "L" mark and ½" below "L" mark.

Checking Fluid Level (Hot Transmission) - Proceed as for cold check above. Add or remove oil in accordance with fluid level on dipstick as follows: **L vel between "F" mark and ½" above "L" mark** - Do not add oil - this level is satisfactory. **Level b l w "L" mark** - Add oil to bring level up between the "L" mark and ½" above the "L" mark. **Level above "F" mark** - Remove oil until level is between "F" mark and ½" below "F" mark. *NOTE* - On cars with first type dipstick (1 5/8" between "F" and "L" marks), maintain level at ½" below "F" mark.

CONTINUED ON NEXT PAGE

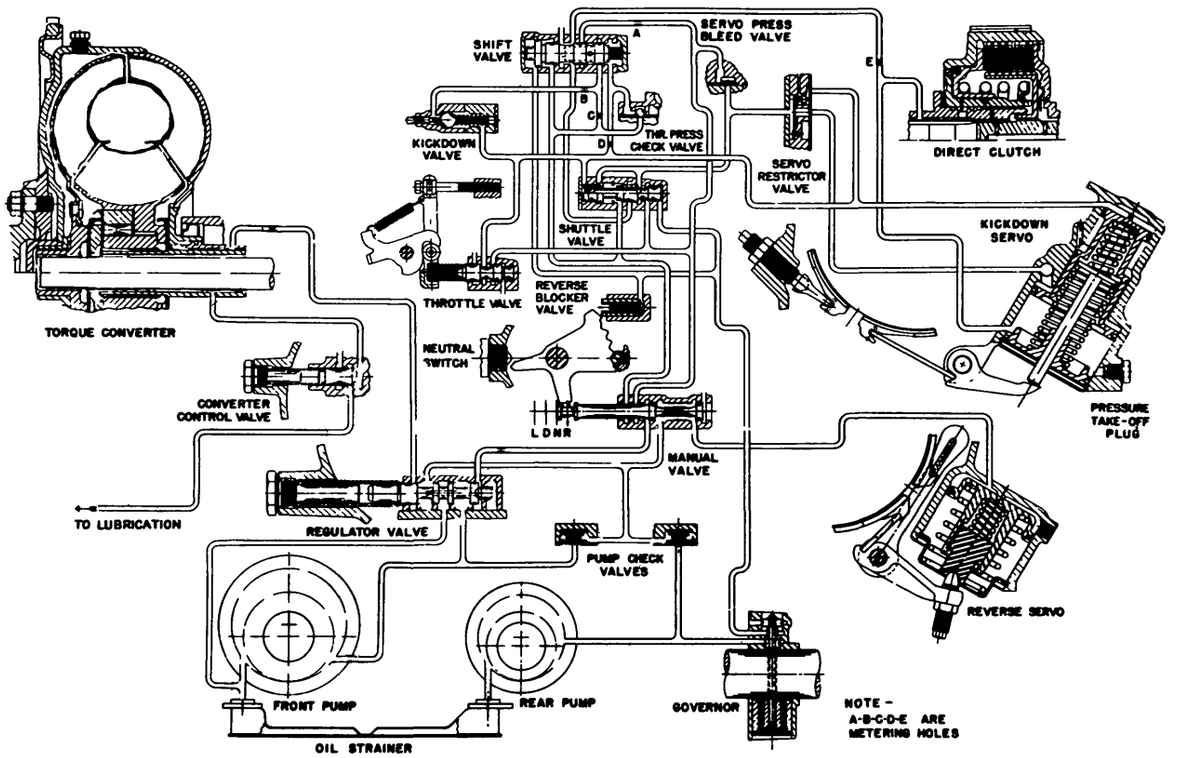
POWERFLITE (C nt.)

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See "Carbur t r" on car m d l pages.*

OPERATION: After push button reaches its limit of travel a lock spring (on push button operating slide) engages actuator bar shaft. This action allows the spring lock to hold push button in the engaged position. When operator selects a different driving range, the top or bottom portion of operating slide (depending on which button was pushed) contacts the actuator bar and releases first push button from lock spring.

Manual C ntr l Cabl Adjustment: Remove neutral safety starting switch from side of transmission. Loosen adjustable mounting bracket capscrew and move cable and bracket assembly (manually) as required, to position the manual valve lever in neutral position. Hold the "N" (Neutral) button tightly in at full travel (the neutral starting switch cam should then be practically centered in neutral starting switch mounting hole). Use a free fitting flat-faced shaft inserted through the neutral mounting switch hole, and apply very light pressure against the manual valve lever to maintain the neutral detent position of lever. *(NOTE* - If tool is not available, lever may be held by finger pressure). Carefully move cable assembly "in" and "out" **without moving** the manual lever, to determine total free-play travel of cable. Locate the cable midway in the free-play range, release pressure against the manual lever and tighten mounting bracket securely. *Do not allow cable t move when tight ning the bracket.* Install neutral starting switch and check transmission fluid level.



N utral Start r Switch Adjustment: Attach an electrical contact indicator to switch outer terminal and to transmission case, tighten switch until initial electrical contact is made, then tighten switch an additional 1/3 to 1/2 turn.

BAND ADJUSTMENT

BAND ADJUSTMENT: *Kickdown (front) band can be adjusted externally. R v rs (rear) band adjustment requir s removal of transmission case oil pan.*

Kickd wn (Front) Band: Working from beneath car, loosen kickdown band adjusting screw locknut (located on left side of transmission case). Check freeness of adjusting screw in transmission case. If free, use inch-pound torque wrench, Tool C-3380 and tighten adjusting screw to 72 inch-pounds *(NOTE - If Extension, Tool C-3583, is used with torqu wrench, tighten adjusting screw to 40-43 inch-p unds).* Use a reference mark of chalk or colored pencil on a corner of adjusting screw square and the transmission case. **Using extreme care, back th adjusting scr w ut xactly 2¾ turns.** Hold adjusting screw stationary with a wrench and tighten locknut securely.

R v rs (R ar) Band: *(NOTE - S "Rear S rvo Piston Producti n Change" above for id ntification of transmissi ns with lat r type reverse s rv piston).* Drain transmission and remove oil pan. Loosen band adjusting screw locknut and tighten adjusting screw to 20-25 inch-pounds. Mark a reference point and back off the adjusting screw **10 turns** (early type servo piston); **12 turns** (later type servo piston). Hold adjusting screw and tighten locknut to 30-35 ft. lbs. Replace oil pan and refill transmission.

POWERFLITE TRANSMISSION HYDRAULIC CIRCUITS

TESTING

Transmission Shift Speeds (MPH)

DeSoto S-25 & S-27

Throttle Position	Upshift	Downshift

Wide Open	41-46	9-16
Closed	12-15	9-11
Kickdown Limit		41-46

Plymouth V8

Throttle Position	Upshift	Downshift
Wide Open	50-59	9-17
Closed	13-16	9-11
Kickdown Limit		50-59

ROAD TESTING TRANSMISSION: If transmission operation not satisfactory, following complete procedure is recommended to check performance and diagnose trouble. 1) Move selector push buttons through their positions. Check for binding or hanging, or insufficient travel. Do not operate engine in reverse at wide open throttle. 2) Attach an electric tachometer to engine. Push in "D" (Drive) selector button. Check speed and smoothness of engagement. Apply both hand brake and foot brake and check for band slippage at wide open throttle *(CAUTION - Do not hold throttle wid p n mor than a f w s conds).* See "Stall Speed Table" below. Check for kickdown band adjustment before proceeding with road test.

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

3) Accelerate engine at very light throttle. The transmission should upshift at speeds given in "Shift Speed Table" above. Check quality of shift.
4) Slow car to 15 MPH, and go quickly to wide open throttle (without going into kickdown). Check for possible clutch slippage. The transmission should not downshift at this time.
5) Make a kickdown at 15 to 20 MPH and check quality of shift. Release accelerator to approximately half throttle so that transmission upshifts at 25 to 30 MPH. Check quality of shift.
6) Make a kickdown, between kickdown limits as indicated in "Shift Speed Table" above, and check the quality of shift. Release accelerator to closed throttle and check quality of "lift foot" shift.
7) Make a kickdown at 45 MPH and check quality of shift. Accelerate in kickdown, at wide open throttle, until transmission upshifts. The shift should occur at speeds indicated in "Shift Speed Table" above. Check quality of shift.
8) Slow down to 40 to 50 MPH and push in "L" (Low) selector button. The transmission should downshift. Push in "D" (Drive) button at approximately 20 MPH. The transmission will upshift. Coast to a stop. The transmission should downshift as indicated in "Shift Speed Table" above. Check for smoothness of shifts.

STALL TEST: Use an accurate tachometer to check engine speed. With engine idling, push in the "D" (Drive) selector button and note smoothness of shift. Set hand brake firmly and apply foot brakes to hold car. Accelerate engine to wide open throttle and check engine speed. Speed in excess of maximum RPM as indicated below may be caused by band slippage. *Do not hold engine at wide open throttle more than a few seconds.*

Stall Speed Test ①

Car Model	Engine RPM
DeSoto (All Models)	1400-1500
Dodge (All Models)	1400-1500
Plymouth 6 Cyl.	1370
Plymouth V8 (277 Cu. In. Engine)	1670
Plymouth V8 (301 Cu. In. Engine)	1720

① — Wide open throttle, "D" (Drive) selector button pushed in.

▷ *CAUTION — When making stall test, do not hold throttle wide open for more than a few seconds.* If engine speed excessive and is not corrected by band adjustment, make additional checks as follows: Check for incorrect manual control cable adjustment; leakage at valve body mating surfaces; defective throttle valve; defective shuttle valve or valve body and cover plug; defective kickdown servo parts.

HYDRAULIC PRESSURE TESTS: *CAUTION* - Pressure differences from 15 lbs. to 250 lbs. will be found in making following tests and correct pressure gauge must be used.

Gauge No. C-3292 (100 lbs.) — Use for throttle pressure, governor pressure, and lubrication pressure checks.
Gauge No. C-3293 (300 lbs.) — Use for line pressure check.

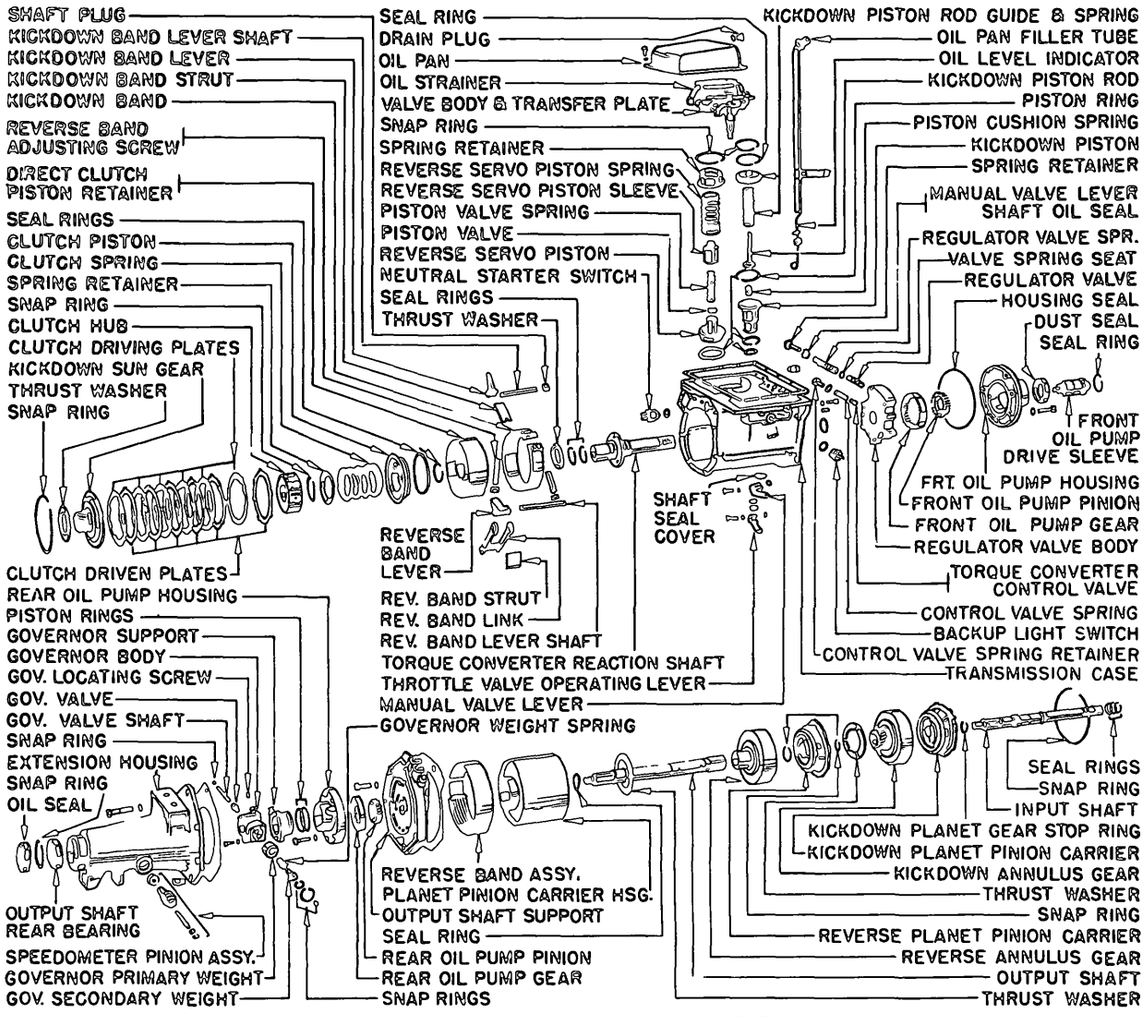
Line Pressure: Remove 1/8" pipe plug from line pressure take-off hole (front left side of transmission case), install C-3293 (300 lb.) pressure gauge at this point. Check reverse oil pressure first (brakes off), then apply brakes to hold car and check the other points. Run engine at speed indicated in table below, check line pressure for each selector button position.

Line Pressure

Selector Button Engaged	Eng. RPM	Pressure
"R"	1400	225-275 lbs.
"N"	800	85-95 lbs.
"D"	800	85-95 lbs.
"L"	800	85-95 lbs.

▷ *NOTE:* If line pressure not correct, check for: Low oil level or clogged strainer; defective regulator valve and spring; manual valve and lever; throttle valve, cam and spring; oil leakage at valve body, or regulator body mating surfaces; defective kickdown piston and related parts; worn front pump or defective front pump drive sleeve or pinion.

Throttle Pressure: Remove 1/8" pipe plug from throttle pressure take-off hole (right center of transmission case between the servos), install C-3292 (100 lb.) gauge at this point. Apply brakes to hold car, push in the "D" (Drive) selector button, run engine at speed indicated in table below and note throttle pressure at each speed.



Throttle Pressure

Throttle Opening	Eng. RPM	Pressure
Closed	Idle	13-15 lbs.
Wide Open	①	80-90 lbs.

① — See engine RPM for various models in "Stall Speed Test Table" above.

▷ *CAUTION: When making the above test, do not h ld*

CONTINUED ON NEXT PAGE

POWERFLITE TRANSMISSION (EXPLODED VIEW)

POWERFLITE (Cont.)

throttle wide open for more than a few seconds. If engine speed exceeds maximum as indicated in "Stall Speed Table" above (indicating band slippage), check the cause in the same manner as for "Stall Test".

▷ *NOTE:* If throttle pressure not correct, check line pressure (above) and also check the following points: Incorrect throttle linkage adjustment, leakage at valve body mating surfaces, defective throttle valve, cam & spring, defective throttle pressure check ball or kickdown valve ball and rod, defective kickdown piston or related parts.

Governor Pressure: Remove 1/8" pipe plug from governor pressure take-off hole on lower left side of output shaft support (plate between transmission case and extension housing), install C-3292 (100 lb.) gauge at this point. Support car securely with rear wheels off floor so that they are free to turn, push in the "D" (Drive) selector button and run engine at speed indicated (as noted on speedometer). Note governor pressure in each speed range.

Governor Pressure Table

	℄ Governor Pressures		
Car Model	15 PSI	45 PSI	60 PSI
DeSoto (All Models)	13-16	23-26	55-62
Dodge (All Models)	13-16	23-26	55-62
Plymouth 6 Cyl	12-14	19-23	41-48
Plymouth V8	13-16	23-26	55-62

℄ — Governor pressure at indicated MPH.

▷ *NOTE:* If governor pressure not correct, check for leakat valve body mating surfaces or output shaft support gaskets, defective governor assembly, or defective rear pump.

Lubrication Pressure: Check only when there is reason to believe that it is incorrect Remove pipe plug at upper left side of output shaft support and install 1/8" flared tube connector Connect Gauge C-3292 With engine running at 800 RPM, in "N" (Neutral) position, lubrication pressure should read 35 to 50 lbs

▷ *NOTE:* If lubrication pressure is not correct, check for leakage at regulator body mating surfaces or at output shaft support gasket, defective converter control valve, defective front pump drive sleeve, defective reaction shaft bore, defective input shaft seal rings, plugged lubrication holes.

Clutch Pressur : Remove the 1/8" pipe plug fitting from pressure take-off hole tapped in kickdown servo (clutch pressure take-off plug on forward right hand side of transmission case) and install gauge C-3292. With rear wheels free to turn, accelerate the engine slowly until an upshift occurs. During the upshift, the pressure gauge attached to the kickdown servo should show a very rapid rise from 0 to final clutch or line pressure (see "Line Pressure Table" above). This rise should not take more than 1½-2 seconds. With engine speed not less than 650 RPM (trans. upshifted), the direct clutch pressure should not read lower than 10 lbs. below line pressure. Should a slow rise in clutch pressure be observed or a clutch pressure of more than 10 lbs. lower than line pressure be obtained, it is an indication of abnormal leakage.

▷ *NOTE* – If clutch pressure not correct, check oil level, throttle linkage adjustment, converter control valve, valve body mating surfaces, throttle valve, cam and spring, kickdown piston and guide, regulator valve body mating surfaces, front pump drive sleeve, clutch retainer bushing and reaction shaft seal rings, clutch discs and plates, clutch piston, seal rings and eheck valve ball.

TROUBLE SHOOTING & DIAGNOSIS

EXCESSIVE SLIPPAGE:

All Ranges—Inspect oil level Adjust gearshift linkage Check oil pressure, if low, inspect regulator valve and torque converter control valve for sticking Inspect valve body in transmission case mating surfaces for evidence of oil leakage

Kickdown—Readjust throttle linkage and kickdown band Inspect valve body to transmission case mating surfaces for evidence of oil leakage Check operation of throttle valve and note wear of valve bore and cam Check spring Check valve body end cover for oil leakage Check shuttle valve for free movement Inspect kickdown piston and guide for binding Inspect spring Inspect band lining for wear and band lever for free movement

Kickdown (Over 25 MPH)—Inspect valve body end cover for oil leakage Inspect shuttle valve and plug for free movement Inspect spring

Direct—Inspect valve body to transmission case mating surfaces for evidence of oil pressure leakage Check kickdown piston for binding Check shaft seal rings and clutch retainer bushing for wear Check clutch discs, piston and clutch check valve

Reverse—Check reverse band adjustment Inspect transmission case to valve body mating surfaces for evidence of oil pressure leakage Inspect reverse servo assembly for wear or binding Inspect reverse lever and linkage for free movement

Hill Climbing—Insufficient oil will result in low pressures to kickdown servo or direct clutch if oil level is low

SHIFT PATTERN:

No Upshift—Check oil level and gearshift linkage adjustment Check governor and throttle pressure If there is no pressure rise when accelerating engine in direct drive, governor valve may be stuck closed Check valve body to transmission case for parallelism Check manual valve and lever for correct detent engagement Check shift valve for free operation and shift valve spring for breakage Check kickdown piston assembly Check rear pump drive pinion Drive pinion ball may be cracked or broken, permitting pinion gear to slip Inspect clutch ball check for proper operation Ball check valve must operate freely and seat properly

No Shift in "D" (Drive) Range and an Upshift In Low Range—The cause is the governor valve sticking open This can be verified by checking governor pressure (see "Governor Pressure Test" above) If governor pressure exceeds the pressures indicated in table, governor valve is possibly stuck and in most cases can be corrected in the following manner Clean off area around governor pressure takeoff plug and remove plug Cover oil filler tube with a cloth or plug and hold firmly to prevent air from forcing transmission oil out through filler tube Screw a piece of ⅛" pipe into hole to help direct air into unit Apply clean filtered air to pipe in short blasts, tapping parking brake drum at same time with a rubber hammer just enough to jar governor After applying air pressure, recheck governor pressure and see if valve has been freed up In cases where governor pressure is still to high, it will be necessary to remove transmission extension case for further inspection

Low Upshift Pattern—Readjust throttle linkage Check governor pressure Governor valve may be binding or sticking Inspect the rear pump assembly Check valve body to transmission case for parallelism Check operation of throttle valve and inspect cam and spring Check shift valve for free operation and spring for breakage

Low Upshift Pattern at Heavy Throttle—Inspect regulator valve, throttle valve, and governor for burrs or dirt which may cause binding or sticking Inspect the regulator spring

High Upshift Pattern—Readjust throttle linkage and check both throttle and governor pressures Adjust throttle pressure if necessary If throttle pressure does not rise according to speeds on chart (see "Throttle Pressure" above), throttle valve may be sticking Inspect for dirt or burrs Inspect throttle cam for wear Check valve body to transmission case for parallelism Check shift valve spring If governor pressure does not correspond to pressures indicated in "Governor Pressure" table above, remove governor and inspect valve for sticking Check rear pump gears for wear, broken teeth or excessive clearance Inspect pump drive pinion ball

All Upshifts Below 14 MPH—Inspect throttle valve, cam and spring Check throttle pressure check ball Check governor valve for sticking

Erratic Shifting—Check oil level Inspect valve body to transmission case for parallelism Check action of shift valve Inspect governor support gaskets for oil leakage

No Downshift—Check governor pressure High initial pressure indicates valve is stuck open Remove governor and inspect Inspect shift valve action, check spring

Low Downshift Speed—Governor valve is stuck open Remove and clean and check for burrs and dirt

High Downshift Speed—Readjust gearshift linkage Inspect valve body to transmission case for parallelism Inspect manual valve and lever Inspect kickdown valve and ball

No Kickdown—Adjust throttle linkage Inspect valve body to transmission case for parallelism Inspect throttle valve, cam and spring Also inspect kickdown valve and shift valve components

Low Kickdown Limit—Check governor pressure Governor valve may be sticking due to dirt Inspect regulator valve and spring for proper operation Inspect rear pump gears and drive pinion ball Check valve body cover plate for parallelism

SHIFT QUALITY:

Harsh Shift from Neutral to Reverse—Adjust engine idle speed Readjust rear band Inspect condition of the reverse band, strut and linkage Inspect the reverse servo piston, spring valve and rings

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

Harsh Shift from Neutral to Drive—Adjust engine idle speed. Adjust throttle linkage. Inspect kickdown servo pistons, springs, guide, rod and piston rings.

Delayed Shift from Neutral to Drive—Adjust kickdown band. Inspect condition of band, strut, lever and lever shaft.

Excessive Engine Speed Increase on Upshifts—Check oil level and adjust throttle linkage. Inspect regulator valve and spring and check operation of valve in regulator body. Check valve body mating surface for parallelism. Inspect throttle valve, cam and spring. Check operation of valve in valve body. Inspect kickdown piston components. Check mating surfaces of regulator valve body and transmission for parallelism. Inspect reaction shaft seal ring for deterioration. Inspect input shaft oil seal rings for wear or breakage and condition of reaction shaft bore. Inspect clutch retainer bronze bushing. If worn below bronze surface, replace retainer. Inspect condition of reaction shaft oil seal rings for wear or broken ends. Inspect condition of clutch plate and condition of friction material on seal ring. Check clutch check valve ball.

Excessive Engine Speed Increase on Upshifts at Light Throttle—Check line pressure. Inspect front oil pump gears for wear and excessive clearance.

Harsh Upshift—Adjust throttle linkage. Inspect regulator valve and spring. Check for sticking shuttle valve. Check valve body mating surfaces for parallelism. Inspect throttle valve, cam and spring. Inspect kickdown piston components. Check regulator valve body mating surfaces for parallelism. Inspect direct clutch spring, spring retainer, and snap ring.

Harsh Lift Foot Shift—Adjust throttle linkage. Check valve body mating surface. Check operation of throttle valve. Inspect valve, valve bore, cam and spring. Inspect servo pressure bleed valve for dirt. Check operation of shuttle valve. Inspect shuttle valve, plug, inner and outer springs, and guide pin.

Excessive Engine Speed Increase on Downshift at Part Throttle—Check oil level and adjust throttle and gearshift linkage. Check valve body mating surface. Check operation of manual valve and valve lever. Inspect servo restrictor valve and operating plug. Check plug for free operation. Check valve spring for distortion or looseness.

Harsh Downshift—Adjust engine idle speed and throttle linkage. Inspect valve body mating surface. Inspect throttle valve, cam and spring for proper operation. Inspect for dirt, burrs or wear, or breakage. Inspect servo restrictor valve for proper operation. Inspect clutch plates and disc friction material. Inspect the piston for wear or scoring. Check seal for wear or deterioration which would result in leakage. Inspect thrust washers for excessive wear.

Excessive Increase in Engine Speed on Kickdown—Readjust kickdown band. Check regulator valve and spring for proper operation. Inspect for dirt, wear, or breakage. Check valve body mating surface for nicks, burrs and trueness, which would cause leakage. Check operation of servo restrictor valve and shuttle valve. Inspect valve and plug for dirt, burrs or wear. Inspect all parts of kickdown piston assembly. Inspect piston rings for excessive wear or broken ends. Check governor valve for wear, dirt, binding or sticking. Inspect rear pump gears for excessive wear or broken teeth. Check pump clearance, drive pinion gear and pinion ball.

Harsh Kickdown—Adjust kickdown band. Inspect regulator valve and spring. Inspect for dirt, burrs or breakage. Inspect servo pressure bleed valve for dirt. Check operation of shuttle valve. Check valve and plug for burrs, dirt or excessive wear. Inspect all parts of kickdown piston assembly. Inspect piston rings for scoring, wear or broken ends. Inspect regulator valve body mating surface for nicks, burrs and trueness which would cause leakage. Inspect reaction shaft neoprene seal for deterioration. Inspect governor valve for free operation. Check for dirt which would cause sticking. Inspect rear pump gears for excessive clearance, worn or chipped teeth. Inspect drive pinion gear and drive pinion ball. Inspect the input shaft seal rings for excessive wear or broken ends, and reaction shaft bore for scoring. Inspect all parts of the direct clutch assembly.

OIL PRESSURE:

No Governor Pressure—Governor valve may be stuck in closed position due to dirt. To free valve, apply a short spurt of high air pressure (90 lbs.) to governor pressure take-off hole and at same time tap transmission extension housing with a rubber mallet. Before applying air pressure, cover filler tube with a cloth. In addition, drain two or three quarts of oil from transmission oil pan. After air is applied, reinstall governor pressure take-off plug and run transmission in Reverse a few seconds. Recheck governor pressure. This corrective procedure may not be permanent. If valve becomes stuck again, remove governor for servicing. If pressures do not correspond to those indicated in "Governor Pressure" table above, the governor may need service. However, before servicing governor, check the other points in the transmission that could cause low pressure as follows: Check the valve body mating surface for trueness, nicks or burrs. These could cause oil leakage. Check both output shaft support gaskets for evidence of internal leakage. Check operation of governor valve and inspect for foreign matter. Check the rear pump gears for broken teeth, wear, and excessive clearance. Check the mating surface of output shaft for trueness, burrs or nicks.

High Initial Governor Pressure—High governor pressure at low engine speeds is due to the governor valve being stuck in the open position, usually caused by dirt *(see "No Governor Pressure" above)*, for clearing with air pressure.

Line Pressure—If line pressure does not correspond to pressures indicated in "Line Pressure" table above, it will be necessary to investigate and make the following adjustments or corrections: Check transmission oil level. Inspect regulator valve for free operation, dirt or burrs, and condition of valve spring. Check valve body mating surface for trueness, nicks or burrs. Check operation of manual valve and lever. Inspect front pump gears for worn or chipped gears. Check clearance between gears and face of housing.

Throttle Pressure—If throttle pressures do not correspond to pressures indicated in "Throttle Pressure" table above, check line pressure and make the following adjustments and corrections: Adjust throttle linkage. Inspect operation and condition of regulator valve and spring. Check valve body mating surfaces for nicks, burrs and trueness. Check operation and condition of throttle valve, cam and spring. Check throttle pressure check valve ball for nicks and dirt. Inspect condition of kickdown rod and ball.

Direct Clutch Pressure—Direct clutch pressure should be approximately 10 lbs. lower than line pressure with transmission upshifted and engine speed not lower than 650 RPM. If not, refer to "Excessive Engine Speed on Upshifts" above. A pressure drop between line pressure and direct clutch pressure as high as 25 lbs. may be due to broken or damaged seal rings in the direct clutch circuit. These are: three interlocking type input shaft seal rings; the direct clutch piston retainer seal ring, direct clutch piston neoprene seal ring, the neoprene reaction shaft seal ring, and the two interlocking type reaction shaft seal rings.

Lubrication Pressure—Lubrication pressure is checked at the upper left side of the output shaft support, Remove the ⅛" pipe plug and use 100 lbs., pressure gauge C-3292 to check pressure. Lubrication pressure should be 35 to 50 lbs. pressure with transmission in neutral and engine speed at fast idle. If pressure readings are incorrect, check line pressure and inspect torque converter control valve. Low pressures may be due to internal oil leakage at the following points: drive sleeve seal ring, regulator valve body mating surface, reaction shaft seal ring, output shaft support gaskets, input shaft seal rings, and reaction shaft bore. Low oil pressure may also be caused by plugged lubrication lines.

IMPROPER RESPONSE TO GEARSHIFT SELECTOR LEVER POSITIONS:

Moves Forward in "N" (Neutral)—Adjust gearshift linkage. Adjust kickdown band. Inspect manual valve lever assembly. Check valve body mating surface for nicks, burrs and trueness which would cause leakage. Check operation of manual valve. Inspect all parts of kickdown piston. Check regulator body mating surface for nicks, burrs and trueness. Check clutch discs and plates for warpage which would cause dragging. Inspect clutch ball check.

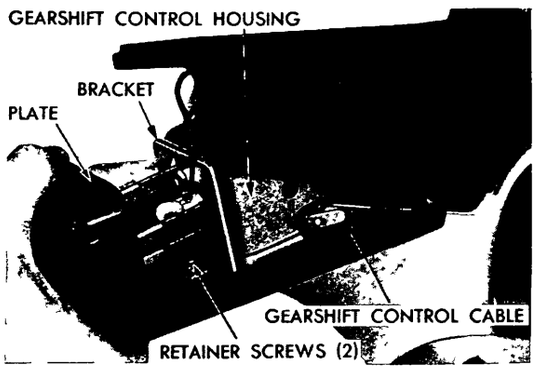
Car Moves Forward in "N" (Neutral) at High Engine Speed—Clutch check valve ball bleed hole may be plugged causing centrifugal oil pressure to partially engage the direct clutch. A slight surge which is not continuous is normal.

Car Moves Backward in "N" (Neutral)—Readjust gearshift linkage and inspect manual valve and valve lever for proper engagement. Adjust reverse band, levers, strut, and shaft. Check for binding, dirt, excessive wear.

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

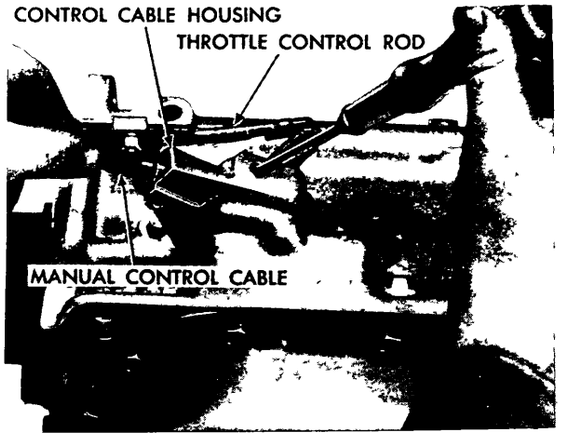
MISCELLANEOUS DIAGNOSIS PROCEDURES:
Starter Will Not Energize—Adjust gearshift linkage. Test neutral starter switch. Inspect manual valve lever for proper engagement.
Hard Shifting Into "N" (Neutral)—Check operation of neutral starter switch and inspect manual valve lever.
Hard Shifting Into "R" (Reverse)—Check operation of backup light switch and manual valve lever.
Oil Foams From Filler Tube—Check fluid level in transmission. Inspect transmission breather vent.



GEARSHIFT CONTROL UNIT REMOVAL & INSTALLATION

MANUAL CABLE ADJUSTMENT: *See "Manual Cable Adjustment" above.*

CABLE ASSEMBLY: Removal (Transmission End) – Drain transmission fluid and remove oil pan. Remove neutral safety switch to provide access to cable lock spring and remove cable bracket and screw. Insert screwdriver through neutral safety switch hole and push gently against vertical projecting portion of cable lock spring and pull outward on cable. *(CAUTION – Move spring only a sufficient amount to permit removal of cable as undue pressure will dislocate spring).*



Installation: (Transmission End) – Move manual valve lever into reverse position which will place the cable adapter in close proximity with cable entrance hole in transmission case. Push in the "L" button on transmission control. Place "O" ring seal on cable ferrule *(NOTE –* Inspect "O" ring seal for cuts, abrasions, brittleness or cracking. If any of these conditions are present, replace "O" ring seal. Hold cable parallel to hole centerline in transmission case and push control cable in until spring lock engages groove in cable end. Position cable bracket and install bracket capscrew. Measure and adjust cable free play (See "Free Play Adjustment" below), being careful not to move manual lever *(NOTE –* Rubber sheath on cable must be pressed onto cable ferrule in order to prevent any possible leakage of oil at this point. On later model cable assemblies, the ferrule will be double grooved and the rubber sheath will be held to the ferrule by the crimped connector). Tighten cable bracket screw. Operate push buttons to check cable adjustment. Adjust as necessary *(CAUTION –* Make sure cable housing is not forced in or out during tightening procedure as backlash will be disturbed). Replace neutral safety switch and transmission oil pan. Refill transmission to correct level using Automatic Transmission Fluid Type "A".

Cable Backlash Adjustment: *See Manual Control Linkage Adjustment under LINKAGE ADJUSTMENT.*

PUSH BUTTON GEARSHIFT CONTROL (INSTRUMENT PANEL UNIT)

PUSH BUTTON CONTROL UNIT: (Removal) – Remove three bezel retaining screws (one screw is located on underside of unit receiver), and remove bezel and push buttons. Remove the two hex head nuts and lockwashers holding push button control unit to instrument panel. Pull push button control unit from rear of instrument panel, down and toward front of car. Remove the two screws holding cable assembly bracket to control unit. Remove hairpin clip securing cable end to actuator bar and remove cable. (After cable is removed from transmission, see "Cable Assembly" above, pull cable through rubber grommet, or remove grommet on dash panel).

TRANSMISSION GEARSHIFT CONTROL (CABLE RELEASING PROCEDURE)

Installation: Reverse removal operations and adjust cable free play.

Control Unit Light Bulb Replacement: Remove the three bezel retaining screws (one screw is located on underside of unit receiver) and remove bezel and "D" push button. Install light bulb, replace push button, reinstall bezel and test operation of unit.

OVERHAUL

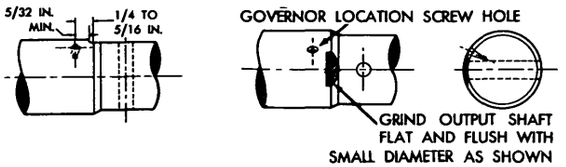
OVERHAUL: Service procedures are the same as for 1956 models. *See "PowerFlite Transmission" in 1956 Annual Data.*

TORQUEFLITE (CHRYSLER, DE SOTO, DODGE, PLYMOUTH)

Chrysler, Imperial, DeSoto, Dodge, & Plymouth Models (1957)

►CHANGES, CAUTIONS, CORRECTIONS

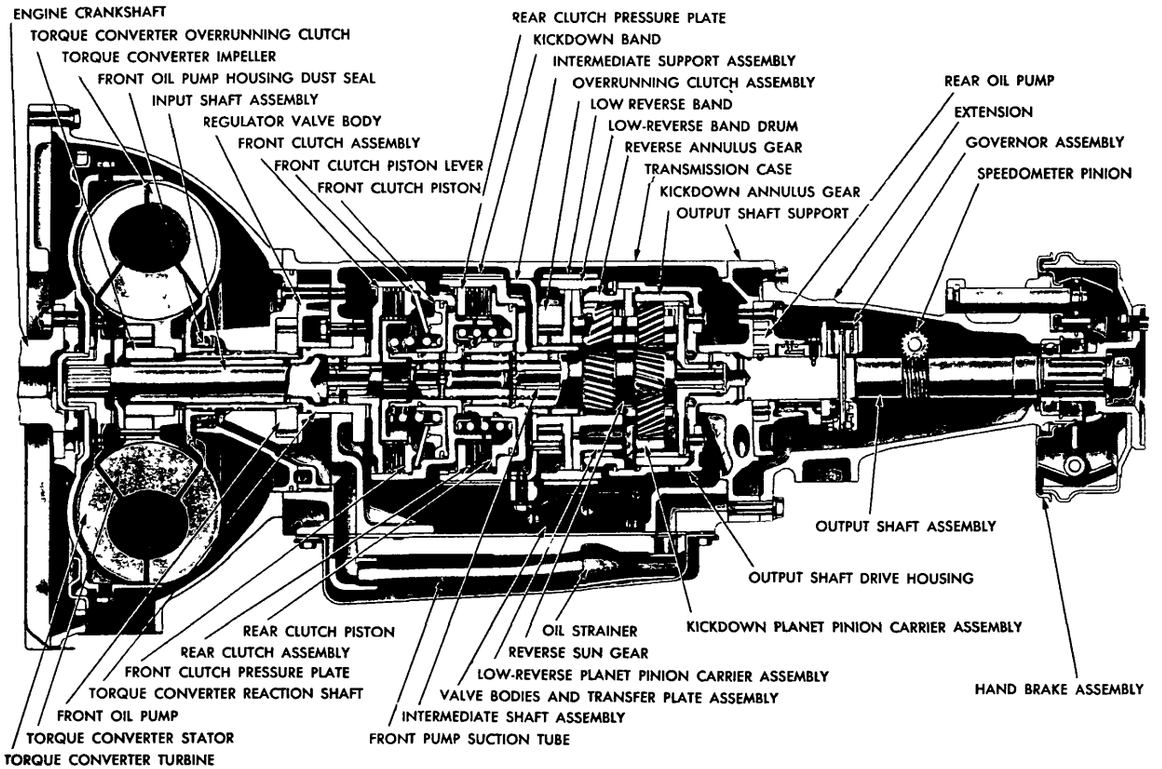
►*STARTING ENGINE BY PUSHING CAR: (Towing car to start is not recommended because of sudden surge of power when engine starts).* Turn ignition switch on, then push the "1" (Low) button in and depress accelerator pedal slightly. After car attains a speed of 15 MPH, the transmission will start engine.



►*TOWING TORQUE-FLITE CARS: Following procedure is recommended:*

Transmission Operating Properly—Car may be towed safely in "N" (Neutral) position at moderate speeds. For long distance towing (over 100 miles), the propeller shaft should be disconnected.

Transmission Inoperative—Tow car with rear end raised or remove the propeller shaft.



►*1957 TORQUEFLITE REVERSE SERVO PISTON "COCKING" CORRECTION & PRODUCTION CHANGE:* If the reverse servo piston "cocks" over and misses the pilot hole on the reverse band lever, a "no reverse" condition would result. To prevent the above condition, a new reverse servo piston guide, Part No. 1824474, must be installed. This guide is installed in end of servo piston spring and is held in place by the spring retainer and snap ring. Transmissions having the code letter "F" and later, stamped on the pan rail on right side of case have been changed in production and it is not necessary to install the guide.

►*1957 TORQUEFLITE ERRATIC SHIFT PATTERN & NO. 3-1 DOWNSHIFT CORRECTION (Reverse push-button cannot be pushed in with engine running):* This condition may be caused by governor valve or weight sticking due to foreign matter in governor or by governor weight striking output shaft. Check governor pressure with selector lever in "N" position. If pressure is evident (there should be no pressure), inspect governor assembly for cause of sticking. To correct, remove large governor weight and inspect output shaft end for signs of mushrooming. Correct as follows: On all models, except DeSoto Adventurer and Plymouth Fury, grind a 45° chamfer around edge of output shaft end of large governor weight. Diameter of flat surface on end of governor weight must not be less than ¾" after chamfering. On DeSoto Adventurer & Plymouth Fury, the output shaft must be removed and a flat surface ground on shaft surface as indicated in illustration.

GOVERNOR STRIKING CORRECTION

►*1957 TORQUEFLITE FRONT CLUTCH PRODUCTION CHANGE:* The early "8 lever" front clutch assembly has been changed to a "4 lever" assembly on later cars. The "8 lever" clutch uses five bonded discs and four steel plates while the "4 lever" clutch uses four bonded discs and three steel plates

TORQUEFLITE TRANSMISSION (SECTIONAL VIEW)

►*1957 TORQUEFLITE ACCUMULATOR SPRING NOTE:* In some transmissions, two springs, Part Nos. 1732030 and 1732031 were used in the accumulator while other transmissions have one spring, Part No. 1736228. Combined value of the two springs (1732030 & 1732031) are equal to the value of the single spring (1736228) and either may be used.

►*1957 DESOTO & PLYMOUTH REAR CLUTCH PRESSURE PLATE PRODUCTION CHANGE:* In later transmissions, the rear clutch pressure plate, Part No. 1732114 has been changed to the same plate as used in the front clutch (Part No. 1736408). The later type rear plate may be used for service replacement on early transmissions. *NOTE* - The later type pressure plate cannot be used for adjustment of the front clutch clearance. It is necessary that an early type rear clutch pressure plate, Part No. 1732114 be used for this adjustment.

►*1957 DESOTO THROTTLE PRESSURE ADJUSTING GAUGE:* This new gauge, Tool C-3610 is to be used only in the event throttle pressure adjustment is suspected of being incorrect (improper part throttle shift pattern, although governor pressure checks satisfactorily and throttle linkage adjustment is known to be correct). *See "Hydraulic Control Pr ssure Ch cks" below.*

►*1957 PLYMOUTH 1-2 UPSHIFT SLIPPAGE OR HARSH SHIFTING CORRECTION:* If this condition occurs, check line pressure *(See "Hydraulic Control Pressure Tests" below),* and if found to be within specifications, proceed as follows: Attach a tachometer to engine, then with engine operating and transmission in "D" range, raise car on a hoist and attach a pressure gauge in take-off plug on top of kickdown servo. Move accelerator rod until engine reaches 850 RPM (pressure should read 32-34 lbs.). If pressure is not within this range, loosen link on throttle valve rod (adjacent to throttle lever on transmission), and adjust until the correct reading is obtained

►*1957 TORQUEFLITE SPACER WASHER (BETWEEN PLANET PINION CARRIERS) PRODUCTION CHANGE:* A new steel spacer washer, Part No. 1638667 is now being used between the aluminum planet pinion carriers to minimize scuffing.

►*1957 DESOTO S-27 "NO KICKDOWN" CORRECTION:* If this condition exists and throttle linkage cannot be adjusted properly, check to make sure the right bell-

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

crank-to-transmission throttle rod is installed (DeSoto Part No. 1734979 which has a straight portion approximately 7½" long from bellcrank end to center of the bend). The corresponding part for PowerFlite is approximately 1" shorter. Adjust throttle linkage *(see "CARBURETOR" on car mod l page).*

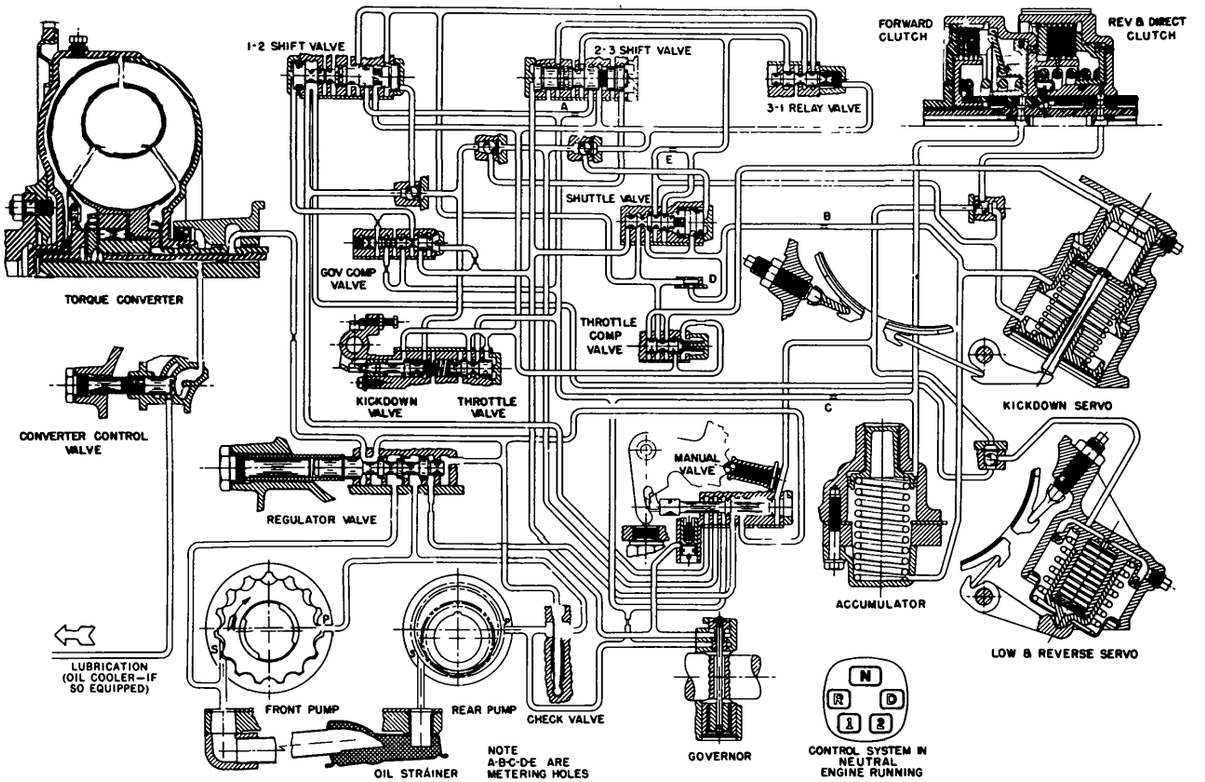
DESCRIPTION

DESCRIPTION: Torque-Flite Transmission consists of a wide range torque converter and a hydraulically controlled automatic planetary transmission. Two multiple disc clutches, an overrunning clutch, two bands and two planetary gear sets provide three forward ratios and one reverse ratio. The oiling system consists of two pumps (front & rear) which circulate oil through transmission, torque converter and oil cooler (where oil cooler is used), with oil supply carried in transmission case oil pan. Transmission speed range selection is controlled by a five button (push button) control located to left of steering wheel in drivers compartment.

OPERATION

OPERATION: Transmission operation in each position of the push button control is outlined below. In "D" (Drive) position (normal driving position), operation varies in accordance with car speed and operating conditions. *See "Shift Speed Tables" below.*

"D" (Driv) P siti n–Br akaway: Power flow is from converter turbine through input shaft and front clutch retainer. Front clutch is applied and the drive continues through clutch hub to intermediate shaft and kickdown annulus gear. Kickdown annulus gear drives the kickdown planet gears, rotating them in the same direction. Kickdown planet gears are meshed with kickdown sun gear which is integral with the reverse sun gear. Both sun gears are forced to rotate in a reverse direction by reaction of the kickdown planet pinion carrier together with the reverse annulus gear, both of which are splined to the output shaft drive housing. The reverse planet pinion carrier is attached to and prevented from turning backward by an overrun clutch and becomes stationary in forward drive (overruns on coast). Therefore, the reverse carrier pinions are forced to rotate in a forward direction and force the reverse annulus to rotate in the same direction transmitting power flow to output shaft with the combined ratio of the kickdown and reverse planetary gear sets of 2.45-1.



"D" (Drive) – 2nd Sp d, and "2" (Second) Position – 2nd Sp ed: Power flow is from torque converter turbine through output shaft to front clutch (which is applied). From front clutch through intermediate shaft to the annulus gear of the kickdown (rear) planetary gear set. Kickdown band is applied which holds the sun gear stationary. The annulus gear drives the kickdown planet pinions which rotate in the same direction as input and intermediate shafts. Kickdown planet pinions are meshed with the sun gear, therefore, they walk around this gear and exert force through kickdown planet pinion shafts to rotate the kickdown planet pinion carrier. The carrier, which is splined to output shaft drive housing, moves at a slower speed than the annulus gear, thus providing a gear ratio of 1.45-1.

"D" (Drive) Position – Direct: Power flow from converter goes directly through transmission because the planetary elements of the gear train are locked up by two multiple disc clutches and both bands are released. The torque converter provides all the torque multiplication. Gear ratio is 1.00-1.

Kickdown (Forced Downshift) in "D" (Drive) Position Below 25 MPH: This will force transmission to downshift and the power flow will be the same as "D" (Drive) Position – Breakaway.

"l" (Low) Position – Low Speed: In "1" (Low) position, the power flow is the same as "D" (Drive) position – Breakaway or "2" (Second) Position – Breakaway, with one exception, the low-reverse band is applied, locking the overrun clutch to provide engine braking.

'R" (Reverse) Position: Rear clutch and low-reverse band are applied; all other friction elements are released. The power flow is from torque converter turbine through input shaft to rear clutch hub (part of front clutch retainer). The rear clutch is splined to reverse sun gear. The carrier of reverse (front) planetary gear set is held stationary by the low-reverse band; therefore, the set acts as a simple reverse train through reverse planet pinions to reverse annulus (which is splined to output shaft drive housing) and provides a reverse ratio of 2.20-1.

TORQUEFLITE TRANSMISSION HYDRAULIC CIRCUITS

LUBRICATION

► *FLUID LEVEL & CHECKING PROCEDURE CHANGE:* To avoid overfilling and trouble under high speed and high temperature operating conditions, it is recommended that the following checking procedure be used and the recommended fluid level not be exceeded. *This supersedes previous recommendations.*

► *NOTE:* It is recommended that fluid level be checked with transmission "Cold" (after being parked for a considerable time and before being driven several miles). If necessary to check transmission "Hot" (after car driven for several miles), observe the special hot fluid level given below.

Checking Fluid Level (Cold Transmission) - Run engine at idling speed with parking brake applied. Operate all push buttons in turn (leave in each position momentarily), then check fluid level with "N" (Neutral) button pushed in. Note level indicated on dipstick, add or remove oil as follows: **Lev l b tween "L" mark and ½" b l w "L" mark** - Do not add oil - this level is satisfactory. **L v l b l w ½" b l w "L" mark** - Add oil to bring level up to between "L" mark and ½" below "L" mark. **L v l abov**

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

"L" mark - Remove oil until level is between the "L" mark and ½" below the "L" mark

Checking Fluid Level (Hot Transmission) - Proceed as for cold check above Add or remove oil in accordance with fluid level indicated on dipstick as follows: **Level between "F" mark and ½" above "L" mark** - Do not add oil - this level is satisfactory. **Level below "L" mark** - Add oil to bring level up between the "L" mark and ½" above the "L" mark. **Level above "F" mark** - Remove oil until level is between "F" mark and ½" below the "F" mark *NOTE* - On cars with first type dipstick (1 5/8" between "F" and "L" marks), maintain level at ½" below "F" mark

Draining & Refilling: Remove filler tube connector at oil pan and pull back on tube to drain Retighten connector after draining Remove access plate from bottom of housing and rotate torque converter until drain plug is accessible Remove plug and drain fluid Install drain plug and tighten, then install access plate Pour approximately 5 quarts of Automatic Transmission Fluid Type "A" through oil pan filler tube Apply parking brake and start engine Add approximately 4 qts (Chrysler & Imperial), 3 qts (DeSoto, Dodge, & Plymouth) while engine is running, to bring fluid level in transmission to the correct point as indicated in "Checking Fluid Level" (above)

►*WINTER DRIVING NOTE* During extreme cold weather (for which 5W oil is recommended for the engine) should slow engine turn-over be experienced on starting, it is permissable to drain one quart of fluid from transmission and replace with one quart of kerosene If additional lubricant is required, Automatic Transmission Fluid Type "A" should be used to make up the difference *It is not necessary to drain and refill transmission with regular fluid as the weather warms up, as the increased operating temperatures will gradually drive off the kerosene.*

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE See "Carburetor" on car model pages.*

Manual Control Cable Adjustment: **1)** Push the "N" (Neutral) button in Drain approximately 2 quarts of fluid from transmission Loosen cable-to-transmission adjustable mounting bracket screw Remove neutral starting switch Place point of screwdriver through neutral starting switch opening in transmission case and against neutral starting switch cam of manual control lever to hold lever in neutral position

2) While holding manual lever in reverse position, adjust control cable for free play by pushing in until cable stops Mark position on cable in relation to adapter housing Withdraw control cable to stop, and measure travel Push control cable in adapter housing one-half of total travel With cable in this position, install control cable adjusting clip, flat washer, lockwasher, screw, and tighten Install neutral starter switch and wires

3) To check for proper adjustment, push the various push buttons, return to neutral each time and check starter operation A test light attached to starter neutral switch may be used instead of the starter for checking proper operation and adjustment Refill transmission to proper level

BAND ADJUSTMENT

Kickdown (Front) Band: Kickdown band adjusting screw is located on left side of transmission case Using a ¾" wrench, loosen locknut and back off approximately 5 turns Check freeness of adjusting screw in transmission case Tighten the adjusting screws to **70-75 inch pounds,** using wrench C-3380 Using a reference mark of chalk or colored pencil on the corner of adjusting screw square and the transmission case, back the adjusting screw out exactly the number of turns indicated in table below While holding adjusting screw stationary tighten locknut to 35-40 ft lbs

Low-Reverse (Rear) Band Low-reverse band adjusting screw is located on right side of transmission case Using a ¾" wrench, loosen locknut and back off 9 turns Check freeness of adjusting screw in transmission case If free, set the click device on the small inch-pound torque wrench C-3380 for **70-75 inch pounds** and tighten the adjusting screw Using a reference mark of chalk or colored pencil on the corner of adjusting screw square and the transmission case, back the adjusting screw **exactly** the number of turns indicated in table below While holding adjusting screw stationary *tighten locknut to* 35-40 ft lbs

Transmission Band Adjustment

Car Model	Kickdown Band	Low-Rev. Band
Chrysler (All)	3½ turns	2 5 8 turns
DeSoto (S-27)	3½ turns	2 5 8 turns
DeSoto (Early S-25,26) ①	2 turns	2 turns
DeSoto (Late S-25,26) ②	2¼ turns	2 5 8 turns
DeSoto (Adventurer) ③	2¼ turns	2 5 8 turns
Dodge (All)	3½ turns	2 5 8 turns
Plymouth (All)	3½ turns	2 1 4 turns

① - Transmission Part No 1671747 ② - Transmission Part No 1736544 ③ - Transmission Part No 1823593

TESTING

ROAD TESTING TRANSMISSION: If transmission operation not satisfactory, the following complete procedure is recommended to check performance and diagnose trouble

►*ROAD TESTING NOTE* Before road testing, engine must be properly tuned Adjust idle speed to 400-450 RPM (Single 4-Barrel Carb Cars), 650 RPM (Two 4-Barrel Carb Cars), with engine and transmission at normal operating temperature and with transmission in "N" (Neutral) position Bring transmission fluid level to correct mark on dipstick If throttle linkage has been disturbed in tuning engine, linkage must be adjusted before making tests

►*STALL TESTING CAUTION DO NOT stall test the torque converter. To prevent damage to transmission, wide open throttle stall operation is not recommended.*

1) Push in "N" (Neutral) outton and check for dragging up to an engine speed of 800 RPM

2) Push in "R" (Reverse) button and note shift time and smoothness of the shift

3) Push in "D" (Drive) button and note shift time and smoothness of engagement

4) Accelerate car at very light throttle The transmission should upshift into second at approximately 8-10 MPH and into direct speed at approximately 15-17 MPH Check quality of the shifts

5) Slow the car to approximately 15 MPH, then depress accelerator pedal quickly to wide open throttle (without going into kickdown) Check for slippage of front and rear clutches The transmission should not downshift at this time

6) At a car speed of approximately 20-22 MPH, depress accelerator pedal fully The transmission should downshift to breakaway gear Check quality of shift

7) Release accelerator pedal and allow transmission to upshift Accelerate car to 40 MPH Depress accelerator pedal fully The transmission should downshift to second gear Check quality of shift

8) Release accelerator pedal to closed throttle Check quality of the "lift-foot" upshift

9) Accelerate car to 60 MPH and depress accelerator pedal fully The transmission should downshift to second gear Check quality of the shift

10) Accelerate car to kickdown (second gear) at wide open throttle until the transmission upshifts The shift should occur at approximately 70 MPH Check quality of the shift

11) Slow car down to 30-40 MPH and engage the "2" (Second) button The transmission should downshift to second gear Check for gear noise

12) Slow car to 15 MPH and depress accelerator pedal quickly to wide open throttle without going into kickdown Check for kickdown band or front clutch slippage The transmission should not downshift at this time

13) Release accelerator pedal and push the "1" (Low) button The transmission should downshift at approximately 25 MPH

14) With accelerator pedal at light throttle, push the "D" (Drive) button at approximately 20 MPH (the transmission will upshift), coast to a stop The transmission should downshift at approximately 8 MPH Check quality of downshift

HYDRAULIC CONTROL PRESSURE TESTS: *NOTE–Use Pressure Gauge C-3293 (300#) for all the following tests.*

Line Pressure Remove the 1/8" pipe plug from line pressure take-off hole located on left side of transmission case (lower plug forward of control lever and cable connection) Install pressure gauge at this point and make the following tests

Line Pressure Test (All Models)

Push Button Position	Rear Wheels	Engine Speed (RPM)	Pressure (Lbs.)
R	Free	1600	200-250
N		800	85-95
D	Free	800	90
2	Free	800	85 95
1	Free	800	85-95

Line Pressure Adjustment - With transmission in "D" range and engine operating at 800 RPM turn adjusting screw in regulator valve spring retainer (on right side of transmission directly below torque converter control valve) clockwise to increase pressure and coun-

CONTINUED ON NEXT PAGE

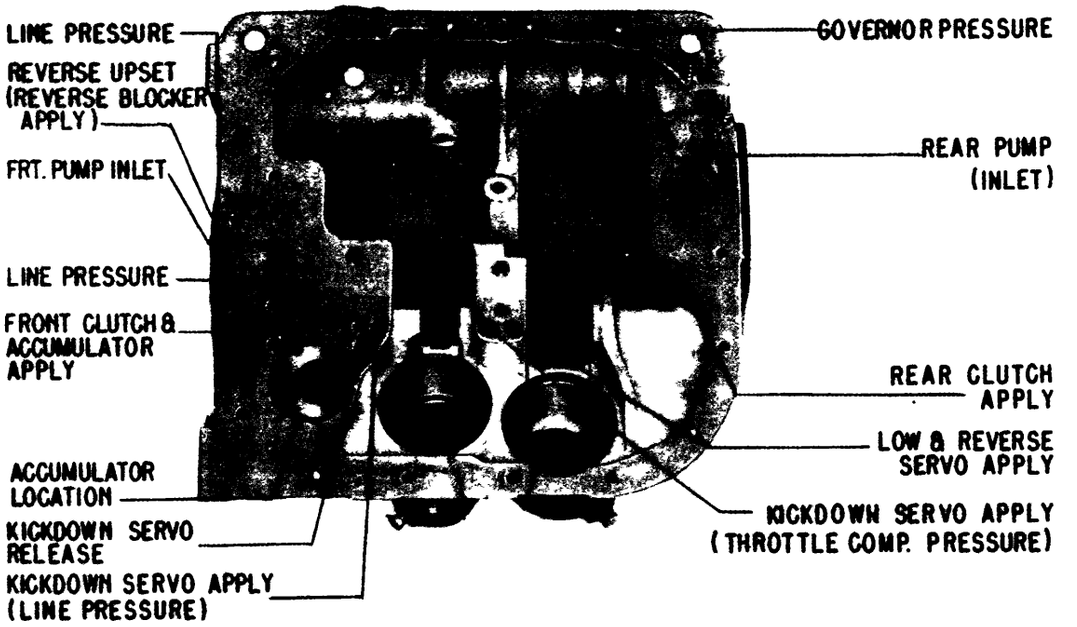
TORQUEFLITE (C nt.)

terclockwise to decrease pressure, until pressure is within the specified limits as indicated in table.

Govern r Pressure: Remove 1/8" pipe plug from governor pressure take-off hole located on lower left side of transmission case (at rear of case in output shaft support). Install pressure gauge at this point and make the following tests:

Gov rnor Pressure Tests ①

Mod l	Axle Ratio	Governor Pressure (MPH) 15 lbs.	45 lbs.	75 lbs.
Chrysler C75, C76 ..	3.18-1	17-19	32-39	66-71
Chrysler C75, C76 ...	3.36-1	16-18	29-36	63-67
Chrysler C76	2.92-1	19-21	35-42	73-79
Imperial	2.92-1	19-21	36-43	74-80
Imperial	3.18-1	18-20	33-40	68-74
Imperial	3.36-1	17-19	31-37	64-70
DeSoto	All	16-18	29-35	61-66
Dodge	All	16-18	29-35	61-66
Plymouth	All	16-18	29-35	61-66



① - Tests are made with transmission in "D" (Drive) range with wheels free to turn.

►*NOTE: If governor pressure not correct, and does not correspond to car spe d, see "Trouble Shooting & Diagnosis" below.*

Lubricati n Pr ssur : Remove 1/8" pipe plug from lubrication pressure take-off hole located on left side of transmission case (middle plug forward of control lever and cable connection). Install pressure gauge at this point and proceed as follows: With engine running at 800 RPM in "N" (Neutral), lubrication pressure should be approximately 10-30 lbs. If pressure is incorrect, check line pressure and see "Trouble Shooting & Diagnosis" below. If pressure is extremely high (above 50 lbs.) it is an indication of a restriction due to dirt or foreign matter in lubrication passages.

Front Servo Release & Rear Clutch Apply Pressure: The front servo release and rear clutch apply pressure can be checked simultaneously with line pressure or immediately after line pressure has been determined. Remove the 1/8" pipe plug from front servo release and rear clutch apply pressure take-off hole located on lower right side of transmission (in servo boss just above transmission lower flange). Install the pressure gauge at this point. The pressure should not be less than 15 lbs. lower than line pressure in the "D" (Drive) position — **in direct only.**

Throttl Pr ssur Adjustment (DeSoto): *NOTE* - This adjustment is to be made only in the event throttle pressure adjustment is suspected of being incorrect (improper part throttle shift pattern, although governor pressure checks satisfactorily and throttle linkage adjustment is known to be correct). With car off floor and wheels free to turn, install a 100 lb. pressure gauge on the compensated throttle pressure take-off hole at top of kickdown servo on right side of transmission. Disconnect throttle linkage bellcrank from transmission. Start engine and place selector lever in "D" (Drive) range. While holding transmission throttle lever forward against its stop, increase engine speed slowly to 1500 RPM to obtain an upshift to direct ratio (there will be no compensated throttle pressure until upshift takes place). After the shift takes place compensated throttle pressure should read 26-32 lbs. Check compensated throttle pressure as follows: As transmission throttle pressure lever is moved away from its stop toward full throttle, compensated throttle pressure should begin to rise after 0° to 5° movement (zero to 7 32" travel at outer end of the 2½" long transmission throttle lever). If compensated throttle pressure is above 32 lbs., and begins to rise immediately when the lever is moved or if pressure is 26-32 lbs., but fails to rise after approximately 5° movement, throttle pressure should be adjusted as outlined: *NOTE*- Before stopping engine, move throttle lever slowly through its full travel. Compensated throttle pressure should rise to approximately 80-90 lbs. and then fall smoothly without hesitation as the lever is returned to its stop. The pressure reading at the stop should be consistent. Failure of the pressure to return smoothly or inconsistent stop pressures is indicative of faulty or sticking throttle valve or throttle compensator valve. Clean and inspect valve body. Shut off engine, drain transmission and remove oil pan. Loosen throttle lever stop screw approximately 5 turns. Insert gauge Tool C-3610 between throttle valve lever tang and the end of kickdown valve. By pushing in on kickdown valve with the tool, bottom the throttle valve and kickdown valve and tighten throttle valve lever stop screw finger tight (do not use wrench) to remove all free play of throttle valve lever. Be sure the adjustment is made with throttle valve spring fully compressed and the gauge pin held squarely in line with the kickdown valve. Before removing gauge, tighten throttle valve lever stop screw locknut securely. Reinstall oil pan and throttle linkage.

TORQUEFLITE OIL PASSAGES IN TRANSMISSION CASE

AIR PRESSURE TESTS: The front clutch, rear clutch, kickdown servo, and low and reverse servo may be checked by applying air pressure to their respective passages when valve body is removed *(CAUTION – Air supply must be free of all dirt and moisture).* Refer to "Oil Passages in Transmission Case" illustration for location of air passages.

1) Raise car on hoist, drain transmission fluid and remove transmission oil pan.

2) **Front Clutch**–Remove accumulator cover. Apply pressure to front clutch passage. Listen for a dull thud which indicates that front clutch is operating. Hold air pressure on for a few seconds and check for excessive oil leaks in system.

3) **Rear Clutch**–Remove valve body assembly and apply air pressure to rear clutch passage. Listen for a dull thud which indicates that rear clutch is operating. Check for excessive oil leaks.

4) **Kickdown Servo**–Apply air pressure to kickdown "apply" (line)) pressure passage. Observe operation of kickdown servo, lever and band when air pressure is applied. Apply air pressure to "apply" (compensated throttle) pressure passage and observe operation of kickdown servo.

5) **Low & Reverse Servo**–Apply air pressure to low & reverse servo passage and observe operation of servo, lever, and band.

6) **G v rnor**–Apply air pressure to "line pressure-to-governor" passage. Rotate propeller shaft slightly to bring governor flyweight down while applying the

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

pressure. Operation of the governor will be indicated by a sharp click when air pressure is applied.

►*AIR PRESSURE TEST NOTE: If all the above units operate properly, "no drive", "erratic" and "no upshift" conditions are caused by trouble in the control valve assembly.*

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Except where noted, the following operations can be performed without removing the transmission from the car.*

LINE PRESSURE INCORRECT: Oil level incorrect. Check for stuck or scratched regulator valve or buckled spring. Check kickdown servo for broken seal rings, stuck piston or broken linkage. Check low & reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Check for possible leak at front pump suction tube, tube elbow or rear pump suction tube. Check for loose bolts, burrs or scratches on mating surfaces of valve body. Clean valve assembly and check for stuck valves, dirt, scratched valve or body, and burrs on valves. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Check regulator valve body for scratches and scoring on valve bores and face which bears against front pump housing. Examine regulator valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

GOVERNOR PRESSURE INCORRECT (Does not correspond to car speeds): Clean governor assembly, and check weight assembly and valve for burrs, scratches or sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. Clean and inspect rear pump assembly for side or diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring.

LUBRICATION PRESSURE INCORRECT: Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter control valve or buckled spring. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Flush out converter and check converter-to-housing runout.

HARSH NEUTRAL-TO-DRIVE OR NEUTRAL-TO-REVERSE SHIFT: Check hydraulic control pressures. Adjust low and reverse band. Adjust engine idle speed. Check Low & Reverse servo for torn seal, stuck piston sleeve, broken band or broken linkage. Check accumulator cover screw torque and piston for broken rings. *Transmission must be removed for the following:* Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage. Clean and inspect rear discs, plates, return spring and piston. Check rear clutch circuit for leakage.

DELAYED NEUTRAL-TO-DRIVE SHIFT: Check transmission oil level. Check hydraulic control pressures. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage.

RUNAWAY ON UPSHIFT & 3-2 KICKDOWN: Check transmission oil level. Adjust throttle linkage *(see "Carburetor" on car model pages).* Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

HARSH UPSHIFT & 3-2 KICKDOWN: Adjust throttle linkage *(see "Carburetor" on car model pages).* Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. *Transmission must be removed for the following:* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

NO UPSHIFT: Proceed as for "Runaway on Upshift & 3-2 Kickdown" above, and clean governor assembly and check weight assembly and valves for burrs, scratches and sticky operation. Examine governor valve shaft, shaft snap rings and seal rings.

NO KICKDOWN OR NORMAL DOWNSHIFT: Proceed as for "Runaway on Upshift & 3-2 Kickdown" above. Check control cable adjustment. Adjust low and reverse band. *Transmission must be removed for the following:* Clean and inspect overrunning clutch assembly for brinnelled rollers and cam, and improperly assembled rollers and springs.

SHIFTS ERRATICALLY: Check transmission oil level. Adjust throttle linkage *(see "Carburetor" on car model pages).* Check control cable adjustment. Check hydraulic control pressures. Check for stuck or scratched regulator valve or buckled spring. Check output shaft rear bearing for roughness or an unseated snap ring. Check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Test transmission units with air pressure (see above). Clean governor assembly and check weight assembly and valve for burrs, scratches and sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings.

SLIPS IN FORWARD DRIVE POSITIONS: Check transmission oil level. Check hydraulic control pressures. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure. *Transmission must be removed for th following:* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage. Clean and inspect the overrunning clutch assembly for brinnelled rollers or cam, and improperly assembled rollers and springs.

SLIPS IN LOW-REVERSE ONLY: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn oil seal, stuck piston sleeve, broken band or linkage. Check control valve body for loose bolts, burrs, scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Test transmission units with air pressure. *Transmission must be removed for th following:* Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump. Examine valve body to determine if the secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

SLIPS IN ALL POSITIONS: Check transmission oil level. Check hydraulic control pressures. Check for a stuck or scratched regulator valve or buckled valve spring. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Test transmission units with air pressure (see above). *Transmission must be removed for th following:* Clean and inspect front pump and drive sleeve assembly for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump. Examine valve body to determine if the secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

NO DRIVE IN ANY POSITION: Proceed as for "Slips in all Positions" above, and in addition, check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube.

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

NO DRIVE IN FORWARD RANGES: Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for th following:* Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage. Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage. Clean and inspect overrunning clutch assembly for brinnelled rollers or cam, and improperly assembled rollers and springs.

NO DRIVE IN REVERSE: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect rear clutch disc, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

DRIVES IN NEUTRAL: Adjust gearshift control cable. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. *Transmission must be removed for the following:* Clean and inspect front clutch disc, plates, drive hub, return spring and piston. Check front clutch circuits for leakage.

DRAGS OR LOCKS: Adjust kickdown band and the low-reverse band. Check handbrake for excessive drag. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check low-reverse servo for torn oil seal, stuck piston sleeve, broken band or linkage. *Transmission must be removed for the following:* Clean and inspect discs, plates, drive hub, return spring and piston of both front and rear clutches. Check front and rear clutch circuits for leakage. Clean and inspect planetary gear set for worn thrust washers, nicked or rough gear teeth, and excessive pinion clearance. Clean and inspect overrunning clutch assembly for brinnelled rollers and cam and improperly assembled rollers and spring.

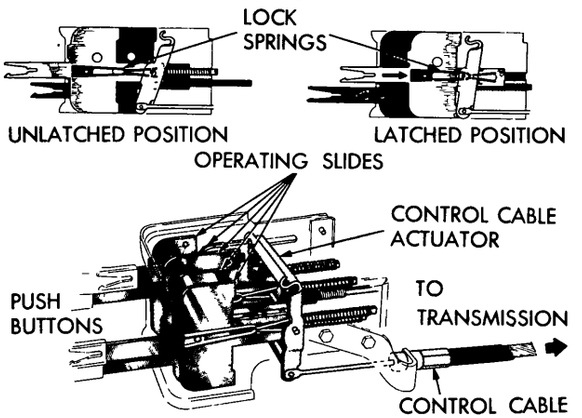
GRATING & SCRAPING NOISES: Check handbrake for excessive drag. Check output shaft rear bearing for roughness or an unseated snap ring. Clean governor assembly, and check weight assembly and valves for burrs, scratches, or sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. Clean and inspect rear pump assembly for side or diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support for scoring. *Transmission must be removed for the following:* Clean ar l inspect front pump assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect front and rear clutch discs, plate, drive hubs, return spring and pistons. Check front and rear clutch circuits for leakage. Clean and inspect planetary gear set for worn thrust washers, nicked or rough gear teeth, and excessive pinion clearance.

BUZZING NOISES: Check transmission oil level. Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter valve or buckled spring. *Transmission must be removed for the following:*. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump housing. Examine valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

TRANSMISSION HARD TO FILL (Oil blow out filler tube): Check transmission oil level. Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter valve or buckled spring. Check to determine whether tube is free of dirt. Check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube. *Transmission must be removed for the following:* Clean and inspect front pump assembly for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against front pump housing. Examine valve body to determine if secondary reaction orifice if free of dirt. Check gasket for uniformness of compression by valve body.

TRANSMISSION OVERHEATS: Check transmission oil level. Adjust kickdown band and low-reverse band. Check handbrake for excessive drag. Check regulator and converter valves for stuck or scratched valves or buckled springs. Check for mud, dirt, or other foreign material on screens or torque converter cooling fins. Clean and inspect rear pump assembly for side and diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side and diametral appearance. Examine oil pump inner and outer rotor for scoring. Check drive sleeve seal rings. Check and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump housing. Examine the valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body. Clean and inspect front and rear clutch discs, plate, drive hubs, return spring and piston. Check front and rear clutch circuits for leakage.

IMPOSSIBLE TO PUSH CAR: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Check valve body for loose bolts, burrs or scratches on mating surfaces. Clean valve body assembly, check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Clean and inspect rear pump assembly for side and diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring.



STARTER WILL NOT ENERGIZE: Adjust gearshift control cable. Adjust engine idle speed.

GEARSHIFT CONTROL UNIT

►*BACK-UP LIGHT SWITCH NOTE:* The back-up light switch is located on push button control unit and is operated by the "R" (Reverse) button.

►*STARTER SWITCH NOTE:* On Chrysler and Dodge models, the starter switch is located on rear of push button control unit and is operated by fully depressing the "N" (Neutral) button.

OPERATION: Mechanical connection between gearshift control unit on instrument panel and the transmission manual control valve is by a single push-pull cable. One end of wire cable is secured to cable actuator in push button control unit while other end enters control cable adapter housing on transmission case to engage manual control valve lever assembly. When button is pushed in, the operating slide contacts the cable actuator, causing it to pivot, and movement of actuator about its axis moves that attached wire cable. When push button reaches its limit of travel, a spring lock on the operating slide engages actuator shaft, holding the push button in an engaged position. When another button is pushed to select a different range, the top or bottom portion (depending on which button was pushed) of the slide contacts the actuator which releases the first push button from restraint of spring lock and allows it to return to the original position.

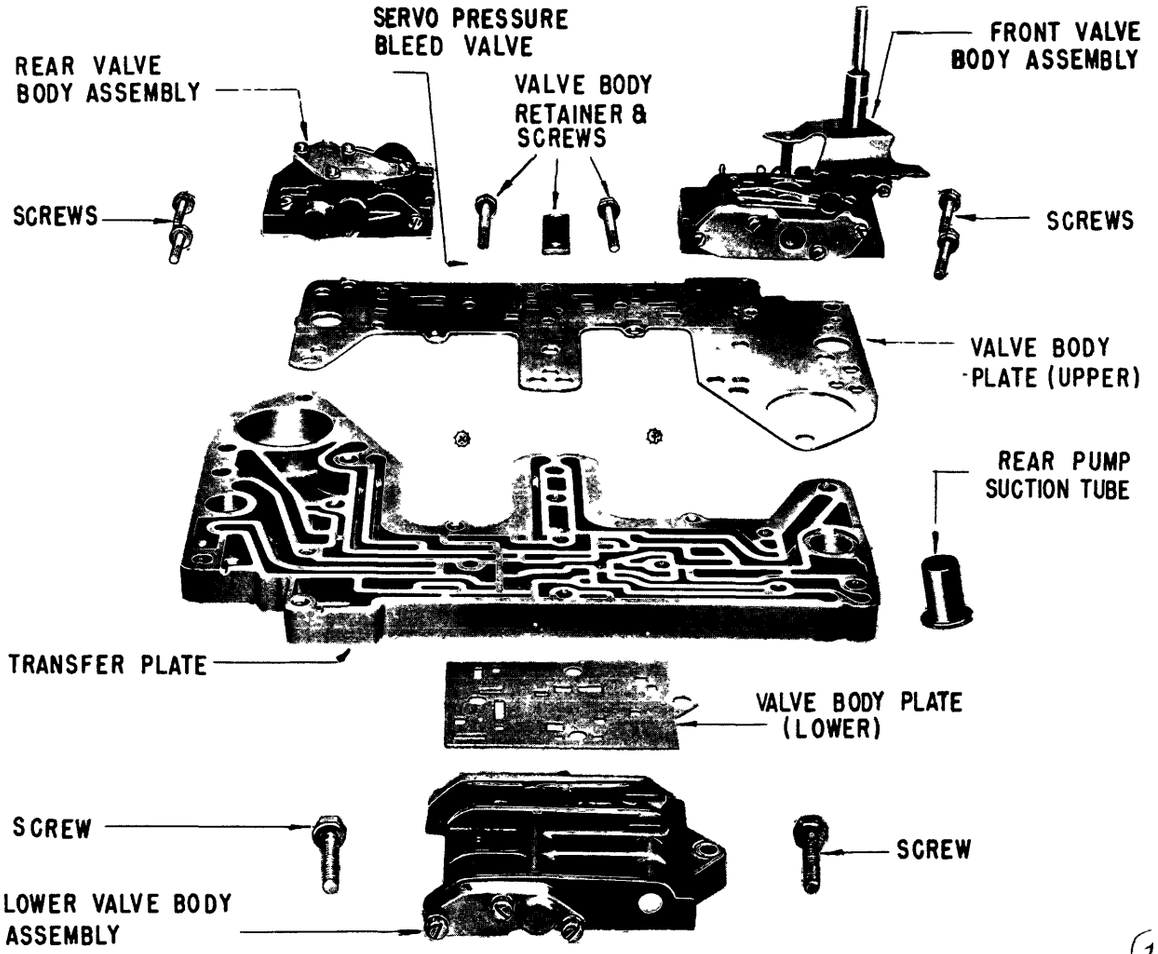
PUSH BUTTON GEARSHIFT CONTROL UNIT

GEARSHIFT CONTROL UNIT (Removal): Remove four screws holding gearshift housing and plate assembly to instrument panel. Pull plate and gearshift control housing assembly straight out and down from instrument panel (*NOTE* - If housing is equipped with back-up light switch, be careful not to damage switch when removing plate). Remove two retaining screws securing gearshift housing to plate and remove plate by withdrawing from push buttons. Remove hairpin clip secur-

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

ing cable end to actuator. Remove two screws securing cable assembly bracket to gearshift control housing and remove cable assembly. Remove wires from back-up light switch. Remove illuminating lamp lead wire. Remove leads from starting motor switch (if so equipped). *(NOTE* - If necessary to remove push buttons from slides, withdraw by pulling on buttons. Do not spread the slide tangs or fingers).



Installation: Install end of control cable on actuator and install clip. Place cable bracket in position on gearshift control housing, install two screws and tighten securely. Reconnect back-up light switch wires (check wire routing as noted at disassembly). Reconnect starting motor switch leads. If push buttons were removed, slightly compress fingers on slides (if necessary) to aid in retention of push buttons. Place gearshift control housing in position on plate and secure with two retainer screws. Carefully guide plate and gearshift housing assembly back into position in instrument panel and secure with four screws. If housing is equipped with back-up light switch, exercise care during positioning of plate in instrument panel to avoid damaging switch. Adjust manual control cable.

MANUAL CONTROL CABLE (Removal): Engage "1" button to place spring lock in line with control cable adapter plug hole in transmission case. Remove gearshift control unit from instrument panel (see above). Remove cable adjustable mounting bracket on transmission. Remove control cable adapter housing plug, insert screwdriver through hole and release control cable spring lock. While releasing the spring lock, remove cable. Using the same screwdriver, insert through cable hole in adapter housing and push lever rearward to last detent. Reinstall housing plug and tighten. From front of dash, pull cable assembly and grommet from dash panel.

Installation: Place grommet on cable. From front of dash, install control housing end of cable through dash panel. Install gearshift control unit (see above). Install cable grommet in dash panel. Remove oil pan. Remove neutral starting switch from transmission case. Position manual lever in "low" range detent. Hold the "R" (Reverse) button in at full travel position. Insert cable into transmission manual lever adapter until spring lock engages control cable securely. Release the "R" button and hold "N" (Neutral) button in. Adjust manual control cable (see above).

GEARSHIFT UNIT LAMP BULB REPLACEMENT: Remove gearshift housing and plate (see above). Remove one or more push buttons for clearance. Replace defective or burned out bulb. Replace control housing and plate assembly. Test operation of unit.

BACK-UP LIGHT SWITCH REPLACEMENT: Remove gearshift control housing and plate (see above). Back-up light switch is fastened to control unit by four tabs. Remove lead wires, then straighten tabs to remove switch. To install, position switch and bend tabs to secure switch to housing. Reconnect lead wires. Check reverse slide action (slide should freely return for full travel). Install gearshift control housing.

TORQUEFLITE VALVE BODY & TRANSFER PLATE ASSEMBLY

STARTING MOTOR SWITCH REPLACEMENT (CHRYSLER & DODGE): Remove gearshift housing (see above). Remove starter motor switch by drilling out rivets. Mount replacement switch on housing assembly and secure by riveting or suitable screws. Be sure that sufficient clearance is maintained for free movement of operating slide ends if screws are used.

Adjustment: Depress "N" (Neutral) button to the neutral position only, then press only far enough beyond this point to remove all free movement from actuator. Clearance between slide and motor starting switch contact should be .010-.015". If clearance is not within specification, tab on neutral operating slide may be adjusted by carefully bending to bring within specifications *(CAUTION - Us car as op rating slid is of hard n d mat rial and may be br k n during bending op ration).*

GEARSHIFT CONTROL UNIT TROUBLE SHOOTING & DIAGNOSIS

LOW & REVERSE BUTTONS REQUIRE HEAVY PRESSURE TO LOCK: Adjust manual control cable. See *"Manual Control Cable Adjustment" above.*

"CLUNKING" NOISE WHEN BUTTON RETURNS: Remove control unit and replace rubber bumper if missing or damaged.

PUSH BUTTON WILL NOT RETURN: Remove control unit and replace broken or defective return spring.

PUSH BUTTON WILL NOT LOCK: Replace operating slide.

PUSH BUTTON BINDS: Replace operating slides if

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

warped. Align bezel so push buttons are centered. Position light lead wire as outlined under "Gearshift Control Unit Installation" above. Carefully relieve area where push button contacts felt. This can be done by inserting a .005" feeler gauge between push button cover and the felt mask. Gently moving the gauge in and out in this area will usually relieve the binding condition. Should it become necessary to replace or reglue the mask, use a suitable adhesive and place glue in an area where it will not interfere with operation of the push buttons.

LOOSE PUSH BUTTON COVER: Remove bezel to expose push button. Using a small screwdriver, exert sufficient pressure to force tang into plastic recess on push button.

TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

▷*NOTE: When units are removed from transmission, each unit must be inspected before assembly as outlined under "Transmission Overhaul".*

NEUTRAL STARTER SWITCH (Removal): Drain approximately two quarts of fluid from transmission and reinstall drain plug. Remove wire from switch and remove switch and gasket.

Installation: Reverse removal procedure and tighten switch to 15-20 ft. lbs.

REGULATOR VALVE ASSEMBLY (Removal): Remove regulator valve spring retainer, gasket and spring. Using a mechanical retriever or a piece of welding rod (5/32") inserted in end of valve, remove valve.

Installation: Reverse removal procedure and tighten spring retainer to 45-50 ft. lbs.

TORQUE CONVERTER CONTROL VALVE (Removal): Remove torque converter control valve spring retainer, gasket and spring. Using a mechanical retriever or a piece of welding rod (1/8") inserted in valve, remove valve.

Installation: Reverse removal procedure and tighten retainer to 35-40 ft. lbs.

OIL PAN (Removal): Drain transmission, install drain plug and tighten. Remove oil pan filler tube from pan and loosen support bracket screw. Remove oil pan.

Installation: Reverse removal procedure. Tighten pan screws to 12-17 ft. lbs. Tighten filler tube nut to 35-40 ft. lbs.

VALVE BODIES & TRANSFER PLATE (Removal): Place push button control unit in "L" (Low) position (it is necessary that control adapter be in this position when removing cable). Remove oil pan. Disconnect throttle linkage from throttle lever on transmission. Remove all dirt and foreign material from around control cable housing. Loosen throttle control lever screw and remove lever assembly. Remove flat washer and felt oil seal from throttle lever shaft. Remove control cable adjustable mounting bracket. Remove control cable adapter housing plug, insert screwdriver through hole and release the control cable spring lock. While releasing control cable spring lock, remove cable. Insert screwdriver through cable opening in adapter housing and push lever rearward to last detent. Reinstall housing plug and tighten. Remove three control cable housing screws and washers and remove housing and gasket. Loosen manual control lever screw and slide lever off shaft. Remove the four oil strainer assembly screws and washers and remove oil strainer assembly. Loosen and remove the three accumulator cover screws with washers. Remove cover and spring from transfer case. Remove transfer plate screws and washers and remove valve bodies and transfer plate assembly from transmission case.

Installation: Clean mating surfaces and check for burrs on both transmission case and valve body transfer plate. Install valve bodies and transfer plate assembly on transmission case. Install transfer plate screws and washers and tighten to 16 ft. lbs. evenly (*CAUTION - Dished type washers should be installed on screws with dished portion facing away from screw head*). Install accumulator spring through transfer plate and position in piston. Install accumulator cover, screws, and washers. Draw screws down evenly. Place oil strainer in place on transfer plate assembly. Install four screws and lockwashers. Draw down evenly and tighten strainer and accumulator cover screw to 16 ft. lbs. Install oil pan, then install manual control lever with locking screw to rear on manual valve shaft. Position lever on shaft so there is 7/32" clearance between lever and transmission case (without gasket). If control cable adapter has been removed from manual valve control lever, reinstall by positioning in lever (end of spring lock up), and installing pin. Place manual valve control lever in reverse position (last detent to rear) and install gasket, control cable housing, and screws and washers. Draw down evenly and tighten to 16 ft. lbs. Install felt washer, flat washer, and throttle lever control assembly. Tighten clamping bolt. Connect throttle linkage to throttle lever on transmission. Install control cable in housing and adapter making sure spring lock engages cable. Replace cable adjustable mounting bracket. Adjust manual control cable (see above).

KICKDOWN PISTON (Removal): After removal of valve bodies and transfer plate (see above), loosen kickdown band adjusting screw locknut and back adjusting screw out sufficiently to remove anchor. Remove kickdown band strut. Install Tool C-3529 or C-3289 (modified), apply sufficient pressure on kickdown piston rod guide, and remove snap ring. (Oil will drain from servo when compression portion of tool is loosened). Loosen compression portion of tool and remove piston rod guide, piston spring and piston rod. Using pliers, Tool C-484, remove kickdown piston from transmission case.

Installation: Lubricate piston rings and place kickdown piston assembly into position, compress outer ring, and start assembly into case. With piston properly centered (so not to damage rings) tap lightly and bottom piston into transmission case. Slide piston spring over kickdown piston rod assembly and install in piston. While holding in this position, install the kickdown piston rod guide assembly on kickdown piston rod. Using Tool C-3529 or C-3289 compress the kickdown piston spring to the point that piston guide seal ring slightly binds on transmission case. Work seal ring into position and gradually compress spring until seal ring enters case and snap ring can be installed. Install kickdown piston rod guide snap ring, making sure it is properly seated. Loosen compressing portion of tool and remove tool from transmission. Place kickdown band strut in position in band and lever and compress band end sufficiently to install anchor over adjusting screw. Adjust kickdown band. Install valve bodies and transfer plate assembly.

ACCUMULATOR PISTON (Removal): Remove valve bodies and transfer plate (see above). Using pliers, Tool C-484, remove accumulator piston from transmission case.

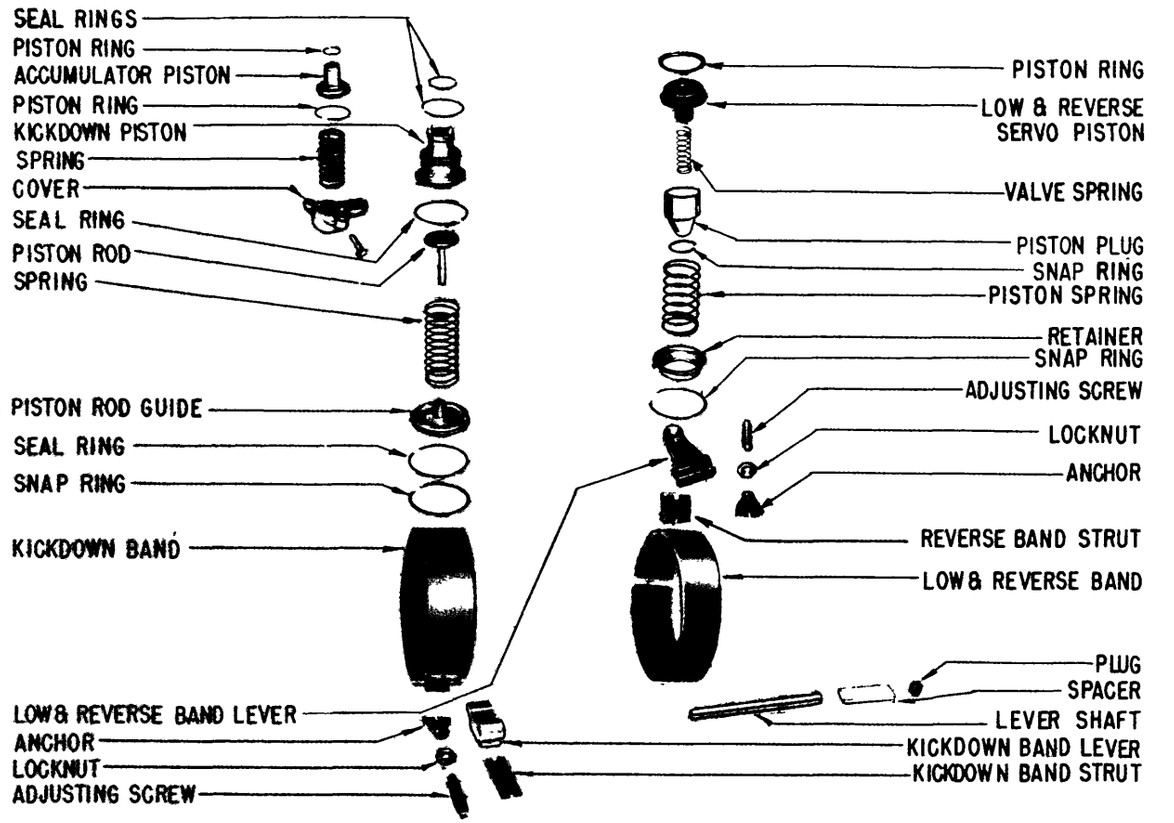
Installation: Lubricate seal rings and place accumulator piston into position. Compress outer seal ring and tap lightly into transmission case. Install valve bodies and transfer plate assemblies.

OUTPUT SHAFT REAR BEARING OIL SEAL (Removal): Disconnect front universal joint. Apply hand brake and remove propeller shaft flange nut and Belleville washer. Release hand brake and install puller, Tool C-452 (if necessary). Remove propeller shaft flange and brake drum assembly. Remove transmission brake support grease shield spring (small one). Remove brake support grease shield from extension (*CAUTION* - If screwdriver or sharp instrument is used in performing this operation, care must be taken to prevent damage to neoprene sealing surface at bottom of shield), Install puller, Tool C-748, and remove transmission output shaft rear bearing oil seal.

Installation: Using driver, Tool C-3205, install output shaft rear bearing oil seal (metal portion of oil seal facing in) until driver bottoms on extension. (*CAUTION* - Indent on grease shield must match groove in extension for correct positioning. Also, shield must be located on extension far enough to permit installation of spring). Install brake support grease shield spring (opening in spring toward adjusting sleeve). Make sure spring is properly seated in groove. Install propeller shaft flange, Belleville washer, and nut. Apply hand brake and tighten propeller shaft flange nut to 200 ft. lbs. Connect front universal joint and torque nuts to 33-37 ft. lbs. Refill transmission (if necessary).

EXTENSION HOUSING (Removal): Drain approximately two quarts of fluid from transmission. Disconnect front universal joint. Apply hand brake and remove propeller shaft flange nut and Belleville washer. Release hand brake, and using puller, Tool C-452 remove propeller shaft flange and drum assembly. Remove brake adjusting screw cover plate and loosen cable clamp bolt on hand brake support. Disengage the ball end of cable from operating lever and remove cable from brake support. Disconnect speedometer cable and housing at transmission extension and remove speedometer drive pinion and sleeve assembly. Remove nuts and lockwashers holding engine rear support insulator to crossmember, leaving insulator attached to extension. Remove the two top extension to case screws and lockwashers. Using a suitable jack and extreme care to prevent damage to oil pan, raise transmission sufficient-

CONTINUED ON NEXT PAGE



TORQUEFLITE (C nt.)

ly for insulator on extension to clear crossmember. Remove four of the remaining extension to case screws and lockwashers and install guide studs, Tool C-3283. *(NOTE* - Due to interference of the insulator, it will be necessary to remove the bottom extension to case screw with the extension, that is, back out the screw as far as possible and slide extension back and continue loosening screw). *(CAUTION - Do not remove the one output shaft support to transmission case screw).* Remove extension and hand brake as one assembly. Remove extension gasket. *NOTE* - If care is used, it is not necessary to remove hand brake support and shoe assemblies from extension to replace output shaft rear bearing.

Installation: Reverse removal procedure and note the following: Start bottom extension to case screw as the extension is pushed into position against support. *(CAUTION - Do not attempt to pull extension in with aid of th screws; damage to extension may result).* Tighten extension to case screws to 25-30 ft. lbs. Tighten propeller shaft flange nut to 200 ft. lbs. Tighten universal joint nuts to 33-37 ft. lbs. Tighten speedometer pinion and sleeve assembly to 40-45 ft. lbs.

GOVERNOR (Removal): Remove extension housing, see above. Remove governor valve shaft and valve from governor body assembly. Using pliers, Tool C-3229, remove governor weight assembly snap ring (large) and remove weight assembly. *(NOTE* - The primary cause of governor operating failure is usually due to improper operation of governor valve which may be sticking in housing or travel restricted by chips or other foreign matter. If inspection indicates complete removal, proceed as follows): Remove governor support locating screw and remove governor and support assembly from rear oil pump housing. Normal servicing does not require removal of governor body from support. If condition warrants removal of governor body from support, when reassembling, do not tighten governor body screws until governor body support is located on output shaft.

Installation: Slide governor body and support assembly into position in rear oil pump housing, using extreme care, compress governor support seal rings as support enters oil pump housing. DO NOT FORCE. Align locating hole in output shaft to locating screw hole in governor support and install screw. Tighten to 5-7 ft. lbs. Holes can be aligned by turning output shaft and holding governor body. If governor body has been removed and reinstalled, tighten the four governor body screws to 6-8 ft. lbs. Place governor weight assembly (secondary weight snap ring facing out) into governor body; and using pliers, Tool C-3229, install snap ring. Make sure snap ring seats properly. With governor valve (small end up) on governor valve shaft, slide shaft into governor body through the output shaft and governor weight assembly; at the same time position valve into body. Install governor valve shaft snap ring. Make sure it is locked securely to shaft. Replace snap ring if distorted *(NOTE* - After snap ring installation, apply sufficient pressure to both ends of valve shaft to force snap ring to outer portion of snap ring grooves). Check operation of governor weight assembly and valve by turning output shaft. Both should fall freely in valve body. Install extension housing.

TORQUEFLITE SERVO & BAND ASSEMBLIES

REAR OIL PUMP (Removal): Remove extension housing, see above. Using a screw driver, remove governor valve shaft snap ring from weight assembly end. Remove governor valve shaft and valve from governor body assembly. Using pliers, Tool C-229, remove governor weight snap ring (large) and remove governor weight assembly from governor body. Remove governor locating screw from governor support. Remove oil pump-to-output shaft support screws and Belleville washers, and install guide studs, Tool C-3288. Remove pump housing, gear, and governor assembly from output shaft. Use prussian blue and mark pump gears in relation to pump housing face *(CAUTION - Do not scribe).* When removing oil pump pinion, use care so as not to lose the small ball used as a key. Remove rear oil pump pinion from output shaft and mark in same manner. Remove governor assembly from oil pump housing.

Installati n: Install governor support and body assembly into position in rear pump housing. Compress governor support seal rings as support enters oil pump housing. DO NOT FORCE. Place rear oil pump pinion ball in ball socket in output shaft. Place rear oil pump pinion (as marked when removed) over output shaft and into position aligning keyway in pinion with ball in shaft. With rear oil pump properly positioned in pump housing (check marking), slide rear oil pump and governor assemblies over output shaft and guide studs into position against support. *(CAUTION - Ther ar two xtra hol s in housing which are used for v nts. Make d finitely sure no attempt is made to install screws in thes hol s).* Remove guide studs and install pump housing-to-output shaft support screws and Belleville washers (install washers with dished portion facing away from head). Tighten screws evenly to 10-12 ft. lbs. Rotate output shaft to make sure pump gears are free to rotate. If not, remove pump to determine cause. Align locating hole in output shaft-locating screw hole in governor support. Install locating screw and tighten to 5-7 ft. lbs. Complete installation by following governor installation procedure outlined above.

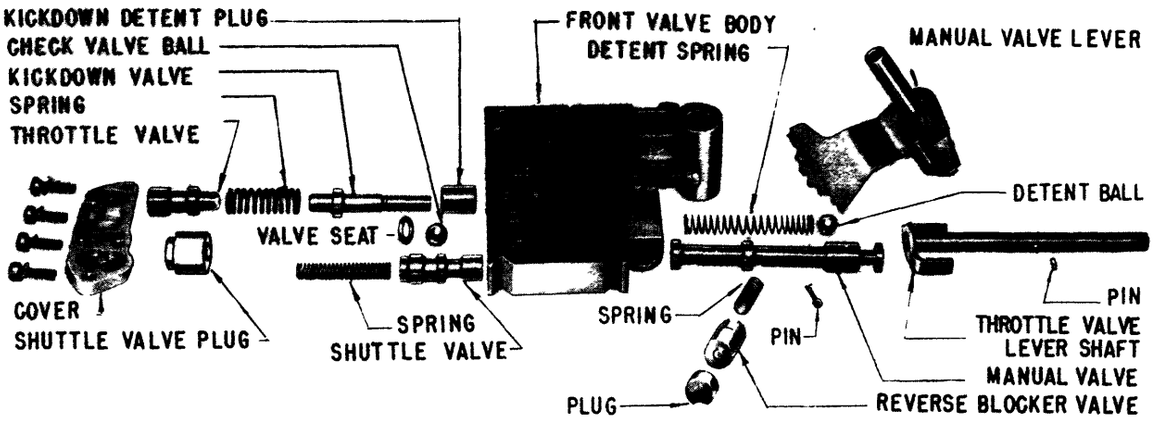
CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

TRANSMISSION REMOVAL & INSTALLATION

REMOVAL: 1) Disconnect battery. Push in the "1" (Low) button and raise car off floor *(NOTE* - Push button must be in the "1" position to remove cable from adaptor housing on transmission). Drain transmission and torque converter (see "Draining & Refilling" above). Disconnect oil pan filler tube assembly from oil pan and loosen support bracket screw.

2) Disconnect the front universal joint and secure propeller shaft out of the way. Remove brake adjusting screw cover plate and loosen cable clamp bolt on hand brake support. Disengage the ball end of cable from operating lever and remove cable from brake support. Disconnect speedometer cable and housing at transmission extension. Disconnect neutral starter wire at switch. Unclip wires from crossmember.



3) Disconnect throttle control linkage from throttle lever on transmission. Loosen push button control cable adjustable mounting bracket. Remove control cable adapter housing plug, insert screwdriver through hole and release control cable spring lock. While releasing control cable spring lock, remove cable from adapter housing. Using same screwdriver, insert through cable opening in adapter housing and push lever rearward to last detent. Reinstall housing plug and tighten.

4) Disconnect the two oil cooler lines from transmission (if so equipped). Remove nuts and lockwashers holding engine rear support insulator to crossmember, leaving insulator attached to extension. Remove starter.

5) Install engine support fixture, Tool C-3487. Insert hooks of fixture firmly into holes in side of frame member with support ends up against underside of oil pan flange. Adjust fixture to support weight of engine. Raise engine slightly, remove crossmember-to-frame bolts and remove crossmember. *(CAUTION - Do not lower engin more than three inches from floor pan).*

6) Remove the two transmission case-to-torque converter housing screws and lockwashers from right side and install guide studs, Tool C-3276. With transmission supported, remove the two transmission case-to-converter housing screws and lockwashers from left side. Slide transmission straight back to avoid damage to front oil pump driving sleeve, then lower to floor.

INSTALLATION: 1) Install guide studs, Tool C-3276, in the two transmission mounting holes in right side of torque converter housing. With front oil pump drive sleeve lubricated, install, making sure driving lugs are properly engaged with oil pump pinion. *(NOTE* - Main portion of drive sleeve will be flush with front of pump housing when properly installed). Note position of driving lugs inside torque converter hub, then position front oil pump drive sleeve on transmission accordingly, to aid on proper engagement when transmission installed. Slide transmission over guide studs and into position against converter housing. Make sure driving lugs on front oil pump drive sleeve properly engage torque converter.

TORQUEFLITE FRONT VALVE BODY ASSEMBLY

►*CAUTION - To avoid damage to front oil pump, do not attempt to use torque converter housing screws to bring transmission and housing together. If oil pump drive sleeve and input shaft have been properly aligned, the transmission should slide into position relatively easy. DO NOT FORCE.*

2) Install the two transmission-to-torque converter housing screws and lockwashers in left side (do not tighten). Remove guide studs and install the two transmission-to-housing screws and lockwashers in right side, then draw the four down evenly and tighten to 45-50 ft. lbs. Place crossmember into position and install crossmember-to-frame bolts. Tighten to 50-55 ft. lbs.

3) Lower engine and at the same time align mounting studs in insulator with holes in crossmember. Install the two nuts and lockwashers holding engine rear support and insulator to crossmember and tighten to 30-35 ft. lbs. Remove support fixture from side of frame member.

4) Install bracket holding oil cooler lines to cylinder block (if so equipped) on transmission case and tighten. Connect neutral starter-to-switch wire. Install oil pan filler tube and tighten filler tube nut to 35-40 ft. lbs. Tighten support bracket screw.

5) Connect speedometer cable and housing at extension. Engage ball end of hand brake cable in operating lever and tighten cable clamp bolt. Install adjusting brake screw cover plate on hand brake support. Connect front universal joint and tighten nuts to 33-37 ft.lbs.

6) Connect throttle control linkage to throttle lever on transmission. Install gearshift control cable in adapter making sure spring lock engages cable. Install starter, connect battery, refill transmission and adjust throttle linkage and gearshift control cable.

TORQUE CONVERTER REMOVAL

REMOVAL: Remove transmission, see above. Remove torque converter housing-to-adaptor screws and lockwashers. Remove torque converter housing. *(NOTE* - If torque converter is being removed because of excessive runout damage, check runout by using a dial indicator on hub, and mark the highest point of runout on both converter and crankshaft flange. This will aid later in determining if runout is due to converter or crankshaft). Using wrench, Tool C-589, remove the stud nuts and lockwashers from crankshaft flange. Remove converter from crankshaft. Check crankshaft flange runout which should be a maximum of .002".

CORRECTING HUB RUNOUT: Permissible converter hub runout, when mounted on the crankshaft is .004" total indicator reading. When mounting a new torque converter, make sure all foreign matter, raised metal around studs, burrs, chips and dirt are removed from converter and crankshaft drive flanges. Check crankshaft runout (maximum .002").

1) Check converter runout by mounting a dial indicator to adaptor plate or some other unit which is mounted rigidly to the engine block. Rotate converter 360° and determine converter hub, outside diameter, runout. If this exceeds .004" total indicator reading, then correct by using heat in the following manner: Mark position of hub low spot as accurately as possible on the impeller shell. Rotate converter so this mark is downward. Remove dust shield from front of adaptor plate. Using a piece of chalk, mark front cover radius directly opposite the hub low spot previously marked on impeller shell. The subsequent heating operation can now be done through the opening in adaptor plate. *(CAUTION - Drain converter housing before heating).* The size of the spot to be heated is governed by amount of hub runout and is usually 1/2" diameter for .008" total indicator reading. Using an acetylene torch having a No. 3 tip (set to maximum heat) apply to selected spot until it becomes a dull red. Rapid heating of the local area is essential and if the torch is adjusted properly, the spot will become red within a few seconds *(CAUTION - If sparks are noted, it is an indication that torch is too close and metal is starting to burn; move torch back slightly. Care should b taken to r move torch th instant the selected spot becomes a dull r d to avoid ov rcorrection or damag to the unit).* The area is then

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

quenched as rapidly as possible with cold water (hose or wet rags). It is suggested this be done by starting around the heated area and working in toward the spot This prevents heat from spreading. *(NOTE - The hub runout should not be rechecked until the converter has returned to a uniform room temperature).* If the converter hub runout exceeds .016" total indicator reading, remove converter and recheck drive flanges for chips, burrs, etc. Check crankshaft flange runout (max. .002"). If runout remains in excess of .016", install a new converter.

STARTER RING GEAR (Removal): Support torque converter assembly in a vise and with a file carefully remove the staking lugs which retain ring gear to converter. *(CAUTION - Be careful when supporting converter in the vise to avoid distortion).* Place converter on blocks of wood for support while removing. Using a blunt chisel or drift, tap around ring gear until it comes off torque converter.

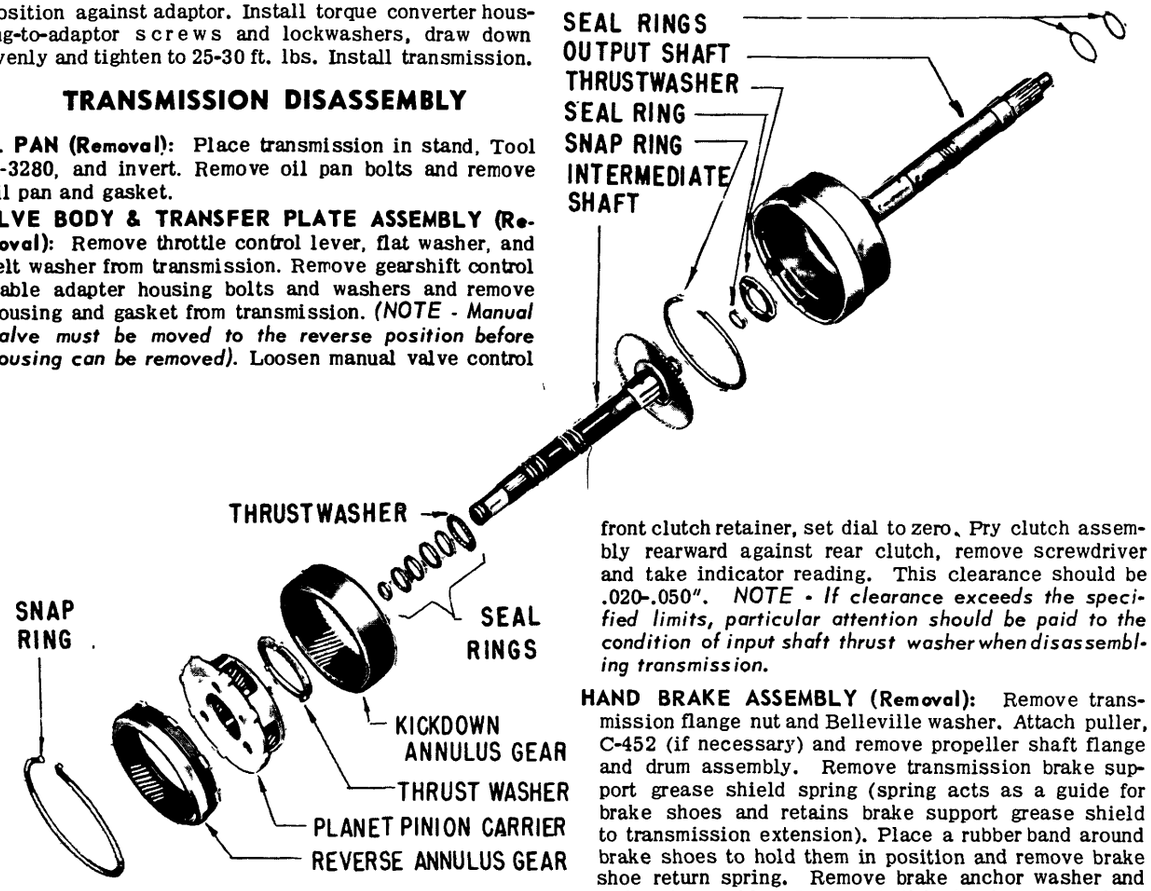
Installation: Remove burrs or raised spots (left on gear contact surface of converter), with a file, being careful not to remove more metal from converter than is required to remove burrs and rough surfaces. Any of the following methods may be used to heat starter ring gear for installation on converter:

Oven - When available, use oven C-794 and set temperature at 150° F. Allow ring gear to remain in oven approximately 15-20 minutes.

Boiling Water – Place ring gear in a shallow pan, add water, and heat approximately 8 minutes after water has come to a boil.

Steam – Place ring gear on a flat surface and direct steam flow around gear for approximately two minutes.

Flame – Place ring gear squarely on a flat surface. Using a medium tip, direct a low flame around inner rim of gear, being careful not to direct flame onto teeth of ring gear. Place a few drops of water on face of gear at short intervals during the heating process. When gear is hot enough to boil the drops of water, installation of gear on converter can be made.



Reweld ring gear to converter using extreme care to place as nearly as possible the same amount of metal in exactly the same location as original assembly. This is necessary in order to maintain proper balance of unit. Place welds alternately on opposite sides of converter to minimize distortion. In making the weld, use a welding current of 200 amps. Use a D.C. welder that is set at straight polarity or an A.C. welder. Use a 5/32" dia. Fleetweld No. 47, or General Electric No. W28 (or equivalent). *(CAUTION - To prevent burning through the converter, the arc should be directed at intersection of gear and housing from an angle of approximately 45° from face of gear. DO NOT GAS WELD).* Before installing converter, inspect all gear teeth and remove nicks where metal is raised, or welding splatter.

INSTALLATION: Inspect mating surfaces on converter and crankshaft flange for burrs and dirt. Install converter on crankshaft. Install torque converter stud nuts and lockwashers. Draw down evenly and tighten. Check converter assembly runout which should not exceed .004". Place torque converter housing over dowels and into position against adaptor. Install torque converter housing-to-adaptor screws and lockwashers, draw down evenly and tighten to 25-30 ft. lbs. Install transmission.

TRANSMISSION DISASSEMBLY

OIL PAN (Removal): Place transmission in stand, Tool C-3280, and invert. Remove oil pan bolts and remove oil pan and gasket.

VALVE BODY & TRANSFER PLATE ASSEMBLY (Removal): Remove throttle control lever, flat washer, and felt washer from transmission. Remove gearshift control cable adapter housing bolts and washers and remove housing and gasket from transmission. *(NOTE - Manual valve must be moved to the reverse position before housing can be removed).* Loosen manual valve control lever bolt. Using caution to prevent loss of cable adapter pin, slide lever and cable adapter off shaft. Remove oil strainer assembly bolts and lockwashers, and remove oil strainer (one strainer is used for both front and rear oil pumps). Loosen (to relieve spring load) the three accumulator cover bolts with washers, and remove cover and spring from transfer plate. Remove transfer plate bolts and washers and remove valve bodies and transfer plate assembly from transmission case *(CAUTION - Use care not to damage mating surfaces).* Place valve body in stand, Tool C-3528. Remove neutral starting switch located in left side of transmission case.

TRANSMISSION UNIT NO. 1

FRONT CLUTCH END CLEARANCE CHECK: Before removal of propeller shaft flange and drum assembly, check end clearance of front clutch piston retainer assembly using dial indicator, Tool C-3339 mounted on case in such a manner as to have dial indicator plunger bearing against rear side of front clutch piston retainer assembly. Pry front clutch forward by inserting screwdriver between front and rear clutch. Remove screwdriver and with dial indicator point contacting edge of front clutch retainer, set dial to zero. Pry clutch assembly rearward against rear clutch, remove screwdriver and take indicator reading. This clearance should be .020-.050". *NOTE - If clearance exceeds the specified limits, particular attention should be paid to the condition of input shaft thrust washer when disassembling transmission.*

HAND BRAKE ASSEMBLY (Removal): Remove transmission flange nut and Belleville washer. Attach puller, C-452 (if necessary) and remove propeller shaft flange and drum assembly. Remove transmission brake support grease shield spring (spring acts as a guide for brake shoes and retains brake support grease shield to transmission extension). Place a rubber band around brake shoes to hold them in position and remove brake shoe return spring. Remove brake anchor washer and brake shoe guide. Remove both brake shoe assemblies, adjusting sleeve, nut, screw, and brake shoe operating lever link. *(NOTE - Operating link is marked for installation purposes).* Make sure adjusting nut turns freely on screw. Remove the other brake shoe guide from anchor pin. Remove brake support grease shield from extension being careful not to damage neoprene sealing surface at bottom of shield. Slide brake support assembly from rear extension and anchor. Inspect neoprene spacer on back of support plate for deterioration and note the steel sleeve used between neoprene spacer and extension.

EXTENSION HOUSING: Remove speedometer drive pinion and sleeve assembly (damage to nylon gear will result if drive pinion and sleeve assembly is not removed first). Inspect output shaft, rear bearing oil seal, and remove if necessary, using puller, Tool C-748. Remove transmission extension-to-case screws and lockwashers. Install guide studs, Tool C-3283, and remove extension from output shaft support assembly by tapping housing lightly with a soft hammer. Housing may be separated

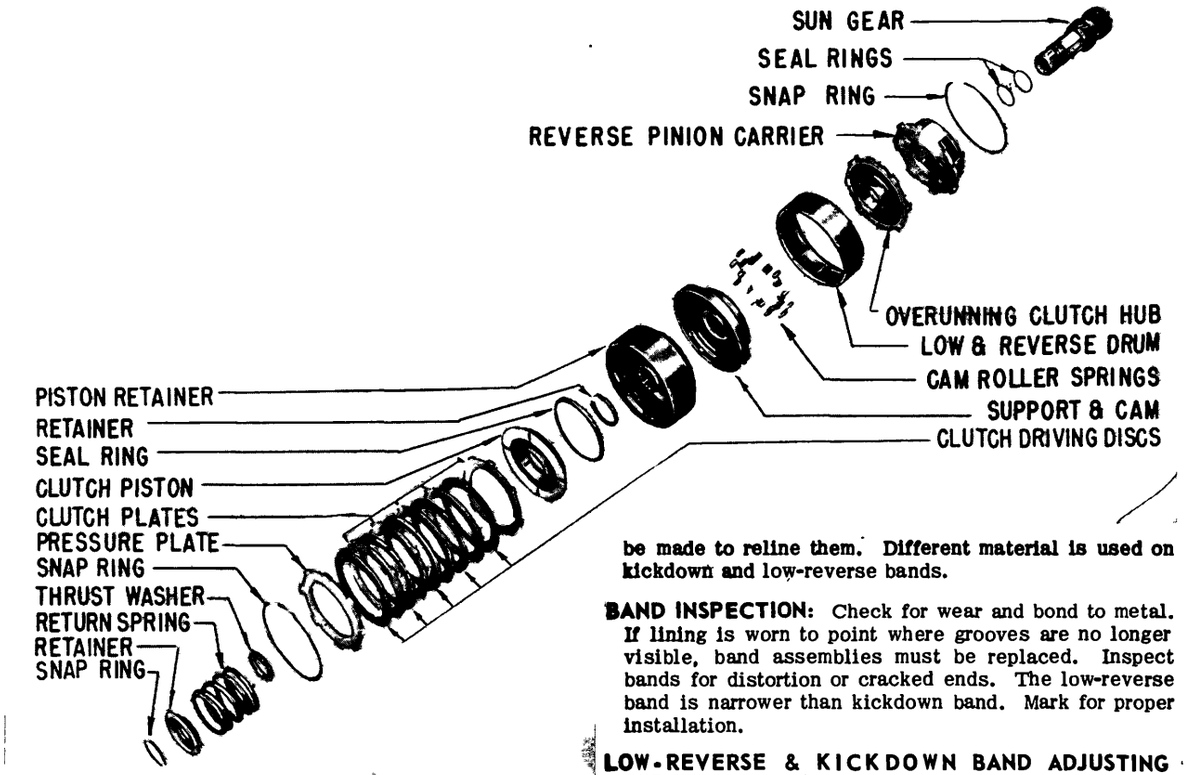
CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

from support by using a pry bar between support screw and housing bracket. Remove gasket.

Insp ction: Inspect extension housing for cracks in casting and remove burrs from gasket surfaces. Inspect vent in top of housing and make sure it is free of dirt. Clean output shaft rear bearing and dry with compressed air. Inspect bearing for rough spots. Do not remove from housing unless it is necessary to replace.

GOVERNOR & REAR OIL PUMP HOUSING (Removal): Using a screwdriver, remove governor valve shaft snap ring from weight assembly end. Remove governor valve shaft and valve from governor body assembly. Using pliers; C-3229, remove governor weight assembly snap ring (large) and remove governor weight assembly from body. Using a 5/16" socket, remove governor locating screw from governor support. Remove five rear oil pump-to-output shaft support screws (with Belleville washers). Remove pump housing, gear, and governor assembly from output shaft. Use prussian blue and mark face of pump gears in relation to pump housing. *(CAUTION* - Do not use scribe). Remove oil pump pinion, being careful not to lose ball used to key pinion to output shaft, from output shaft, and mark in same manner as for gears.



Insp ction: Inspect pump housing plug for leaks and machined surfaces for nicks and burrs. Inspect gears for scoring or pitting. With gears cleaned and installed in housing (as marked) and using straightedge, Tool C-3335 and feeler gauge, check clearance between pump housing face and face of gears. Clearance should be .001-.0025".

OUTPUT SHAFT SUPPORT (Removal): Remove output shaft support-to-transmission case screw and washer. Slide output shaft rear support assembly and gasket from transmission case. If rear support is stuck to case, it can be loosened by tapping with a soft hammer. Remove guide stud from transmission case.

Insp cti n: Inspect all oil passages in support for obstructions. Remove pressure take-off plugs (governor and rear clutch supply) and clean passages with compressed air. Check rear oil pump mating surfaces for burrs and score marks. Check for stripped threads in support. Inspect gasket surfaces for burrs and score marks. Inspect inside bearing surface for wear or scoring.

POWER TRAIN UNITS (Removal): Unit No. 1 (Output Shaft, Kickd wn Planet Pinion Carrier, and Intermedi- at Shaft Assemblies) – Remove by sliding unit out rear of transmission case being careful to support unit as much as possible to prevent damage to seal rings on intermediate shaft.

Unit No. 2 (Sun G ar, Reverse Planet Pinion Carrier, Overrunning Clutch, and Rear Clutch Assemblies) – Loosen locknuts on low-reverse and kickdown band adjusting screws, and back adjusting screws out 2 to 3 turns. Remove the three intermediate support locating screws and lockwashers (two outside of case and one inside). *(CAUTION - When removing unit, identify locating hole in intermediate support to correspond with the thr aded locating hol insid of case, f r installation purposes).* Keep unit centered as much as possible to prevent binding of intermediate support, and remove assembly from transmission case. *CAUTION - Make sure front clutch and sun gear thrust washers remain in position in front of unit.*

TRANSMISSION UNIT NO. 2

Unit No. 3 (Front Clutch Piston Retainer and Input Shaft Assemblies) – Keep unit centered as much as possible, and remove from transmission case. *CAUTION-* Use care when removing to prevent damage to seal rings on input shaft and sealing surface of reaction shaft.

LOW-REVERSE BAND ASSEMBLY (Removal): Mark low-reverse band assembly for installation purposes. Compress ends of band sufficiently to remove low-reverse band strut. Remove low-reverse band assembly by rotating band ends through rear opening in transmission case. Remove low-reverse band anchor from adjusting screw.

KICKDOWN BAND ASSEMBLY (Removal): Compress kickdown band ends sufficiently to remove band strut (note that strut is grooved to act as a guide). Remove kickdown band anchor from adjusting screw. Remove kickdown band assembly by rotating band ends over center support in transmission case, using care not to damage lining on edges of transmission case. *NOTE* - Both bands have bonded lining and no attempt should be made to reline them. Different material is used on kickdown and low-reverse bands.

BAND INSPECTION: Check for wear and bond to metal. If lining is worn to point where grooves are no longer visible, band assemblies must be replaced. Inspect bands for distortion or cracked ends. The low-reverse band is narrower than kickdown band. Mark for proper installation.

LOW-REVERSE & KICKDOWN BAND ADJUSTING SCREWS (Removal): Remove both band adjusting screws locknuts and remove adjusting screws. *CAUTION* -It is very important that adjusting screws fit freely into transmission case. When locknuts are loose, adjusting screws must be finger free. If not, inspect screws and nuts for pulled threads or foreign material in threads.

LOW-REVERSE AND KICKDOWN BAND LEVER ASSEMBLIES (Removal): Remove kickdown and low-reverse lever shaft stop plug at rear of transmission case. Using a pair of long nosed pliers, remove kickdown and low-reverse shaft lever spacer (flat). Thread guide stud, Tool C-3288 into shaft, and remove shaft from case. Remove kickdown and low-reverse servo levers.

Inspection: Inspect levers for being cracked or worn and make sure they are free to turn on shaft and have side clearance when installed. Inspect lever shaft for excessive wear.

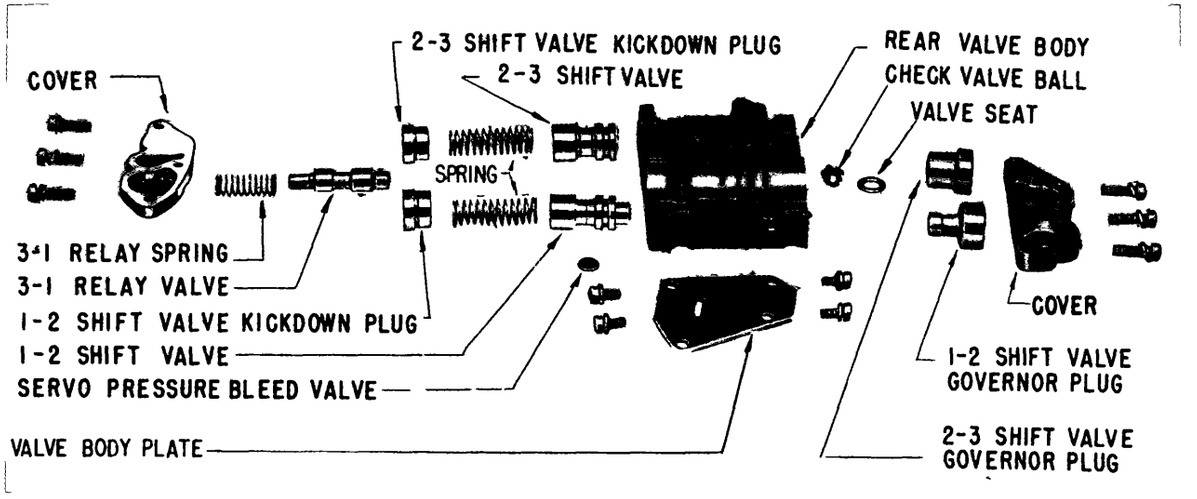
LOW-REVERSE SERVO (Removal): Install Tool C-3529 or C-3280 on transmission case and compress piston spring retainer. Using a screwdriver, remove low-reverse servo piston spring retainer snap ring, then loosen compression portion of tool and remove. *(CAUTION* - Spring retainer may require guiding out of transmission case). Remove spring retainer, spring and servo piston assembly.

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

Insp ction: Inspect lever contacting surface on servo piston plug for excessive wear. Remove and inspect servo piston seal ring for deterioration and hardness. Inspect seal ring groove for nicks and burrs. Inspect servo piston return spring, retainer, and snap ring for being distorted.

KICKDOWN SERVO (Removal): Install Tool C-3529. Apply pressure on the kickdown piston rod guide, and remove snap ring. Loosen compressing portion of tool and remove from transmission case. Remove piston rod guide, piston spring, and piston rod. Using pliers, Tool C-484, remove the kickdown piston from transmission case. Remove accumulator piston from case.

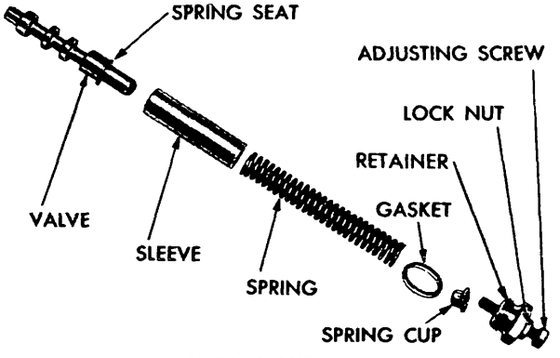


Insp ction: (Kickdown Piston Assembly) – Inspect riveting of kickdown piston rod. Inspect guide contacting surface for nicks or burrs. Inspect seal ring on guide for wear and make sure it turns freely in groove. Check fit of guide on piston rod. Inspect the three rings (two interlocking) on piston for wear or broken locks. Make sure they turn freely in groove. *(NOTE* - It is not necessary to remove rings unless condition warrants. When replacing new rings, use care to avoid damaging interlocking portion of ring). Inspect piston for light scores and wear. Inspect piston spring and rod guide snap ring for distortion.

Insp ction: (Accumulator Piston Assembly) – Inspect both piston seal rings (one interlocking) for wear or broken locks and make sure they turn freely in grooves. *(NOTE* - It is not necessary to remove rings unless condition warrants). Inspect accumulator piston for nicks, burrs, and excessive wear. Inspect accumulator spring for distortion.

FRONT OIL PUMP (Removal): Remove front oil pump drive sleeve (if installed). Remove transmission regulator valve spring retainer, gasket, cup, spring, sleeve, and valve. Remove torque converter valve retainer, gasket, spring, and valve *(NOTE* - This valve can be removed with a mechanical retriever or a piece of welding rod, 5/32" for regulator, 1/8" for torque converter, inserted in end of valve). Remove front oil pump housing-to-transmission case bolts and washers and remove oil pump housing assembly by tapping with a hammer *(NOTE* - Sealing washers used under oil pump attaching bolts are aluminum and should be discarded if damaged). Mark face of gears in relation to face of pump housing using prussian blue. DO NOT SCRIBE.

► *FRONT PUMP DUST SEAL NOTE:* Do not remove dust seal from housing unless inspection indicates that it is necessary. To remove dust seal, use a brass drift and drive seal out front of housing. To replace, position seal in housing (metal portion of seal down) and use driver, Tool C-3278. Drive seal in until tool bottoms on face of housing.



Inspection: Inspect drive sleeve seal ring contacting surface in housing for wear and scratches. Inspect steel back bronze bushing in hub for scratches or scoring and excessive wear, (bushing and housing is serviced as an assembly). Remove oil pump gears and inspect contacting surfaces for scratches, burrs or grooving. Inspect regulator body casting surface on pump housing face for nicks or burrs. Inspect housing passages and make sure they are free of dirt or other material. Clean and replace oil pump gears in housing noting marks made at disassembly. Using straightedge, Tool C-3335, and feeler gauge, check clearance between housing face and face of gears. Clearance limits are .001-.0025". Measure tip clearance between rotor lobes. Replace rotors if clearance exceeds .010". Measure clearance between outer rotor and pump housing bore. Replace rotors or pump housing if clearance exceeds .010". After checking clearance, lubricate with Automatic Transmission Fluid.

TORQUEFLITE REAR VALVE BODY ASSEMBLY

REGULATOR VALVE BODY (Removal): Install guide studs, Tool C-3288, and using two threaded holes provided in valve body, install guide studs and pull regulator valve body off torque converter reaction shaft and remove gasket. *CAUTION - Valve body is aluminum and should be handled with care to avoid damage.*

Inspection: Clean body and valves and dry with compressed air. Inspect reaction shaft seal ring surface in bore for scratches, nicks or burrs. Inspect both valves for free movement in valve body (they should fall in and out of bores when valves and body are dry). Crocus cloth may be used to polish valve (do not round the sharp edges of valve). Check all fluid passages for obstruction and inspect mating surfaces for burrs and distortion. If regulator valve has a slight nick or raised portion on mating surfaces, it may be removed by using a flat surface plate and crocus cloth. Inspect front and rear pump check valve for proper seating on both surfaces. If necessary to remove valve, use a pair of long nosed pliers.

RE ULATOR VALVE ASSEMBLY

TORQUE CONVERTER REACTION SHAFT (R moval): If inspection indicates necessity of removing torque converter reaction shaft, proceed as follows: Remove reaction shaft seal ring (neoprene). Remove the three transmission case-to-reaction shaft screws and washers. Using Tool C-3531, press reaction shaft out of case.

Inspection: Inspect inside of reaction shaft for burrs and inspect splines on shaft for burrs and wear. Inspect seal ring for deterioration and hardness. Inspect thrust surface for wear and slight scores.

TRANSMISSION CASE (Inspecti n): Inspect case for cracks, sand holes and stripped threads. Check for burrs on mating surfaces. Blow compressed air through all passages to make sure they are open. Check pressure takeoff plugs for tightness. Using a straightedge, Tool C-3335, inspect valve body mating surfaces on case for any burrs or irregularity in surface. Surface should be smooth and flat. Inspect servo and accumulator bores for any scores or scratches. Light scratches may be removed with crocus cloth. Check regulator valve body mating surface in front of case for any irregularities. *NOTE* - Disregard any scratches which may have been made by torque converter reaction shaft screw lockwashers.

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

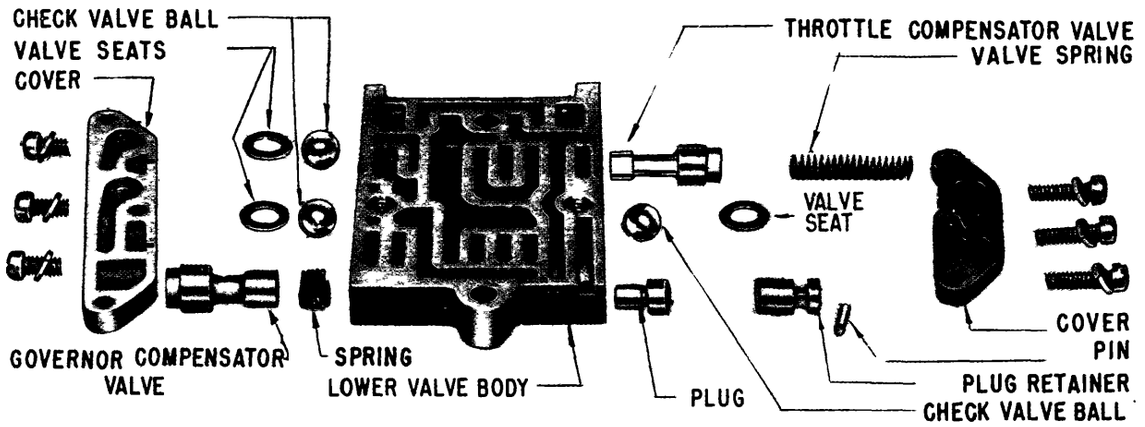
OVERHAUL OF UNITS

VALVE BODY & TRANSFER PLATE DISASSEMBLY: Place valve body and transfer plate assembly in stand, Tool C-3528.

► *CAUTION: Never clamp any portion of this assembly in vise or use force when removing or installing valves and plugs.*

► *CLEANING & INSPECTION NOTE:* After disassembly and each part has been cleaned and inspected, place on clean paper until ready for reassembly.

1) Wash all parts in clean solvent and dry with compressed air. Make sure all passages are free from obstructions. Check for porous castings.



2) Inspect all mating surfaces for burrs, nicks, or grooves. Small ones may be removed with crocus cloth; otherwise damaged parts must be replaced. Using a straightedge, check all mating surfaces for distortion. Using a light, inspect bores in valve body for scoring marks, pits and irregularities. Inspect all springs for distortion and collapsed coils.

3) Inspect all valves and plugs for burrs, nicks, or scores. Small ones may be removed with crocus cloth providing extreme care is used not to round off the sharp edge portion of valve. Check valves and plugs for free operation in bores; they must fall freely in bores when valves, plugs, and bores are clean and dry.

Lower Valve Body (Removal): Remove the two valve body screws from retainer plate located between front and rear valve bodies, and remove plate. Invert valve bodies and remove the two lower valve body screws and lockwashers. Remove lower valve body and plate from transfer plate *(CAUTION - Use extreme care to prevent loss of governor compensator valve plug retaining pin).*

Disassembly - Remove governor compensator valve plug retaining pin, retainer, and compensator plug. Remove the three screws from governor compensator cover (larger cover on valve body). Use care to prevent loss of the two check valve balls and seats, and remove cover. Invert valve body and remove governor compensator valve and spring. While holding throttle compensator valve cover in place (spring loaded), remove the three screws and lockwashers. Use care when removing cover to prevent loss of check valve ball and seat. Remove throttle compensator valve spring and valve. *NOTE* - Inspect ball contacting surface in valve seats and valve body for nicks and burrs. Inspect cover for flatness and porosity.

Reassembly – Place valve body in an upright position and install throttle compensator valve and spring. Make sure spring is properly seated in valve. Place ball and ball seat in position in valve body. Place throttle compensator valve cover in position over spring and body and install three screws and lockwashers. Draw down evenly and tighten. Place governor compensator valve spring on valve then install governor compensator valve into valve body (small end first). Place the two check valve balls and seats in position in valve body; then install governor compensator valve cover, screws and lockwashers. Draw down evenly and tighten. Install governor compensator valve plug (small end first) in valve body, then install retainer and pin.

TORQUEFLITE LOWER VALVE BODY ASSEMBLY

Rear Valve Body (Removal): Remove the two rear valve body screws and lockwashers, and remove rear valve body from transfer plate assembly. Remove the servo pressure bleed valve to prevent loss. Invert valve bodies and transfer plate assembly and place on stand, Tool C-3528.

Disassembly - Hold pressure against kickdown plug cover and remove the bolts and lockwashers. *(CAUTION - Release pressure slowly on cover to prevent loss of small parts).* Remove 3-1 relay valve spring, 1-2 shift valve kickdown plug and 2-3 shift valve kickdown plug. Remove 1-2 shift valve spring and valve, and 3-1 relay valve. Remove 2-3 shift valve spring and valve, then remove the three governor plug cover bolts and lockwashers. *(CAUTION - When removing cover be careful not to lose check valve ball seat and ball).* Remove 1-2 shift valve governor plug from valve body. Remove 2-3 shift valve governor plug, then remove valve body plate.

Reassembly - Install the 1-2 shift valve (small end first), and 2-3 shift valve (spring pilot facing out), in valve body, then position the 1-2 and 2-3 shift valve springs in valves. Place 2-3 shift valve kickdown plug (identified by large pilot) over the 2-3 shift valve spring. Compress spring sufficiently to seat plug in valve body and secure by placing a thin piece of metal (6" scale) behind plug Install 3-1 shift valve (large end first) in valve body and install spring on pilot Place 1-2 shift valve kickdown plug over the 1-2 shift valve spring Place the kickdown plug cover over 3-1 relay valve spring and 1-2 kickdown plug, then compress springs and guide the 1-2 kickdown plug into valve body Install cover screws and lockwashers and draw down evenly and tighten Remove metal strip securing 2-3 shift valve spring Install rear valve body plate then place 1-2 shift valve governor plug in valve body (small end first). Install the 2-3 shift valve governor plug (small end first) in valve body. Install check valve ball and seat, then install governor plug cover, bolts and lockwashers, and tighten securely.

Front Valve Body (Removal): Remove two front valve body to transfer plate screws and lockwashers and separate front valve body from transfer plate assembly. *(CAUTION – Do not disturb throttle valve stop screw setting).*

Disassembly – Keep thumb pressure against shuttle valve cover (spring loaded) and remove the four screws and lockwashers. Use caution when removing cover to prevent loss of front check valve ball seat and ball. While holding thumb over throttle valve, invert valve body and remove shuttle valve plug and the shuttle valve and spring. Remove throttle valve spring, kickdown valve, and detent plug, (it is not necessary to remove detent plug retaining screw and lockwasher). Remove cotter pin from valve body in outer end of reverse blocker valve. Remove reverse blocker valve plug, blocker valve, and spring. *NOTE* - Normally it is not necessary to remove the throttle valve lever shaft, manual valve lever assembly, or manual valve. However, if condition warrants, proceed as follows: Support throttle lever shaft on block of wood. Using a small punch and hammer with care, remove the throttle valve lever shaft pin (a rubber band may be used to hold manual lever in place while removing pin). Remove any burrs from throttle valve and manual valve lever shafts, and slide them from valve body. Slide throttle valve lever shaft out of manual lever assembly. Using caution to prevent loss of detent ball and spring, slide manual valve lever assembly out of valve body. Using a twisting motion, remove manual valve.

► *FRONT VALVE BODY INSPECTION NOTE:* Inspect manual valve detent ball and make sure it slides freely into valve body. Inspect riveting and wear on manual valve lever pin in lever assembly. Inspect the staking of manual lever and throttle cam to their respective

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

shafts. Inspect the kickdown valve detent plug to make sure it slides freely on valve. Inspect check valve ball seat in valve body for faulty casting. Inspect manual valve lever needle bearing in valve body *(CAUTION - Do not remove, as body and bearing are serviced as an assembly).*

Reassembly – Place valve body on clean paper in an upright position, and using a twisting motion, install manual valve until it bottoms on paper. Place manual valve lever detent ball spring and ball in position in valve body. While compressing detent ball in position with right index finger, install manual valve control lever by sliding over detent ball and engage pin on lever with manual valve (hold this assembly in position with a rubber band). While holding manual lever assembly in position against valve body, install throttle valve lever assembly with flat portion on end of shaft facing away from valve body to allow maximum travel of lever. While holding levers in position in valve body with rubber band, support throttle lever on wooden block. Install shaft pin using a small punch and hammer. Remove rubber band. With reverse blocker valve spring in position in valve and with slots in valve aligned with pin, install reverse blocker valve in valve body. Install reverse blocker valve plug and compress spring sufficiently to install pin. Lock pin in position. Check kickdown detent plug stop screws for being tight, and install detent plug (large inner diameter first) on kickdown valve, and position kickdown valve (detent plug first) into valve body. Install throttle valve spring and throttle valve into valve body. Install shuttle valve and spring then install shuttle valve plug in valve body. Install front check valve ball and seat in valve body, then install shuttle valve cover, bolts and lockwashers. Draw down evenly and tighten.

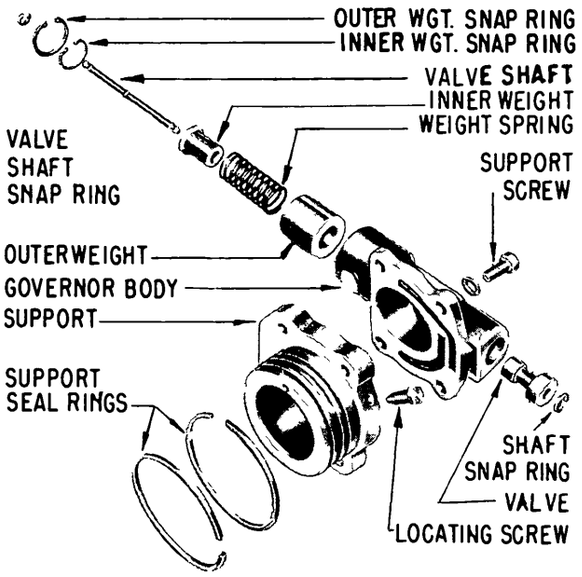
VALVE BODIES & TRANSFER PLATE REASSEMBLY: Place valve body transfer plate in an upright position on stand, Tool C-3528. Place steel plate (upper) over pilots on Tool C-3528 and into position on transfer plate.

Front Valve Body: Position front valve body on steel plate (upper) and install two screws and lockwashers in outer end of valve body and draw down finger tight.

Rear Valve Body: Invert transfer plate and replace on stand. With servo pressure bleed valve in place, hold rear valve body up in position against steel plate and install the two outer screws (short) with lockwashers through the transfer plate and into lower valve body. Draw up finger tight.

Lower Valve Body: To prevent loss of governor compensator valve retainer pin, position steel plate (lower) on lower valve body. Place valve body and steel plate into position on transfer plate. Install the two screws (intermediate length) and lockwashers. Tighten the two lower valve body and rear valve body screws to 50-60 inch lbs. Invert valve bodies and transfer plate and replace on stand. Install valve bodies retainer plate and two screws (long) with lockwasher and tighten retainer plate and front body screws to 50-60 inch lbs. Check manual valve to make sure it operates freely.

OUTPUT SHAFT REAR BEARING & SEAL (Removal): Remove rear bearing seal. Using pliers, Tool C-760, remove rear bearing snap ring (note that snap ring has a beveled edge). Inspect ring for distortion. Using driver, Tool C-3275, drive output shaft rear bearing out of rear extension.



Installation: Using driver, Tool C-3204, install bearing in extension making sure it is properly seated. Lubricate with automatic transmission fluid. Using pliers, C-760, install rear bearing snap ring with beveled side out. Make sure snap ring seats properly. Using driver, Tool C-3205, install shaft bearing seal with metal portion of seal facing in until tool bottoms on extension.

GOVERNOR (Disassembly): Using pliers, Tool C-3229, remove snap ring from governor weight assembly (keep thumb pressure against secondary weight when removing snap ring). Remove governor secondary weight and spring. Inspect all parts for burrs and wear. Check secondary weight for free movement in primary weight by placing secondary weight in primary weight without spring. Primary weight should fall free when both parts are dry. Place secondary weight and spring in primary weight, compress spring and install snap ring. Slide governor body and support from rear oil pump housing. Remove the two governor support seal rings. Remove the four governor body-to-support screws and lockwashers and separate body from support. Inspect oil passages and make sure they are free from dirt or other material. Clean passages with compressed air. Inspect governor body for slight scores. Valve should travel freely in governor body.

Reassembly: Lubricate the two governor support seal rings with automatic transmission fluid and install on governor support. Make sure seal rings are free to rotate in grooves. Position governor body on support and install the four screws and lockwashers (do not tighten screws at this time). Slide governor support and body assembly into position in rear pump housing. Compress governor support seal rings with fingers as support enters oil pump housing. DO NOT FORCE.

POWER TRAIN UNITS (Disassembly): Unit No. 1 (Output Shaft, Kickdown Planet Pinion Carrier, and Intermediate Shaft Assemblies) – *NOTE - Unit may be placed in the propeller shaft flange and hand brake drum assembly to aid in disassembly.* Using a screwdriver, remove output shaft drive housing snap ring. Remove reverse annulus gear from output shaft assembly. Remove intermediate shaft and kickdown shaft and kickdown carrier assemblies from output shaft assembly. Remove output shaft thrust washer located inside of housing. Remove kickdown planet pinion carrier assembly from intermediate shaft assembly *(NOTE - The kickdown planet pinion carrier assembly used in this unit is the same as the low-reverse planet pinion carrier assembly used in Unit No. 2. No attempt should be made to interchange these units).* Remove kickdown carrier thrust washer from carrier assembly. Remove sun gear roller thrust washer from intermediate shaft assembly. With a screwdriver, remove kickdown annulus gear snap ring and separate gear from intermediate shaft assembly.

Inspection (Output Shaft): Inspect all bearing and thrust surfaces for scoring or scratches. Blow compressed air through all oil passages: make sure they are open

TORQUEFLITE GOVERNOR ASSEMBLY

and free of dirt. Inspect the four large and two small interlocking seal rings for excessive wear, broken ends, and make sure they rotate freely in grooves. Intermediate shaft and clutch feed tubes are serviced as an assembly.

Inspection (Kickdown Planet Pinion Carrier): Inspect planet carrier for cracks and pinions for broken or worn gear teeth. Using a feeler gauge, check clearance on individual planet pinion gears (clearance should be .006-.017"). Inspect pinion shafts for fit in carrier and make sure pinions are free to rotate on shafts. Make sure shaft lock pins are installed. Inspect oil holes in carrier to make sure they are open. *(NOTE* - Do not replace carrier unless this inspection indicates it is necessary. The planet pinion carrier and pinions are serviced only as a complete assembly). Inspect kickdown thrust washer for scratches or excessive wear.

Inspection (Reverse and Kickdown Annulus Gears): Inspect for worn, cracked or broken gear teeth. Check contacting surfaces of teeth for indications of binding. This condition will usually be evidenced by a brinelling condition. If "brinelling" is noticed, check thrust washer contacting surfaces and alignment of annulus gear on shaft. (Annulus gear teeth having slight cracks, or what appear to be cracks, should provide sufficient evidence to warrant replacement of gear). While burrs or slight obstructions on gear teeth can be safely removed with a hone, under no circumstances should broken areas of gear teeth be filed or ground. In this case the annulus gear should be replaced. Wash annulus gear and be sure to remove all metal pick-up from teeth.

Reassembly (Unit No. 1): *(NOTE* - To aid in reassembly, position output shaft in the propeller shaft flange and brake drum assembly for use as a holding fixture). With

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

output shaft in an upright position, lubricate output shaft thrust washer with automatic transmission fluid and place into position in housing. Place kickdown annulus gear in position on intermediate shaft assembly and install snap ring (select fit). Using a feeler gauge, check clearance under kickdown annulus gear snap ring. Hold clearance as close as possible to .000". Snap rings are available in the following two thicknesses: .060-.062" (Part No. 1636357), .064-.066" (Part No. 1636358). *(NOTE* - When checking clearance, support annulus gear on edge of bench so intermediate shaft will seat properly in gear). Make sure snap ring seats properly. Place intermediate shaft assembly in output shaft housing. Lubricate kickdown carrier thrust washer with automatic transmission fluid and place in position in kickdown annulus gear (make sure thrust washer remains in position). Place reverse annular gear in position in housing and install output shaft drive housing snap ring, making sure it seats properly in housing. Lubricate and install sun gear thrust washer (roller type) over intermediate shaft and into position in carrier assembly.

Disassembly: Unit No. 2 (Sun Gear, Reverse Planet Pinion Carrier, Overrun Clutch, and Rear Clutch Piston Retainer Assemblies) - With unit in upright position, remove sun gear and front clutch thrust washer. Using two screwdrivers inserted between clutch and intermediate support, remove rear clutch retainer assembly from sun gear. Remove two clutch neoprene seal rings from sun gear. Remove reverse sun gear from overrun clutch and reverse planet pinion carrier assemblies. Install Tool C-3527, in intermediate support and cam assembly from overrun clutch hub. Using a screwdriver, remove snap ring from low-reverse band drum. Remove overrun clutch hub assembly from low-reverse band drum. Remove overrun clutch cam roller springs and rollers (ten of each) by removing Tool C-3527 from intermediate support and cam assembly *(CAUTION* - Place assembly over bench when removing tool so springs and rollers will not be lost).

Rear Clutch Piston Retainer Disassembly - Using screwdriver, remove snap ring (large) from rear clutch piston retainer assembly. Remove rear clutch pressure plate from retainer assembly. *(NOTE* - Rear clutch plates (steel) are dished and identified by a notch in one of the driving lugs. When removing the steel plates from clutch retainer, note that dished side of these plates is facing out. Check for dished side by using a straightedge across plate). Invert clutch piston retainer assembly and remove clutch plates and driving disc assemblies (five each). Using Tool C-3533, slightly compress the rear clutch piston return spring retainer, being careful not to damage retainer by compressing spring too far. Using pliers Tool C-3301, remove piston return spring snap ring. Release Tool C-3533 and remove clutch return spring retainer and spring from clutch piston retainer assembly (spring retainer may require guiding past snap ring groove as tool is released). Using a twisting motion, remove clutch piston assembly from retainer. Remove rear clutch piston inner and outer seal rings.

Inspection (Clutch Driving Disc & Plate) - Inspect driving discs and plates for evidence of burning, glazing and flaking off of facing material. Check disc by scratching facings with finger nail. If material collects under nail, replace all driving discs. Replace driving discs if splines have become damaged. Inspect the steel clutch plates and pressure surface for evidence of burning, scoring, and damaged driving lugs. Replace if necessary.

Inspection (Piston & Seal Rings) - Inspect seal ring surfaces in piston retainer for nicks and deep scratches. Light scratches will not interfere with sealing of neoprene rings. Inspect inner and outer piston seal rings (neoprene) for deterioration, wear, and hardness. Inspect seal ring groove in piston for nicks or burrs. Inspect inside bore of piston for score marks; if light, remove with crocus cloth; if heavy, replace piston. Inspect piston spring, retainer and snap ring for distortion.

Inspection (Clutch Piston Retainer) - Note ball check in clutch retainer. Make sure ball operates freely. Inspect the band contacting surface for deep scores and burns, especially if the band lining is worn to point where steel band has been contacting rear clutch piston retainer. *(CAUTION – Do not machine the piston retainer in an engine lathe to remove score marks).* Inspect steel clutch plate contacting surfaces for burrs or brinelling. Make sure clutch driving lugs on steel clutch plates travel freely into retainer. Remove any metal pick-up on hub of retainer.

Rear Clutch Piston Retainer Reassembly - Lubricate and install inner piston seal ring on hub of clutch retainer (seal lip must be facing down, and seal must be properly seated in groove). Lubricate and install outer seal ring on clutch piston (lip of seal facing away from flange). Place piston assembly in clutch retainer, and with a twisting motion, seat piston in bottom of retainer. Install piston return spring on hub and position spring retainer snap ring on spring. Using Tool C-3533, compress clutch spring sufficiently to seat the snap ring. Make sure snap ring is properly seated. Remove Tool C-3533. Lubricate all clutch plates and discs with automatic transmission fluid. Assemble by placing one rear clutch steel plate (identified by a notch on one of the lugs) with the dished side facing out, in the clutch retainer, followed by a driving disc. Repeat this procedure until all five discs and five plates have been installed *(CAUTION – All steel driving plates must be installed with dished sides facing same direction for proper travel of clutch pressure plate).* Install rear clutch pressure plate. Select and install snap ring making sure it is seated properly in clutch retainer. Using feeler gauge, check the clearance between snap ring and pressure plate. Clearance limits are as close to .000" as possible. Snap rings are available in the following sizes: .060-.062" (Part No. 1636315); .064-.066" (Part No. 1636316).

Inspection (Reverse Sun Gear Assembly): Inspect gears for cracked or broken teeth. Inspect steel back bronze bushing for scoring or excessive wear. Bushing and reverse sun gear are serviced as an assembly. Inspect intermediate support bearing surface of gear for wear and slight scores. Inspect rear clutch seal ring grooves on gear for nicks or burrs. Inspect inner ring sealing surface in bore of sun gear for grooves or scratches. Inspect thrust area of sun gear for nicks, scratches, or burrs. Inspect neoprene seal rings for deterioration, wear, nicks, or hardness. Inspect front clutch and sun gear thrust washers for scratches or excessive wear.

Inspection (Support & Cam Assembly): Inspect riveting of cam to intermediate support. Inspect cam roller surface for brinelling. Inspect roller spring retaining tabs for being bent or distorted. Inspect bearing surface on hub for scoring. Inspect steel backed bronze bushing in hub for scratches or scoring and excessive wear. Bushing and intermediate support are serviced as an assembly. Inspect overrunning clutch cam rollers for being pitted or scored. Inspect overrunning cam roller springs for distortion. Replace if necessary.

Inspection (Low-Reverse Planet Pinion Carrier): Inspect carrier for cracks and pinion for broken or worn gear teeth. Using a feeler gauge, check end clearance on individual planet pinion gears, clearance should be .006-.017". Inspect pinion shaft for fit in carrier and and make sure pinions are free to rotate on shafts. Make sure shaft lock pins are installed. *(NOTE* - Do not replace carrier assembly unless inspection indicates that it is necessary. The planet carrier and pinions are serviced as an assembly).

Inspection (Low-Reverse Band Drum): Inspect band contacting surface for deep scratches and burrs, especially if band lining is worn to point where steel band has been contacting drum *(CAUTION - Do not attempt to machine drum in an engine lathe to improve score marks).* Inspect driving lugs inside drum for excessive wear.

Inspection (Overrunning Clutch Hub): Inspect cam roller contacting surface for brinelling. Inspect steel back bronze bushing in hub for scratching or scoring and excessive wear. Bushing and hub are serviced as an assembly. Inspect lubricating hole and make sure it is free from foreign matter by cleaning with compressed air. Inspect reverse drum snap ring for distortion.

Reassembly (Unit No. 2): Install overrunning clutch hub assembly (hub first) into snap ring side of the low-reverse band drum. Place low-reverse planet pinion carrier assembly in position in low-reverse band drum. With drum supported, select snap ring to give minimum clearance. Snap rings are available in the following thicknesses: .060-.062" (Part No. 1636315); .064-.066" (Part No. 1636316); .068-.070" (Part No. 1636317). Place tool C-3527, in position in intermediate support and cam assembly and install cam springs and rollers. *(CAUTION - Make sure that cam springs and rollers are properly seated against cam; otherwise, damage to springs will result when overrunning clutch hub is installed).* With intermediate support and cam assembly resting on bench, lubricate bushing and install low-reverse band drum assembly over hub. While holding the two assemblies together, remove Tool C-3527. Lubricate bearing surface on reverse sun gear and install intermediate support and planet pinion carrier assembly. Lubricate the two sun gear rear clutch seal rings (neoprene) with automatic transmission fluid, and install on reverse sun gear. Install rear clutch piston retainer assembly on reverse sun gear. *(CAUTION - T prevent injury, do not place fingers under clutch retainer assem-*

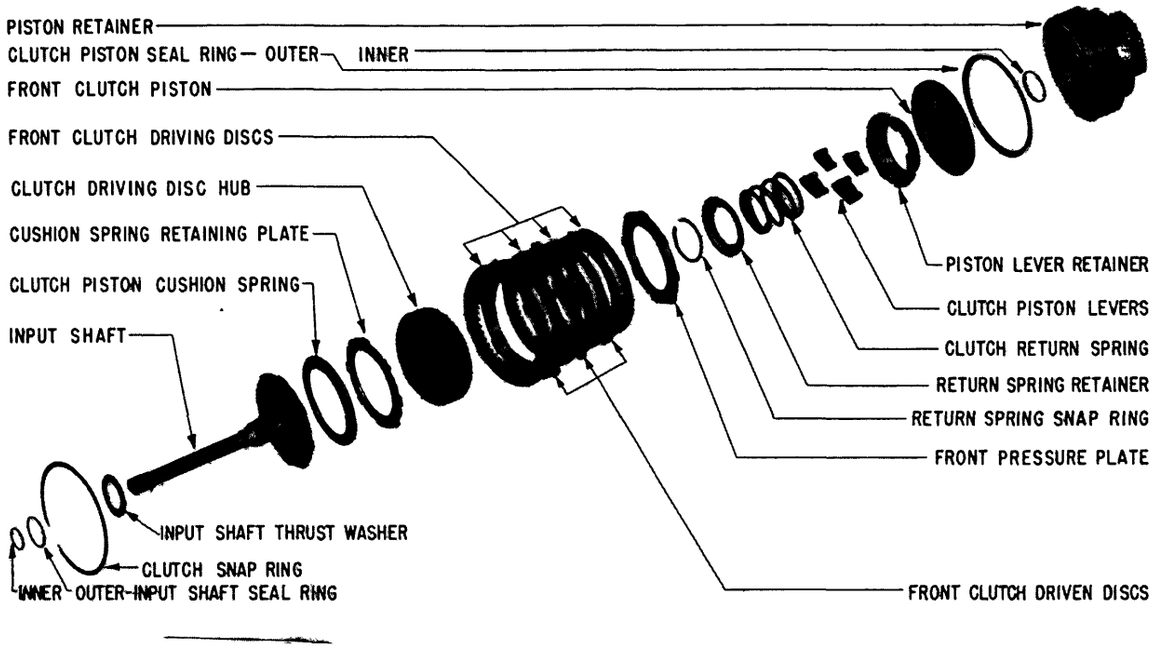
TORQUEFLITE (C nt.)



bly when installing). Install front clutch and sun gear thrust washer (Lubriplate may be used to hold thrust washer in position).

Disassembly: Unit No. 3 (Input Shaft & Front Clutch Piston Retainer Assemblies) - Remove input shaft fibre thrust washer (select fit). To remove clutch assembly from piston retainer (front clutch cushion spring is under approximately 500 lbs. pressure), place the assembly in an arbor press with rear of piston retainer resting on a suitable support. Press the input shaft only far enough into retainer to permit removal of the snap ring with a screwdriver. *(NOTE* - If an arbor press is not available, use two large "C" clamps placed 180° apart and apply equal pressure, making sure that clamps are positioned so as not to damage the ball check located in back side of retainer). Slowly release pressure on arbor press, then remove retainer and input shaft from press. Remove input shaft assembly from clutch piston retainer. Invert piston retainer and remove retaining plate, cushion spring, driving discs and clutch plates (Early cars used five driving discs and four clutch plates. Later cars used four driving discs and three clutch plates). Remove pressure plate and clutch hub. Install compressor, Tool C-3575 and compress front clutch piston return spring retainer. Remove piston return spring snap ring, then release and remove Tool C-3575. Remove clutch piston return spring retainer and spring. Remove lever retainer and levers from clutch piston retainer. Using a twisting motion, remove piston assembly.

Inspection (Input Shaft): Inspect thrust washers for cracks or excessive wear. Inspect front clutch snap ring for distortion. Inspect interlocking seal rings for wear or broken locks. Make sure they turn freely in grooves. *(NOTE* - When replacing rings, use extreme care not to damage interlock portion). Make sure all passages are open by blowing air through them. Check splines and lugs for nicks or burrs. Inspect bearing and thrust surfaces for nicks or scratches. Inspect steel back bronze bushing for scratches, scoring or excessive wear (bushing and input shaft are serviced as an assembly).

Inspection (Clutch Driving Discs, Plates, and Hub): Inspect driving discs for evidence of burning or glazing, and flaking off of facing material. Check discs by scratching facings with finger nail; if material collects under nail, replace all driving discs. Replace driving discs if splines have become damaged. Inspect steel clutch plates and pressure plate surface for evidence of burning, scoring, and damaged lugs; replace if necessary. Inspect lever contacting surface on pressure plate for evidence of wear (oil passages in hub are to lubricate clutch plates). Make sure they are free of foreign matter.

Insp cti n (Fr nt Clutch Pist n, S al & L v rs): Inspect levers for wear or distortion. Remove and inspect inner and outer piston seal rings (neoprene) for deterioration, wear, and hardness. Inspect seal ring groove in piston for nicks or burrs. Inspect inside portion of piston hub for score marks. If light, remove with crocus cloth, if heavy, replace piston. Inspect lever ring for seating properly in groove on piston. Inspect lever retainer, return spring, spring retainer, and snap ring for distortion.

TRANSMISSION UNIT NO. 3

Inspection (Front Clutch Retainer): Make sure check ball operates freely. Inspect seal ring surfaces in hub; if intermediate shaft seal rings have excessively worn or grooved this surface, replace the clutch piston retainer. Remove any metal pick-up on hub of retainer, and inspect seal ring groove for nicks or burrs. Inspect steel clutch plate contacting surfaces for scores or brinelling. Inspect thrust surface on rear of retainer for scratches or scoring. Make sure all clutch feed and lubricating passages are open and free of dirt.

Reassembly (Unit No. 3): Lubricate and install neoprene oil seal ring on hub of clutch retainer (seat seal properly in groove with lip of seal facing down). Lubricate and install outer seal ring on clutch piston with lip of seal facing away from flange. With piston lever ring seated in piston, place piston assembly in clutch retainer, and with a twisting motion, seat piston in bottom of retainer. Place lever retainer in piston and install the levers (eight used on early cars, four used on later cars), making sure they are free and properly seated in slots in piston. Install clutch return spring over hub of clutch retainer and position spring retainer and snap ring on spring. Using compressor, Tool C-3575, compress clutch return spring sufficiently to seat snap ring with pliers, Tool C-3301, making sure snap ring is properly seated. Remove Tool C-3301. Install pressure plate with smooth side up, in retainer. Install discs and plates by placing one of the driving discs in clutch retainer followed by a steel plate. Repeat this procedure until all discs and plates have been installed, then check and adjust front clutch pressure plate travel *(see "Front Clutch Pr ssure Plate Trav l & Adjustment" below).* After completing clutch travel adjustment, install front clutch hub, cushion spring (concave side toward retaining plate). Place front clutch and input shaft assembly in an arbor press with rear of piston retainer resting on a suitable support, then press input shaft into clutch retainer until retainer snap ring can be installed. *(NOTE* - It will require approximately 500 lbs. pressure to compress spring for assembly). Remove assembly from arbor press and install input shaft thrust washer.

Front Clutch Pressure Plat Trav l Ch ck & Adjustment: Install a rear clutch pressure plate, Part No. 1732114 on top of front clutch pack. *(NOTE - R ar clutch pressure plate, Part No. 1732114 has be n replaced in production on DeS to & Plymouth, and possibly on other cars, with the same plat , Part No. 1736408, used in the front clutch. Front clutch pressure plate, Part No. 1736408 cannot be used for ch cking front clutch travel. Part No. 1732114 must be us d f r this purpos).* Holding this plate firmly in position, insert a feeler gauge between plate and the top disc in the assembly. Total clearance should be .020-.040". If measured clearance is not within these limits, the clutch discs should be replaced with any combination

TORQUEFLITE (C nt.)

of new discs, Part Nos. 1636260 (.060-.063"); 1636372 (.073-.076"); 1636373 (.087-.090"), to provide for proper clearance. Remove rear clutch pressure plate and install front clutch hub. Complete assembly as indicated above.

TRANSMISSION REASSEMBLY & INSTALLATION

TORQUE CONVERTER REACTION SHAFT (Installati n): Using sun lamps, heat front of transmission case to approximately 170-190°F. Install guide studs, Tool C-3283, in front face of reaction shaft flange. Lubricate portion of reaction shaft flange (that presses into case) with automatic transmission fluid. Position torque converter reaction shaft into front of transmission case so that guide studs in shaft align with threaded holes in case. Using Tool C-3531, press reaction shaft into place. Remove guide studs and start the three transmission case-to-reaction shaft screws and washers. Draw down evenly and tighten to 10-15 ft. lbs. Coat torque converter reaction shaft seal with automatic transmission fluid, and install on shaft.

REGULATOR VALVE BODY (Installation): Install guide studs, Tool C-3288 in transmission case. Install valve body gasket over guide studs and into position on transmission case. With seal ring (neoprene) in position on reaction shaft, install regulator valve body and valves over guide studs and into position *(CAUTION* - Hold valves in place to prevent damage while installing valve body).

FRONT OIL PUMP (Installation): With inner and outer seals lubricated and pump gears in position in housing (counterbore in pinion gear facing down as identified when removed), place oil pump housing over studs and slide into position. Start five of the screws (with aluminum washers) and draw housing down evenly until it is seated in transmission case. Remove guide studs and install the two remaining screws and washers. Tighten the two long screws and five short screws to 14-16 ft. lbs. *(CAUTION - Improper tightening of these screws may cause pump gears to bind).* Lubricate and install front pump drive sleeve (bearing surface first), and engage the driving lugs of oil pump pinion to determine if oil pump gears turn freely (main body of driving sleeve should be flush with oil pump housing when properly installed). If gears do not turn freely, remove pump and check for foreign matter between pump gears and housing. Install torque converter control valve spring, retainer and gasket. Tighten to 35-40 ft. lbs. Install transmission regulator valve spring, retainer and gasket. Tighten to 45-50 ft. lbs.

ACCUMULATOR PISTON (Installati n): Lubricate seal rings and place accumulator piston into position. Compress outer seal ring and tap lightly in transmission case.

KICKDOWN PISTON (Installation): Lubricate piston seal rings and place kickdown piston assembly into position, compress outer ring, and start assembly into case. With piston properly centered so as not to damage rings, tap lightly and bottom piston into case. Place kickdown piston rod assembly in piston and slide piston spring over kickdown piston rod. Install Tool C-3529, for kickdown piston installation. Compress spring sufficiently to install snap ring. Loosen compressing portion of tool and remove from transmission case. Place servo piston sleeve over piston. Make sure sleeve slides freely on piston by working it up and down.

LOW-REVERSE PISTON (Installation): Lubricate reverse servo piston seal ring and install in piston (with lip of seal facing end of piston). Install cushion spring and plug into servo piston and secure with snap ring. *(CAUTION - Make sure that snap ring seats properly).* Install piston assembly into transmission case, then place reverse servo piston spring over piston and position spring retainer over spring. Install Tool C-3529 or C-3289 compress spring and install snap ring.

KICKDOWN BAND (Installation): Install kickdown band assembly by rotating band ends over center support in transmission case *(CAUTION - Use care when installing bands so not to damage lining on edges of transmission case).* Install anchor on kickdown band adjusting screw.

LOW-REVERSE BAND (Installation): Install anchor on reverse band adjusting screw. Install band by rotating band ends through rear opening in transmission case.

LOW-REVERSE & KICKDOWN BAND LEVER ASSEMBLIES AND STRUTS (Installation): Place levers in position in case and slide shaft through levers from rear of transmission case. Remove guide stud, Tool C-3288, from threaded end of shaft and install shaft lever spacer (flat) and plug. Tighten plug to 30-35 ft. lbs. Position kickdown band over anchor and compress band sufficiently to install kickdown band strut. Place reverse band into position on anchor and compress band end; and with aid of a screwdriver, install strut.

POWER TRAIN UNITS (Installation): Unit No. 3 (Front Clutch Piston Retainer and Input Shaft Assemblies) - If when transmission was disassembled, the end clearance was found to be incorrect, correction can be made at this time by selection of proper input shaft thrust washer. To accomplish this, use a micrometer and measure thickness of thrust washer which was removed. Select a thicker or thinner washer to give proper clearance *(NOTE - Front clutch end clearance should be .020-.050" with transmission fully assembled).* Thrust washers are available in the following sizes: .115-.117" (Natural color, Part No. 1637669); .097-.099" (Black, Part No. 1638670); .078-.080" (Red, Part No. 1638671). With input shaft thrust washer in position and input shaft seals lubricated, start unit through rear of transmission case. By supporting and keeping unit centered as much as possible, guide through bands and reaction shaft into position.

Unit N . 2 (Sun G ar, R v rs Plan t Pini n Carri r, Ov rrunning Clutch, and R ar Clutch Ass mbli s) - Start unit through rear of transmission case. Align identified locating hole in intermediate support with threaded locating hole inside of transmission case. By supporting and keeping unit centered as much as possible, guide through bands until it contacts hub on front clutch. While pushing in on assembly, rock sun gear to engage clutch plates of rear clutch on hub of front clutch *(CAUTION* - While rocking sun gear, make sure unit does not bind on bands or in intermediate support. Do not use excessive force when installing this unit so as to prevent damage to clutch discs in rear clutch). Use a drift punch to assist in alignment of intermediate support locating holes. Install the three intermediate support locating screws, lockwashers, and tighten to 25-30 ft. lbs. Use great care when installing the locating screw to prevent loss of lockwasher. Check input shaft and sun gear for turning freely.

Unit No. 1 (Output Shaft, Kickdown Planet Pinion Carrier, and Intermediate Shaft Assemblies) - Be sure reverse sun gear thrust washer (roller type) is in position in planet pinion carrier assembly. Lubricate seal rings and bearing surfac e on intermediate shaft, with automatic transmission fluid. Install unit by placing intermediate shaft in sun gear. Keeping unit centered as much as possible and slowly turning output shaft, slide into position (large seal ring on output shaft flush with rear of transmission case). *CAUTION* - Use care when installing to prevent damage to seal rings on intermediate shaft.
